The Saint Paul hospital has 100 beds, with four large wards. At present there are nearly fifty patients in the hospital, with an almost even ratio of men and women, ranging from childhood to old age. Persons of all religious denominations are accepted.

A registered nurse is in constant attendance and practical nurses assist. A local physician is in charge, patients receiving a maximum of care and comfort.

It is a rule of the Servants of Relief that no pay is accepted from patients, their relatives or friends; nor has state and city aid ever been accepted. This work is supported entirely through the generosity of the public

WASECA GROUP TO BUY HOSPITAL EQUIPMENT

Mrs. George H. Olds

The Waseca Auxiliary is collecting extra dues to buy equipment for the hospital in Waseca. An additional hospital project was sewing and mending but that work has since been assumed by individual volunteers in Waseca.

This Auxiliary has 100 per cent membership of Waseca county doctors' wives and two meetings are held each year, one in January and one in May.

EDUCATION FOR HANDICAPPED: PROJECT

Mrs. B. Marden Black

An educational program to aid handicapped patients undergoing long treatment at hospitals has been organized by the Olmsted-Houston-Fillmore-Dodge County Auxiliary. The program includes tutoring for children, to enable them to keep up with their school work, and vocational instruction for adults, helping them

in HAY FEVER

Three major qualities distinguish

Your local pharmacy stocks Neo-Antergan in 25-mg. and 50-mg. tablets, supplied in boxes of 100 and bottles of 1,000.

Neo-Antergan®

MALEATE

(Brand of Pyranisamine Maleate)

(N-p-methoxybenzyl-N',N'-dimethyl-N-α-pyridylethylenediamine maleate)

1. EFFICACY Neo-Antergan has provided complete or appreciable symptomatic relief in 71 per cent of an accumulated series of more than 500 cases of hay fever.

2. WIDE THERAPEUTIC RANGE Neo-Antergan has proved effective in relieving allergic symptoms in certain patients who had failed to respond to other therapeutic measures.

3. SAFETY It was necessary to discontinue Neo-Antergan therapy only in approximately 3.5 per cent of a series of over 1,500 patients because of untoward side effects.

MERCK

EDUCATION FOR HANDICAPPED

(Continued from Page 546)

to prepare for occupations that are within their physical capacities. The assistance is available to resident or non-resident patients.

Like many other Auxiliaries, the OHFD is making cancer dressings—distributed to the indigent of four counties. Members meet every Friday afternoon at the home of Mrs. F. P. Moersch to carry on this project.

Most current activity of the Auxiliary is the Health Day program, being presented May 11, in conjunction with the Federated Women's Clubs of the four counties. A lecture of diseases of the heart and their complications will keynote the event.

MOWER COUNTY WINS ANNUAL HYGEIA AWARD

Mrs. Chester Sheedy

The Mower County Auxiliary, through the efforts of Mrs. Tracy Barber, placed third in Group I of the annual *Hygeia* subscription contest this year. The Auxiliary received a cash prize of $15.

Although the contest is over, Auxiliary women are urged to continue promoting *Hygeia,* keeping the public correctly informed by means of the best laymen's health magazine.

WRIGHT COUNTY PLANS NEW HOSPITAL

Members of the Wright County Auxiliary are looking forward to the construction of a new hospital before the end of the year and are making plans for an accelerated program of hospital-correlated activities.

During the year the Wright county group has held meetings at which Health Days, Blue Cross and Blue Shield and medical subjects were discussed.

STATE PRESIDENT TO ADDRESS WEST CENTRAL

Mrs. F. W. Behmler

Mrs. Harold F. Wahlquist, state Auxiliary president, will address the next scheduled meeting of the West Central Woman's Auxiliary.

The Auxiliary, which includes four counties—Stevens, Pope, Big Stone and Traverse, now has twenty-four members and holds four meetings each year, two in the fall and two in the spring.

UPPER MISSISSIPPI LEADS HOSPITAL AID

Mrs. I. L. Mitby

Little Falls doctors' wives have organized a group to aid the hospital there and, finding many other women eager to help, accepted them in the group. The members meet once a month in the hospital and have, thus far, contributed a sewing machine and dishes to the hospital, made stuffed animals for the pediatrics department, and now are completing arrangements for buying a sterilizer for the hospital. Money is raised by holding silver teas and other benefit events, including a "Calico Ball."

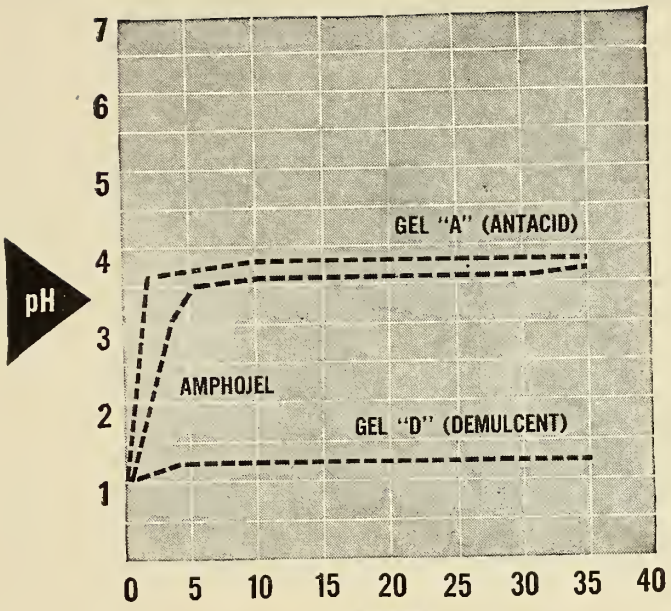
The Upper Mississippi group noted with pride that this year one of the members, Mrs. John Thabes, Sr., of Brainerd, is serving as president of the Minnesota Public Health Association. She is the first woman president in forty-three years.

FIRST HEALTH DAY IN RAMSEY COUNTY, APRIL 21

Mrs. W. G. Johanson

Initiated by the Women's Auxiliary to the Ramsey County Medical Society and co-sponsored by the Saint Paul Area Public Health Council, the first Saint Paul and Ramsey County Health Day was held April 21. The all-day program was held in the Saint Paul Auditorium, which was granted without charge by the City Council.

Each major session, beginning at 9 a.m., 1 p.m., and 7:30 p.m., opened with the showing of motion pictures, selected by a visual education committee of experts from Canadian and American sources. Professional equipment and operator were underwritten by twenty-two service clubs of the city.



The morning program featured three speakers, in addition to a greeting by the mayor of the city. They were: Dr. Robert N. Barr, who spoke on "Let's Live Longer," Miss Irene Netz, nutritionist, "You Are What You Eat"; and Dr. Walter C. Alvarez of Mayo Clinic, who drew the largest audience of the day with, "What Makes Women Nervous."

The afternoon was devoted to child health problems. Dr. Paul H. Dwan spoke on "Basic Child Health Needs," after which a panel of experts held a discussion on "The Whole Child." It was moderated by Judge Carlton F. McNally, and included Dr. Edward Dyer Anderson, child psychiatrist; Dr. Dwan; Selmer H. Berg, public school superintendent; and Miss Agnes A. Larson, nutritionist and home economist. The Parent-Teacher groups of the city particularly promoted this session, substituting this program for their own annual program on health at monthly Council meetings.

The evening session featured Dr. Thurman B. Rice, of Indianapolis, widely known public health administrator and professor in the Indiana Medical Center. His informal message on "How to Live Better," held the audience from the beginning, with alternate laughter and surprise at his unexpected advice "to enjoy yourself and have fun."

The Central High School choir of seventy sang during the morning, the Bethesda Hospital nurses in uniform at the afternoon, and the Johnson High School band of fifty-five played on the evening program. One hundred and twenty-five ushers from volunteer women's service groups, such as Red Cross Motor Corps, nutrition classes, first aid and Grey Ladies, were on duty in the morning; graduate nurses from Saint Paul hospitals, in the afternoon; and high achievement winners in health projects and citizenship from youth organizations, in the evening.

More than forty exhibits, demonstrations and displays were arranged in a special room, giving free of charge almost 200 free chest x-rays, vision and audiometer tests to show the program carried on in the schools, and free literature.

The reaction rate of Amphojel and its component gels.

the double action of AMPHOJEL®

antacid
demulcent

Amphojel – Aluminum Hydroxide Gel, Alumina Gel Wyeth – is unique because it is a colloidal mixture of two essentially different types of alumina gel, one having an antacid effect . . . the other a demulcent action.

The "antacid gel" instantly stops gastric corrosion and establishes a mildly acid environment.

The "demulcent gel" provides a prolonged local protective effect, and might be likened to a "mineral mucin."

Thus, through its double action, Amphojel gives you an ideal preparation for use in the management of peptic ulcer.

Wyeth®

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

WYETH INCORPORATED, PHILADELPHIA 3, PA.

Of General Interest

March 25 was "De Boer Day" in Edgerton. Residents of the community gathered in the high school auditorium that evening to pay tribute to the city's pioneer physician, Dr. Hermanus De Boer, and to thank him for his forty-three years of service.

Since 1906, when Dr. De Boer began his medical practice in Edgerton, he has served as mayor of the city for twenty-two years and as its physician for forty years. He retired from active practice in 1946.

* * *

With ninety-eight years of community service behind them, Dr. Myron W. Smith and his wife, Dr. Grace Gardiner Smith, celebrated the fiftieth anniversary of their arrival in Red Wing on March 16.

In 1899 the two physicians arrived in Red Wing and opened medical offices. Dr. Myron Smith is still conducting an active practice. Dr. Grace Smith retired in 1947. During their half century of medical service, both physicians have been prominent in numerous civic activities and projects.

* * *

Three Rochester physicians, working in the Mayo Foundation, received master of science degrees at the University of Minnesota commencement exercises on March 17. The physicians and the fields in which they received their degrees are Dr. J. O. Gooch, otolaryngology and rhinology; Dr. W. G. McCreight, dermatology and syphilology, and Dr. N. K. White, medicine.

* * *

Guest speaker at a meeting of the David Wisted American Legion auxiliary in Duluth on March 21 was Dr. William Coventry, whose talk was entitled "Your Doctor Serves You."

* * *

Dr. W. R. Humphrey, Stillwater, recently flew to Virginia to be with his brother who had to undergo a major operation. After flying back, he was in an automobile accident on the way from the airport to Stillwater. Although the car was damaged, Dr. Humphrey fortunately was not injured.

* * *

The Food and Drug Administration is making seizures of syrup of urethane, a cough syrup manufactured by Marvin R. Thompson, Inc., Stamford, Connecticut. More than 2,300 gallons of the syrup have been distributed to physicians and druggists. When the syrup is administered as directed on the label, there is danger of the development of leukopenia. Physicians and druggists have therefore been warned.

* * *

Beginning in 1952, the minimum requirements for eligibility to examination for the American Board of Orthopaedic Surgery, Part I, will be the completion of an internship, a year of resident training in general surgery, and two years of resident training in orthopedic surgery on an approved service.

The AMA, in co-operation with the U. S. Office of Education, is making a study of school health services through its Bureau of Health Education. The survey is a preliminary step in efforts designed to bring about improvement of school health programs within the framework of the private practice of medicine. The secretaries of each local medical society will soon receive a questionnaire which they are urged to complete and return. The U. S. Office of Education in Washington will concurrently query the schools with a different questionnaire. The information obtained should bring out strengths and weaknesses in school services and indicate needs for future action.

* * *

Dr. William C. MacCarty, emeritus consulting physician of the Mayo Clinic and emeritus professor of the Mayo Foundation, was a voting delegate at a United Nations meeting in Brussels, Belgium, April 4 through 8. The meeting was a conference of the United Nations Educational, Scientific and Cultural Organization.

* * *

Dr. Karl C. Wold, Saint Paul, whose book, "Mr. President, How Is Your Health?" was recently issued by the Bruce Publishing Company of Saint Paul, was the guest speaker at a meeting of the Exchange Club in the Hotel Saint Paul on March 23. Dr. Wold's book was the cause of a recent national controversy concerning the state of Franklin Roosevelt's health during the last years of his life.

* * *

At a meeting of the Twin City Organized Reserve Medical Units, held at Fort Snelling on March 21, Dr. Daniel J. Moos, Minneapolis, spoke on "Reconstructive Surgery."

* * *

The Kandiyohi County Citizens' Mental Health Committee, at a meeting in Willmar on March 15, heard an address by Dr. Stanley B. Lindley, director of the Willmar State Hospital. On March 23, Dr. Lindley was guest speaker at the final meeting of a family relationship course conducted in Willmar. At that meeting he discussed personality development and mental hygiene.

* * *

Dr. A. C. Peterson was the guest of honor at an "appreciation day" party in Dassel on March 27. Residents of Dassel and the surrounding rural area gathered in the First Lutheran church that afternoon to pay tribute to Dr. Peterson for his forty-five years of medical service to the community.

After receiving his medical degree in 1903, Dr. Peterson practiced for a year at Shevlin and for another year at Murdock. Early in 1905 he moved to Dassel, where he has since practiced. During the past year he has been forced to curtail his practice because of ill health.

Among Minnesota physicians attending a continuation course in physical medicine at the University of Minnesota on March 28, 29 and 30 was Dr. R. H. Puumala of Cloquet.

* * *

Speaking at a meeting of the Rotary Club in Hibbing on March 31, Dr. Clarence Jacobson, Chisholm, denounced the government health program and said that socialized medicine "has failed in every country that has tried it." He pointed out flaws in the plan and described the unsatisfactory situation in England under government-controlled medicine.

* * *

Among those taking part in the discussions at a continuation course in pediatrics at the University of Minnesota, April 7 through 9, was Dr. Karl H. Pfeutze, superintendent of the Mineral Springs Sanatorium at Cannon Falls.

* * *

In April, Dr. E. H. Frost of Willmar began his fiftieth year of medical practice in Kandiyohi County. To mark the occasion, a surprise program was presented by Rice Hospital staff members at their regular meeting. Talks honoring Dr. Frost's record of service were given by Dr. R. J. Hodapp, Dr. J. C. Jacobs, Dr. B. J. Branton and Dr. R. E. Anderson, all of Willmar, and Dr. Hans Johnson of Kerkhoven.

* * *

Dr. A. O. Swenson, Duluth, presented a talk on "Socialized Medicine" at a meeting of the Arrowhead Society of Medical Technologists in Duluth on March 31.

* * *

At a regional meeting of the National Association of Chiropodists in Omaha, Nebraska, April 9 through 11, Dr. Walter F. Kvale, Rochester, presented a paper entitled, "Occlusive Arterial Diseases and Their Relation to Chiropody."

* * *

Dr. B. J. Branton, Willmar, was elected a member of the state board of the Minnesota Trunk Highway Federation at its foundation meeting in St. Cloud late in March.

* * *

The Minneapolis Children's Heart Clinic moved to a new location on April 8. After twenty-seven years in the former Lymanhurst Hospital, now the Elizabeth Kenny Institute, the clinic is now being conducted at the outpatient department of the University of Minnesota Hospitals. Under the direction of Dr. M. J. Shapiro, head of the clinic since its formation in 1922, the clinic is open on Tuesday and Thursday afternoons.

* * *

At the annual convention of the Pacific Coast Oto-ophthalmological Society, held in Coronado, California, on April 6, Dr. Robert E. Priest, of the University of Minnesota, discussed the use of tracheotomy in the treatment of persons suffering from bulbar poliomyelitis.

* * *

Dr. Owen H. Wangensteen, chief of surgery at the University of Minnesota, left for Puerto Rico on April 5 to take part in a conference of the Puerto Rico Medical Association.

* * *

New methods in combatting cancer were described by Dr. F. H. Baumgartner, Albany, at a meeting of the Albany Community Club on April 7. Two motion pictures on cancer were shown at the meeting.

* * *

Dr. and Mrs. John S. Lundy left Rochester on March 26 for a month of traveling. They planned to spend the first two weeks touring the eastern states, with Dr. Lundy attending several medical meetings en route. The last two weeks of the trip were reserved for a vacation in Cuba.

* * *

A talk by Dr. F. H. Magney, Duluth, on the detection of cancer was a feature of the program for the April 5 meeting of the Duluth Associated Pharmacists.

* * *

A meeting was held in Coleraine on March 31 to organize committees to prepare for a mass chest x-ray survey in Itasca County. The x-ray survey, the first to be done in that county, is under the sponsorship of the Minnesota Department of Health, the Itasca County Medical Society and the Lake Julia Sanatorium.

* * *

Dr. Ralph Rossen, superintendent of the Hastings State Hospital, led a discussion on personnel problems at a mental hospital institute held in Philadelphia, April 11 to 15, sponsored by the American Psychiatric Association.

* * *

At a joint meeting of the Range Medical Association and its auxiliary in Hibbing on March 22, Dr. F. J. Elias of Duluth presented a talk on "The Evils of Socialized Medicine."

* * *

Contagious diseases in children were discussed by Dr. S. W. Watson, Royalton health officer, at a meeting of the Parent-Teacher Association in Royalton on March 14. In his talk Dr. Watson described the public health laws in regard to contagious diseases.

* * *

A Saint Paul and Ramsey County Health Day was held in the Saint Paul Auditorium on April 21, with motion pictures, exhibits and talks presented to the public throughout the day. Dr. Walter C. Alvarez, Rochester, opened the day's program with a talk on "What Makes Women Nervous?" The principal speaker in the afternoon was Dr. Paul F. Dwan, University of Minnesota pediatrician and research specialist in rheumatic fever.

* * *

The bi-annual Rice County chest clinic was held in Faribault on April 4 under the direction of Dr. Karl H. Pfuetze, superintendent of Mineral Springs Sanatorium. Free Mantoux tests were available to the public.

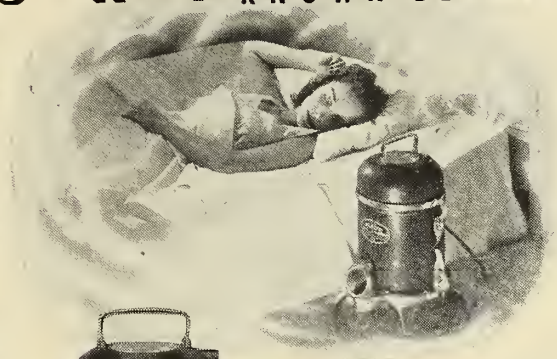
C-O-M-F-O-R-T YOU HAVE NEVER KNOWN BEFORE

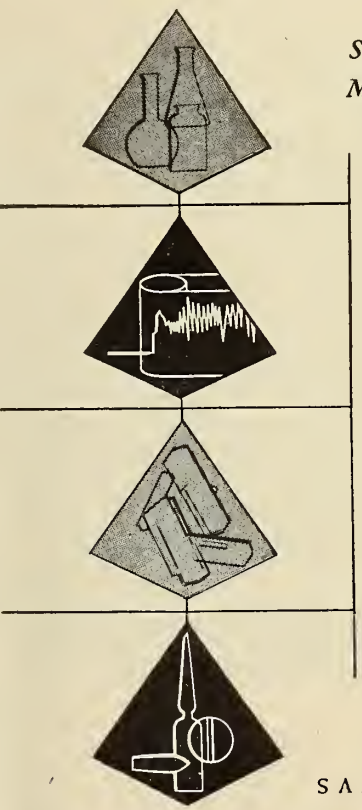
"WASHED" AIR IS WHOLESOME AIR



The moment you enter a Rexaired room, you will notice how fresh the air is; how comfortable it is to breathe. Rexair is the amazing new appliance that actually improves the air you breathe.

Rexair takes dust from carpets, bare floors, drapes, upholstered furniture, and from the air itself. Rexair collects dust and dirt in a water bath; discharges cleaner and moistened air back into the room.

The longer Rexair runs, the cleaner and fresher the air becomes. Rexair has no porous bag from which dust can escape back into the air you breathe. Dust is permanently trapped in water. You pour the water down the drain—dust and dirt go with it.



Illustrated at the right is a Rexair with the reservoir cut away to show the water which traps and holds dust so that it cannot escape. You feel better and work better when the air you breathe is clean, fresh, and wholesome.

REXAIR DIVISION, MARTIN-PARRY CORP.
Box 964, Toledo 1, Ohio, Dept. L-59

FREE BOOK—Send for this free, illustrated 12-page book. Shows how Rexair even cleans the air you breathe.

SANDOZ CHEMICAL RESEARCH HAS DEVELOPED MANY NEW MEDICINALS

Following full pharmacological study, substances showing promise of therapeutic value are subjected to extensive clinical investigation.

Representative of the many Sandoz "FIRSTS" IN THERAPEUTICS ARE:

GYNERGEN® (ergotamine tartrate): specific for migraine headache

DIGILANID® (lanatosides A, B & C): cardiac glycosides of D. lanata

SCILLAREN® pure cardiac glycosides of squill

SANDOZ

SANDOZ®

Every Sandoz product is uniform in purity and potency, assuring dependability of action.

(Continued from Page 552)

Dr. James A. Cosgriff was appointed health officer of Olivia at a meeting of the village council late in March.

* * *

Dr. William Austin, after completing postgraduate work at the University of Minnesota, began practice in Paynesville early in April. Dr. Austin formerly operated a thirty-bed hospital in Saskatoon, Saskatchewan, Canada.

* * *

Plans were announced late in March to construct a one-story clinic building in Litchfield, to house the offices of Dr. H. E. Wilmot, Dr. C. A. Wilmot and Dr. D. E. Dille. It was expected that the building would be completed within six months.

* * *

The life insurance companies of the United States and Canada, through the Life Insurance Medical Research Fund, will contribute $680,000 during 1949 for the support of heart disease research. From the fund, $585,300 will be used as grants-in-aid by thirty-five universities and research centers for the support of fifty-three research projects being carried on by individuals or by groups of investigators. In addition, $94,700 has been allocated for the support of eighteen graduate and nine undergraduate research fellows in the field of heart disease. Dr. Karl W. Anderson, medical director of the Northwestern National Life Insurance Company of Minneapolis, is a newly appointed director of the fund.

Dramamine for Seasickness. According to a recent release of the U. S. Army, a new drug, a member of the chemical family of benadryl and pyribenzamine, known as Dramamine, has been found to produce startling results in the prevention or cure of seasickness.

Credit for the original research is given Dr. Leslie N. Gay of the Protein Clinic of Johns Hopkins Hospital, who first began research on the drug in 1947.

In experiments conducted on army transports, there was only a 2 per cent failure if the drug was given before and during a voyage and only a 3 per cent failure in relieving those already suffering from seasickness. A dose of 100 mg. on sailing, repeated in six hours and administered thereafter before meals and on retiring, was effective. In using the drug after the onset of seasickness, rectal administration was sometimes necessary, and it proved effective. No untoward effects from the drug were experienced.

The drug should prove effective in travel by plane.

* * *

Physicians are warned against authorizing prescriptions for veterans before being authorized to treat the veteran. The Veterans Bureau reimburses the pharmacy for prescriptions filled for veterans on a physician's authorization. The Veterans Bureau will be constrained to collect from the physician the cost of such falsely authorized prescriptions. Being designated a participating physician in the program does not constitute an authorization for treatment. Authorizations for treatment must be obtained in each case.

BETTER VISION — with MAY-O-LITE

It's an established fact that surface reflection is one of the biggest handicaps of those who wear glasses. Reflections produce "ghost images," confusion, and eye-strain.

By the application of Low Reflection Lens Coating to the surfaces of your lenses, up to as much as 95% of these out-of-focus reflections are converted to useful transmitted light. This coating is harder than glass.

As a refractionist you are chiefly concerned with bettering the vision of your patients. In that interest, consider this information.

May-O-Lite Low Reflection Coating reduces surface reflection; eliminates out-of-focus "ghost images"; hardens the lens surface, thereby reducing surface scratches; improves image definition—lessens eye strain.

Each of these factors represents a possibility of better vision for your patients. You can investigate that possibility and explain it to your patients.

Low Reflection Lens Coating is available through your manufacturing and dispensing opticians. Write for a descriptive pamphlet and a treated sample of glass, today.

MAY RESEARCH
Incorporated

Minneapolis 1, Minnesota

Dr. W. R. Miller returned to Red Wing on April 4 after attending a five-day convention of the American College of Physicians in New York.

* * *

Dr. and Mrs. C. G. Uhley, Crookston, were in Minneapolis on April 9, where Dr. Uhley attended a meeting of the board of directors of the Minnesota Cancer Society.

* * *

It was announced on April 6 that Dr. D. W. Kohler had been named chairman of the cancer drive in St. Joseph.

* * *

In St. Cloud, Dr. L. M. Evans has been appointed chairman of the St. Cloud Chamber of Commerce Committee on Public Health. Other officers of the committee are Dr. L. A. Veranth, vice chairman, and Dr. E. V. Wetzel, secretary. The committee develops and encourages citywide activities and procedures that create better living standards.

* * *

Balaton lost its only physician late in March when Dr. Lloyd A. Smith left for Tyler to become associated in practice with Dr. A. L. Vadheim and Dr. P. C. Johnson.

* * *

Dr. Grant J. Griebe, formerly of Great Falls, Montana, became associated in practice with Dr. Joseph Selmo in Norwood on April 1. A graduate of the Northwestern University Medical School, Dr. Griebe has been located in Great Falls for the past three years. Dr. Selmo and Dr. Griebe hope to establish a Norwood Clinic in the near future.

* * *

Dr. Donald M. Houston, Park Rapids, announced on March 31 that in April Dr. G. V. H. Kleifgen, of Jamestown, North Dakota, would become associated with him in practice in Park Rapids.

A graduate of the University of Minnesota Medical School in 1944, Dr. Kleifgen interned at General Hospital in Minneapolis and then completed a three-year fellowship in surgery at the Mayo Clinic. In Jamestown he served as a consulting surgeon at the Jamestown Clinic.

* * *

On April 4, Dr. Charles F. Brigham, Jr., announced his association with the St. Cloud Clinic. He is limiting his practice to general surgery.

* * *

Dr. B. J. Hughes, after practicing in Rolla, North Dakota, for ten years, recently moved to Minneapolis to begin a three-year residency in general surgery at the Veterans Hospital. A former resident of Virginia, Dr. Hughes is a graduate of the University of Minnesota Medical School. He interned at St. Luke's Hospital, Duluth, and in 1939 he began practice in Rolla.

* * *

Dr. Reuben A. Johnson has been elected president of the newly organized Minneapolis Society of Internal Medicine. Other officers of the society are Dr. Reuben

Berman, vice president; Dr. George N. Aagaard, secretary; Dr. Russell M. Wilder, recorder, and Dr. Harold E. Miller, treasurer.

* * *

Among members of a Nurses Advisory Committee for Carver County, which was formed at a meeting in Waconia on March 15, are Dr. James W. Bratholdt, Watertown, and Dr. M. B. Hebeisen, Chaska. At the organizational meeting, Dr. Bratholdt was elected vice chairman of the committee.

* * *

Guest speaker at the tenth annual dinner meeting of the Duluth Mental Hygiene Clinic on March 29 was Dr. Donald W. Hastings, head of the department of psychiatry and neurology at the University of Minnesota. Dr. Hastings spoke on "What Psychiatry Is."

* * *

Dr. Mark B. Coventry, Rochester, participated in a symposium on cancer at a sectional meeting of the American College of Surgeons in Butte, Montana, on April 5.

* * *

One of the principal speakers at the Fillmore County Safety Institute, held in Rochester on March 22, was Dr. Henry H. Young of the Mayo Clinic staff. Dr. Young presented an illustrated talk on farm safety.

* * *

Late in March it was announced that Dr. Richard A. Whitney had reopened his office in Cambridge, having decided to continue his practice there rather than move to Princeton as previously planned.

* * *

In Le Roy, Dr. M. P. Morse moved into a suite of offices in his newly completed building on March 12. His new offices consist of a reception room, nurse's room, examination room, recovery room, drug room and an x-ray laboratory.

* * *

The Chisago Lakes Clinic purchased the practice of Dr. John A. O'Hanlon in Lindstrom on March 9. Dr. O'Hanlon has moved to Minneapolis and opened a new practice at 738 East Seventh Street.

* * *

It was announced on March 17 that Dr. Edward P. Engels, formerly of Rochester, had opened a general medical practice in Spring Valley. A graduate of the University of Minnesota Medical School in 1948, Dr. Engels served his internship at Indianapolis General Hospital.

* * *

One of the speakers at a continuation course at the University of Minnesota on March 28 was Dr. Donald J. Erickson, Rochester, who spoke on "Shortwave and Microwave Therapy."

* * *

Dr. Martin R. Henry of the St. Peter State Hospital was the guest speaker at a meeting of the Monday

Club in Le Sueur on March 21. Dr. Henry described the methods of treatment used at the hospital in the care of the mentally ill.

* * *

Dr. Edward H. Juers and Dr. George C. Kimmel, Red Wing, aided in conducting a crippled children's clinic in St. Cloud during the middle of March.

* * *

It was announced on March 16 that a new clinic had been opened in Glenwood by Dr. Edward M. Elsey of that city.

* * *

A report presented to the Hennepin County Tuberculosis Association on April 9 recommended that a panel of three physicians be hired to speed up disposition of 2,661 possible tuberculosis cases found in the Minneapolis x-ray survey two years ago. The recommendation was made by Dr. David Reisner, director of the tuberculosis control division for the Denver Bureau of Health and Hospitals, who was called to Minneapolis to study the situation and suggest what work remained to be done. It was estimated that a review of the 2,661 cases still awaiting diagnostic evaluation and disposition would require three or four months of work by a panel of three physicians and seven nurses.

* * *

At a meeting of the Mankato Council of Parents and Teachers on March 21, Dr. Arthur H. Langhoff, Mankato, discussed the Minnesota mental health program, pointing out the need for more attendants, more buildings and more modern equipment. He said that 90 per cent of the nurses and attendants at state hospitals haven't had the proper training for psychiatric treatment. Dr. Langhoff is a former member of the staff of the St. Peter State Hospital.

* * *

Among the speakers at a meeting in Winona on March 28 to review the city's public health services were Dr. Samuel Schaefer, city health officer, and Dr. C. W. Rogers, Winona pediatrician.

* * *

The official opening of the new Slayton Clinic in a modernistic one-story building was held on March 27. The new structure, which contains seventeen rooms, is owned by Dr. Roy F. Pierson, who has practiced in Slayton for nine years. The clinic is staffed by four physicians: Dr. Henry C. Doms, Dr. Vernon A. Doms, Dr. Osmund A. Wisness and Dr. Pierson.

* * *

At a meeting of the Lions Club in Duluth late in March, Dr. Martin O. Wallace discussed the reason for the opposition of the medical profession to compulsory national health insurance. On April 12, Dr. Wallace was the principal speaker at a meeting of the Duluth Business and Professional Women's Club, where he spoke on "Pros and Cons on Compulsory Health Insurance."

* * *

Among Minnesota physicians attending a continuation course in physicial medicine at the University of Minnesota March 28 through 30 was Dr. Arthur I. Arneson of Morris.

A lecture on the medical aspects of atomic explosions was presented by Dr. Hanns C. Schwyzer, Saint Paul, at a meeting at Fort Snelling on April 19. The meeting marked the start of a joint training program of army and naval medical reserve officers in the Twin Cities area.

* * *

Dr. John C. Mickelson, of the Mankato Clinic, attended the sectional meeting of the American College of Surgeons at Butte, Montana, on April 5 and 6.

* * *

As guest speaker at a meeting of the Little Falls Rotary Club on April 7, Dr. Edwin J. Simons, Swanville, discussed aspects of socialized medicine. Dr. Simons is director of the District 8 office of the Minnesota Department of Health.

* * *

"Current Medical Bills in the Legislature" was the title of a talk given by Dr. Gordon C. MacRae, Duluth, at a meeting of the St. Louis County Medical Auxiliary in Duluth on April 12.

* * *

Dr. Maurice B. Visscher, head of the department of physiology of the University of Minnesota, attended a meeting of the medical advisory council of the American Foundation for High Blood Pressure, which met in Cleveland on April 15. The foundation was established in 1947 to support and stimulate research in the underlying causes and treatment of hypertension and arteriosclerosis.

The board of trustees of the Community Health Center in Two Harbors announced on April 7 that Dr. William Kosiak, formerly of Chisholm, had joined the staff of their hospital and clinic. Dr. Kosiak, a graduate of the University of Minnesota Medical School in 1947, interned at Ancker Hospital in Saint Paul and practiced for a year at Milaca before going to Two Harbors. In his new position he replaces Dr. Edward Menefee, who left at the end of March to begin a fellowship in pathology at the Mayo Clinic.

* * *

Dr. Raymond K. Minge, formerly of Minneapolis, joined the staff of the Worthington Clinic on April 4, replacing Dr. W. R. Schmidt, who withdrew from the clinic to engage in special studies in Minneapolis. Dr. Minge, a graduate of the University of Minnesota Medical School, served in the army during World War II and recently completed a three-year fellowship at Minneapolis General Hospital.

* * *

After two years of practice in Lemmon, South Dakota, Dr. George R. Smith moved to Hutchinson on April 5 to become associated in practice with a clinic there.

* * *

At a meeting in Windom on March 30, residents of Cottonwood County decided to form a health council. Named as temporary chairman of the group was Dr. Elmer S. Schutz of Mountain Lake. Dr. Merton A. Johnson, Storden, was appointed vice chairman. At the

organizational meeting, Dr. B. O. Mork, Worthington, director of Health District 5, presented a talk on the formation of a county-wide health council.

* * *

In an election held in Willmar on April 12, Dr. Berton J. Branton was named mayor of the city for the next two years.

* * *

Among the officers of the Nobles County Health Council elected at a meeting held in Worthington on April 6 were Dr. Donald E. Nealy, Adrian, vice chairman, and Dr. Helen B. Wolff, Worthington, secretary-treasurer.

* * *

At a continuation course at the University of Minnesota on April 11 and 12, Dr. Raymond J. Jackman, Rochester, spoke on "Symptomatology and Technique of Proctoscopic Examination," "Anal Infections" and "Anal Abcess and Fistula in Ano."

* * *

Dr. Dean Clark, formerly of St. Paul, has been appointed director of the Massachusetts General Hospital. A graduate of Johns Hopkins Medical School in 1932, Dr. Clark was director of the Federal Office of Vocational Rehabilitation in 1933-34, chief of the hospital section, medical division, of the Office of Civilian Defense in 1942-43. After serving with the U. S. Public Health Service, he has recently been medical director of the Health Insurance Plan of Greater New York.

* * *

Numbered among "Minnesota's 100 Living Great" chosen recently by a poll sponsored by the Minnesota Junior Chamber of Commerce were: Dr. Alfred W. Adson and Dr. Charles W. Mayo of Rochester, and Dr. Frank E. Burch of St. Paul.

* * *

Dr. Eugene V. Meyerding, son of Dr. and Mrs. E. A. Meyerding of Saint Paul, and a graduate of the University of Minnesota Medical school, left for Camp Stoneman in California, April 25. He is a First Lieutenant in the United States Army Medical Corps and this is his first assignment from the Surgeon General's office, Washington, D. C.

* * *

Dr. Robert E. Priest was the guest speaker at the Pacific Coast Oto-Ophthalmological meeting at Coronado, California, April 5. Dr. Priest spoke on "Tracheotomy in Bulbar Poliomyelitis."

* * *

Drs. Walter A. Fansler and Howard M. Frykman addressed the Stearns-Benton County Medical Society in St. Cloud at the regular April meeting. They held a round-table discussion on "Common Rectal Problems."

* * *

Dr. Clyde A. Undine of Minneapolis attended the meeting of the American College of Physicians at New York City, March 28 to April 1. While in New York he attended the Knickerbocker Hospital concert at the Colony Club, featuring Robert F. Rounseville of the New York City Opera.

HARDRx LENSES
MAY BE SPECIFIED

These controlled HEAT-TREATED prescription lenses are offered the patient where added protection and safety is desirable. Excellent for all children's glasses where added safety is desirable. A HARDRx Lens is ground to a minimum of 2 mm. thickness at thinnest point.

For hazardous industrial use, BEN-SAFE lenses may be specified.

Dr. William A. Brand of Redwood Falls was honored as an outstanding citizen and member of the Lions Club at a dinner given by the Lions Club recently. Dr. Brand has completed forty-five years of service to the community. He has been mayor of the city and for many years has served as health officer and coroner. Each year the Lions Club similarly honors an outstanding citizen.

HOSPITAL NEWS

In an article in a recent issue of the *Modern Hospital* magazine, progress towards a "surgical utopia" at the University of Minnesota Hospitals is described by Dr. Fred T. Kolouch, a former staff member who is now with a clinic in Twin Falls, Idaho.

Dr. Kolouch discusses the work done by the hospitals' three-year-old surgical committee in solving problems of caring for surgical patients and in improving staff morale. "The modern complexities of surgery," Dr. Kolouch writes, "have developed rapidly, with little objective thought being directed by the surgeons toward the impact of their techniques on the hospital organization, personnel and facilities. Likewise, hospital administration and nursing are only slowly adjusting to the new needs of surgery."

Such problems at the University Hospitals are discussed by the surgical committee, which is composed of representatives of the entire staff, from surgeons to orderlies. As a result, there is a greater understanding between staff members, and organizational changes can be made to save nursing time and improve care of patients.

A hospital for the community of Wells was apparently assured on March 22 when the village council let contracts for $328,000 for the construction of the building. On April 1 a drive for $25,000 in additional funds was started, the money being needed, it was explained, to finance preparation of the grounds, landscaping and a proposed enlarging of the hospital from twenty-six to thirty-two beds.

* * *

The possibilities of having a third Community hospital in Faribault County were considered at a Community Club meeting in Winnebago on Marcch 10. A week earlier, Dr. M. D. Cooper and Dr. J. L. Mills, who operate the Winnebago Hospital, announced that the institution would be closed on September 1 unless the village took over the operation of it. A committee was directed to meet with the city council and discuss the matter.

* * *

The physicians of Eitel Hospital Staff on April 21, 1949, formed a corporation for the purpose of establishing and administering the Student Nurses' Loan Fund of Eitel Hospital.

The officers elected to operate the loan fund were: W. R. Jones, M.D., F. R. Hirshfield, M.D., and H. A. Reif, M.D., Trustees; Olga S. Hansen, M.D., Treasurer.

* * *

Among the staff departmental heads recently named at St. Mary's Hospital, Duluth, are the following: Dr. K. E. Latterell, anesthesiologist; Dr. W. V. Knoll, pathologist, and Dr. J. R. McNutt, radiologist.

BLUE SHIELD NEWS

As of March 31, 1949, Minnesota Blue Shield had made payment on 4,877 cases in the amount of $191,116.57. This represented the amount paid for the first three months of 1949. This amount, when compared with the total payment of $166,229.63 for 1948, quite emphatically emphasizes the rapid growth of Blue Shield within the state.

During the last few months, the Blue Shield representatives have been exceedingly busy bringing in many new subscribers in both large and small groups. At the present time, subscribers include groups from many of the large retail stores in the Twin Cities, the Investors Syndicate; Farwell, Ozmun, Kirk; Donaldson Co., Inc., the Coolerator Company of Duluth, to cite but a few. Also enrolled are such national organizations as Swift and Company, Ford Motor, and most recently Northwest Airlines.

Northwest Airlines is perhaps the largest group and will be covering approximately 3,000 persons, not only in Minnesota but also the northwestern part of the United States, including Detroit, Chicago, Seattle, Anchorage, Alaska, as well as stations in the Orient. With the addition of this group Blue Shield can really put into practice the boast that "Blue Shield will pay your doctor for his services in any part of the world." To facilitate and expedite the handling of cases outside of the country, a special system of reporting such cases has been devised so that it will be possible to clear and make an allowance on a case in the Orient almost as rapidly as in the Twin Cities. Such national enrollment would appear to be an excellent argument against any type of socialization of medicine, since it is possible for a local organization to provide voluntary medical care to a group, such as Northwest Airlines, which is international in scope.

In a recent issue of a national publication for the medical profession, Mr. Wallace Werble, a long-time analyst of Washington affairs, points out the various political aspects of the national plan for health insurance. From this article, it would appear that it is not too likely that any such program will be enacted into law during the present Congressional session. Mr. Werble makes this conclusion based on the fact that any such program must be first heard in the various committees and also be thoroughly investigated. Since any such program would be extremely large in nature and thereby require considerable time for study, it does not seem reasonable to assume that any definite action will be taken before the 1950 session of Congress. Action in 1950 is anticipated, since many members of both Houses of Congress will be coming up for re-election, and Congressmen will want to fulfill if possible the campaign promises made in 1948. It is anticipated that the legislation will be an entirely new proposal and not be any revised form of the Wagner-Murray-Dingle Bill.

The longer it is possible to forestall action on any national health legislation, the greater will be the opportunity of the public together with the medical profession to prove the worth of voluntary medical insurance. Therefore, we are particularly glad to enroll such

national groups as mentioned herein, also to enroll groups through their unions which in turn act as a stimulant upon the smaller groups. The next move, of course, will be to be able to enroll any and all applicants in Blue Shield regardless of group affiliation.

ANALYSIS OF ELECTROCARDIOGRAMS OF NINETY-THREE PATIENTS WITH ACUTE RHEUMATIC FEVER

(Continued from Page 485)

ours, and the incidence of T wave changes among their patients was almost twice as great as ours. We are in agreement with the conclusions of these authors that T wave changes actually occur with a much greater frequency than PR interval changes in acute rheumatic fever. However, because the T wave changes are usually of a transitory nature (indeed, they may come and go in the space of a day), they are frequently missed if tracings are not obtained frequently enough.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

OPERATIVE SURGERY. Frederick C. Hill, B.A., M.S. (Surg.), M.D., Associate Professor of Surgery, Creighton University School of Medicine, Omaha, Nebraska. Foreword by Charles W. Mayo, B.A., M.S. (Surg.), M.D., Section on Surgery, Mayo Clinic, Rochester, Minnesota. 698 pages. Illus. Price, $12.75, cloth. New York: Oxford University Press, 1949.

TRANSACTIONS OF THE THIRD AMERICAN CONGRESS ON OBSTETRICS AND GYNECOLOGY. 412 pages. Illus. Price $9.00, cloth. Portland, Oregon: Western Journal of Surgery Publishing Company, 1948.

YOUR BABY: THE COMPLETE BABY BOOK FOR MOTHERS AND FATHERS. By Gladys Denny Shultz, Contributing Editor, *Ladies Home Journal* and Lee Forrest Mill, M.D., former President, American Academy of Pediatrics. 278 pages. Illus. $3.50. Garden City, N. Y.; Doubleday & Company, Inc., 148.

This is a well-written and well-organized baby book. It presents all the most recent advances and ideas in infant and child care up to school age.

No problems are left unanswered and many are anticipated for parents and likewise cleared up. Father is included, as an important cog in bringing up baby, and that is as it should be.

The book is easy reading, interesting and understandable for both parents and the medical profession.

E.L.S.

AMERICAN RED CROSS—First Aid Textbook for Juniors. Carl J. Potthoff, M.D., 127 pages. Illus. Philadelphia, Blakeston Co., 1949. Price $1.00.

This small textbook for school children, twelve to fourteen years of age, has been written by Carl J. Potthoff, M.D., National Director of First Aid and Assistant Medical Director of The Red Cross. The author was formerly a high school principal and school superintendent and for eight years was a member of the faculty of the University of Minnesota School of Medicine.

The purpose of the book is to provide a text for class work in first aid. Statistics indicate that those who receive first aid education show a markedly lower incidence of accidents as a group. A knowledge of first aid principles, too, is often life saving when accidents occur.

This small volume is written simply, is well illustrated, and is particularly adapted to junior students. In view of the fact that some 15,000 children from five to nineteen die from accidents and almost 1,500,000 suffer disabling injuries, there is great need for first aid instruction.

OCCUPATIONAL MEDICINE AND INDUSTRIAL HYGIENE. By Rutherford T. Johnstone, A.B., M.D. Price $10.00. 604 pages, with 117 illustrations. St. Louis, Mo.: The C. V. Mosby Company, 1948.

This book possesses a gold mine of information and is most instructive. The author states, "He has adequately combined the clinical aspects of occupational diseases with a description of industrial processes, their appraisal and control from his own personal experience." He

further states that, "Occupational medicine is interested in man and *all* that aids or hinders his welfare."

The book is divided into four parts:

In Part I are discussed industrial medicine and workmen's compensation, functions of the industrial physician, the basic approach to a diagnosis of occupational disease and the laboratory procedures of value in diagnosis of occupational diseases.

Part II deals with industrial solvents, the aliphatic, halogenated, chlorinated and aromatic hydrocarbons with detailed discussions of their occupational uses, hazards, exposures, pathology and physiological behavior, clinical signs or symptoms, medical-legal aspect and treatment, appended with many case histories and personal comments.

Part III deals with occupational exposure to the heavy metals such as lead, arsenic, mercury, chromium, copper, aluminum, manganese, phosphorus, antimony and the new industrial hazard, beryllium of fluorescent lights.

Part IV deals rather fully with known dust hazards of silica compounds and asbestos, with their effects on the respiratory system; the inert dusts and a complete discussion of dermatosis; the newer field of synthetics and the special industrial processes of electroplating, degreasing, sand blasting, welding and its hazards.

In complete detail the author discusses all phases of industrial hygiene. The chemical content of the common trade-name products is of interest in a well-tabulated, easily read appendix. Adequate illustrations occur throughout the book.

The general arrangement affords easy reading and each subject is presented in such a fascinating manner that a general practitioner may grasp the significance with as much ease and interpretation as a Specialist in Industrial Medicine who seeks further knowledge. The reviewer was fascinated by the thoroughness of the author and the simplicity of arrangement by the publisher and believes this book an essential part of any physician's library.

CYRIL M. SMITH, M.D.

OASI TRUST FUND

. . . Stated in another way, what is happening is this. If all Social Security taxes on employers and employees amount to $1 billion in a given year, that amount is paid into the Federal Treasury in exactly the same way as income taxes are paid. Then the Treasury, as a bookkeeping device, and nothing more, gives to the Trustees of the Old-Age and Survivors Trust Fund $1 billion in IOU'S. The Treasury spends the money, has some IOU's printed, gives these to the Trustees, and then, as a bookkeeping device, charges benefit payments and administrative costs to the Trust Fund.

In the early stages of an insurance system premiums pour in in excess of benefits paid out. In a legitimate private insurance company the funds in excess of claims are invested and jealously guarded. In the Government Social Security scheme the money is spent currently. To add insult to injury the Government, after swiping the money, makes the public at large, through its income taxes pay interest on the money that isn't there. —*American Medicine and The Political Scene,* March 24, 1949.

Remember in 1932 we brought out Pablum?*

Embodying a new concept of cereal nutrition, easy of preparation, nonwasteful, forerunner of present day widely practised principles of food fortification—remember?

Later, in response to requests from physicians, we went a step further in Pabena,* similar in nutritional and convenient features to its father-product, Pablum, different in flavor because of its oatmeal base. If our pioneer work and ethical policy meet with your approbation, remember, please, to specify Pablum and Pabena.

*"Pablum" and "Pabena" are the registered trademarks of Mead Johnson & Company for these vitamin-and-mineral-enriched mixed cereal foods.

Mead Johnson & Company. Evansville. Indiana. U.S.A.

advantage in epilepsy

DILANTIN

"It has the distinct advantage of being unassociated with mental clouding or drowsiness."* DILANTIN, highly effective in suppressing grand mal seizures, is notably free from hypnotic side-effects thus facilitating the educational, vocational and social rehabilitation of the epileptic patient.

Absence or great diminution in frequency and severity of attacks is achieved with individualized dosage schedules.

ETROIT 32, MICHIGAN

BRINGING THE MOUNTAIN TO MAHOMET

Through timely contemplation you will find that the dearest and most valued possessions are those near at hand and often overlooked while gazing at the horizon for the Utopia.

We have brought to your door the opportunity for a valuable possession.

It is sage advice, doctor, to suggest that you apply for the noncancellable Accident and Health policy that has been made available to you by your Association.

The horizon holds no greater value.

if she is one of your patients...

The farm housewife whose work is truly never done may find that the distressing symptoms of the climacteric make the smallest chore an arduous project. She depends on your help to resume normal efficiency in the performance of her daily tasks as well as to maintain a positive outlook during this trying period.

***"Premarin"** offers a solution. Many thousand physicians prescribe this naturally-occurring, oral estrogen because...*

1. *Prompt symptomatic improvement usually follows therapy.*
2. *Untoward side-effects are seldom noted.*
3. *The sense of well-being so frequently imparted tends to quickly restore the patient's confidence and normal efficiency.*
4. *This "Plus" (the sense of well-being enjoyed by the patient) is conducive to a highly satisfactory patient-doctor relationship.*
5. *Four potencies permit flexibility of dosage: 2.5 mg., 1.25 mg., 0.625 mg., and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).*

Ayerst

While sodium estrane sulfate is the principal estrogen in "Premarin," other equine estrogens...estrodiol, equilin, equilenin, hippulin...are probably also present in varying amounts as water-soluble conjugates.

IN TRIBUTE TO THE

... "for services

WHO shall measure devotion, or put a price on sacrifice?
Who shall assess the long war against the power of Death?
Or set a sum upon the gift of Life?

There is a service beyond the measure of a fee.
A cause above remuneration.
An ideal for which there is no price.
This is the service...the cause...the ideal...of the American doctor.

How shall we reckon it, and by what formulae?
How much for the laughter of a little child rescued out of crisis?
What's the cost of discouragement?
Who can pay for a sleepless night?
Name the price of a cure!

AMERICAN DOCTOR

rendered..."

There is no algebra for it, no scribble of figures, no proper value.
For this is a service as large as life, and as manifold.
It is a soldier crying in agony on a thousand battlefields.
It is the terrible word "Why?" under the surgeon's probe.
It is the end of pain.
It is Hope.
It is the lonely, unending quest for knowledge.
It is the fight against ignorance, sloth, superstition.
It is the dumb, unspeakable joy in the eyes of a parent.
It is the rock of grief.
It is cold rain and pounding storm and bone-weariness and the new-born babe gasping its first breath in the grey dawn.

It is all this, and the quiet glory of the job done,
Dedicated to service—in the name of Mercy
And the common brotherhood of man.

Soft-diet patients down in the mouth?

Perk up appetites with Swift's Strained Meats!

6 varieties:
Beef, lamb, pork, veal, liver, heart

Simply putting soft foods on a tray is no assurance that patients will put them away. That's why so many physicians today are recommending Swift's Strained Meats—flavorful, real meats they're sure patients will eat! Prepared specially, soft and smooth, Swift's Strained Meats are so good they tempt even the most apathetic appetites!

Nutritionally, Swift's Strained Meats are an excellent base for a high-protein, low-residue diet. They're highly digestible—easy to eat. Rich in biologically valuable proteins, they make available simultaneously all known essential amino acids—for optimum protein synthesis. Further, Swift's Strained Meats supply hemapoeitic iron and goodly amounts of natural B vitamins. Let protein-rich Swift's Strained Meats put palatability in menus for your soft-diet patients!

To vary patient's menus, six different Swift's Strained Meats: beef, lamb, pork, veal, liver, heart. Convenient—ready to heat and serve!

The makers of Swift's Strained Meats invite you to send for the new physicians' handbook of protein feeding, written by a doctor, "The Importance of Protein Foods in Health and Disease." Send to:

ACCEPTED COUNCIL ON FOODS AND NUTRITION AMERICAN MEDICAL ASSOCIATION

All nutritional statements made in this advertisement are accepted by the Council on Foods and Nutrition of the American Medical Association.

For patients who can take foods of less fine consistency—Swift's Diced Meats offer tender morsels of nutritious meats with tempting flavors patients appreciate.

The magic wall

Nowhere in the realm of biology exists so highly specialized and so biologically efficient a membrane as the mucosa of the human intestinal tract. Within this mucous membrane, about five millimeters thick, there take place the most intricate biochemical reactions designed to facilitate absorption of the products of digestion.

Research upon the fundamental aspects of hemopoiesis has gone forward steadily at *Lederle* for more than 20 years. Liver extract, FOLVITE* Folic Acid, vitamins, combinations with ferrous iron, and such products of nutritional value in tissue repair as amino acids, have been made available as rapidly as they could be perfected.

Lederle research is proceeding actively in the field of the nutritional anemias, to the end that these almost completely preventable diseases may one day essentially disappear from daily clinical practice.

Optimal Nutrition

SO VITAL FOR OPTIMAL HEALTH

In the achievement and maintenance of optimal health, no other single influence looms so vital as sound nutrition. In fact, so important is this principle to preventive medicine that *optimal nutrition* has become the basis of all modern day health programs.

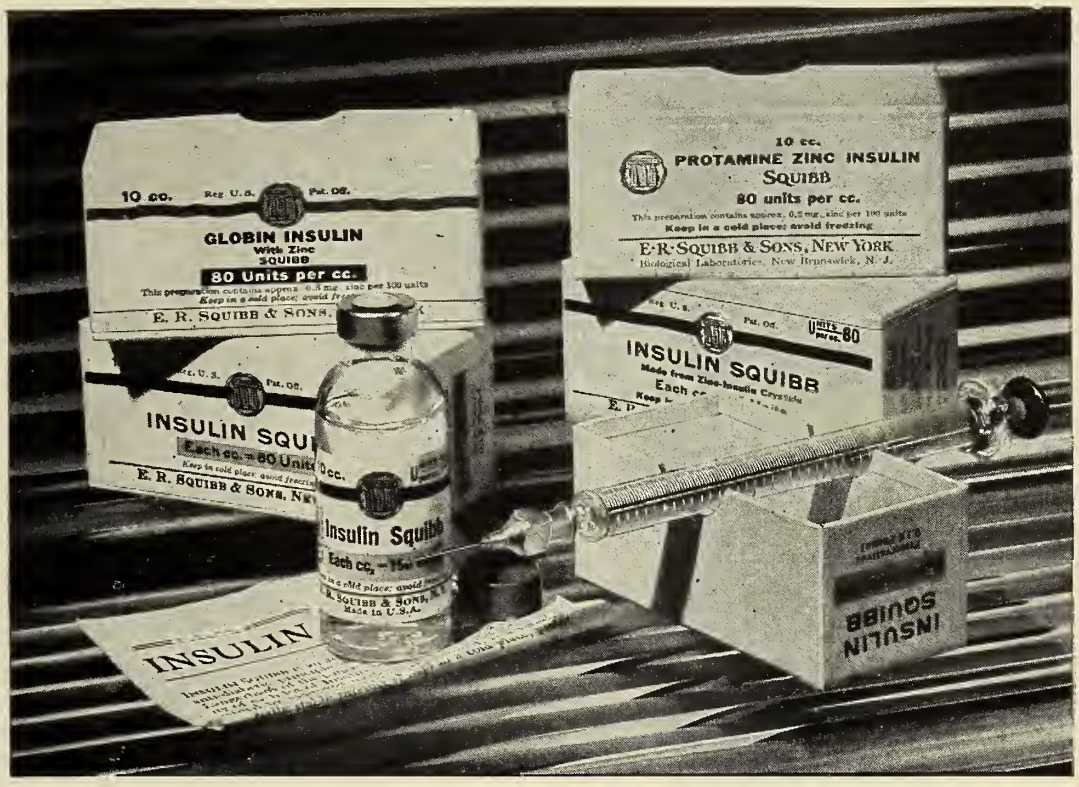
When nutritional health is threatened, as in dietary restrictions often imposed by disease, or during convalescence, or when the nutrient intake is insufficient because of other reasons, the *multiple dietary supplement* Ovaltine in milk is especially useful for overcoming nutrient deficiencies of the diet.

Three glassfuls daily may readily supplement even poor diets to adequacy. Easy digestibility makes its many valuable nutrients—vitamins, minerals, biologically complete protein, and food energy—quickly available. The pleasing flavor adds to its wide applicability and usefulness.

The table below gives the amounts of nutrients in three glassfuls of Ovaltine in milk.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine



Three servings daily of Ovaltine, each made of ½ oz. of Ovaltine and 8 oz. of whole milk, provide:*

CALORIES	676	VITAMIN A	3000 I.U.
PROTEIN	32 Gm.	VITAMIN B_1	1.16 mg.
FAT	32 Gm.	RIBOFLAVIN	2.0 mg.
CARBOHYDRATE	65 Gm.	NIACIN	6.8 mg.
CALCIUM	1.12 Gm.	VITAMIN C	30.0 mg.
PHOSPHORUS	0.94 Gm.	VITAMIN D	417 I.U.
IRON	12 mg.	COPPER	0.5 mg.

*Based on average reported values for milk.

Two kinds, Plain and Chocolate Flavored. Serving for serving, they are virtually identical in nutritional content.

the difference is noteworthy

Trimeton

(brand of prophenpyridamine)

TRIMETON* differs from most other antihistaminic agents in not being a derivative of ethanolamine or ethylenediamine. This difference is noteworthy and is responsible for the gratifying clinical results obtained. In one study of 227 patients with various allergic conditions[1]

83% obtained benefit from Trimeton

Side effects, common to all antihistaminics, occur with TRIMETON, but only a few patients find that they cannot tolerate the drug.[1]

Relief from allergic symptoms is usually obtained with one TRIMETON 25 mg. tablet three times daily; in some patients half this dosage is sufficient. The action of TRIMETON lasts from four to six hours.[2]

PACKAGING: TRIMETON (1-phenyl-1-(2-pyridyl)-3-dimethylaminopropane) is available in 25 mg. tablets, scored, in bottles of 100 and 1000.

Convenient, Safe Storage
with the Professional Model
Lilly
BIOLOGICAL REFRIGERATOR

- Quality Designed and Built
- Long, Dependable Service
- Quiet, Efficient Operation
- Low Operating Cost

The Professional Model 100 Lilly Biological Refrigerator is designed and built for practical service to doctors, hospitals and clinics. Spacious, yet compact, it takes adequate care of all storage requirements. Weight of the unit is 75 pounds. It is fully guaranteed one year against defective workmanship and materials.

The materials used for both the interior and exterior construction is steel with a white infra-red baked enamel finish. Drawer fronts are pressed steel, with the drawers made of fine perforated metal to permit free air circulation. The combination evaporator and ice tray shelf, 10" long x 5" wide, is steel, treated to prevent corrosion. It also serves as the shelf and freezing plate for the ice tray.

Temperature of the interior is controlled at a minimum of 38 degrees F. to prevent freezing. Operation of the compressor is controlled by a thermostat. Condensing unit assembly (consisting of compressor, condenser, fan, motor, thermostat, evaporator, capillary tube for metering refrigerant) is assembled on one common base.

Insulation is of fibre-glass category. Standard power requirements: 110 volts, 60 cycle, single phase. Hinges on the door are of a sturdy type and are almost completely concealed. Door hardware is a sturdy chrome finished handle which requires a minimum pressure to close. An attractive pin-tumbler type lock is provided for complete safety.

Dimensions

External overall dimensions	35" high x 19½" wide x 18⅛" front to back
Internal refrigerated space dimensions including drawer assembly	15" high x 12" wide x 12" deep

Further evidence of the safety of 'Benzedrine' Sulfate therapy

More data, showing that 'Benzedrine' Sulfate, in proper dosage, produced no toxic effects, have lately been published in a study by Caveness.[1]

He gave the drug for 14 consecutive weeks to 23 unselected hospital patients whose ages *averaged 65 years.* Daily dosages over the period ranged from 5 to 30 mg. The author observes:

"... no significant changes were noted in the cardiovascular, urinary, hematopoietic, or respiratory systems..."

From this study, it would appear that 'Benzedrine' Sulfate may be safely used in the treatment of depression in the aged.

THROAT SPECIALISTS PROVE CAMEL MILDNESS IN

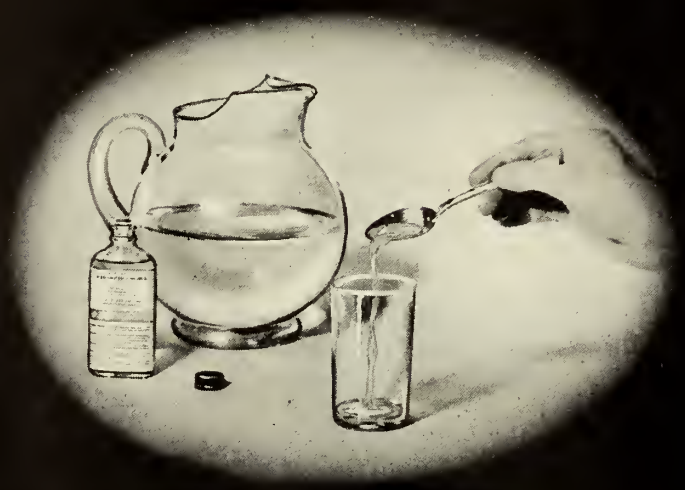
30-DAY SMOKING TEST

● In a recent coast-to-coast test, hundreds of men and women smoked Camels—and only Camels—for thirty consecutive days. They smoked on the average of one to two packages of Camels a day. Each week during the entire test period, the throats of these Camel smokers were examined by throat specialists. A total of 2,470 careful examinations were made. And after correlating these case histories, the throat specialists reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION due to smoking CAMELS."

MONEY-BACK GUARANTEE!

Try Camels and test them as you smoke them. If, at any time, you are not convinced that Camels are the best cigarette you've ever smoked, return the package with the unused Camels and you will receive its full purchase price, plus postage. *(Signed)* R. J. Reynolds Tobacco Co., Winston-Salem, N. C.



According to a Nationwide survey:

MORE DOCTORS SMOKE CAMELS

than any other cigarette

When three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel.

CEREBRAL ANGIOGRAPHY

LYLE A. FRENCH, M.D., and PAUL S. BLAKE, M.D.
Minneapolis, Minnesota

CEREBRAL angiography is the procedure by which the intracranial vascular system is visualized roentgenographically following the intracarotid injection of radiopaque dyes. The procedure was first used in 1927 by Egaz Moniz,[8] a Portuguese neurologist. It was not immediately accepted nor extensively used until the few years before World War II when it received widespread acceptance in Europe. It became accepted in this country after the war. Because of the inherent toxicity of the dyes originally used, the risk of the procedure did not at first seem to be worth the added information obtained, but after the pioneers demonstrated the great utility of the procedure and introduced less toxic dyes, cerebral angiography as an accessory diagnostic aid in intracranial lesions came into frequent general use.

Before Moniz used angiography in his clinic, he experimented extensively with animals and cadavers. He used many bromine, strontium, and iodine salts before finally selecting a 25 per cent solution of sodium iodide for use on his patients. This drug was not ideal because it could not be sterilized and it had to be freshly prepared before injection. There were also many unpleasant reactions from its use. In 1931 Löhr and Moniz simultaneously began using thorotrast, a 25 per cent colloidal suspension of thorium dioxide which has the same viscosity as blood. This drug caused few, if any, immediate side effects, and its use became generalized. However, thorotrast is radioactive. It is not excreted from the body but is picked up and retained by the reticulo-endothelial system. Some concern over the radiation effect was felt since sarcomas in rats could be caused by the injection of the drug, but those who used it felt that by restricting the amount of thorotrast to 30 c.c., the long-term toxicity of the drug would be negligible. No ill effects ascribable to the use of thorotrast were reported by the early workers. However, Jacobson and Rosenbaum[5] reported extensive fibrosis in the reticulo-endothelial system several years following its injection, and MacMahon, Murphy, and Bates[7] reported a patient who developed a sarcoma of the liver twelve years after the injection of thorotrast. Because of this radioactivity, thorotrast is being used less and less frequently for cerebral angiography.

Torkildson and Engeset[1] in Sweden, and Gross[2] in this country, in 1942 began the use of diodrast in 35 per cent solution. This dye fills the smaller vessels better than thorotrast but does not give the excellent roentgenographic contrast obtained with thorotrast. Most patients experience some mild reactions to its injection, such as a murmuring sound, a flushing of the face or pain over the side of the head. Occasionally convulsions have occurred. These side effects are very infrequent, and 35 per cent diodrast is the dye now most widely used.

Technique of Injection

The procedure is done under nembutal sedation and procaine infiltrated locally. It is wise to infiltrate the carotid bifurcation thoroughly with novocain solution to eliminate or abolish the carot-

From the Division of Neurosurgery, University of Minnesota Hospitals, Minneapolis, Minnesota.

id sinus reflex. The dye is injected into the common carotid artery. In most clinics the artery is exposed and the puncture of the artery is made under direct vision. There is a definite

Fig. 1. Carotid angiogram in a patient with an aneurysm of the internal carotid artery. The patient was treated by trapping the aneurysm between ligatures applied on the internal carotid artery above and below the site of origin.

trend toward inserting the needle percutaneously. The procedure we have followed has been to attempt a percutaneous injection, and if not successful, to surgically expose the artery. Many surgical techniques for exposure of the artery have been described. We have isolated the common carotid by making a short transverse incision above the thyroid cartilage at the anterior edge of the sternocleidomastoid muscle. A 17- or 18-gauge needle is then inserted into the vessel. An attempt is made to push the point of the needle to the posterior part of the artery and then to turn the bevel of the needle posteriorly so that the majority of the dye, as it is injected, joins the stream of blood flowing up the internal carotid artery. A hard rubber tube with a three-way stopcock is connected to the needle, and a slow stream of saline is kept flowing through the needle until everything is in readiness, when 10 to 15 c.c. of the dye is forced into the carotid artery as rapidly as possible. Just before the injection is complete, an exposure is made to demonstrate the arterial tree, and three seconds later a second exposure is obtained in order to visualize the venous channels. The circulation time from common carotid to internal jugular through the internal carotid is about four seconds, and through the external carotid this time is about six seconds. Some persons slow this circulation down by compressing the jugular during the procedure, others by occluding the common carotid below the needle.[1] So far we have felt that these measures are unnecessary and complicate the procedure.

The technique of injection of the vertebral artery is similar to that of the carotid except for the site of injection. The vessel is visualized as it arises from the subclavian artery. It is the first branch and transverses in a cephalad direction. The needle is inserted as described above, and 10 to 20 c.c. of diodrast are injected and roentgenograms made. Both lateral and anteroposterior views are obtained.

Clinical Interpretation

Aneurysms.—The most frequent locations of aneurysms of the cerebral vessels are at the bifurcations of the large basal vessels, such as the junction of the internal carotid with the anterior or middle cerebral artery. Less frequent are aneurysms at the junction of the carotid with the anterior or the posterior communicating artery or on the internal carotid artery itself.

With arteriography, both the location and size of the aneurysm may be ascertained. Occasionally the size of the aneurysm as seen in the angiogram is considerably smaller than that seen at the time of operation. This is due either to a clot of blood within the aneurysm or to the neck of the sac being only partially filled with the dye. Occasionally the neck of the aneurysm may be so small that none of the contrast media enters the sac, in which case the aneurysm is not visualized.

The internal carotid artery enters the cranial cavity through the foramen lacerum. It remains extradural until it reaches the level of the anterior clinoid process. Extradural aneurysms rarely burst because they are well protected by this overlying dural sheath. Clinically they resemble slowly growing neoplasms and must be differentiated from parasellar tumors. An aneurysm in this location (extradural portion of the internal carotid artery) encroaches on the third, fourth, fifth, and sixth cranial nerves so that various combinations of palsies of eye movements and

hypesthesia over the face occur. Occasionally direct pressure by the aneurysm on the optic chiasm or nerve results in visual abnormalities. The aneurysm may produce erosion visible in roentgenograms in the parasellar region. A definite differential diagnosis between aneurysm and parasellar tumor can usually be made preoperatively by angiography.

Aneurysms arising on the internal carotid artery or its branches, after the artery has pierced the dura at the level of the anterior clinoid process, may produce no symptoms until they rupture. They are usually located on the posterior aspect of the carotid siphon.

The surgical treatment of intracranial aneurysms consists of either occluding the stalk or neck of the aneurysm or trapping the aneurysm by occluding the vessel both proximally and distally to the lesion. If the aneurysm is located below the origin of the posterior or anterior communicating arteries, the therapy of choice is ligation of the carotid artery in the neck, which occludes the proximal flow of blood, and then occluding the vessel intracranially distal to the aneurysm. Ligation of the carotid artery in the neck does not embarass an aneurysm arising distal to the communicating vessels. Aneurysms in this location are best treated by an intracranial approach.

Fig. 4. Carotid angiogram showing upward displacement of middle cerebral vessels by a temporal lobe glioma.

Fig. 5. Carotid angiogram in the same patient as in Figure 4, showing upward displacement of the middle cerebral artery as seen in an anteroposterior view.

Brain Injuries.—Löhr[6] has studied angiographically 1,000 patients with skull fractures. He classifies brain injuries as (1) "commotio cerebri" and (2) "contusio cerebri." In the commotio

cerebri group he found very narrow constricted vessels on the injured side and interpreted this as due to brain swelling or possibly to vascular spasm. In the contusio cerebri group he observed an increased resistance to injection of the dye and noted that the vessels were broad and flat. Angiograms in patients with subdural or extradural hematomas reveal the vessels to be displaced away from the lateral wall of the skull.

Brain Tumors.—Brain tumors are localized by (1) displacement of the normal vessels supplying the brain, (2) enlargement of afferent vessels to a tumor or efferent vessels from a tumor area, and (3) pathological changes of blood circulation within the tumor itself.

The arteries of the brain lie on the surface and normally take a tortuous course as they follow the cerebral convolutions. A space-occupying tumor will tend to displace the vessels away from its center. Also as the tumor enlarges, the overlying cortical convolutions become flattened and the arteries become stretched and thin, separated from each other, and follow straight courses around the area of localized enlargement. The cerebral veins may be displaced by the tumor mass or engorged due to the slowing of cerebral circulation resulting from increased intracranial pressure, but the extreme variability of the venous drainage in normal brains makes their displacement only of confirmatory value in diagnosing space-occupying lesions.

Tumors produce characteristic abnormalities visible in angiograms. The basic changes will be described briefly; many intermediate forms, of course, exist.

Anteroposterior View.—The ascending portion of the anterior cerebral artery is examined for displacement across the midline by a tumor lying laterally in the hemisphere. The horizontal portion of the anterior cerebral is then examined for possible elevation by a tumor mass such as a hypophyseal tumor lying beneath it. The horizontal portion of the middle cerebral artery may be elevated by tumors in the anterior portion of the temporal lobe. This is important in distinguishing these tumors from those in the posterior portion of the temporal lobe, which do not disturb this portion of the middle cerebral artery. The carotid siphon may be straightened or displaced, indicating a lesion in the vicinity of this structure.

Lateral Views.—An upward or downward displacement by a tumor of the pericallosal and Sylvian vessels may be visualized. This displacement occurs appropriate to the location of the tumor, either above or below the major vessels. Centrally located tumors cause direct lateral pressure and will not produce an appreciable shift in the position of these vessels. In the latter case, stretching of the arteries with elimination of the frequent curves can be significant. Vessels may be displaced in a circular fashion around a tumor. If there are no vessels within the circle, a cyst or abscess or an astrocytoma must be considered.

Ventricular enlargement, either congenital or acquired, will cause straightening and stretching of all vessels but most noticeably those in the Sylvian group. In addition, the arch of the anterior cerebral artery around the ventricle may be widened. The venogram may reveal the carotid veins to be small, due to compression resulting from the increased intracranial pressure.

The displacement of vessels as described above is a valuable method of localizing tumors, but the visualization of the tumor circulation not only more accurately defines the tumor's position but it may also make possible a histological diagnosis of the type of tumor. Moniz was the first to describe variations in tumor circulation depending upon the histological type of tumor. Engeset[1] believes that a more accurate histological diagnosis can be obtained by angiography than by frozen sections of the tumor. He feels sufficiently confident with angiography to ascribe a lesion as inoperable from its angiographic appearance.

Glioblastoma Multiforme.—Tönnis[9] was the first to describe the angiographic appearance of the glioblastoma multiforme. At operation he noticed arterial blood in the veins surrounding these tumors and in angiograms pointed out the frequency of intraneoplastic arteriovenous aneurysms. Because of the rapid circulation through these tumors due to these fistulas, tumor circulation may be visible in the arteriogram and not in the venogram. Several cases have been reported in which the tumor circulation of glioblastoma was seen on venograms,[5] but the angiographic diagnosis of glioblastoma multiforme from a roentgenogram exposed so late that the normal venous channels are filled is precarious. The cir-

culation of most other tumors will appear on venograms. The glioblastomas have an abundant vascular supply with the vessels irregularly arranged and of irregular calibre. They show irregular concentration of dye in the veins, and between the vessels are small irregular spots which may be miliary aneurysms. Large arteriovenous aneurysms and one or two abnormal veins leading away from the tumor area may be visible. The circulation may vary from a faint spotted haze of weak contrast accumulation, with small pinhead-sized vessels which cannot be followed for over 1 centimeter, to more pronounced vascular changes with huge loops of vessels 2 or 3 centimeters in length. Occasionally vascular changes are present only at the periphery of the tumor, indicating extensive central necrosis. On the venogram in these cases there is either no dye left in the tumor area or only a light capillary haze.

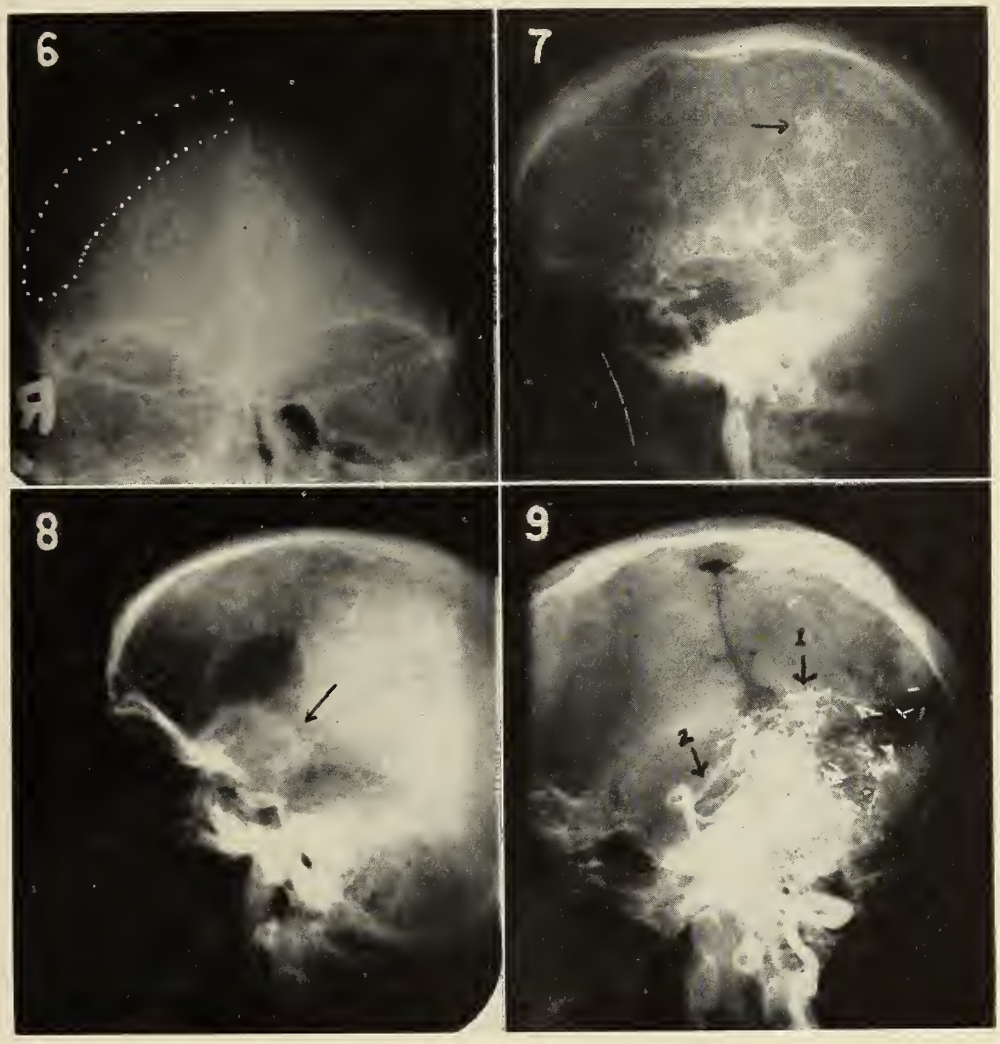

Fig. 6. Carotid angiogram in a patient with a subdural hematoma. Note the space between the cerebral vessels and the cranium.

Fig. 7. Carotid angiogram in a patient with a parietal lobe tumor (meningioma of falx).

Fig. 8. Carotid angiogram (venous phase) in a patient with a sphenoid ridge meningioma.

Fig. 9. Vertebral angiogram showing (1) a meningioma extending both above and below the tentorium, and (2) the source of blood supply to the tumor (from posterior cerebral arteries).

Metastatic Tumors.—Metastatic carcinomas, like glioblastomas, have an abundant vascular supply with frequent arteriovenous aneurysms and irregularity of vessels. The presence of normal vessels arranged annularly about the lesion, with just a faint haze of circulation in the tumor

in the arteriogram but with a maximum circulation within the tumor visible in the venogram, is characteristic.

Astrocytomas.—Astrocytomas seldom show any vascularity in either the arterial or venous phase. Some investigators believe that vascular lakes and intraneoplastic circulation visible in venograms is indicative of an astrocytoma, but most reports do not agree with this. According to Engeset,[1] astrocytomas characteristically show a marked dislocation of normal vessels around the tumor with practically no vessels within the curved enclosed area. Vessels seen in the tumor are usually straight and even. Oligodendrogliomas, abscesses, cysts and cholesteatomas cannot be distinguished from astrocytomas angiographically, but with help of clinical symptoms and signs and plain roentgenograms, the diagnosis can usually be made.

Meningiomas.—Meningiomas present a typical picture on the angiogram. They almost always receive part of their blood supply from the external carotid artery, and if this source of blood in the tumor can be demonstrated, it is practically pathognomonic. If the tumor gets all of its blood supply from the external carotid and the internal carotid alone has been injected, the appearance of the normal vessels circling around the extracortical tumor is often diagnostic. In the arteriogram, when the tumor circulation is filled, enlarged vessels leading up to the tumor but ending in brush-like fans at the edge of the tumor may be seen. The vessels are all of constant calibre and have constant dye concentration. Because the circulation through meningiomas is slow, the venogram reveals a diffuse accumulation of dye within the tumor, sharply demarcating it from the surrounding brain tissue. Arteriovenous fistulas within the tumor are rare, and irregularities in size of vessels are not seen in meningiomas. If these features do occur in what otherwise appears to be a meningioma, a sarcomatous type of meningioma or a metastatic carcinoma must be considered.

Vascular tumors.—Angiomatous lesions may produce Jacksonian seizures or subarachnoid hemorrhages. On angiograms they may be confused with a glioblastoma because they contain large arteriovenous fistulas. However, angiomas rarely cause a shift of the midline structures or a ventricular deformity as do the glioblastomas.

Arteriosclerosis.—Cerebral arteriosclerosis is not an indication for angiography in itself, but it produces abnormalities which are sometimes visible in patients suspected of other lesions. There is a loss of the physiological loops and curves of normal arteries; they become straight and there is considerable variation in calibre, with narrowed and enlarged regions or even aneurysms. A sudden break in continuity of an artery due to an intravascular block is said to be characteristic of arteriosclerosis.

Thrombosis.—Carotid thrombosis is an entity which recently has been recognized as a fairly frequent cause of headache, psychic disturbances, hemiparesis, and aphasia. The maintenance of blood supply to the involved areas is insufficient because of poor collateral circulation. No dye can be injected into a thrombosed carotid artery, of course, but an angiogram done on the opposite side may reveal filling of both hemispheres through the collaterals in the circle of Willis.

Indications

The indications for angiography are not closely defined because it is felt that the full value and significance of the procedure is not as yet known. In general, it is used whenever it is felt that such study would provide knowledge valuable in diagnosis and treatment of the intracranial lesion.

Angiography is used routinely in patients with subarachnoid hemorrhage in order to ascertain the site of the vascular rupture. It is often done bilaterally because lateralizing signs may be minimal and the side first injected reveals no abnormality. Poppen injects patients with subarachnoid hemorrhage twenty-four to forty-eight hours after aneurysmal rupture, for he feels that he cannot inject the dye fast enough through an 18-gauge needle to raise the pressure significantly within an aneurysm. Others prefer to wait four to six weeks following the accident in order to provide time for the site of rupture to heal. We have progressively shortened the interval between hemorrhage and angiogram until it has now been reduced to four days. The reason for shortening this interval is twofold: (1) to decrease the period of hospitalization, and (2) to treat the aneurysm before recurrent rupture with possible fatal hemorrhage.

TABLE I. DATA ON 100 CONSECUTIVE ANGIOGRAMS

Indication	Total No.	Unilateral	Bilateral	Positive	Negative
Subarachnoid hemorrhage	42	23	19	6	36
Suspected brain tumor	32	32	0	0	32
Verified brain tumor	21	21	0	13	8
Head injury	2	2	0	1	1
To study circulation of tumor	3	3	0	3	0
Total	100	81	19	23	77

Angiography is used on patients with suspected brain tumors in whom the side of the lesion is known and in whom ventriculographic studies are deemed inadvisable or are found to be unsatisfactory for tumor localization. In addition, angiography is used on patients in whom it is anticipated that it would be advantageous to know either the histological type of tumor or the source of the blood supply to the tumor.

Results

Included in this report are 100 consecutive angiograms performed from 1939 to 1949. The majority of them have been made during the last three years. The carotid artery was injected in ninety-six and the vertebral in four cases. From 1939 to 1945 the open technique of injecting the vessel was used. As the technical aspects of injection of the contrast media as well as the timing and amount of roentgen exposure became standardized, the percutaneous or closed method of injection has been used in increasing proportions. In the last thirty angiograms, twenty have been made with percutaneous injections, and only after the percutaneous method has been unsuccessful has the open method been used in these recent cases.

Thorotrast was used as the contrast media in ten cases, neo-iopax in nine, and diodrast in eighty-one cases. The use of thorotrast was discontinued because of the dangers of radioactivity even though it seemed to provide greater contrast than other media. The use of neo-iopax was discontinued because its injection was associated with a convulsive seizure in four of the nine cases in which it was used. A 35 per cent solution of diodrast has been the media of choice because of the paucity of reactions observed with its use. Irrespective of the type of solution injected, 50 per cent of the patients experienced disagreeable sensations over the side of the head, with visible ipsilateral flushing of the face. Two per cent of the patients experienced tingling in the contralateral extremities.

Table I reveals the indications and results of the angiograms included in this series. Thirty-two were performed on patients suspected of having a brain tumor. These patients were diagnostic problems, the history or neurologic examination suggesting the possibility of a tumor, but in whom the routine diagnostic procedure such as roentgenograms and electrocephalograms were of little help in settling the problem. In none of the thirty-two was there angiographic evidence of a neoplasm. Angiograms were performed on twenty-one patients with verified brain tumors, and in thirteen (62 per cent) of these there was angiographic evidence of the location of the lesion. The histological type of tumor was meningioma in six cases, angioma in one case, glioma in five cases, and granuloma in one case. In three patients angiograms were made in order to study the blood supply of previously verified tumors. The purpose of the study was to ascertain the most feasible method of surgical attack, and in all cases it did furnish the desired data. Angiograms were made on forty-two patients with evidence of subarachnoid hemorrhage. In six (14 per cent) the location of the aneurysm was determined. Two patients with head injuries were subjected to angiography, and in one there was evidence of a subdural hematoma. In the other patient the study was normal.

Summary

1. A series of 100 angiograms is reported.

2. Demonstrable evidence of a tumor was present in 62 per cent of the patients with verified brain tumors.

3. Demonstrable evidence of an aneurysm was present in 14 per cent of the patients with subarachnoid hemorrhage.

4. Angiography has been of definite value as an accessory diagnostic aid.

NEVOXANTHO-ENDOTHELIOMA

CARL W. LAYMON, M.D., Minneapolis, Minnesota
and
EUGENE P. SCHOCH, M.D., Fort Jay, New York

NEVOXANTHO-ENDOTHELIOMA was the term used by McDonagh[6] in 1912 to describe an odd type of xanthoma characterized by the development, early in life, of a group or groups of yellowish or yellowish-brown papules or nodules, chiefly on the extensor surfaces. McDonagh described five cases and included some others which had been previously reported in the literature, including those of Kobner, Thibierge, Eichoff and Bizzozero. McDonagh concluded from a study of the histologic sections in three of his cases and the pathologic reports of four of the cases selected by him from the literature that the tumors were endotheliomas, belonging to the class of nevi, and that due to fatty degeneration a xanthomatous disorder was produced.

Under the title multiple endothelioma of the skin, Wise,[10] in 1919, reported an eruption in a Jewish boy, aged twenty-two months, characterized by the presence of hundreds of macular and papular lesions on the trunk and extremities. The lesions were rose-red and bluish-red, while the papules were more pronounced in color, most of them being yellowish-brown and salmon-yellow. The eruption clinically resembled urticaria pigmentosa but histopathologic examination ruled out such a diagnosis. A diagnosis of multiple endothelioma of the skin was made.

In 1930, Jacobi and Grund[4] described an eruption, which occurred in an infant of sixteen months, characterized by the sudden development of a large number of reddish-brown tumors on the face and body which varied in size from a pinhead to that of a pea and which were definitely raised from the surrounding skin. The lesions varied in color from flesh to pinkish-yellow to reddish-brown. The clinical diagnosis was xanthoma tuberosum multiplex, but the histologic examination showed the presence of many endothelial cells without definite xanthoma cells. The case was reported as one of nevoxantho-endothelioma.

Adamson,[1] in 1936, discussed various cases which had appeared in the literature under the title of nevoxantho-endothelioma and concluded that most of them were atypical cases of xanthoma multiplex. His article was entitled, "A Note on Multiple Eruptive Xanthoma." Adamson believed that the nevoid character of nevoxantho-endothelioma had not been proved and therefore a clinically descriptive term should be applied to the disorder.

Senear and Caro,[8] also in 1936, reviewed the literature on nevoxantho-endothelioma and presented an additional case in a boy five and a half years of age, whose eruption was characterized by the presence of yellowish nodules on the trunk, extremities and left eyelid. The first lesion had appeared at the age of three on the left thigh as a small round reddish papule which increased in size slowly and eventually became yellowish. These authors urged caution in making a diagnosis of endothelioma of the skin and stated their belief that careful study of all cases of this type will prove that nevoxantho-endothelioma is in reality a special type of juvenile xanthoma.

In 1937, Lamb and Lain[5] reported an additional case of nevoxantho-endothelioma in which the eruption appeared as erythematous nodules at the age of three months in an apparently healthy child. At the age of one year the child became emaciated and presented respiratory difficulties and appeared to be in a critical condition. During the next four or five months the liver became enlarged, and lesions were shown to be present in the lungs by means of roentgen examination. The patient was found to have a disturbance of the lipoid metabolism, the total fat and fatty acids being low while the cholesterol was increased. The child's condition improved, and at the age of five the patient appeared healthy. The weight was normal and many of the tumors had disappeared. Lamb and Lain felt that their case might well be related to Schüller-Christian disease on the basis of involvement of the liver and lungs. They believed that the term nevoxantho-endothelioma should be retained to describe a congenital malformation showing peculiar endothelial giant cells, xanthoma cells, histiocytes and fibroblasts, and disappearing later in childhood. They felt that nevoxantho-endothelioma might be the connecting link

From the Division of Dermatology, University of Minnesota, H. E. Michelson, M.D., director; and the Department of Dermatology, Minneapolis General Hospital, Carl W. Laymon, M.D., Director.

between Schüller-Christian disease and cutaneous xanthomas.

Clinical Features

Nevoxantho-endothelioma is characterized by an eruption which is either present at birth or which appears rather suddenly in crops within the first few weeks of life. In some cases the eruption may appear at a later date, as for example in Kobner's case, in which the first lesions came at the age of two years, more appeared at fourteen, and some of them were still present at the age of twenty-seven. Thibierge reported two cases, occurring in brothers, in which the onset was at eight and fourteen years, respectively. The eruption consists of round or oval papules and nodules which vary in size from 1 to several millimeters, or larger. The lesions are raised from the surrounding skin and rather sharply demarcated. At the beginning they are usually red in color, becoming distinctly yellow or yellowish-brown. There may be but a few lesions which are frequently grouped, or they may be numerous and widely distributed. The palms, soles and flexor surfaces are usually spared. A family history may or may not be present. The lesions tend to disappear spontaneously within the first few months or years of the patient's life, although they may persist for many years, as in the cases of Kobner and Thibierge. In McKenzie's case (cited by McDonagh) the lesions were present in brothers all of their lives, and a sister and grandfather were similarly affected. The lesions may superficially resemble those of urticaria pigmentosa, although their firm consistency, lack of urtication, and histologic structure makes a definite differentiation possible. The lipoids in the blood are not increased.

Histologic Features

Nevoxantho-endothelioma is characterized histologically by a densely packed cellular infiltration, in which the predominating type of cell is a large histiocyte with a poorly defined, pale, foamy cytoplasm and a large, oval or irregularly rounded, pale nucleus. The cells may become elongated and thin and may resemble fibroblasts. Large giant cells of the Touton type are encountered, each consisting of a peripheral ring of ovoid nuclei surrounding a pale central cytoplasm. According to Ormsby and Montgomery,[7] foam cells and endothelial giant cells are also seen. Sections stained with Sudan III show the presence of many droplets of lipoids throughout the zone of infiltration as well as within the giant cells.

Fig. 1. Nevoxantho-endothelioma. The patient developed multiple yellowish-brown nodules on the scalp, face, trunk and extremities at the age of six months. Most of the lesions had undergone involution by the time the child was two years of age.

Report of Cases

Case 1.—Baby J. T., aged two months, was first seen on October 15, 1946. Two subcutaneous tumors had been present at birth, one in the left scapular area and one on the posterior surface of the left thigh.

Examination showed a firm, yellowish-brown nodule, 2 cm. in diameter with superficial ulceration, on the posterior surface of the left thigh. The lesion over the scapular region was almost identical in size, color and consistency, except that the surface was smooth. At the request of the parents the lesions were excised. Within a few months several yellowish nodules, 2 to 4 mm. in diameter, reappeared along the scar.

Case 2.—Baby C. C., aged six months, was examined first on February 20, 1947. The parents stated that yellow nodules had appeared on the right side of the neck when the baby was three months of age. Within a month similar lesions appeared on the trunk and both upper and lower extremities.

On examination there were multiple firm, yellow nodules, from 1 to 3 mm. in diameter, scattered over the face, neck, arms, legs and trunk.

Case 3.—Baby G. K., aged five weeks, was first examined on March 14, 1947. The child was born with a few scattered yellowish nodules on the scalp, trunk and extremities. At the time of examination, the parents stated that the lesions seemed to be becoming lighter in color and smaller.

On examination there were scattered, slightly raised, nodular lesions, varying from 0.5 cm. to 2 cm. in diam-

eter, over the forehead, face, right shoulder, left breast, abdomen, scalp, back, forearms and lower extremities. The lesions varied in color from yellow to brownish-yellow and purplish-brown. The lesions on the eyelid simulated xanthoma palpebrarum.

Case 4.—C. P., a male infant aged six months, developed a yellow tumor, 1.5 cm. in diameter, on the right cheek shortly after birth. At the age of two and a half months another similar tumor appeared on the scalp, followed by the development of multiple small lesions on the body.

On examination there were multiple, firm, painless, yellow nodules scattered over the scalp, face and body. The largest lesion was on the right cheek and measured 2.5 cm. in diameter. Roentgenograms of the bones showed no abnormality. The blood lipoids were normal.

The histologic features in all four cases were essentially the same and consisted of a proliferation of the connective tissue and an infiltrate made up of histiocytes, endothelial giant cells, foam cells and Touton giant cells. Sections which were stained with Sudan III showed the presence of lipoid droplets throughout the zone of infiltration.

Comment

There has been considerable confusion concerning the proper classification of nevoxantho-endothelioma. Ewing[3] stated that the diagnosis of endothelioma should be accepted only when the evidence is clear and conclusive, since the group has been used as a "catch-all" for many miscellaneous tumors on which studies have been inadequate. He brought out the fact that several distinct new growths have acquired a wide or general acceptance as endotheliomata, only to lose their claim for recognition in this category through the more careful studies of critical observers.

Arzt,[2] after studying a case of nevoxantho-endothelioma clinically and histologically and after comparing it with other similar cases in the literature, regarded the disorder as a form of juvenile xanthoma.

Sweitzer and Winer,[9] in 1936, maintained that true endothelioma of the skin does not exist, since the origin of an endothelioma must be from endothelially lined structures such as blood or lymph vessels; therefore, the so-called endothelioma of the external surface is either a hemangio-endothelioma or a lymphangio-endothelioma.

In our opinion, the benign course and the tendency toward spontaneous involution completely separate nevoxantho-endothelioma from Letterer-Siwe disease or Schüller-Christian disease. In the latter, systemic involvement is always present and a fatal outcome is the rule. It would seem best to classify nevoxantho-endothelioma as a peculiar and rare type of juvenile xanthoma.

Summary

1. Nevoxantho-endothelioma is an unusual type of juvenile xanthoma, characterized by yellow or reddish nodules present at birth or developing shortly thereafter. The general health is not affected, and there is a tendency towards spontaneous involution, although the lesions may persist for several years.

2. The values for the blood lipoids are normal.

3. The histologic picture is distinctive and consists of a proliferation of the connective tissue and an infiltrate of histiocytes and endothelial giant cells. Foam cells and Touton giant cells are also present. Appropriate stains show the presence of lipoids in the infiltrated areas.

4. Four cases of nevoxantho-endothelioma are reported.

INGUINAL AND FEMORAL HERNIOPLASTY

C. B. McVAY, M.D., Ph.D.
Yankton, South Dakota

SURGEONS in general are an egocentric group, and an off-hand opinion as to one's hernia recurrence rate is usually to the effect that he has no recurrences. Furthermore, as a young surgeon, it has been my repeated experience that older and more experienced surgeons resent any implication that their varied techniques are anatomically and physiologically wrong. In the evaluation of any group of herniorrhaphies from a statistical standpoint of recurrence, it is important to break the group down into types of hernias repaired. The reporting of a series of herniorrhaphies with a favorable recurrence rate is valueless unless the types of hernias repaired are stipulated. A 2 per cent recurrence rate for the small indirect variety would not be remarkable, but a 2 per cent recurrence rate for the repair of direct inguinal hernias would be phenomenal. As most groin hernias are of the small indirect variety, they serve to bolster or give a false impression of the rate of recurrence in the more difficult hernias. The recurrence rate in the repair of direct inguinal hernias is said by some to be 50 per cent or more.

To the young surgeon, the galaxy of great names associated with inguinal herniorrhaphy and the almost endless number of operations for the cure of inguinal hernias are a baffling introduction to one of the oldest known afflictions of man. I know of sixty-seven recorded operations for the repair of inguinal and femoral hernias, most of which are linked with a proper name. Minor variations on these known operations are legion, and almost every surgeon has a pet trick or two which gives him confidence in his repair. As one reviews the many recorded operations for inguinal hernia, the consistent use of the inguinal ligament as the anchoring structure for the inguinal strata is evident. These numerous operations, then, are all variations upon a central theme. Dr. B. J. Anson and I, in collaboration, have repeatedly presented the anatomy of the inguinal region, demonstrating that the lower inguinal portion of the transversus layer inserts into Cooper's ligament and that there is no attachment to the inguinal ligament; also, that the inguinal ligament is a free margin, loosely held in its slightly concave position by the fasciae. The breadth of the transversus insertion into Cooper's ligament determines the transverse diameter of the femoral ring; or, stated another way, the medial boundary of the femoral ring is the lateralmost attachment of the transversus stratum into Cooper's ligament and not the lacunar ligament, as usually stated.

With these brief introductory remarks I should like to present a concept of the pathologic anatomy of groin hernias and a method for their repair based upon the restoration of inguinofemoral anatomy to normal. For this purpose, groin hernias are divided into two groups. Group I includes only the small indirect inguinal hernias. Group II includes large indirect inguinal, direct inguinal and femoral hernias, or any combination of these, including the small indirect variety.

Group I. Small Indirect Inguinal Hernias

The only pathologic condition present in the small indirect inguinal hernia is a congenital peritoneal diverticulum which passes through the abdominal inguinal ring and extends for a variable distance, intimately associated with the cord structures and within the sheath of the internal spermatic fascia. After opening the sac, the examining finger should be passed into the peritoneal cavity and, by a combination of palpation and inspection, the coexistence of a direct inguinal or a femoral hernia excluded. If the posterior inguinal wall is strong and the femoral ring is closed, the only problem is the removal of peritoneal sac and tightening of the abdominal inguinal ring. The sac is removed after high ligation in a conventional manner, and then the abdominal ring is tightened by one or two sutures which approximate the transversalis fascia to the anterior layer of the femoral sheath, medial to the cord structures. One fine silk suture is usually used to pick up the cord fasciae at several points and attach it to the transversalis fascia to prevent the cord from sliding back and forth through the ring, on the hypothesis that the preperitoneal fat might work its way through the ring and act as an entering wedge for the recurrence of an indirect inguinal hernia.

Presented before the Minneapolis Surgical Society, November 6, 1947.

The removal of the sac and the closure of the abdominal inguinal ring as just outlined completes the repair of this type of hernia. Since no other pathologic condition exists there is no need for buttressing sutures between the inguinal ligament and the conjoined tendon. The spermatic cord is dropped back against the posterior wall and the external oblique aponeurosis closed over it. Both the subcutaneous and abdominal inguinal rings are closed snugly but not too tightly so that there will be no interference with the blood supply of the testis. A general rule in this regard may be stated that after the closure of these "rings," the tip of the fifth finger should be able to pass through the ring along with the cord structures. For descriptive purposes we call this simple procedure "abdominal ring repair," and it is the most frequently used procedure since most groin hernias are of this type.

Group II. Method of Repair for All Other Groin Hernias

This group includes all other groin hernias or combinations thereof, and a single method for their repair will be outlined. Before discussing this group of hernias and their repair, it is necessary to establish the definition of the posterior inguinal wall. As used by this speaker, it consists only of the transversus abdominis aponeurosis and its investing fasciae which are fused into one layer in this region. The innermost layer of fascia is the transversalis fascia; the outermost is unnamed and thinner, but the spermatic cord and investing fasciae lie upon this fascia as the cord traverses the inguinal canal. The extent of the posterior inguinal wall is roughly delineated by the area known as Hesselbach's triangle, but the base of this triangle has nothing to do with the inguinal ligament. The medial portion of the base of the triangle is the insertion of the transversus abdominis aponeurosis into Cooper's ligament and the lateral portion is the continuity of the transversalis fascia with the anterior layer of the femoral sheath, where the aponeurotic fibers of the transversus layer cease. Medially, the posterior wall passes anterior to the rectus muscle as a component of the rectus sheath. Superiorly and laterally, the layer is muscular with the same investing fasciae. The reason for grouping large indirect inguinal, direct inguinal and femoral hernias under one heading is that they all encroach upon this posterior inguinal wall. The rationale of a single method of repair is that they all represent defects in the same layer, i.e., the transversus abdominis.

A large indirect inguinal hernia encroaches upon the posterior inguinal wall from the lateral side, and the degree of destruction is directly proportional to the size of the dilated abdominal inguinal ring. In the extreme case, the entire posterior wall is destroyed and in attenuated form becomes part of the coverings of the hernial sac. In this large hernia the medial wall of the abdominal inguinal ring lies adjacent to the rectus muscle, and the inferior epigastric vessels lie behind the rectus muscle. The problem of repair is exactly the same as for the diffuse direct inguinal hernia. In the direct inguinal hernia the posterior wall is attenuated over the advancing direct hernial sac.

The mechanism of the destruction of the posterior inguinal wall in the direct and large indirect inguinal hernias is clear to everyone. Just how the femoral hernia compromises the posterior inguinal wall is a little more obscure. The transversus abdominis aponeurosis (posterior inguinal wall) inserts into Cooper's ligament from the pubic tubercle to the medial margin of the femoral ring. Whether a congenitally narrow insertion of the transversus aponeurosis into Cooper's ligament (and a correspondingly broad femoral ring) is the etiologic precipitating factor in a femoral hernia, or whether an established femoral hernia attenuates and narrows this insertion secondarily is not known. The fact remains that the defect to be repaired to prevent a femoral recurrence is to broaden this attachment into Cooper's ligament and close the femoral ring. In passing, it is worthy of note that when the femoral ring is dilated in the presence of a femoral hernia, the medial margin of the femoral ring then is bounded by the lacunar ligament, as stated in the standard textbooks of anatomy. In normal anatomy, however, the medial boundary of the femoral ring is about 1 centimeter lateral to the lacunar ligament, and, as stated before, this medial boundary of the femoral ring is the lateralmost insertion of the transversus abdominis aponeurosis (posterior inguinal wall) into Cooper's ligament.

Therefore the problem in the Group II hernias is a reconstruction of the posterior inguinal wall. When the posterior inguinal wall is destroyed, as in the large indirect and direct inguinal hernias,

all the attenuated aponeurosis and fascia are cut away until a strong superior border of the transversus stratum is obtained. Cooper's ligament is exposed throughout its extent, and the cut margin of the anterior femoral sheath is dissected free over the vessels. In dealing with a femoral hernia the procedure is slightly different, in that there is usually no attenuation of the body of the posterior inguinal wall; therefore, this layer is incised close to Cooper's ligament and the incision carried lateralward over the femoral vessels by incising the junction of the transversalis fascia and the anterior layer of the femoral sheath. This then gives adequate exposure for dealing with the femoral hernia which is pulled out into the position of a direct inguinal hernia; the inguinal ligament may be cut if necessary. All hernial sacs are dealt with in a conventional manner which need not be chronicled here.

From this point on, all three types of hernia in this group are dealt with in an identical manner. The reconstruction of the posterior wall and the closure of the defect is in effect a sliding of the transversus stratum from above where it is strong into place below and suturing it to the normal insertion. So that this transfer may be made easily and sutured without tension, a relaxing incision is made in the rectus sheath. The relaxing incision begins at the pubic crest and extends for 5 or 6 cm. superolaterally, staying as close to the midline as the line of fusion of the external oblique aponeurosis permits. It should be noted that this relaxing incision is made through the fused internal oblique and transversus abdominis aponeuroses (conjoined tendon) and deep to the external oblique aponeurosis, which is separable almost to the midline in this region. When the repair is complete, the fact that this is a relaxing incision is evident by the conversion of a narrow cleft into a triangular defect. This defect is protected posteriorly by the rectus muscle and the medial continuation of the transversalis fascia, the rectus fascia.

The reconstruction of the posterior inguinal wall proceeds in the following manner. The recently cut strong border of the transversus abdominis aponeurosis and fused fasciae is sutured to Cooper's ligament, beginning at the pubic tubercle and continuing lateralward to the femoral vein. Interrupted nonabsorbable sutures are used and placed approximately 2 millimeters apart; none of these sutures are tied until all of these sutures are in position and the following two sutures are in place. The two sutures just referred to accomplish the transition from the deep level of Cooper's ligament to the more superficial level of the anterior femoral sheath. The first of these two sutures will unite the transversalis fascia to the pectineus fascia medial to the femoral vein and at the point where the anterior femoral sheath normally curves posteriorly to be continuous with the posterior femoral sheath. The second of these two sutures will approximate the transversalis fascia to the medialmost extent of the anterior femoral sheath. Now, the sutures are tied in the order in which they were placed, beginning at the pubic tubercle. When all these sutures are tied, the reconstruction of the posterior inguinal wall is completed by suturing the transversalis fascia to the anterior layer of the femoral sheath. This suture line is carried lateralward far enough to make a snug closure of the abdominal inguinal ring, as described under the abdominal ring repair. The spermatic cord is dropped in against the new posterior inguinal wall and the external oblique aponeurosis closed over it.

The line of suture beginning at the pubic tubercle and extending along Cooper's ligament to the femoral vein is the normal insertion of this part of the posterior inguinal wall. The only variation from normal anatomy is that this insertion is broadened to obliterate the femoral ring. The intermediary suture between the pectineus fascia and the transversalis fascia serves to close a small defect that would exist between the two suture levels and has its counterpart in normal anatomy in the fascial limitation of the medial wall of the femoral canal. The suture line which approximates the transversalis fascia to the anterior layer of the femoral sheath re-establishes this normal fascial continuity. In referring to the superior margin which is brought down and sutured first to Cooper's ligament and then to the anterior femoral sheath, two terminologies are used, but it is the same anatomic layer. In general the transversus layer is aponeurosis and fused fasciae where it is sutured to Cooper's ligament; however, lateral to this the layer becomes muscular, and so only the fascia on the deep surface of the transversus muscle (the transversalis fascia) is sutured to the anterior layer of the femoral sheath.

Summary

The detailed anatomy of the inguinofemoral region has been published repeatedly in the past and only pertinent excerpts have been presented in this paper.

A simple method of repair of the abdominal inguinal ring for the small indirect inguinal hernia is presented.

A single operation of reconstruction of the posterior inguinal wall for the repair of large indirect inguinal, direct inguinal, and femoral hernias is presented. It is demonstrated that they are all encroachments upon the continuity of the posterior inguinal wall and therefore logically require the same operative procedure. The operation for these hernias includes the excision of attenuated aponeurosis and fascia, the sliding of a strong superior transversus layer into the defect and suturing this layer to the normal anatomic attachments, i.e., Cooper's ligament and the anterior femoral sheath.

The error of using the inguinal ligament in the repair of any inguinal or femoral hernia is demonstrated.

Discussion

DR. HAMLIN MATTSON: The surgical world is indebted to Dr. McVay for his restudy of the anatomy of the inguinal region based on 500 dissections.

In 1898 Lotheissen, while working on a forty-five-year-old woman who had recurrent inguinal hernia, found the inguinal ligament gone. It was the era of early enthusiasm for the principles advocated by Bassini a few years before. Lotheissen recalled the description of the superior pubic ligament by Sir Astley Cooper in 1804 and sutured the conjoined tendon to it. Dr. McVay has revived this operation.

I encountered a similar situation in a soldier in World War II. The so-called conjoined tendon was flimsy and almost destroyed. I decided to turn back a flap of rectus and pyramidalis muscle, as described by Bloodgood in 1903, for the inguinal ligament. Such an improvisation seemed to fit the situation and worked out very well. While in the service I operated on thirty-five patients, twenty-two of them with direct hernias. For the indirect hernias I opened the cremaster envelope and sutured the transversalis fascia to the fascia of the femoral sheath with interrupted silk around the actual structures of the cord. I have copies of the records of these soldiers and have arranged with them to contact their physicians in due time.

Since returning from the service in 1945 and to date, I have performed seventy-four operations for inguinal hernia. Fifty-seven were indirect and fourteen direct. Of the latter, three were recurrent. All have been done according to the methods indicated above. I hope to carry out a five-year physical examination follow-up on these patients. Most follow-up studies in the literature have been by letter, and the usual period has been eighteen months to two years.

DR. MCVAY: I certainly am indebted to Dr. Mattson for his staunch support for the use of Cooper's ligament rather than the inguinal ligament in inguinal herniorrhaphy. His use of the rectus and pyramidalis flap gives a strong posterior wall when sutured to Cooper's ligament, but it changes the direction of the transversus fibers and it leaves a larger defect over the rectus muscle than the simple relaxing incision and the sliding of the layer as described by Rienhoff. However, this objection may be only theoretical, and I know of other surgeons who are using the rectus flap in their Cooper's ligament repair.

DR. HAMLIN MATTSON: Early in my experience with the rectus flap I noticed separation at the hinge in some cases. Subsequently I have added a suture line at the hinge between the flap and the tendinous insertion of the rectus muscle.

DR. CARL O. RICE: We have come to the conclusion that there are only six or eight fundamentally different operative procedures designed for the repair of inguinal hernias. Most of these fundamental procedures aim to narrow the internal ring, reinforce the floor of the canal, and change the contour of the inguinal canal.

Bassini did this by approximating the conjoined tendon to Poupart's ligament under the cord. Bloodgood did it by pulling a portion of the rectus muscle down to this structure. Later a flap of rectus sheath was turned down and anchored to the inguinal ligament. Andrews employed the fascia of the external oblique for this purpose, imbricating one leaf under and the other over the cord. Ferguson in his first procedure sutured all of the inguinal structures over the cord, and in his second procedure brought the cord out at the inguinal ring, imbricating the external oblique and conjoined tendon all under the cord. McArthur designed the fascial strip from the locally available external oblique fascia, using these as suture material for any type of procedure which he chose to use. McVay has popularized the use of Cooper's ligament as the anchoring point.

Mattson of this society has devised a procedure in which he brings a flap of rectus sheath over the conjoined tendon, suturing it to the Cooper's ligament. Giving credit to the originators of each principle, I prefer to call this a Bloodgood-McVay procedure. Likewise, I should prefer to call other combinations by the name of the originator of each particular principle.

In reviewing the operative procedures at the St. Barnabas Hospital, we have seen described combinations of a number of different procedures, and I presume that almost every surgeon has a special modification which he has adapted to his own use.

I employ a combination of the McArthur, McVay, and Bassini procedures, using the McArthur fascial strip for suture material. Two of these strips are left attached at the pubic tubercle, and one at the muscle end. With the first strip the transversalis fascia is sutured to

Cooper's ligament, thus reinforcing the approach to the floor of the inguinal canal, over which a direct hernia must pass before it can force itself out through the floor of the canal. The additional portion of this strip or the second strip approximates the conjoined tendon to Poupart's ligament (Bassini), and closes the roof of the canal over the cord in its distal third. The third strip, attached at the muscular end, closes the rent in the lateral portion of the external oblique fascia, thereby restoring the anatomical relationship of the cord and inguinal canal.

DR. McVAY: I made no special reference to suture material other than the fact that I use non-absorbable sutures. My objection to fascial sutures is that the usual fascial suture needle is so large that damage may be done to the transversus layer in making the closure. Cooper's ligament is certainly thick and strong enough to withstand any size needle or suture.

DR. L. C. CULLIGAN: I know of no speaker before the Minneapolis Surgical Society who has provoked so much discussion and argument as Dr. McVay has. I think that is an indication of the keen interest every surgeon has in the problem of hernia. However, it is safe to say that no matter which side of the argument we may take, we are all agreed that Dr. McVay has made his mark in the literature of hernia and that his name will go down with Bassini, Halsted, McArthur, Ferguson and others who have contributed much to our knowledge of this subject.

If Dr. McVay is correct in his thesis that Poupart's ligament is a weak structure and inadequate for use in the repair of inguinal hernia, he has certainly brought something new. I know that Dr. McVay will be the first to admit that his type repair is more difficult than the usual repair, because in doing it one has to work in a deeper hole. In the fat person, who is especially prone to direct hernia, it has definite technical disadvantages. Also, it is more hazardous, in that one must work close to the femoral vessels and there is real danger of injuring these large vessels. There is more tension involved in suturing in view of the fact that Cooper's ligament is deeper than Poupart's ligament. So, if Dr. McVay's operation is to survive, these disadvantages must be offset by real dividends in lower recurrence rates. What this will be, only time alone can tell. It will be years before accurate statistics will be available to settle this question.

When I heard of Dr. McVay's coming, I talked to Dr. Carlyle, who is now studying the hernias operated at the Veterans' Hospital. I estimate that 5,000 hernias have been done there in the past twenty years, so this should prove to be a fruitful study. About 2,000 of these should be the McArthur type of fascial repair. We started this very type of repair in 1934 and used it almost routinely in all direct and large indirect hernias.

We thought that we could throw some light on the problem of whether or not the McVay type of repair is necessary by making a study of all the recurrent hernias that had been operated there during a ten-year period from 1936 to 1946. To do this we got out all the records of patients with recurrent hernias operated on and also all the patients with femoral hernias admitted to the hospital during the same period. In this way we were able to study 150 recurrent hernias and determine fairly definitely the point of recurrence. There were sixty patients admitted with femoral hernias during this period. Eight of these had previously been operated on for inguinal hernias on the same side. Combining these two groups, the 150 recurrent hernias and the eight femoral hernias which had previously had inguinal herniotomies, we were able to study 158 hernias. Of this group 35 per cent had recurred in the region of the internal ring, 36 per cent came back in the floor of the canal, 23 per cent at the pubis, and 5 per cent had developed a second hernia in the femoral canal. From this study it would appear that there are relatively few inguinal hernias which recur in the region of the femoral canal.

DR. McVAY: Dr. Culligan has presented a most interesting analysis of recurrences at the Veterans' Hospital. My experience is too limited for me to express an opinion upon the sites of recurrence, but in my personal series of 100 herniorrhaphies, twelve were recurrent hernias. Of these, three were indirect, seven direct, and two were femoral recurrences. I am interested to learn that the slide which Dr. Culligan presented, which shows the inguinal wall in posterior view, was taken from a text, because it demonstrates an artifact that has been perpetuated in the standard texts and atlases of anatomy. If, as this slide demonstrated, one can see the inguinal and lacunar ligaments in a posterior view of the inguinal region, then the transversus layer (posterior inguinal wall) and its insertion into Cooper's ligament has been removed.

Dr. Culligan is quite correct that it is more difficult to suture to Cooper's ligament than to the inguinal ligament, especially in a fat subject. However, with a little practice, especially by holding the preperitoneal fat down with a ribbon retractor, the operation is not difficult. On the contrary, danger of injury to the femoral vein is less likely in the Cooper's ligament repair because it is exposed in each instance and the surgeon knows exactly where it is at all times. I am sure many surgeons do not realize how close their needle comes to the femoral vein in the conventional inguinal ligament repair. Only the anterior femoral sheath separates the femoral vein from the inguinal ligament. In carrying out the lateral part of the reconstruction operation, in which the transversalis fascia is sutured to the anterior layer of the femoral sheath, the femoral vein is visualized during the placing of every suture. I should add that when difficulty is experienced in delineating the edge of the anterior femoral sheath, I frequently doubly ligate and cut the small veins which enter the external iliac or femoral vein at this point. I have had some cases of annoying bleeding when I have not done this when the veins were adherent to the sheath.

DR. O. H. WANGENSTEEN: The writings of Dr. McVay and his former associate, Professor B. J. Anson, on the anatomy of inguinal hernia are well known and

constitute an important contribution to our knowledge of hernia. Dr. McVay would have us believe that, in the repair of an inguinal hernia, it is necessary to take steps to prevent the occurrence of femoral hernia as a consequence of, or sequal to, repair of the inguinal hernia. This suggestion is not in accord with the experience of Dr. Culligan nor with our own. Dr. Donald Ferguson has just recently completed a study in our clinic of 191 patients operated upon for inguinal and femoral hernia. These patients were operated upon between January, 1940 and June, 1944, so that a period of more than three years has elapsed since the most recent operations. Of 151 patients in the group undergoing operation for inguinal hernia, in only one instance was the recurrence a femoral hernia. In other words, the problem in the repair of an inguinal hernia is the prevention of recurrence of inguinal hernia, not femoral hernia. As the studies of Dr. McVay and his associate, Professor Anson, have shown, the tethering of the inguinal ligament to the structures beneath is by no means strong; on the contrary, the attachment is surprisingly weak. Nevertheless, the nature of the fixation of the inguinal ligament between the anterior superior spine and pubic tubercle, despite its weak attachment to underlying structures, must be such as to constitute a satisfactory buttress, protecting against dissection of a hernia beneath Poupart's ligament lateral to the lacunar ligament.

Dr. Ferguson's study indicated that, in our own experience at least, the chief problem in the repair of inguinal hernia is recurrence of inguinal hernia. Dr. Ferguson found that the over-all recurrence rate following the repair of inguinal hernia in our clinic was approximately 10 per cent—a rather disconcerting observation; for indirect inguinal hernia, the incidence of recurrence was 7 per cent, for direct hernia 30 per cent! When Dr. Ferguson told me this, I thought this high recurrence rate must be owing to the circumstance that a number of the operations were done by the junior staff. Dr. Ferguson informed me, however, that such was not the case. The larger number of recurrences were to be found amongst patients operated upon by the senior staff. Of the twenty-seven patients operated upon by me, one had a recurrence. This was a seventy-nine-year-old man who was blind, who had bilateral direct and indirect inguinal hernias—the direct hernia on each side being the more important item. The recurrence in this patient was at the site of the internal ring on the side of the smaller hernia. In other words, the failure in this instance was in that component of the hernia (indirect) which should have been more easily dealt with. The conclusion therefore is inescapable, namely, I did not take as careful pains as I should have in dealing with that portion of the problem which should have been most readily resolved.

Dr. Ferguson's study indicated that our staff as a whole was partial to the Bassini operation. The operations performed by me were of the Halsted type I. As you will remember, Professor Halsted described two types of procedures; in the first, the cord was transplanted subcutaneously with complete obliteration of the external ring. After a few years, Halsted abandoned this procedure, reverting essentially to the Ferguson operation without transplantation of the spermatic cord—the latter structure being brought out through the abdominal wall just above the pubic tubercle. In this latter type of operation (Halsted type II), the internal ring is completely obliterated.

The whole problem of inguinal hernia centers about the circumstance that the spermatic cord comes through the abdominal wall. Moreover, in the repair of the hernia, the surgeon must make some provision for the spermatic cord, at the same time trying to make a strong repair of the abdominal wall. In recurrent hernias the surgeon may divide the spermatic cord high up, thereby permitting him to make a complete closure of the structures of the abdominal wall. It is perhaps unnecessary to suggest that this expedient simplifies the problem considerably, and in the repair of difficult recurrent or sliding hernias most of us at some time or another have taken advantage of this maneuver to augment the chances of a satisfactory cure of the hernia.

The first important step in the repair of an indirect inguinal hernia is removal of and satisfactory closure of the sac. Closure with a purse string suture is rarely adequate. And certainly a broad sac should never be closed in this manner. The placement of a generous number of interrupted sutures of fine silk is just as important here as in the closure of any abdominal incision. I think it would not be an overstatement to suggest that many recurrences in indirect hernias are due to failure to obtain adequate closure of the peritoneal defect.

Now with reference to the hernioplasty, I believe the Bassini operation should be abandoned because it leaves the surgeon and the patient with the problem of maintaining both internal and external rings. Only sacrifice of the spermatic cord resolves the problem in such a manner that both internal and external rings are done away with. In the Halsted I operation, the internal ring is left and the external ring is closed; in the Halsted II or Ferguson type of procedure, the internal ring is closed and the external ring is preserved. Whereas my own personal experience with the Halsted operation has been entirely with the type I operation, I believe that inasmuch as it obliterates the external ring, this procedure is especially suitable for direct hernias; similarly, inasmuch as in the type II procedure, the internal ring is closed, this operation should be particularly suitable for indirect hernias. The problem of making provision for the spermatic cord in the repair of an inguinal hernia is essentially the same problem as making a colostomy with avoidance of an incisional hernia. Only the careful preplacement of interrupted silk sutures uniting parietal peritoneum and gut wall can prevent hernia at the site at which the gut comes through the abdominal wall. This important matter cannot be left to chance, otherwise incisional hernia will occur about the colostomy. And such, too, is the problem in inguinal hernia.

I hesitate to inflict these elementary considerations relating to inguinal hernias upon you. Yet I must confess that it was a feeling of unwillingness to see the con-

ventional procedures for the repair of inguinal hernias set aside that prompted me to attempt some defense of them. It was a real pleasure to have had the opportunity of hearing Dr. McVay and to learn something of his enthusiasm for attaching the fascial structures of the lower abdominal wall to Cooper's ligament. Following the example of Lotheissen of Vienna, most of us have employed this scheme in the repair of femoral hernias. As Dr. McVay suggests, this maneuver strengthens the lower abdominal wall. The question is, is it necessary in the repair of inguinal hernia? The primary problem of recurrence after repair of inguinal hernia, as I see it, is failure to deal satisfactorily with the spermatic cord. I am hopeful that when Dr. McVay has had the opportunity to enlarge surgically upon his nice anatomical studies of the problem of hernia, he too will find some things worth salvaging in the conventional surgical methods for the repair of inguinal hernia.

Dr. McVay: I must agree with Dr. Wangensteen that my surgical experience is not commensurate with my anatomical experience. However, let me reiterate two anatomic facts that are violated in the Halsted I operation. First, the inguinal ligament is the anchoring structure, when the normal insertion is into Cooper's ligament medially and the lateral continuity is with the femoral sheath. Second, the Halsted I operation violates normal anatomy in changing the obliquity of the inguinal canal to one of direct emergence. There are many statistical analyses of herniorrhaphies showing excellent results but these are worthless unless the hernias repaired are listed as to type. The primary purpose of my paper tonight is to present a method of hernioplasty which repairs the defect and returns the inguinal anatomy to normal.

Dr. S. E. Williams, Chippewa Falls, Wis.: I am not a member of the Minneapolis Surgical Society, but, through kindness, was invited here. I have driven 100 miles tonight to hear this Dr. McVay speak.

This is a very interesting subject. I am looking back on forty-three years, and I think I am, along with my friend in the front seat, one of the old timers. I have spent a good share of my forty-three years of practice in a rural district in Wisconsin and have operated on a number of people for hernia. Very few of our farmers and lumberjacks developed recurrences. Dr. A. J. Ochsner taught us that the simpler you did the hernia, the longer it would last. Surgeons at Augustana hospital in Chicago have abandoned silk, wire, and linen and for the past ten years have used only catgut. They have been getting fewer recurrences with catgut. Babcock of Philadelphia states that none of his cases in which he used wire developed recurrences. I can give you the names of eleven doctors in Saint Paul today who are wearing trusses following operations by some of you. There may be more in Minneapolis.

Dr. McVay: Dr. Williams has made an excellent point, which is "the simpler you do a hernia, the better." As I stated at the beginning of my paper, the small indirect inguinal hernia needs only to have the peritoneal diverticulum removed and the abdominal inguinal ring tightened. Any additional imbricating, plicating or other sutures are not only superfluous but may damage the posterior inguinal wall so as to cause a direct or femoral recurrence. The repair of a direct inguinal or large indirect inguinal hernia is an entirely different matter, and it is in this group that the incidence of recurrence is so high. It is in this latter group that reconstruction of the posterior inguinal wall is indicated.

Dr. A. E. Benjamin: I began surgery when one could not depend upon the suture material for hernias. We had a great deal of trouble with catgut or whatever material was used. I decided not to depend upon buried sutures. I thought it was important to build the posterior wall of the canal solidly. I put in retention sutures of silk-worm gut. I first included the external oblique, internal oblique and transversalis with mattress sutures brought through the muscles and conjoined tendon and through the shelving edge of Poupart's ligament. I was very careful to ligate the sac high and to run my finger around to see if there were any adhesions, any fat tissue to be removed, or if a direct or femoral hernia was present. I tied the mattress sutures over rolls of gauze on the skin. That made an elastic sling which allowed no cutting of sutures through the tissues. I got the patients out of bed early. In 1908 I wrote a paper on "The Ambulatory Treatment of Hernia Cases." Some patients were sent home the first day. Occasionally I would keep them in the hospital two weeks. Few surgeons have tried this method, but its continued use in my hands has been justified. The nonabsorbable sutures tied loosely over gauze rolls made it possible for patients to get around early with no danger of sutures giving way. I took the sutures out at the end of two or three weeks. Usually I would bring the external oblique beneath the cord and make one point of exit of the cord. Later, when I could depend upon the catgut, I used fine chromic catgut, No. 0 or 00, to reinforce the suture line. I imbricated the external oblique. I have operated on a femoral hernia at the same time as a direct, or a direct and an indirect simultaneously. If there is no other undiscovered hernia left, there is less chance of a recurrence. Usually I transplanted the stump of the sac with a suture through the internal oblique and fastened it over the fascia of the external oblique. I think transplantation of the sac is very important for some of the cases.

In patients with pot bellies, intra-abdominal pressure is too great, and may result in a return of the hernia. I have used Cooper's ligament of late. I did not know I was using it years ago, but in retrospect, I do think it was incorporated in some of the sutures. I got down deep on the inguinal ligament. If these fat patients are given exercises after the operation, and cut down on their diet, I believe we will have fewer recurrences.

Dr. McVay: Dr. Benjamin has emphasized a very important point, namely, that in the repair of any type of groin hernia, be sure that there is not another type of

(Continued on Page 607)

ADRENAL SYMPATHOBLASTOMA (NEUROBLASTOMA)

EARL A. LOOMIS, M.D., Minneapolis, Minnesota

and

GEORGE L. LOOMIS, M.D., Winona, Minnesota

TUMORS of the sympathetic nervous system are occasionally seen in the practice of ophthalmology. The medullary portion of the suprarenal gland is the site of a comparatively rare group of tumors, one of which is the sympathetic neuroblastoma or sympathoblastoma. These growths constitute a definite clinical entity seen almost entirely in infants and children and always terminate fatally. Burch[2] reported it was seen occasionally in adults. The disease is relatively infrequent. A summary of the literature up to 1933 disclosed only 158 reported cases.[9] In 1938, 105 more cases were collected by another group which brought the total, with their cases, up to 270. In 1942 Bothman and Blankstein[1] reported four cases. In the same year Thompson[10] reported three more cases. Moore and Gildersleeve[7] reported a case in 1943. Grier[5] added a case in 1944. Cox[4] added a case in 1948.

The clinician will see a case of ecchymosis of one or both lids, bluish discoloration of the temporal region with a definite palpable mass, exophthalmos, papilledema and roentgenological evidence of bone destruction in the skull with separation of the sutures and involvement of the long bones. Other findings are palpable masses in the abdominal cavity, rapidly increasing in size. Anemia, cachexia and weakness rapidly follow. The disease progresses, and death occurs in a few months. The average length of life after the onset of the first signs is a little over four months. The occurrence of ecchymosis of one or both lids alone or associated with exophthalmos should be enough evidence to establish a tentative diagnosis.

Although the great majority of sympathoblastomas arise from the medullary portion of the adrenal gland, other points of origin have been reported. Chandler and Norcross[3] reported, in a review of the literature, cases originating in the scapula, cervical sympathetics, mediastinum, thoracic cavity, sacrum, retroperitoneal region, abdominal sympathetic trunk, jejunum, intervertebral foramen and the skin of the thigh.

Some have divided these tumors into a group first described by Pepper,[8] who emphasized the adrenal origin, the metastasis to the liver and the early age of onset. The Hutchinson[6] type occurred in a somewhat older group and showed metastasis to the skull, orbits and long bones. Actually these two types are indistinguishable histologically and are an arbitrary division based on the point of metastasis.

Fig. 1. A case of sympathoblastoma.

The adrenal medulla in these tumors is soft, lobulated and highly vascular, depending on the degree of the hemorrhage.

Wright[11] in 1910 described these tumors histologically and showed their resemblance to cells of the sympathetic nervous system. The presence of highly undifferentiated round cells resembling lymphocytes, with the frequent tendency to formation of rosettes and the presence of fibrillae, is characteristic. It could often be confused with other highly undifferentiated neoplasms such as lymphosarcoma and round cell sarcoma when diagnosis was made from biopsy alone.

The following case report is presented as an addition to the literature (Fig. 1).

Case 1.—T. R., a year and a half of age, was first examined by one of us (E.A.L.) on April 28, 1948. His mother, a graduate nurse, reported that two weeks previously she had noticed a swelling over his left eyelid. There was exophthalmos and proptosis downward. The conjunctiva was normal. Pupillary reactions and fundus examination were normal, with no papilledema. The true diagnosis was not even considered at this time.

The patient was sent to a radiologist for x-ray examination of the orbit and skull, which were found normal.

Read at the spring meeting of the Winona County Medical Society.

Laboratory findings were also negative, with exception of considerable elevation of cerebrospinal pressure.

On May 2, a biopsy was taken from the mass in the orbit, and the pathologist's report was sympathoblastoma. An x-ray of the adrenals showed a mass over the left kidney in the lumbar region. This helped to verify the diagnosis of metastatic sympathoblastoma from the adrenal gland. The child became progressively worse and died in October, 1948. Permission to perform an autopsy was not obtained.

Summary and Conclusion

A case of sympathoblastoma in a young child is presented, along with the diagnostic points to be encountered. A partial summary of the literature has been given. These cases are characterized by exophthalmos, edema of the lids, rapid downhill course clinically and fatal termination in all cases. Microscopically the presence of small round cells, highly undifferentiated, rosettes and fibrillae are diagnostic.

Ecchymosis with proptosis in one or both eyes in children, should arouse suspicion of adrenal neoplasm.

INGUINAL AND FEMORAL HERNIOPLASTY

(Continued from Page 605)

hernia present. Certainly the overlooking of a coexistent hernia accounts for some of our recurrences. I spend considerable time dissecting the peritoneal sac well above the fascial abdominal ring and do not feel that transplantation of the neck of the sac is necessary. If the peritoneal sac is adequately freed-up, the ligated neck should retract at least 2 centimeters above the fascial abdominal inguinal ring.

Dr. D. C. McKinnon: Recently the iliopubic tract has been described as a thickening of the transversalis fascia in the upper portion of the femoral sheath parallel and posterior to the inguinal ligament. It has been utilized in Dr. McVay's third phase of the repair by other surgeons. After suturing the transversalis fascia to Cooper's ligament, the transversalis fascia was sutured to the iliopubic tract lateral and anterior to the femoral vessels. Since Dr. McVay has performed so many anatomical dissections, I wish to ask him how often he finds the iliopubic tract present as a definite structure?

Dr. McVay: The iliopubic tract is a thickening of the preperitoneal connective tissue over the femoral vessels and is actually a part of the internal femoral sheath. It is always present but is not to be confused with the external femoral sheath which is a parietal or muscular fascia, e.g., in this instance, the transversalis fascia. It is the continuation of the transversalis fascia into the thigh, the anterior layer of the femoral sheath that I use in the lateral part of the reconstruction of the inguinal wall. Practically, we are perhaps talking about the same structure with different names, as is so frequently the case. Different names for the same structure or different layers with the same name have caused much of the confusion that exists today.

Dr. L. H. Fowler: If the inguinal ligament is not a satisfactory structure to suture the transversalis fascia to, why don't we get more recurrences as femoral hernias?

Dr. McVay: The only way in which I can answer Dr. Fowler is by indirection. In my personal series of 100 hernias, of which twelve were of the recurrent type, two were femoral by virtue of their relationship to the inguinal ligament. Actually they were direct inguinal hernias as far as their relationships to the pubic tubercle and femoral vessels were concerned, the inguinal ligament having been pulled superiorly. It usually is difficult to determine the exact relationships in a recurrent direct inguinal hernia, but I have had the experience and heard others, including Dr. Mattson this evening, state that they have not found sufficient inguinal ligament remaining to do a conventional inguinal ligament repair. My principal objection to the use of the inguinal ligament is, of course, that it is not the normal insertion of the transversus layer and therefore should not be used when the normal insertion is infinitely stronger and readily available.

In closing, I wish to express my appreciation to the Minneapolis Surgical Society for the privilege of presenting my views on the subject of inguinal hernia repair. I have of necessity omitted many details of the anatomy of the inguinofemoral region and have gone over the operative procedure rather rapidly. I have also made some rather broad provocative statements intentionally to stimulate the audience to discussion. From the number of queries and opinions expressed it is obvious that the ancient affliction of hernia is still a very live subject, and I am delighted with the enthusiastic response in discussion.

LABORATORY STUDIES OF CEREBROSPINAL FLUID IN MENINGITIS AND POLIOMYELITIS

HAROLD H. JOFFE, M.D., and ARTHUR H. WELLS, M.D.
Duluth, Minnesota

THE advent of specific antibiotics for the different bacterial types of meningitis makes the laboratory means of establishing the etiology of inflammation in the central nervous system indispensable to proper therapy.

The purpose of this paper is to determine the diagnostic value of various common laboratory procedures through a review of the cerebrospinal fluid findings in the cases of meningitis and poliomyelitis admitted to this hospital from 1938 through 1947. Wherever practical, our findings will be compared with the larger series of Merritt and Smith.[1]

During this eleven-year period, a total of 167 cases were clinically diagnosed as poliomyelitis and 110 as meningitis. The cases selected for this study had to meet the following criteria: (1) well-defined clinical symptoms, (2) adequate cerebrospinal fluid and bacteriologic studies, and/or (3) confirmation by necropsy examination.

On the bases of the foregoing, ninety-six (87.3 per cent) of the cases clinically diagnosed as meningitis and 122 (73 per cent) of the cases of poliomyelitis were selected for the review. A plausible explanation for the lower percentage of selected cases of poliomyelitis lies in the fact that mild or abortive symptoms during an epidemic may have been considered sufficient evidence to make the diagnosis, but physical findings and cerebrospinal fluid studies in our opinion were inadequate to confirm the clinical impression.

This selected group study will be reviewed from the standpoint of: bacteriology, total cell and differential cell counts, and quantitative protein, chloride and sugar determinations.

Bacteriology

Our selection of culture media depends upon the other cerebrospinal fluid findings. If we suspect an acute bacterial meningitis and cannot find the organism in smears after concentration by means of centrifugation, we use multiple media suitable for either Hemophilus influenza, Neissera intracellularis or anaerobic streptococci. These media include brain broth, blood agar and chocolate agar. Half of the inoculated plates and tubes are incubated in a carbon dioxide atmosphere. If we suspect a tuberculous meningitis, the fluid after concentration by centrifugation or the pellicle, if present, is streaked on slants of Petragnani's and Hohn's or Wooley's media.

TABLE I. CAUSATIVE ORGANISM

Organism	Number	Percentage
N. intracellularis	37	51.3
Pneumococcus	17	23.6
H. influenza	11	15.3
Streptococcus	5	6.9
Staphylococcus aureus	2	2.8

In our series of seventy-two cases of acute purulent meningitis (Table I), N. intracellularis accounted for 51.3 per cent, pneumococcus for 23.6 per cent, H. influenza for 15.3 per cent, streptococcus for 6.9 per cent, and Staphylococcus aureus for 2.8 per cent. In 88.9 per cent of these cases, the organism was identified by culture methods, and of these, 9.7 per cent were postmortem examinations. In 11.1 per cent, smears alone were considered sufficient. In Merritt and Smith's series of 163 cases of acute purulent meningitis, the causative organism was meningococcus in 39.3 per cent, pneumococcus in 25.2 per cent, streptococcus in 23.9 per cent, Staphylococcus aureus in 7.9 per cent, and the influenza bacillus in 3.7 per cent of cases.

In our series of fifteen cases of tuberculous meningitis, six had pulmonary involvement, eight had a miliary form of the disease, and one patient had osseous tuberculosis. A pellicle formation, although not pathognomonic, was present in 66.6 per cent of cases. In no case was a positive culture obtained, which illustrates the importance of the other cerebrospinal fluid studies for differentiating tuberculous from the other types of meningitis.

Cell Counts

It is generally agreed that a predominance of neutrophiles and a high total cell count favor a diagnosis of acute purulent meningitis, while a

From the Department of Pathology, St. Luke's Hospital.

predominance of lymphocytes and a relatively low total cell count favor either poliomyelitis, tuberculous, syphilitic or viral meningitis. We hoped to find a more exact rule of differentiation.

In our series of seventy-two cases of meningitis due to bacteria other than M. tuberculosis (Table II), 2.8 per cent had a total cell count of under 100 per cu. mm., and 6.9 per cent ranged from 100 to 1,000. In 75 per cent of the cases, the count ranged between 1,000 to 10,000, and in 12.5 per cent, between 10,000 to 20,000. The neutrophiles ranged from 38 to 100 per cent of the total cell count, with an average of 91.9 per cent.

It has been our contention that a spinal fluid differential cell count level of 15 per cent lymphocytes could be used as one of the diagnostic means of differentiating the acute purulent meningitides from other inflammations of the central nervous system. On the basis of the foregoing, we found that only six (8.3 per cent) of our cases of acute purulent meningitis had a lymphocyte count above 15 per cent of the total cell count.

In Merritt and Smith's series of 152 cases of acute purulent meningitis, only 1 per cent showed a cell count of under 100. In 12 per cent of the cases, the count ranged from 100 to 1,000, from 1,000 to 10,000 in 72 per cent, and from 10,000 to 20,000 in 16 per cent. The neutrophiles constituted from 90 to 95 per cent of the total.

Two cases in our series of meningococcus meningitis had a cell count of under 100, which was the result of an examination of the fluid during the first few hours of the disease.

In our series of fifteen cases of tuberculous meningitis (Table II), the cell count ranged between 50 and 500 in 86.8 per cent. The highest total cell count was 1,340 per cu. mm. The lymphocytes ranged from 72 to 98 per cent of the total cell count, for an average of 89.3 per cent. In the Boston series of eighty-four cases, the cell count was between 5 and 25 in 1 per cent, between 25 and 50 in 5 per cent, between 50 and 500 in 85 per cent and between 500 and 2100 in 9 per cent of the cases. The lymphocytes predominated and averaged 80 per cent of the total cell count.

The cell count in poliomyelitis varies with the stage of the disease and is highest in the preparalytic stage. As the disease progresses, there is usually a rapid drop. The neutrophile is frequently the predominate cell in the very early stage but is rapidly replaced by the lymphocyte.

TABLE II. CELL COUNT

Acute Purulent Meningitis	Cells Per Cubic Millimeter				
	Under 100	100 to 1000	1000 to 10,000	10,000 to 20,000	Over 20,000
Meningococcus	2	1	27	6	1
Pneumococcus	0	0	16	1	0
Influenzal	0	3	7	0	1
Streptococcus	0	1	2	2	0
Staphylococcus	0	0	2	0	0

	5 to 25	25 to 50	50 to 500	500 to 1,340
Tuberculous Meningitis	0	1	13	1

	0 to 10	10 to 50	50 to 200	Over 200
Poliomyelitis	19	39	56	8

In our series of 122 cases of poliomyelitis (Table II), 32 per cent had a total cell count of between 11 and 50 and 46 per cent between 50 to 200. The highest total cell count was 530 per cu. mm. The lymphocyte count varied from 5 to 100 per cent of the total cell count, with an average of 60 per cent. In only three (3.3 per cent) of the cases was the lymphocyte count below 15 per cent of the total cell count. The rather unexpected high average percentage of neutrophiles, we believe, reflects the frequent predominance of the neutrophile in the very early stage of the disease. It also illustrates the importance of repeated spinal punctures. There is no proof that repeated punctures produces a pleocytosis as the result of meningeal irritation.

In the Boston series of 109 cases of poliomyelitis, approximately 80 per cent of those punctured within the first five days of the onset showed a predominance of lymphocytes. In the same series, 33 per cent of the cases showed a cell count between 11 and 50, and 45.9 per cent between 50 and 200, with 5.5 per cent between 0 to 10, and 15.6 per cent with a total cell count of over 200.

Protein

An increase in the total amount of protein in the cerebrospinal fluid is probably the most frequent change encountered with diseases of the brain or its meninges.

The normal quantitative protein varies between 15 and 45 mg. per 100 c.c. and for all practical purposes consists of albumin and globulin in a ration of 5 to 1. An increased protein is usually associated with a pleocytosis. Even slight traces

TABLE III. PROTEIN

Acute Purulent Meningitis	Mg. per 100 cc.			
	Under 45	45 to 100	100 to 500	500 to 1000
Meningococcus	2	6	29	0
Pneumococcus	0	3	13	1
Influenzal	0	3	8	0
Streptococcus	0	1	4	0
Staphylococcus	0	1	1	0

Tuberculous Meningitis	Under 45	45 to 100	100 to 500
	0	1	14

Poliomyelitis	45 or less	45 to 75	75 to 100	100 to 500
	55	48	12	7

of blood will cause an increase in the protein content. With an increase in the total protein there is an increase in the globulin fraction, which is the basis for the commonly used rough qualitative tests. The Pandy and Nonne tests are not to be depended upon between the levels of 50 and 100 mg. The quantitative protein determination is a more accurate and valuable clinical aid. A slight increase is common, but a total of over 500 mg. is rare and is seen only in meningitis, cord or brain tumor, bloody fluids and occasionally in polyneuritis. The presence of serum in the transudate, or extravasated blood, as well as a subarachnoid block, will cause an increase in the total protein. An increased protein associated with a pleocytosis is seen in meningitis, neurosyphilis and in the early stage of poliomyelitis. In cases of cord or brain tumor, polyneuritis and in the late stages of poliomyelitis, an increased protein without a pleocytosis is common.

In our series of seventy-two cases of acute purulent meningitis (Table III), 2.8 per cent had a total protein of under 45 mg., while 19.5 per cent ranged between 45 and 100, with 76.4 per cent between 100 and 500, and only one case showed a protein of over 500 mg. 100 c.c. A total of 97 per cent of our cases had an elevated total protein. In Merritt and Smith's series of 157 cases, the total protein was under 45 mg. in 2 per cent, while 12 per cent ranged between 45 and 100 mg. In 64 per cent of the cases it ranged between 100 and 500, with 14 per cent between 500 and 1,000, and between 1,000 to 2,000 mg. in 8 per cent. A total of 98 per cent of their cases had an elevated total protein.

In our series of fifteen cases of tuberculosis meningitis (Table III), the total protein ranged from 87 to 456 mg. per 100 c.c. with an average of 183.6. In the Boston series, the quantitative protein content in 253 fluids ranged from 25 to 1,142 mg., with an average of 200. In this same series, 99 per cent showed an increased protein.

The total protein in poliomyelitis may be normal in the early stages, but as the disease progresses, there is usually an increase for at least the first two or three weeks. In our series totaling 122 cases (Table II), the total protein ranged from 12 to 207 mg., with an average of 52.6. In 45 per cent the total protein was 45 mg. or less, with 39.4 per cent ranging from 45 to 75 mg. per 100 c.c. In comparison, the total protein in the series of Merritt and Smith, totaling 158 cases, ranged from 12 to 366 mg., with an average of 70. The total protein was 45 mg. or less in 46.7 per cent, between 45 and 75 in 27.8 per cent, between 75 and 100 in 10.1 per cent and between 100 to 500 in 15.4 per cent.

Chlorides

The concentration of chlorides in the cerebrospinal fluid is directly related to that of the serum, being usually decreased in the latter with fever or vomiting, and increased with renal impairment. The normal cerebrospinal fluid ranges from 695 to 762 mg. per 100 c.c., with an average of 726. An increase in the protein content of the cerebrospinal fluid is accompanied by a decrease in the difference between the serum and cerebrospinal fluid chloride. This is in accordance with Donnan's equilibrium theory. In addition, a decreased serum chloride as the result of fever and an increased acidity of the cerebrospinal fluid due to bacterial metabolism may also play a role in decreasing the spinal fluid chloride.

In our series of seventy-two cases (Table IV) of acute purulent meningitis, the chloride content varied from 344 to 843 mg., with an average of 668. In 15.3 per cent of cases it was over 700, in 15.2 per cent 600 or under, and 600 to 700 in 69.3 per cent. In the series of Merritt and Smith, totaling 139 cases, the chloride content ranged from 532 to 760 mg. per 100 c.c. with an average of 649. In 10 per cent of the cases it was over 700 mg., in 14 per cent 600 or under, and 600 to 700 in 76 per cent of cases.

The reduction of chlorides is greatest in tuberculous meningitis, and in our series of fifteen cases (Table IV) it varied from 492 to 698,

TABLE IV. CHLORIDE

Acute Purulent Meningitis	Mg. per 100 c.c. 344 to 550	550 to 600	600 to 650	650 to 700	700 to 843
Meningococcus	2	3	21	5	6
Pneumococcus	1	2	7	5	2
Influenzal	0	0	7	1	3
Streptococcus	0	2	3	0	0
Staphylococcus	0	1	1	0	0

	Below 500	500 to 600	550 to 600	600 to 650	Over 650
Tuberculous Meningtiis	1	1	9	1	3
Poliomyelitis	0	0	0	1	121

TABLE V. SUGAR

Acute Purulent Meningitis	Mg. per 100 c.c. Under 10	10 to 40	40 to 50	50 to 60	Over 60
Meningococcus	4	21	4	4	4
Pneumococcus	2	14	0	0	1
Influenzal	0	7	2	0	2
Streptococcus	0	4	0	0	1
Staphylococcus	0	1	0	0	1

	Below 10	10 to 40	40 to 50
Tuberculous Meningitis	3	11	1

	Below 50	50 to 80	80 to 100	Over 100
Poliomyelitis	7	94	20	1

with an average of 596, and was below 650 mg. in 80 per cent of the cases. In the Boston series of sixty cases it varied from 471 to 753, with an average of 608 mg., and was below 650 in 77 per cent of cases.

In our series of 122 cases of poliomyelitis, the chloride content ranged from 646 to 942 (Table IV), with an average of 723 mg. per 100 c.c., and in 104 fluids in the Boston series it varied from 650 to 772 mg., with an average of 720.

Sugar

The glucose concentration in the cerebrospinal fluid appears to depend on (1) the blood sugar, (2) the permeability of the choroid plexuses and (3) the rate of glycolysis within the fluid. The glycolytic action of the bacteria and pus cells are said to be the cause of the lowered sugar content in cases of meningitis. Viruses apparently do not utilize or otherwise alter glucose levels in the spinal fluid.

In fasting individuals with a normal serum glucose, the normal range is between 50 to 80 mg. per 100 c.c. and between 50 to 100 in non-fasting individuals.

In our series of seventy-two cases (Table V) of acute purulent meningitis, the sugar content was below 50 mg. in 81.8 per cent, below 40 mg. in 73.5 per cent, below 10 in 8.3 per cent, and over 50 and 60 mg. in 12.5 per cent, respectively. In the Boston series of 154 cases, it was below 50 mg. in 86 per cent, below 40 mg. in 80 per cent, below 10 mg. in 23 per cent, and over 50 and 60 mg. in only 7 per cent, respectively.

Early in the course of tuberculous meningitis the reduction of the sugar content is usually less than in the acute purulent meningitides, but as the disease progresses, there is usually a progressive decrease. In our series of fifteen cases (Table V), the sugar content varied from 7.5 to 46.6 mg., with an average of 21.4, and was below 10 mg. in 20 per cent, between 10 to 40 in 73.4 per cent and between 40 to 50 in 6.6 per cent of cases. The sugar content, in 264 fluids examined by the Boston group, varied from 5 or less to 59 mg. per 100 c.c., with an average of 28. It was found to be below 10 mg. in 4.9 per cent, between 10 and 40 in 74.6 per cent, between 40 and 50 in 14 per cent, and above 50 mg. in 6.5 per cent of cases.

In our series of 122 cases (Table V) of poliomyelitis, the sugar content varied between 23 and 113, with an average of 67 mg. per 100 c.c. It was below 50 mg. in 5.7 per cent, between 50 and 80 in 77 per cent, between 80 and 100 in 16.5 per cent, and over 100 mg. in only 0.8 per cent of cases. This compares rather closely with the results found in 123 fluids examined by the Boston group in which the sugar content varied from 41 to 119 mg., with an average of 65. In 4.9 per cent it was below 50 mg., between 50 and 80 in 85 per cent, between 80 and 100 in 8.1 per cent, and over 100 in only 1.6 per cent of fluids.

Summary and Conclusions

1. An attempt at evaluating certain common laboratory procedures has been made in connection with a selected series of meningeal inflammatory conditions, including seventy-two cases of acute purulent meningitis, fifteen of tuberculous meningitis and 122 of poliomyelitis.

2. The N. intracellularis was the most frequent causative organism in our series of acute purulent meningitis and accounted for 51.3 per cent of the cases. The pneumococcus was found in

23.6 per cent, H. influenza in 15.3 per cent, streptococcus in 6.9 per cent and Staphylococcus aureus in 2.8 per cent.

3. In the group of acute purulent meningitis, the total cell count was above 1,000 per cu. mm. in 90.3 per cent of cases, while in the tuberculous meningitis 86.8 per cent ranged from 50 to 500, and in 93.4 per cent of the cases of poliomyelitis the total cell count was below 200 per cu. mm. In no instance of tuberculous meningitis or poliomyelitis was the total cell count over 1,340, the perdominant range of the acute purulent meningitis. However, in 2 per cent of the latter cases the count was below 100.

In conclusion, a total count of over 2,000 per cu. mm. is almost certainly caused by one of the bacteria other than the tubercle bacillus. Rarely, these same bacteria may give rise to a meningitis in the early stages of which the total count is less than 100.

4. We found that only 8.3 per cent of the acute purulent meningitides had a lymphocyte count above 15 per cent of the total cell count. Of these, one case due to H. influenza had a total cell count of 306, while in the five cases due to N. intracellularis it ranged from 3,100 to 7,225. In only 3.3. per cent of cases of poliomyelitis was the lymphocyte count below 15 per cent of the total cell count. In these three cases the total cell count ranged from 152 to 333. This, we believe, reflects the predominance of the neutrophile in the very early stage of the disease. In the tuberculous meningitis series, the lymphocyte count ranged from 72 to 98 per cent.

In conclusion, a differential count with more than 15 per cent lymphocytes greatly favors inflammations due to the tubercle bacillus or the poliomyelitis virus. These two groups hardly ever have fewer lymphocytes, but the acute suppurative meningitides occasionally do have more than 15 per cent lymphocytes. In the latter, however, the total count would in the great majority of cases be over 2,000 per cu. mm.

5. In our series of acute purulent meningitides, the total protein was between 100 to 500 mg. per 100 c.c. in 76.4 per cent of cases. In 93.3 per cent of the tuberculous meningitis it ranged from 100 to 500, and in only 5.8 per cent of poliomyelitis did it range from 100 to 500. In the latter group, 45 per cent had a normal total protein.

In conclusion, quantitative protein determinations maybe of some value in differentiating poliomyelitis from the other two causes of meningitis, but must be interpreted with care in the early cases of meningitis.

6. The chloride content was below 700 mg. per 100 c.c. in 84.7 per cent of the acute purulent meningitides. In tuberculous meningitis it was below 650 in 80 per cent of the cases. None of the 122 cases of poliomyelitis had a spinal fluid below 646.

In conclusion, the low chloride content of spinal fluid is of distinct differential value in distinguishing tuberculous meningitis from poliomyelitis. A level below 600 is almost certainly the result of the former.

7. The sugar content was 40 mg. or below per 100 c.c. in 73.5 per cent of the acute purulent meningitides, and in 93.4 per cent of the tuberculous meningitis. Only 5.7 per cent of the cases of poliomyelitis had a sugar content below 50 mg. per 100 c.c.

In conclusion, tuberculous meningitis can be differentiated with fair certainty from poliomyelitis by the almost uniformly low spinal fluid sugars in the former, and a level above 50 mg. per cent in the latter.

8. The combination of a total cell count between 25 to 500 with a predominance of lymphocytes, an increased protein with a decreased sugar and chloride content, is rarely seen in any other inflammation of the brain and its meninges except in tuberculous meningitis.

SARCOMA OF THE UTERUS

F. H. MAGNEY, M.D., F.A.C.S.

Duluth, Minnesota

SARCOMA of the uterus is not new in medical literature, but due to the fact that it is comparatively rare as compared with cancer of the uterus, it has received very little attention. The first case on record was reported by C. Meyer at the Berlin Obstetrical Society in 1860, and it was described by Virchow in 1862. Very few large series of cases have been reported and these are incomplete, especially from the standpoint of end results or so-called five-year cures.

This presentation is based on the review of the records of St. Mary's Hospital covering the years of 1925 to 1947, inclusive, together with a report of a case by the author. Only seven cases occurred during these twenty-three years. For the purpose of statistics, this small group may not be of great value, but due to its rarity, even the large clinical centers do not have a large series to present. For instance, Kimbrough reports forty-three cases of sarcoma of the uterus from the department of gynecology of the hospital of the University of Pennsylvania, gathered over a period of thirty-three years. Novak found only forty-one cases over a period of twenty-five years at the Johns Hopkins Hospitals. Eighteen additional cases referred from the outside were added to this series, making a total of fifty-nine. Twenty-six thousand, nine hundred and seventy-three case specimens were studied in their laboratories during these twenty-five years. Dannreuter reported the occurance of four cases within a period of three months in the New York Post Graduate Hospital. Previous to this, only two cases had been encountered in this hospital over a period of ten years, although 1,854 operations for fibromyomata had been performed during this time. Randall reports thirty-nine cases from the Buffalo General Hospital and the University of Buffalo. Kardash reports ten cases from the University of Maryland School of Medicine. A study of the records of St. Mary's Hospital shows that it constitutes 0.54 per cent of uterine malignancies, or a relationship of one sarcoma to sixty-four carcinomas. Kardash reports 0.48 per cent. Kimbrough found the proportion to be one to thirty; Veit, one to thirty-seven; Evans, one to forty; and Frankl, one to twenty-seven.

TABLE I. INCIDENCE OF SARCOMATOUS DEGENERATION OF MYOMAS

Author	Incidence of Sarcoma	No. of Cases of Sarcomas	No. of Cases of Myomas
Kimbrough	3,388	26	0.76
Frankl	1,878	38	2.02
Masson	4,322	44	1.01
Randall	3,686	39	1.04
Kardash	1,446	10	0.48
Total	14,720	157	1.06
St. Mary's	1,309	7	0.54

Sarcoma is found both in the body and in the cervix of the uterus, although more commonly in the body, due, no doubt, to the fact that it is the more common site of myomas. It is most common in the fifth decade, but it is occasionally found in the very young. Novak reports its occurance in a child of seven months, and in one of two years. Diagnosis is rarely made before the time of operation, and usually not until the specimen is studied by the pathologist. The symptoms are varied and not specific. They more often suggest carcinoma than sarcoma. Excessive loss of blood at menses, intermenstrual bleeding, or both, may occur, especially in younger women, but absence of bleeding in the presence of the myoma does not rule it out. This is especially true when the endometrium is not involved. There may be a watery discharge which later becomes blood-tinged, and still later as a result of ulceration, foul discharge occurs, with shreds and necrosed tissue. Bleeding with the rapid increase in the size of the tumor points to sarcoma. Pain may be present in the later stages, as well as weakness, anemia, and cachexia.

Both Novak and Kimbrough report many deaths a few days after operation. In the latter's series, 47 per cent of those who died of sarcoma lived less than twelve months after operation. Many patients at St. Mary's died shortly after operation. However, Randall's follow-up shows that nine out of twenty-nine patients were found to be free of symptoms after five years.

Tumor cells may arise from any of the elements of the uterus, that is, muscle, connective tissue, epithelium, or blood vessels, as they are all of mesodermal origin. Sarcomas are classified as primary or secondary. They are classed as pri-

Presented before the Duluth Surgical Society and the Interurban Academy of Medicine.

mary in the absence of other myomas and in the absence of gross or histological evidence of preexisting myoma at the site of the sarcoma, and secondary when found in myomas as a result of degeneration.

common. The organs which are the most common site of the secondary tumor are the lungs and the liver. Gessner in thirty-three autopsies found metastasis in twenty-four, of which fifteen were in the lung, ten in the liver, eight in the intestines, five in the omentum, five in the kidney, and five in the pleura.

TABLE II. ANALYSIS OF CASES OF SARCOMA OF THE UTERUS
ST. MARY'S HOSPITAL, DULUTH, MINNESOTA

Number	Age	Status	Location	Primary or Secondary	Symptoms	Treatment	Results
98610	54	Married nullipara	Endometrium	Primary	Bleeding, pain, weakness	Pan-hysterectomy	Died
104905	55	Married	Myoma	Secondary	Pain, pressure in rectum	Subtotal hysterectomy	Died bowel obstruction
105393	46	Married	Myoma	Secondary	Backache, prolapse	Subtotal hysterectomy	living (12 years)
173761	50	Married multipara	Myoma	Secondary	No bleeding, weakness, anemia	Subtotal hysterectomy	Died 7 days postop.
133613	68	Married multipara	Myoma	Secondary	Bleeding, pain	Subtotal hysterectomy	Died
69089	64	Married multipara	Endometrium	Primary	Bleeding,	Total, pan-hysterectomy	living (2 years)
43955	45	Married multipara	Endometrium	Primary	Bleeding,	Total, pan-hysterectomy	living (4 years)

In advanced cases, this classification is impossible, due to the invasion of all tissues. The primary tumors are three times as malignant as the secondary. The number of mitotic figures determines the degree of malignancy of each specific tumor. Novak's description of the gross specimen is as follows: "Instead of the hard, rather glistening, cut surface of a typical myoma with its characteristic whorl-like appearance, the sarcoma areas present either the 'raw pork' appearance described by Cullen, or, when necrotic changes are more marked, they present as brain-like pultaceous, broken-down areas, with often a ragged cavity formation and perhaps hemorrhage." Dannreuther suspects malignancy in the presence of (1) unusual friability of the broad ligaments, (2) increased vascularity, (3) absence of a sharp line of demarcation between tumor and the myometrium, (4) difficulty in shelling out the tumor, (5) an opaque appearance on section, (6) an edematous appearance of the cut surface. An endometrial sarcoma may be polypoid in appearance, and may be mistaken for a benign polyp, although it is larger, denser, and more friable. In others there may be ulcerations simulating carcinoma. The grape-like sarcoma of the cervix is usually found in infants, although occasionally in adults. It is pinkish in color and edematous, and may fill the entire vagina and spread to the pelvis. It is always fatal.

Metastasis is by continuity, by the blood stream, or by the lymphatics, the blood stream being most

Treatment

Total hysterectomy is the treatment of sarcoma of the uterus. Due to the fact that the condition is seldom diagnosed preoperatively, and usually not until the pathologist makes his report, in most cases a subtotal hysterectomy has been performed. In Kimbrough's series, in twenty-one of the forty-three cases, a subtotal hysterectomy had been done, and a total in only 13. In Novak's series, 36.4 per cent received subtotal hysterectomy, and 22.7 per cent, total. Of the seven cases at St. Mary's Hospital, three had panhysterectomy and four subtotal. Two of those receiving a total hysterectomy were more recent cases, probably because of the fact that this type of operation is more common now since it is a safer procedure than formerly. In one of the subtotal cases the cervix was removed one year after the original operation due to prolapse. No malignancy was found in the stump. After subtotal hysterectomy has been done, and malignancy is reported before the operation is completed, the cervix should also be removed. If sarcoma is reported after the operation has been completed, radium in the cervix, rather than a secondary operation, is the best procedure in the majority of cases. All specimens of myomas should be examined by the pathologist as soon as the uterus has been removed, in order

that the patient may receive the best treatment immediately.

Case Report

Case 1.—Mrs. M. P., white, a widow, aged forty-eight, complained of profuse vaginal bleeding during menstrual periods, which were of eight days duration. No bleeding occurred between periods. The menorrhagia had existed for two years. She also complained of shortness of breath on exertion, lack of energy and drowsiness. Menstruation had begun at nineteen, was regular, and of a twenty-eight-day type. There was one living child, who was mentally subnormal. Two miscarriages had taken place. The family history was of no special interest; there had been no malignancy. The patient stated that she had always been well, and had had no operations.

Physically she was a large woman weighing 175 pounds, with a rather sluggish mentality. She had a scanning speech, a pasty, anemic appearance with puffiness of the lower lids; a dry and thickened skin, and thin and silky hair. Her eyes were normal, and the pupils reacted to light and accommodation. There was dental caries. The thyroid was not palpable. The heart and lungs were normal to percussion and auscultation. The blood pressure was 150/84. Bimanual pelvic examination disclosed the body of the uterus to be the size of the head of the newborn, and the surface was smooth. The uterus was freely movable, and the cervix was normal.

Laboratory studies revealed a hemoglobin of 38 per cent, erythrocyte count of 2,520,000, leukocytes 6,350, with a normal differential count, The urine was normal. The basal metabolism rate was minus 7. The Wassermann was 4 plus.

My clinical diagnosis was myoma of the uterus, with secondary anemia and tertiary syphilis. Due to the anemia and syphilis, it was thought best to improve her general condition before surgery. The bleeding was controlled by x-ray therapy over the pelvis. She was given antisyphilitic treatment, iron, and thyroid gland. Due to her financial status she was admitted to the county hospital and venereal clinic.

I did not see her again for a period of two years. In the meantime a diagnositic curettage had been done, and the pathologist reported normal endometrium. Her general condition was considerably improved. The hemoglobin had risen to 71 per cent, and erythrocytes totaled 3,500,000. She had had intensive antisyphilitic treatment. She was still taking thyroid and stated that she felt sluggish on discontinuing it. The size of the uterus had not increased. A subtotal hysterectomy was done. The tissues were very vascular and friable, and on dissecting the bladder from the uterus, where it was adherent to the fundus, a 2-inch long tear occured in the bladder wall.

The pathologist, Dr. George Berdez, reported a spherical uterus weighing 1,370 grams, and measuring 15 by 15 by 13.5 centimeters. Grossly, it consisted almost entirely of a large, rounded, solid gray fibrous tumor mass with a homogenous firm gray cut surface. The histologic diagnosis was leiomyosarcoma of a grade II malignancy.

Two months after the operation, her homoglobin was 80 per cent, and the her cell count was 4,090,000. Seven months later there were symptoms of metastasis, the most significant of which were a cough and pain in the chest. X-ray films demonstrated a consolidation of the upper three-fourths of the upper left lung, and aspirated fluid was thin and sanguinous. The patient died eleven months postoperatively from generalized metastasis. The autopsy revealed the left lung to be the region of the greatest involvement.

Summary

A brief summary of seven cases of sarcoma of the uterus from the files of St. Mary's Hospital, a review of the literature, and a case report by the author form a basis for this presentation. This series of seven cases, accumulated over a twenty-three-year period, may seem small, but due to the infrequency of the disease, only relatively small numbers of cases are encountered. Our experience as to frequency, diagnosis, and treatment corresponds to those of larger medical centers. One of our patients survived over twelve years, another over four years, and a third over two years. The other four patients were in an advanced stage and died within one year. An immediate gross study and frozen sections, when indicated, should be made at the time of operation by the pathologist in all cases of myoma of the uterus, and if malignancy is found and a subtotal hysterectomy has been done, the cervix should also be removed. Radium may be used in the cervix if malignancy is diagnosed some time after completion of the operation.

THE CHILD, THE SURGEON, THE OPERATION

REYNOLD A. JENSEN, M.D.
Minneapolis, Minnesota

SURGERY and psychiatry, at first glance, may seem to be strange bedfellows. The relationship is, however, not so strange in view of the growing realization of the interrelation of all the specialties in medicine. It is particularly important for surgeons and psychiatrists to co-operate. Surgeons are exacting in their requirements for their field. They can teach the psychiatrists a good deal in terms of methods in the scientific approach to problems. On the other hand, psychiatrists, out of their clinical studies and their more intimate relationships with their patients, may contribute something to the better understanding and management of surgical patients.

If there is any one outstanding difference between psychiatry and other fields of medicine, it is that the psychiatrist tries to get as complete an understanding as possible of the patients' problems in making an adequate adjustment to everyday living. If we, as physicians, regardless of our specialties, regard our function as that of helping the total person to get well, it is imperative that we learn to share our points of view.

In this paper I would like to present some of the clinical observations made over the past ten years at the University Hospitals with respect to children's reactions to operations. These children were having marked difficulty in making a satisfactory adjustment to everyday living—difficulty either precipitated by or originating from some operative procedure.

Surgical procedures are necessary. There is no question that operations on children, as well as adults, are upsetting and disturbing, traumatic not only to tissues but to the individual's psyche. As a general rule, adults are better able to tolerate surgical procedures than a good many children. I say a good many because not all children react adversely to operative procedures. In the main, children seldom share in the decision as to whether or not an operation is to be performed. That decision is usually made for them. Because children lack experience, they are considerably more dependent on others than are adults. This dependency forces them to submit to the decisions of others. Likewise, because children lack experience, they are unable, on their own, to "test reality." They can do this only by sharing with others their reactions and fears, and often they are not encouraged to do so. Often they are not given an opportunity to express their own real feelings about the operation, and they repress them. We know these repressions result in a great amount of fantasy. Children have peculiar notions about the anatomy of the body as well as some rather strange and peculiar misconceptions of the functions of the body. Sometimes their ideas are so strange as to seem almost fantastic. All these things tend to stimulate children's fantasies, with the result their imaginations run riot. This leads to increased inner turmoil or tension, commonly called anxiety, which spells trouble.

To illustrate, I would like to describe some of the rather dramatic experiences we have had with children referred because of difficulties that stemmed from some operative procedure. I do not mean to imply that the operative procedure *per se* caused the difficulty, but in retrospect it seemed to play a significant role in the particular problem presented to us.

Case Reports

Case 1.—Ann, an attractive, bright, preadolescent girl, mature for her age, was referred to the hospital because of anxiety attacks. During these attacks she would suddenly become agitated, to the point of being irrational. She would clutch her chest in the cardiac area, screaming, "I'm going to die, I'm going to die." These attacks occurred in school, on the playground, in the home, and on occasions during the night. They were becoming increasingly frequent.

The family was in modest circumstances. The father, a pleasant but dynamic, energetic individual, always seemed sure of himself. The mother was also a strong person, but since her marriage she had been compelled to assume a dependent role in the family circle. Having suffered deprivations in her early childhood, she had tried desperately to spare her children. She was anxious that they know the "facts of life." Consequently, at an early age our patient was well informed, biologically speaking. She and the mother were "very close to each other." The father, busy with his work and not at home as much as could have been desired, was not on intimate terms with his daughter.

Because of repeated upper respiratory difficulties, the

Dr. Jensen is Associate Professor of Pediatrics and Psychiatry, University of Minnesota Medical School, Minneapolis, Minnesota.

Presented before the Minneapolis Surgical Society, Minneapolis, Minnesota, January 9, 1949.

parents had wanted the child to have a tonsillectomy. This the patient had persistently refused.

During a difficult time which the mother was having with a pregnancy, the father decided the child should have the tonsillectomy. Under protest the child visited the physician for examination. During the examination it was noted the child had a slight mole on one of her external labia.

It was decided to operate on the mole following the removal of the tonsils. Arrangements were made to admit the child to the hospital, the same one where her own mother was convalescing.

The morning for hospital admission, the child was brought by the father, who soon left. She was taken to the operating room and to all appearances was operated on successfully. However, later in the day she experienced her first spell of restlessness. Her convalescence was interrupted by the occurrence of a hemorrhage which necessitated readmission to the hospital for purposes of treatment. She was so reluctant to leave the hospital the second time that it was necessary for the father to offer her an attractive bribe.

It was shortly after return home her "spells" began.

Study of this situation revealed the presence of considerable tension between the parents, particularly regarding the management of the children. Though the parents were devoted to each other, this tension had served to disrupt the smooth workings of the household.

Work with the child finally revealed the source of her own difficulty. She had for a long time resented the mother's and father's disagreements, and in a sense felt personally responsible for a greater part of them. She was particularly resentful at having been compelled to submit to her operations. It was during her anesthesia she first felt she was going to die. "I was scared and I could hear my heart pounding so hard. I thought I was going to die."

As she began to talk these things out, she got a new perspective. Her attacks began to lessen and eventually ceased. She has been leading a successful life free of the "anxiety attacks" now for several years.

Case 2.—Ben, aged twelve, was admitted to the hospital with a broken leg. His father, who accompanied him to the hospital, was intoxicated. During admission proceedings the father disappeared.

Despite proper surgical management, the boy's progress was very unfavorable. In addition, he was belligerent and uncooperative. He appeared morose and unhappy.

After several interviews with this lad, it was learned he had been hit by a car while in the city with his father, who had been drunk. The lad further told about the hectic conditions which prevailed in his home because of his father's alcholism. He worried for the safety of his mother.

The mother was interviewed during one of her frequent visits to the hospital, and the boy's story was substantiated. She further informed us that for some time she had contemplated separation proceedings but had delayed. With the realization of how much the home situation was disturbing the lad and no doubt his siblings, she decided to proceed with separation plans.

She discussed her decision fully with the lad, which resulted in a good understanding between them. From this point on, the lad made very satisfactory progress and was soon able to leave the hospital.

Case 3.—Cathy, aged seven, was referred to our clinic with the following complaints: unwillingness to leave her home, to attend school and to sleep alone at night. She was becoming increasingly irritable and fearful, and with increasing frequency would demand to have someone close to her, preferably her father or mother. The fact that the father lost approximately 20 pounds of weight in the month preceding referral to the hospital suggests the tremendous turmoil he personally was under due to his daughter's disturbance.

What were the circumstances which seemed important in this case? In our interviews the following story unfolded.

Our patient had been the youngest of a family of five children. She had seemed quite happy about the pending arrival of a new baby in the home. However, as the period of gestation neared its completion, the youngster witnessed the death of a favorite friend, which severely upset her. Shortly thereafter she had a severe choking spell, precipitated by a piece of candy which had accidentally lodged in her throat. This further aggravated her restlessness, but no one paid much attention to it.

While her mother was in the hospital for delivery, our patient had the misfortune of injuring her arm. She was taken to the hospital where her mother was confined, for x-ray diagnosis and the application of a plaster cast under anesthesia. No one at this time thought to suggest that the patient might wish to talk to her mother or would like a message carried to her.

Shortly after the mother returned from the hospital with a new sibling, school began. Gradually our patient became more reluctant to leave home, finally refusing to attend altogether. Coincident with this she became more nervous, slept poorly, ate poorly, and was generally unhappy.

When all corrective procedures known to the family had failed, she was brought to a physician for examination, but nothing was noted physically. A mild sedative was prescribed, to no avail. A few intramuscular injections followed. Then spanking was advised. Finally deep surgical anesthesia was induced. None of these produced any change except to increase the presenting complaints.

Repeated interviews over a period of several weeks with both parents and child resulted in considerable improvement. During our work with the patient, she repeatedly discussed her feelings about the death of her best friend, her worry about her broken arm and how fearful she felt about going to sleep. Her chief difficulty seemed to center in her erroneous belief that because so much had happened to her, she must have been a particularly bad child. Again, as in other cases, these thoughts occurred to her during her first anesthesia.

Case 4.—Dan, aged fourteen, was admitted to the psychiatric ward of the hospital because of excessive crying spells, during which he became very agitated. He

was the youngest child and the only boy. He and his mother had always been very close.

The onset of the spells dated from a tonsillectomy he had had at the age of seven. At that particular time the household had been considerably disturbed by financial difficulties, aggravated by considerable parental tension. The lad was fearful of his father, a feeling he still had at the time of hospitalization. His basic difficulty was so deep seated he was finally committed to a mental hospital for long-time care. As the story was finally pieced together, it was the consensus of everyone that the operative procedure was a precipitating factor in the patient's neurosis.

Case 5.—Ed, aged seven, was admitted to the University Hospitals after a short period in the local hospital for treatment of extensive burns. Approximately 30 per cent of the body surface was involved. Soon after admission to our hospital he became a "behavior problem." He was rebellious, irritable, negativistic and decidedly uncooperative. Skin grafting was practically impossible. No one could do anything with him or for him. Finally, however, he did find one of our resident physicians acceptable, and management moved along quite smoothly for a time. However, rotations of the staff physicians soon brought a recurrence of the difficulties.

The staff was at a loss to explain his behavior until the boy gave us a clue one day. A friend who had promised to visit the boy did not arrive. In the course of a short interview with the patient, for he was very unhappy, he blurted out, "He's just like my mother. She never keeps her promises." The lad's complaint was investigated and found to be true. The mother, a very over-solicitous person, was particularly attached to this boy. Since his accident she had been much concerned about him and had not only increased her attentions to him but also had made promises which often were not kept. Among these was the repeated assurance that she would visit him daily whenever she was in the city. A friendly but firm consultation with the mother helped her to see what she had been doing in not being honest with her boy. This she corrected, with a surprising change in the lad's behavior and convalescence from that point on.

Comment

Further case histories could be cited. Enough have been presented to illustrate the kind of personality difficulties which may stem from operative procedures.

In our experience, it can be said with reasonable confidence that a child who later presents problems of adjustment was neurotic to some degree previously. In the cases presented there is enough evidence to justify that supposition. A potentially neurotic child is prone to be more dependent than the average, and hence, less able to handle a threatening situation.

Predisposition to become neurotically disturbed stems largely from difficulties in the home. Among the more prominent are parental discord. Nothing is more threatening to the stability and security of the child than parental tension, whatever its classification or degree.

Difficulties arise when the child is not certain of what his parents expect of him, or when parental disagreement occurs as to what the child can or cannot do.

In some instances, as in the case of Cathy (Case 3), too much happened to the child in a short time interval. Spacing of the events might have spared the child trouble. When too many things happen to a child in too rapid succession, he is unable to cope adequately with them, and anxiety becomes overwhelming.

In no instance was the child encouraged to help make the decision about the operative procedure, nor was an effort known to be made to help the child express his own feelings about what was to happen to him either before or after the operation.

Discussion

It may be asked how often neurotic behavior is encountered in children. No definite figures are available to indicate what the actual percentage of neurotic children is. However, it is possible to say that, in general, a larger number of children manifest signs and symptoms which foreshadow increasing difficulties later in life than is ordinarily appreciated. Between October 1, 1948, and January 1, 1949, 178 youngsters who had some kind of adjustment difficulty were seen at University hospitals.

Some years ago it was estimated that if 100 average grade-school children were selected at random, irrespective of sex, age, or grade placement, between twelve and sixteen would encounter serious adjustment problems later, either because of severe mental illness, delinquency or inadequate educational preparation.

This is a rather significant percentage. A further tragedy is the estimate that between thirty and thirty-five of the remainder are destined to lead unhappy lives because of unwholesome personality traits. Emotional disturbances in children are so much more common than previously appreciated that the fact no longer can be ignored by any of us.

Little is found in medical literature on the subject of the reactions of children to operations. I found but two references. In 1941, Pearson[2] reported a series of eleven cases in which adjust-

ment problems seemed to be precipitated by operative procedures. Several adults were included in his series. In 1945, Levy[1] reported his findings on a series of 124 cases. Of interest is his finding of a higher incidence of difficulties in children who were operated on when three years of age or under. Of further interest is the large number of tonsillectomies in this age group.

In explanation of the higher incidence of difficulties encountered later in children operated on early in life, Levy[1] mentions the forcible separation of the child from the mother at an age when he is more dependent upon her than at any other stage of his development. Mention is also made that the child reacts more definitely to physical pain than later in life. In addition, children in this age-range live in a more circumscribed world and hence lack social experience, which increases their dependency. The child of this age is also less able to express himself verbally and hence is less able to understand explanations offered him. This combination of circumstances leaves him poorly equipped to handle postoperative anxiety feelings, which may pave the way for later difficulties.

Levy[1] found that the difficulties encountered subsequent to operations could be classified in one of several groups: those children who (1) develop fear reactions such as night terrors, or fear of strange persons, places or the dark; (2) become negativistic or uncooperative; (3) become markedly dependent upon one or both parents, or (4) develop regressive phenomena such as temper tantrums or bed wetting.

These findings reinforce the well-known observations that many behavior problems are precipitated by operations performed under anesthesia. The question arises, "What can be done to prevent or minimize the occurrence of subsequent adjustment difficulties?"

Prophylactically, all unnecessary operation should be avoided in every age group, but more particularly in the younger age range.

There are times, however, when an operation is essential and must be performed.

Should an operation be necessary, several important but simple procedures can be done to minimize possible later difficulties.

Pearson[2] calls our attention to the surgeon's concern in evaluating the patient's ability to withstand surgical shock, a factor of primary importance in some instances. He suggests further that the surgeon evaluate the child's ability to withstand the psychic shock of an operation. This may seem a formidable task, but a few observations may make it less so. A few very simple things might be kept in mind. First, an attempt to evaluate the general atmosphere or tone of the home from which the child comes is important. Is there any evidence of marital tension? Has too much been expected of the patient? Does he manifest any evidence of the tension because of the demands imposed on him? Is school performance adequate? What has been his reaction to the present illness? Have there been any unusual experiences immediately prior to the present illness? In other words, have many things happened in a short period of time? And last but not least, what feelings do the parents manifest about the patient, his illness and the proposed operation?

If the parents are calm and confident, the child will have a better chance of taking an operation in his stride than if his parents are indecisive or nervous. The direct relationship which exists between the feelings of a child and an adult associated with him in a threatening situation was one of the best lessons learned during the last war, when children were being evacuated from London during the blitz. It was found that even though they were separated from their families, they could manage the threat of an air raid successfully if they were in the presence of a calm and stable individual. But if they were in the presence of an adult who was nervous, fearful or tense, they were not able to manage so successfully.

It is important to determine the preparation of the child for surgery, both remote and immediate. What has been the general attitude toward operative procedures, not only of the immediate family but of aunts, uncles or cousins with whom the child might have been associated? Few of us have any idea what a tremendous influence discussions of this kind have on children. Some effort should be made to evaluate the remote preparation of the child. Of course, the immediate preparation will be our responsibility. If something is to be done, it is our obligation to inform him. The capacity of the child to "take it," when he knows what is to be done, is amazing. Sometimes the child is rebellious and fearful for a while, but if informed, he at least learns he can depend on us.

The child should be encouraged to share his own true feelings with us. His questions should

be answered honestly and simply. Elaborate discussion is not often indicated. It may be necessary to answer questions over and over. And above all, discussions of the child's problems with our confreres in the presence of the child should be conducted with care and discrimination. Each of us, at some time, has been careless in this respect. Let us remember that the child in pain reacts adversely to being "poked" as though he were just a piece of machinery. As fear and anxiety caused by our thoughtlessness may have devastating results, adequate preparation of the child is of prime importance.

Attention to hospital procedures is likewise essential. The child's admission to the hospital should be with someone he knows and in whom he has confidence. If the child is particularly apprehensive, the adult closest to the child might even be encouraged to accompany him to the operating room.

Preoperative medication should be administered in sufficient dosage and at a time to be maximally effective. Ideally, anesthesia should be induced in a room with no unnecessary equipment or operative tools around. If this is impossible, attention to this detail in the operating room may be kept in mind.

Having someone familiar with the child when he awakens will provide the reassurance and comfort needed. Likewise the possibility of developing adverse feelings or unusual fantasies will be minimized.

The performance of more than one operation at a time, such as a tonsillectomy and circumcision should be avoided. If essential, full preparation of the child is required.

Should a child react adversely to an operation, his emotional disturbance should not be treated lightly. To do so may portend trouble later on. It is a complication and should be handled as such. To treat it lightly, to try to talk the patient out of it, or to ignore it, does the patient and his family an injustice.

In summary, physicians' awareness that personality problems do occur in children is increasing and is gradually becoming a subject of importance in medicine. There are a greater number of children who may be said to be either preneurotic or neurotic than has been generally appreciated. Because operations performed on these children may be important in later adjustment problems, surgeons could well include an evaluation of the child's capacity to withstand the emotional trauma of the operation, along with other preoperative studies. In so doing the possibility of later adjustment difficulties developing may be lessened.

Discussion

Dr. Tague Chisholm: I only have some very brief comment. I enjoyed Dr. Jensen's discussion very much, indeed. I would merely like to amplify one or two details from my own office. I think that if children can see what is being done, they are less apprehensive than if they can't. For example, take a laceration of the hand or lower extremity when suturing should be done. The child can watch and be told what to do. He actually participates in this experience, whereas if the laceration is in the face or close to the eyes or back of the scalp, the child can't see and cannot, therefore, share in the management. I feel, therefore, that the patient should be informed that he is going to have a little anesthetic and that he will be asleep, and that when he wakes up the lacerations will be all fixed up. Then there is no unhappy experience, since the child can share in the task and knows what is going on.

In my period of work in pediatric surgery with Dr. Gross, Dr. Ladd and Dr. Wyatt, I have always been impressed by the way they examine children. They don't go into the examining room and start poking the side of a tender abdomen. They go in and ask first what the child's name is. If a favorite toy has been brought along, they play with it and try to demonstrate to the child they are friends and also friends of his toy.

The most difficult part of the examination is looking at the throat and ears. This should not be done first but last. The most important part is feeling the right lower abdomen first and then continuing the examination in proper order. When these examinations have been completed, the discussion, which frequently ensues between the family physician and parents, relates to whether an operation should be done, what the x-rays show, what the white cell count is. This should not be done in front of the child but outside the room. If an operation is going to be done, then don't bluff the child but tell him it is going to be done. Do not deceive him. I have been constantly amazed that children who come for examination are often under tension, but when a decision has been made and an operation is to be performed, the child feels a lot better if he is informed of the operation. He will be a lot sicker if he does not know about it. Many children who are to have an appendectomy or herniotomy will feel much better the day after the operation if they known they are going to have it. I have felt that these men, Drs. Gross, Ladd and Wyatt, should be a pattern for us to follow when we deal with children who are candidates for operation.

THE VALUE OF THE RORSCHACH TEST

GORDON R. KAMMAN, M.D.

Saint Paul, Minnesota

THE Rorschach test is a projective technique based upon the recording, formulation, and scoring of the patient's responses to ten standard ink blots. These ink blots are on individual cards, and the patient is given each card separately and asked to tell what he sees in the blot. Inasmuch as each blot is an amorphous stimulus and has no meaning in itself, what the patient tells the examiner is a reflection of the patient's own personality. Through a rather complicated system of scoring and formulation, it is possible to obtain by means of a Rorschach test a three-dimensional view of the personality. In other words, the virtue of this type of "projective" technique is that we can learn about various aspects of personality function, factors which would remain hidden to an examiner relying exclusively upon an across the desk interview and upon some of the self-administering tests.

The chief objection to the Rorschach test is the complicated system of recording and scoring. There are several schools of thought about the methods of scoring of a Rorschach test, and there have been several modifications of the technique. However, it is my feeling that when one modifies a technique such as the Rorschach technique, the result is not a true Rorschach record but is somebody's modification of the Rorschach record. Therefore, I believe that in the interests of scientific accuracy, it would be well if we adhered to a standard technique. As in many other fields of scientific work, the establishment of norms is of extreme importance. Therefore, if subjects are exposed to a variety of Rorschach techniques, it is difficult to see how valid norms ever can be established.

The record which is obtained by a Rorschach test is known as a "psychogram." A psychogram is to the psychic structure of a patient what the roentgenogram is to the physical structure of an individual. The psychogram gives a three-dimensional view of the personality; not only do we learn what is going on on the surface of the personality, but we also obtain valuable informamation as to what is occurring in the deeper layers of the personality structure.

To the practicing clinical psychiatrist the Rorschach test furnishes considerable valuable assistance. My first acquaintance with the Rorschach test was formed in 1940 when I attended Dr. Beck's course at the Michael Reese Hospital in Chicago. Since that time I have used the test increasingly and have spent many hours discussing it with Dr. Beck. Moreover, I administer, score, and interpret all of the Rorschach tests taken on patients referred to me for psychiatric treatment. Through these experiences I have been able to form some opinions and draw some conclusions about the value of the test.

From the purely clinical standpoint the value of the Rorschach test can be regarded under three categories: diagnostic, therapeutic, and experimental. Much can be said about the diagnostic value of the test, especially when it is administered by the therapist himself and integrated with his other observations. One feels that if the Rorschach test is to be taken by the therapist, it should be done before the psychotherapeutic interviews are started. As I have pointed out previously, it is better to take the test early than to wait two or three weeks after the patient is first seen. For the sake of scientific accuracy the test should be taken before transference to the therapist has occurred. Otherwise the record may be distorted. (From the diagnostic standpoint I consider the behavioral aspects of the Rorschach test very important, and these may be altered if the test is made after transference.) Unconscious hostilities may lead the patient to prolong his reaction time in an effort to punish the examiner, or the fear that what he is doing may not be pleasing to the examiner may color the record with anxiety. Therefore, I take a Rorschach test during the second or third interview. Moreover, if the therapist waits until after he knows the patient before taking the test, it is difficult when formulating and interpreting to be objective and to distinguish between what one learns from the test and what one has learned about the patient from other sources. Therefore, for the sake of keeping the Rorschach test on as strictly an objective basis as possible, this distinction should be maintained.

I will mention just a few of the areas in psychiatric diagnosis in which the Rorschach test has been especially valuable to me. One is in homosexuality. Most of my clinical experience has been with *male* homosexual patients, and I have secured Rorschach records on a considerable number of them. It is becoming increasingly clear that homosexuality is merely a symptom of some underlying personality disorder. Some homosexual persons are hysterics, some are compulsive neurotics, some are psychopathic personalities, some are schizophrenics, some are feeble-minded, some are suffering from organic brain disease, some suffer from anxiety neuroses, and some are constitutional inverts. Not only does the Rorschach test help greatly in determining the treatability of many homosexuals, but it also has provided important therapeutic leads in the psychotherapy of patients accepted for treatment. I am sure that without the Rorschach test several of the patients successfully treated could not have been helped except possibly through *deep* psychoanalysis.

Another group of patients in whom the Rorschach test has been of value is that of the chronic alcoholic or the problem drinker. In recent years many changes have taken place in our basic concepts regarding these patients. We now know that problem drinking is symptomatic of an underlying neurosis or psychosis. Aside from those who are constitutionally psychopathic, problem drinkers usually are superior adults who are conflicted, display much emotional immaturity, are sometimes fixated at an infantile level, and are strongly introverted. They are sensitive, shy, and frequently suffer from marked feelings of inadequacy. The Rorschach test is helpful not only in identifying the source of conflict in these patients but also in helping to bring conflict material to the surface where it can be dealth with. Furthermore, the content of the patient's responses often furnishes important psychotherapeutic leads which, when followed, bring us to aspects of the problem which, unless the patient underwent a deep analysis, would not be recognized.

Another field in which the Rorschach test is of great value is that of forensic psychiatry. Any psychiatrist who is called upon to give medical-legal opinions, either in court or elsewhere, realizes the importance of "objective signs." During the cross-examination of an expert, attorneys pursue the question of what part of the expert's opinion is based upon "subjective symptoms" and how much is based upon "objective findings." To bring a psychogram into court is to furnish the judge and jury with something that is almost as "objective" as a roentgenogram. As I said before, the psychogram can be regarded as an x-ray of the personality structure just as a roentgenogram is an x-ray of the physical structure of an individual. In a recent case, a man who had been committed under the Minnesota Psychopathic Personality law as a sexual psychopath petitioned for restoration of capacity. He had obtained statements from two competent psychiatrists to the effect that, in their opinion, he had made an adequate adjustment. For various reasons the State had reason to believe that this man had fooled the two psychiatrists, and he was referred to me for examination. As part of the psychiatric survey I made a Rorschach analysis. This analysis showed unmistakable signs of a persisting psychopathic state and led to further investigation of the patient's total life situation. The petition for restoration to capacity was denied, and, to the court, the "objective" nature of the psychogram was a most significant piece of evidence.

Closely linked with diagnosis is prognosis. In all fields of medicine prognosis is of great importance. The patients, their family, their friends, their employers, their clergymen, their insurance companies are much more interested in prognosis than they are in the morbid anatomy, psychopathology, bacteriology, and chemistry of the victim's ailment. Frequently a physician's standing in his community can be seriously affected by the correctness or the incorrectness of his prognosis. Nothing could be more embarrassing to a physician than to make a diagnosis of psychoneurosis on a young woman and then have her come in a few weeks later with the nystagmus, diplopia, spastic gait, and the urinary incontinence of multiple sclerosis. It is very disconcerting for the psychiatrist to make a diagnosis of an organ neurosis on a young man and a few weeks later see him in a full-blown paranoid schizophrenia. The ability to make a prognosis in medicine is not something that can be learned from books. It can be acquired only through long years of experience. Therefore, any instrument that will

aid in making an accurate prognosis surely is a valuable agent. If a young man at the time he is suffering from organ neurosis gives a Rorschach test that denotes a preschizophrenic state, the prognosis and the therapeutic approach are changed in all of their fundamentals. If the young woman who has multiple sclerosis, but also not yet reached the point where the disease has caused reflex changes along with other objective findings, is submitted to a Rorschach test and does not show psychoneurosis or hysteria, one will be much more reserved in making his diagnosis of a functional nervous disorder, and there will be frequent neurological examinations.

This brings us to the ubiquitous question of psychosomatic disorders. I have stated elsewhere that psychosomatic medicine is at present in the limelight. In fact, it seems that there is danger of overemphasizing the importance of psychic factors in disease and ascribing too great a portion of the clinical picture to the "functional overlay." Admittedly, every disease has both psychic and physical components. However, the word "psychosomatic" is already in danger of becoming an all too convenient label for *any* illness in which there is a psychic factor and in which the dynamisms are not immediately clear. There is danger that in lieu of a careful and painstaking examination to discover primary organic etiologic factors in a given case, physicians will, after a cursory glance at the problem, label it "psychosomatic" and neglect definitive treatment directed at the organic substratum. This state of affairs has not yet come to pass but in view of the accolade given the psychosomatic concept, one feels that a note of warning should be sounded. Our thinking about psychosomatic disease must be accurate and careful. The term should not be applied indiscriminately to every condition in which a psychic factor is operating, for if that were the case, every illness would belong in the field of psychosomatic medicine. By restricting the use of the term "psychosomatic" to conditions in which demonstrable physiologic alterations or structural changes result, fully or in part, from psychogenic processes, we exclude the "somatopsychic" entities, the disturbances in the mental life of a person which result from somatic disease, e.g., cerebral arteriosclerosis, brain tumor, syphilis, alcoholic intoxication, vitamin deficiency, the deliria, and the like. Some times it is extremely difficult for the physician to distinguish psychosomatic from somatopsychic disorders, and in many cases the Rorschach test is extremely helpful. Flanders Dunbar[1] says:

"The Rorschach test probes beneath the observable behavior, conversation and mannerisms to deep-lying, often unconscious feelings and motives. The psychosomatic examinations usually give more clearly the specific people and situations in a person's life which occupy his attention, arouse interest, love, anxiety, fear, and the like. The Rorschach test shows the extent to which his interpretations of the external reality are rational and objective, or distorted and erroneous because of past conditioning. The test distinguishes between superficial shock reactions and the more deep-seated characteristic reaction patterns. It gives some indication of whether a symptom or illness represents a wholesale solution of most of life's problems or just a temporary expedient in dealing with a specific problem."

I wish to report briefly two cases in which the Rorschach test was extremely helpful and furnished important diagnostic and therapeutic leads which led to successful treatment in each case. These cases have been reported elsewhere,[2] but I am including them here for purposes of illustration.

Case 1.—F. J. was a boy, fifteen years old, who was suffering from severe bronchial asthma. There was no family history of allergy. Both parents and two siblings, of which F. was the second, were living and well, and there were no dead siblings. The father was a successful businessman, never paid much attention to family problems, and had an unsympathetic attitude toward the patient's illness. The mother was an attractive, dynamic but somewhat vain woman who assumed a strongly protective attitude toward F. Many thought that she "babied" him. Because of his asthma it was necessary for F. to be on a very strict diet, and he also lived in a specially constructed air-conditioned room which had been built for him in the family home. The only relief that F. ever obtained during an asthmatic attack was from adrenalin which was given hypodermically always by the mother. It seemed that the mother was a very important personality in the dynamics of F.'s illness.

During the past few years the patient had been sent to a school in a warm dry climate, and at the school he had many adjustment difficulties and much asthma. His mother made numerous trips to the school (1500 miles from home) in order both to "get things straightened out" and also seemingly to satisfy her own emotional need to maintain a supervisory and protective attitude toward F. The father frequently expressed the opinion that the mother was too "soft" with the patient and felt that the boy should be handled along lines that were more hardboiled. The parents often quarreled over the management of F.'s asthma, the mother taking the boy's part.

F. himself was a pleasant, intelligent, nice-appearing lad who made a good impression. He was slightly effeminate, and his chief interests were art and music. He had some talent as a painter but never showed any interest in the more virile pastimes such as hunting, fishing, or athletics. He did not seem to exhibit any undue fear or concern about his affliction except that it restricted his activities. He took his asthma more or less for granted but was anxious to have something done to relieve it. The question in our minds was how much was the asthma an expression of F.'s need to be dominated and cared for by his mother? Were the attacks a weapon which he was unconsciously using against his father, or a device to get attention from his mother, or the expression of some psychosexual conflict? The psychosomatic history was suggestive but not conclusive.

The Rorschach test showed a sound ego structure but signs that F. was not functioning at the level of his personality. He showed the emotional irritability and instability usually seen in the adolescent and also evidences of mild neurosis. However, there was no deep anxiety, the phantasy life was robust and healthy, and there was no evidences of excessive introversion or extraversion. Associations were broad and free, and the personality was well integrated and liberated. Our conclusion was that the Rorschach test did not follow the psychosomatic formula, and the boy's physician was advised to direct his efforts toward the offending allergens and other medical considerations inherent in the problem. Latest reports indicate that F. is responding very satisfactorily to medical treatment. On the basis of our Rorschach findings and on the basis of F.'s response to medical treatment, psychotherapy in this case would have been a waste of time.

Case 2.—Mrs. A. O. was an attractive white woman, thirty-one years of age. She was referred for a psychiatric survey because she was nervous and still complaining of abdominal pain in spite of several major operations performed in an effort to relieve it. All of the physical examinations and laboratory tests carried out by her physician had given normal findings. Without going into the details of Mrs. O's history, but in order to give an idea of the surgical traumata that she had endured, the following points will be noted. Mrs. O. had a tonsillectomy in 1930, and this was uneventful. She married in 1933. In 1934 she became pregnant, and she stated that this pregnancy "was a burden." She vomited throughout the entire pregnancy, delivery was accomplished only with the aid of high forceps and Mrs. O. had extensive perineal lacerations. She again became pregnant early in 1936, and all through this pregnancy Mrs. O. had excessive nausea and vomiting, backache, and urinary tract infection. She was anxious and tense and at the seventh month was threatened with a miscarriage. However, the pregnancy went to term and delivery was uneventful. Following the puerperium Mrs. O. developed severe abdominal pain which she was told was "due to her tubes." However, she could not stand an operation, so she went to stay with her parents in Florida. Finally in the fall of 1939 a pelvic laparotomy was performed, and all of her organs were found to be in good condition with the exception of the appendix which appeared to be chronically inflamed. The appendix was removed without any relief of the patient's abdominal pain. Following the operation, Mrs. O. never felt well. Her husband became disgusted with her, and for the following five years Mrs. O. was a very unhappy woman. She was depressed, nervous, and jumpy. She again became pregnant in February, 1944, and soon she began to have severe abdominal and right flank pain, chills, and fever up to 103° F. In May, 1944, a nephropexy was performed, and following this the patient was in bed for several weeks because of burning urination, alternating constipation and diarrhea, vomiting and severe abdominal pain. Another physician then made a diagnosis of gastric ulcer and kept Mrs. O. under hospital management for several weeks, during which time she got worse. It was subsequently found that there was no free hydrochloric acid in her stomach. In July, 1944, she was operated upon for a ruptured ectopic pregnancy, and following this the abdominal pain became worse and persistent. She then became depressed, had daily crying spells, was worse in the morning, lost interest in everything and bought a piece of rope with which she planned to hang herself. She consulted her physician, who, after ruling out serious organic disease, referred her to me for a psychiatric survey. Our question was: is this condition somatopsychic or is it psychosomatic?

It was decided to make a Rorachach analysis. In this case, the psychosomatic formula was much in evidence. It showed signs of severe emotional stress, strenuous inner conflict, neurotic behavior, deep anxiety, and emotional immaturity. However, the ego was sufficiently strong to prevent the patient from seeking escape by way of a psychosis. This is what we usually see in the psychosomatic formula. Furthermore, the associational content in this case revealed the nature and origin of the conflicts, many which centered around the patient's mother. It is interesting to note that during the giving of her psychosomatic history, Mrs. O. insisted that she always had admired her mother, that the mother was an ideal person who liked people, liked to entertain, was affectionate, got along well with her husband and "lived for her home and family." It was only after the Rorschach interpretation had been discussed with Mrs. O., and she was asked to try to think of any disturbing reaction to her mother that she might have had, that the true story came out. Although the mother was a very pleasant and gracious person to her friends and acquaintances, she was in reality a chronic surgical invalid. She had a martyr complex. In addition to this, she was tremendously overweight, a state of affairs which Mrs. O. deplored and passionately wanted to avoid. The mother also had an enormous ventral hernia, she suffered from indigestion, constipation and hemorrhoids, and her health was a constant subject of conversation ever since Mrs. O. could remember. Time and space will not permit a full description of the psychological implications of the mother-daughter relation-

CHOLECYSTECTOMY

A Technique for the Occasional Operator

G. M. A. FORTIER, M.D.
Little Falls, Minnesota

It is my purpose in this article not to discuss the extensive subject of gall-bladder surgery and its complicated ramifications, but rather to outline a procedure for simple cholecystectomy. The technique proposed here, I believe, renders the operation safe, relative to accidents involving the vascular and ductal components of the biliary system.

The reader may properly question my justification for such a presentation, considering the numerous articles that have been well prepared and presented by masters in this field. My reasons for writing this paper are as follows:

1. It is written for the occasional operator, with the thought that he has special difficulties to overcome which the practiced surgeon has not.
2. The techniques presented in standard books and periodicals, though written with the intent to instruct in the avoidance of accidents, actually present descriptions and representations of movements which invite castastrophic results, except to those learned in this field.

I have no statistical knowledge of the facts, but I am assured that a large proportion of cholecystectomies are being performed by men who are not finished surgeons in this field. If this is true, those men should have access to literature that has been produced with the purpose of imparting to them in particular the leading points in technical safety. At present, to procure this knowledge and successfully carry the delineation to the operative field, the occasional operator must read a great amount of (to him) superfluous literature in order to glean the proper salient points. The average general practitioner has not the time for that amount of reading. He therefore operates, using a technique that is safe only in experienced hands, and thereby blunders into accidents.

Except by Behrend,[1] the descriptions of anomalies in the operative site are presented in too general a manner, rather than properly pointing out that not only does this area contain numerous anomalies but also that variables exist in the anomalies themselves, producing most deluding situations. The repeated reference to the kinking of the common duct and excision of a part thereof, the torn cystic artery, the clamping of the hepatic artery, the short hilal duct, and injuries due to attempts to secure hemostasis in a pool of blood, leads one to assume that these are the only dangerous possibilities, and the reader is promptly jarred into confusion by another variable. The literature does not properly impress upon the reader that he should accept confusion as a proper mental state for the performance of safe gall-bladder surgery, and that therefore he should carry out a careful inspection of the field before proceeding at any stage.

In the literature I have invariably met with the same situations with respect to authors unintentionally ensnaring the unwary in difficulties by presentation of procedures he cannot properly perform. I feel that these articles, although intended to assist the occasional operator, impart information which leads him into just those dangerous situations which the articles had intended to help him avoid:

Lewis[9] advises and illustrates puncturing of tissues, undermining the cystic duct, and transection near the common duct. He states that the duct and artery may be ligated together, and advises isolation of the cystic artery in the soft tissues.

Bickham[3] illustrates passing an aneurysm needle under the cystic artery and duct, and ligating them together.

Spivack[12] illustrates and discusses the passing of an aneurysm needle around the cystic duct close to the common duct, and the use of a clamp at a set distance from the common duct. He admits to searching for the artery in the tissues. Spivack also illustrates grasping a fold of peritoneum containing the cystic artery. He illustrates further, digging in dangerous tissue in order to locate and ligate the cystic artery. He illustrates the duct and artery being clamped a good distance from the gall bladder.

In Christopher's book[5] there is illustrated the clamping of the cystic duct with its peritoneal covering, and there is demonstrated the passing of a needle and suture into the tissues about the cystic duct. Both of these procedures are admittedly vicious.

Maingot[10] states that the cystic artery should be identified before ligation. He further states that the dissection which is concerned with the exposure is the very method by which the artery may be torn. He also seeks for the artery in tissues dangerous to invade. He

pictures the clamping of the artery near the hepatic duct, then warns of its dangers. He advises encircling the cystic duct with a needle, and also uses clamps at a given distance from the common duct—a predetermined distance.

Behrend,[1] after an excellent consideration of anomalies, illustrates knife dissection near the common duct. He further shows the extreme spreading of tissues, the clamping of the cystic duct at its mid-point, followed by seeking for the cystic artery in the deep tissues.

Vaughn,[13] after a discussion of anomalies, pictures the cystic duct clamped far from the gall bladder. Further, he describes seeking for the cystic artery in the areolar tissue and admonishes against carelessness because of danger to the hepatic artery.

Bettmen[2] states that the first step should be the exposure of the cystic artery, which he illustrates being clamped near the hepatic duct. He states that this artery is easily found and is rarely anomalous.

Cattell[4] states, "Since stricture as of operative injury is preventable, it is a real tragedy." He mentions tearing of the cystic artery during tension on the gall bladder. He pictures clamping the common duct angulation, then illustrates clamping "properly" close to the common duct.

Cutler and Zollinger[6] describe and illustrate the cystic duct being undermined at its mid-point, and there transected. They also seek for the cystic artery in the depths of the fibro-nerve tissue, and ligate at that point.

Graham[7] illustrates the cystic artery ligated close to the hepatic duct.

Lahey[8] describes and illustrates seeking for the cystic artery in the periductal tissues. He illustrates undermining the cystic artery away from the gall bladder. He further describes and illustrates undermining the cystic duct at its mid-point, followed by transection.

It is my opinion that if the above-reviewed techniques are followed by the occasional operator, he will frequently find himself within the realm of a trying siege, discovering dangerous situations only after harm has been done.

None of these articles suggests that one should work as far from danger as possible when destroying tissue, avoiding treacherous areas altogether. These problems can be overcome only by preparation for each stage of advance.

The operation should be entered upon in the proper state of mind—that is, to accept it as a beguiling procedure with pitfalls at every turn, nothing to be accepted as it seems to be without thorough inspection. In an area the size of a dollar, nature has formed for the operator an amazing number of anomalies, making each case a new challenge to the resourcefulness of the surgeon, and demanding of him that he clamp and cut any structure as far from danger as possible, and that there be no sharp dissection or crushing of tissues unless absolute proof of safety is presented.

I consider it quite important that the occasional operator be quick to admit his limitations and resort to a cholecystostomy if the presenting difficulties warrant it. It is paradoxical that Dr. Lahey[8] with his wealth of experience and knowledge would only drain in a case presenting a short hilal-placed duct, while those of vastly less experience will bravely chop through to a cholecystectomy no matter what presents—no matter what the gamble in ultimate harm to the patient.

I wish to present a procedure which I have been employing for many years, with which I have been able to cope successfully with a number of anomalies, and which I feel will protect the occasional operator no matter what anomalies are present.

Technique

The discussion of the abdominal incision is not within the scope of this paper. Suffice it to say that excellent exposure and good lighting are absolutely necessary, with no place whatsoever for trick surgery through small incisions. One should bear in mind continually that the real finesse of the operation is concentrated in a small area about the cystic duct. The purpose of the operation is to enter this area, carry out the proper procedure, and retreat with the assurance that one will do no harm. If that confidence is lacking in a particular case, drainage of the gall bladder is the alternative, rather than aimless sparring with tissues.

The first question to be settled is whether or not the appearance of the gall bladder suggests the possibility of there emptying into it the right hepatic or common hepatic duct.

If the gall bladder is excessively distended, it is emptied of stones and fluid.

The peritoneum of the antero-liver aspect of the gall bladder is incised, the incision progressing from a point about two-thirds the distance from the fundus, near the liver, in a curved manner to the cystic duct, and thence to the common duct. At this point the cystic and common ducts are exposed only minimally in order to establish a rough idea as to their location. No structures except the peritoneum are molested (Fig. 1).

The peritoneum is gently loosened from the gall bladder and peeled toward and only to the area bordered by the liver, the liver aspect of the

gall bladder, the cystic duct, and the right hepatic duct. I will refer to this space of areolo-fibro-nerve tissue as the "danger area."

As each vessel is demonstrated on the gall bladder (please note—on the gall bladder), it is

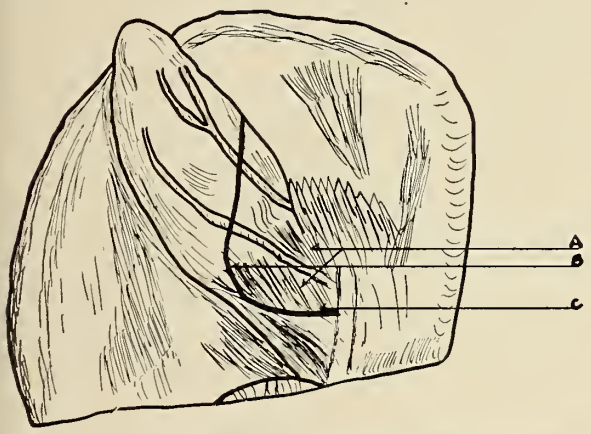

Fig. 1. (*A*) The "danger area" to be avoided. (*B*) Line of incision on the gall bladder. (*C*) The incision continued over the area of the cystic duct.

ligated, transected, and gently peeled off the organ with gauze. It may be noted at this point that after transection of any vessel there is no retraction, and, therefore, an accident resulting in hemorrhage is easily controlled. After this liver aspect of the gall bladder has been cleared of vessels to the distal portion of the cystic duct, there will be apparent one or two ties at the peritoneal edge, the "danger area" not having been encroached upon. Except for an occasional posterior branch or one coursing along the duodenal aspect of the cystic duct, the cystic artery has now been ligated and offers no further difficulties. This area then remains completely cleared to the junction of the cystic duct with the gall bladder.

Employing gauze dissection, the anterior aspect of the cystic duct and a sufficient length of common and hepatic duct are demonstrated. No sharp dissection is done. Up to this point in the operation no harm could have been done to any structure.

Using a tooth-free thumb-forceps, the cystic duct is gently elevated and with gauze dissection the posterior aspect of the duct is freed from its connective tissue base, from the gall bladder to the first point of serious resistance, otherwise to the common duct. Any suspicious tissue or vessels are left untouched. There then remains but a thin layer of fibro-nerve tissue connecting the duct, in its full length, to the "danger area," which has not, up to this point, been molested (Fig. 2). The result is a cleared cystic duct, being bound only on the liver aspect. A puncture is not made through this leaf of tissue. Such a

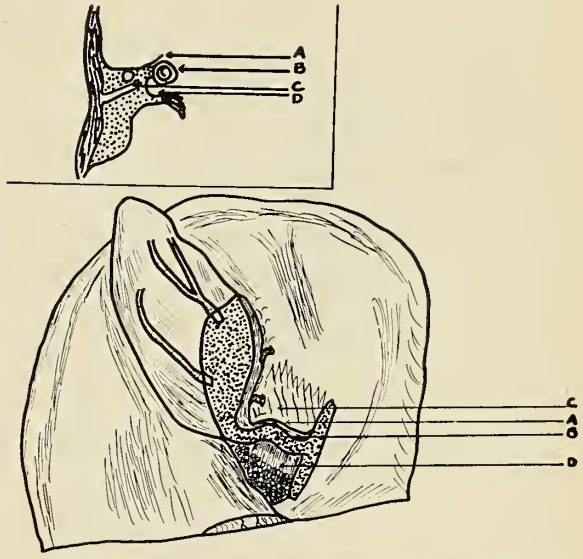

Fig. 2. (*A*) Peritoneum freed from cystic duct only. (*B*) Cystic duct freed except for restraining leaf of tissue attached to its liver aspect. (*C*) "Danger area" covered with peritoneum. (*D*) Tissues freed posterior to cystic duct.

procedure is, I believe, a source of danger and accident. Though it appears thin and harmless this narrow area may contain important vascular and ductal structures.

The cystic duct is doubly clamped *at its junction with the gall bladder.* The points of the clamps face the liver, and do not extend beyond the duct. Transection is then carried nine-tenths through, and no farther. Gentle tension results in a tearing process completing the transection. Up to this stage there has still been no possibility of injuring vital structures, no matter what anomalies are present.

Most gently, the duct is freed from its last restraining tissues, freeing it from the "danger area." If during this procedure an obstruction is encountered at any point which does not separate with the gentlest pressure, one can feel justified in ligating at this point, unless thorough inspection promises safety in continuing. If such be the case, the duct is freed to the common duct. In choosing the point at which separation shall cease, one should consider only the present threat to the patient, rather than the remote possibility of the reformation of a small false gall bladder. The

cystic duct having been fully freed, it may be ligated at any point desired in complete safety (Fig. 3).

Following the above, the first steps in the freeing of the gall bladder are done with gauze dissection, seeking for anomalous vessels and ducts. At this point I wish to warn the reader that if any large vessel is encountered it should not be hurriedly clamped in the belief that it represents a posterior branch of the cystic artery. Rather, it should be carefully preserved until the dissection reaches the fundus or until it is proved that the vessel leaves the liver bed and enters the gall-bladder wall. On two occasions I have seen an artery course nearly to the fundus before entering the liver. It is also important to bear in mind that transection of these vessels results in forceful retraction. It is, therefore, best to slip a tie under the vessel, and transect some distance fundalward.

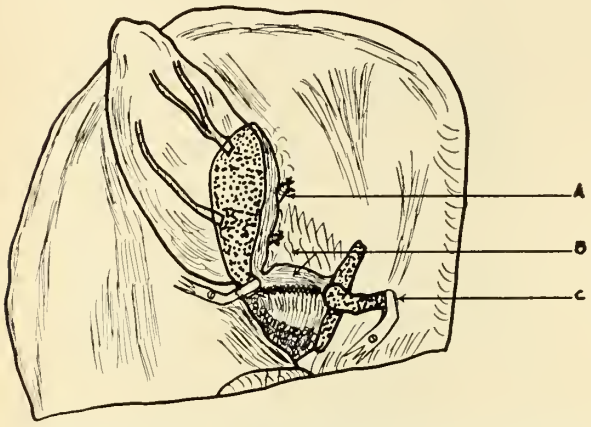

Fig. 3. (*A*) Vessels ligated on the gall bladder and wiped off. (*B*) "Danger area." (*C*) Completely freed cystic duct ready for ligation at point desired, without necessity for tension or for preliminary clamping.

At this point I wish to offer a suggestion, which, however, I do not consider a substitute for compression of the hepatoduodenal ligament. In case of hemorrhage an excellent hemostat is formed by the use of the thumb and first finger. No harm is done, and it is surprisingly easy to carry a suture around them.

Discussion

I feel the reader will agree, in following the steps of the procedure, that at any time abnormalities are present they will become clearly apparent prior to accidental injury, occasioned by doubt in the surgeon's mind as to what tissues he is transecting. He is at all times working as far from danger as possible, and approaching it by safe methods. He never enters the "danger area."

This work has been presented with the principle in mind that there is no measured, correct distance for ligation of the cystic duct. Rather it should be ligated at a point which guarantees safety to the patient.

My desire has been to impress the reader with the fact that gall-bladder surgery is fraught with catastrophic possibilites, and that each step must be executed circumspectly.

Lastly I believe that the will to complete a cholecystectomy should be subordinated to the wish to carry the patient safely through the operation. Therefore, if any particular case presents not easily comprehensible situations, cholecystostomy is the proper procedure.

Conclusions

The writer feels that the efforts of surgeons in outlining techniques for the avoidance of accidents in gall-bladder surgery have been incomplete and even misleading to the occasional operator.

A procedure has been presented which has served the writer well for several years, and which he believes will greatly assist the occasional operator in this type of surgery.

The paper has been limited to a discussion of cases presenting the need for only a simple cholecystectomy.

There has been no mention of a cholecystectomy commencing at the fundus. In uncomplicated cases this is unnecessary. In difficult cases it admits of at least as much and probably more danger than the procedure outlined.

History of Medicine In Minnesota

HISTORY OF MEDICINE IN NICOLLET COUNTY

(Continued from the May issue.)

Jones, William Alexander, was born in St. Peter in 1859 and was educated in the St. Peter public schools. He entered the medical department of the University of the City of New York, being graduated in 1881. He served as intern at the St. Peter hospital from April, 1881, until December of the following year. He was elected secretary of the Minnesota Valley Medical Association in April, 1882. After taking postgraduate work in New York and abroad, he located in Minneapolis and specialized in mental and nervous diseases. In 1888 he was appointed lecturer on nervous diseases at the University. He was, for many years, the editor of the *Journal Lancet* and, for a long period, served on the State Board of Health. He was a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Justice, O. M., was assistant physician at the St. Peter hospital, commencing work in July, 1897, and remaining until May, 1898, when he began to practice in Waterville, Le Sueur County. In June, 1899, he located in St. Peter, succeeding Dr. Ranson.

Kennedy, R., came to Nicollet County in 1849.

Kilborne, Arthur F., was born in Keokuk, Iowa, in 1858. He was graduated from the high school of that city and entered the medical department of the University of the City of New York, being graduated in 1883. After graduation he spent a year or more in Word's Island Hospital for the Insane, in New York. In December, 1884, he began work as assistant physician at the St. Peter Hospital. In June, 1889, he was appointed superintendent of the Rochester Hospital for the Insane, where he remained. He was a member of the Olmsted County Medical Society, the state and national association and the American Medico-Psychological Society.

Kranz, C., practiced in Nicollet, Nicollet county, in the eighties and nineties. He held an exemption certificate.

La Dow, J., came to St. Peter in 1865. In April of that year he was appointed assistant surgeon in Brackett's Battalion at Fort Rice, but returned to St. Peter a few months later. In October, 1867, he accidentally shot and killed himself. He was born in New York and had practiced in Sandusky, Ohio, and in Wisconsin. He was fifty-three years old at the time of his death.

Le Boutellier, C. W., was in St. Peter in 1862 as surgeon of the Ninth Regiment, Minnesota Volunteer Infantry.

Lehnert, Henry C., located in St. Peter in September, 1865. He was a homeopath and came with recommendations from Chicago. He stayed in St.

Peter a short time, returned to Illinois and was preparing to move back to St. Peter when he died at Mt. Vernon, Illinois.

Lincoln, W. L., of Wabasha, took charge of the St. Peter Hospital in the summer of 1879, during the absence of Dr. Bartlett.

Mallison, Elizabeth C., was the first woman assistant physician at the State Hospital for the Insane at St. Peter. Her term there was from March, 1890, until May, 1893, when she left to accept the position of first assistant in the women's department of the Western Pennsylvania Hospital for the Insane, at Dixmount, at a salary of $1,200 per year. Dr. Mallison was born in New York, entered the Women's Medical College of Pennsylvania and was graduated when she was about twenty-two. She went to San Diego, California, and built up a good general practice before coming to St. Peter.

Mayo, W. W., (for Nicollet county). In the spring of 1856 he moved his family to Lake Prairie township, near St. Peter, in Nicollet county, where they lived on a large farm, although not as farmers, for three years. He practiced medicine and supplemented with other occupations. In 1859 he moved his family to Le Sueur and, in 1863, from Le Sueur to Rochester where they settled permanently.

Merrill, Rose Marie, of Mankato, began service as an assistant physician at the St. Peter Hospital in June, 1900, and remained until June, 1901.

Merritt, George F., was born in Dansville, New York, in 1846, and was educated in the public schools of Rochester, New York. In 1856 he moved, with his parents, to Iowa, attending public school and college in Burlington until 1868. In 1872 he was graduated from Rush Medical College and, in May of the same year, commenced practice in St. Peter where he remained until his death in October, 1921. The doctor was a member of the St. Peter school board and coroner of Nicollet County for many years. He also held the position of United States pension surgeon for several terms. He was one of the founders of the Minnesota Valley Medical Association and, excluding the years 1894-95 and 1895-96, was treasurer during its entire existence. After the Minnesota Valley and the Southern Minnesota Medical Associations combined, he continued in the office of treasurer. He was a member of the Nicollet County Medical Society, the Nicollet-Le Sueur Medical Society, the state and national associations. He also belonged to various fraternal orders—the Masons, the AOUW and the Legion of Honor.

Mueller, Alfred, (see Washington and Brown County biographies).

McCohlom, C. A., practiced in St. Peter in 1871.

McCullough, William B., came from Indiana to St. Peter in the spring of 1860 and remained several years before moving to California where he died in the summer of 1868.

McIntyre, George Wesley, a native of Cleveland, Ohio, was born in 1853. He attended school in Wisconsin and Ohio and was graduated from the Minnesota College Hospital in 1883. He also studied at the University of New York and the New York Polyclinic. In October, 1883, he began work as an assistant physician at the St. Peter State Hospital, continuing until May, 1884. He then began to

practice in St. Peter. He was appointed to the local board of health and, for many years, he served as health officer. In August, 1889, he began his second term as assistant physician at the State Hospital and remained there until May, 1893, when he returned to general practice. In 1898 he was appointed a member of the State Lunacy Commission and served one term. Dr. McIntyre continued in active practice until his death, July 11, 1920. He was a member of the county medical society, the Minnesota Valley Association, the state and national associations.

Nelson, J. R., came to St. Peter in 1871. His card, appearing in the *St. Peter Tribune* January 25, 1871, announced his office to be with Dr. J. W. Daniels. It is unlikely that he stayed for any great length of time. He was a graduate of the New York College of Physicians and Surgeons and had practiced in New York.

Nicholson, David A., was born July 19, 1871, on Prince Edward Island, Canada. He entered the Department of Medicine of the University of Minnesota, being graduated in 1897, and served as intern for one year in the Asbury hospital, Minneapolis. He practiced medicine in Olivia, Minnesota, in 1898, and the following year moved to St. Peter. From 1899 until 1904 he served as assistant physician in the St. Peter Hospital. He then moved to Seattle, Washington, where he specialized in mental and nervous diseases. He is a member of the Washington State Medical Association and the American Medical Association.

Page, Frank W., was a graduate of Burlington Medical College in Vermont and had served in hospitals in New York before coming to St. Peter in 1866.

Pehrsoon, John, came to St. Peter in April, 1875, and remained until October, 1877, when he moved to Minneapolis. His office, while he was in St. Peter, was with Dr. A. W. Daniels. In 1883 he was made lecturer on obstetrics at a new medical college in Minneapolis, the College of Physicians and Surgeons in Minneapolis. Later he moved to Duluth.

Pratt, Calvin, came to St. Peter in 1865 and probably remained about two years. In January, 1868, he was physician on a steamer running between Boston and Liverpool. He was a graduate of Harvard.

Putnam, E. C., was born in Mt. Sterling, Illinois, June 18, 1853. He received his early education in Illinois. He was graduated from the Louisville Medical College in 1875 and began to practice medicine in Cooperstown, Illinois. He remained there for one year. Later he practiced for two years in Kansas. In August, 1881, he located in Nicollet, Nicollet County, where he remained until March, 1883, when he moved to Decatur, Illinois. He was probably the first regular physician in Nicollet.

Putnam, Marion, was in Nicollet in 1878 and 1879. It is not known whether he was a regular physician.

Ranson, George, was born in Dodge Center, Minnesota, his father being one of the oldest practitioners in that section of the country. In February, 1898, Dr. Ranson came to St. Peter and took over the office of Dr. D. B. Collins who had just died. He was a member of the Minnesota State Medical Association. He continued to practice in St. Peter until his sudden death in 1899.

Ranson, Mary E., was born in Dodge Center, Minnesota. Her term as assistant physician at the St. Peter Hospital began in 1898 and she continued her duties there until June, 1900. In September of the same year she married Dr. A. F. Strickler and moved to New Ulm.

Ray, C. Wilbur, was born in 1856 and was graduated from the Bennett Medical College in 1885. He practiced in various parts of Minnesota and, in 1893, was in Owatonna, where he remained several years. In 1896 he located in Nicollet, Nicollet County, succeeding Dr. Joseph Wicke, whose stock of drugs and medicines he purchased from the doctor's widow. He was, for a time in 1896, the editor of the *Nicollet Leader*. He spent the summer of 1899 visiting Boston hospitals. The following year he moved to California. He died in Los Angeles in 1913. He was a member of the Minnesota Eclectic Medical Association and served as its secretary for many years.

Robb, C., of Pittsburgh, Pennsylvania, came to St. Peter in August, 1856, and bought a block of business lots. At that time he intended to remain in St. Peter, but it is doubtful that he stayed or practiced there.

Shantz, Samuel E., was the first superintendent of the St. Peter Hospital for the Insane. He was a native of Ithaca, New York, and served as assistant physician at the Hospital for the Insane in Utica, in the same state, for six years. In October, 1866, he came to St. Peter to assume control of the hospital, but served only two years, for he died of typhoid fever in August, 1868. A memorial window in the Church of the Holy Communion honors his brief work in St. Peter.

Scott, M. W., practiced in St. Peter about 1870. Later he moved to Windom, Minnesota, and, in 1878, was to be found in Henderson. He was elected to membership in the Minnesota State Medical Association in 1878.

Skinner, Chauncy Morgan, was born in Hartland, Wisconsin. He was graduated from Rush Medical College and, after receiving his degree, spent one year as an intern in the Cook County Hospital in Illinois. He then practiced medicine in Minneapolis where he owned a drug store. In 1899 he located in St. Peter where he built up a large practice and was elected Nicollet County coroner for several terms. He was an enterprising practitioner and had a private telephone service with Kasota, answering all calls from that town. In the fall of 1891 he rented four rooms in the Amundsen building and fitted them up as a private hospital in which the patients could employ any physician they chose. In 1894 he attended medical lectures in Chicago. In November, 1896, he moved to the town of Nicollet, as a result of the death of Dr. J. Wicke and remained for about one month. After that he returned to his native town of Hartland where he practiced until his death several years later. The doctor was a prominent Mason, a great rifle shot, and inspector of small arms in the Minnesota National Guard. He was a member of the Nicollet County Medical Society and the Minnesota State Medical Association.

Strathern, Fred P., was born in Rich Valley, Minnesota, in 1869. He attended school in Hastings and, in 1890, he entered the state university. He received his bachelor's degree in 1894 and a degree of master of science the following year. He received a degree in medicine in 1899 and, in September of that year, began practice in St. Peter, occupying Dr. George Ranson's old office. He has since

taken graduate work in New York and Chicago and has served on the public library board of St. Peter. He is a member of the Masonic lodge. In 1900 he was admitted to the Minnesota Valley Medical Association, which later merged with the Southern Minnesota Medical Association. He is also a member of the Nicollet-Le Sueur County Medical Society, the state and national associations.

Strickler, Abraham F., was an assistant physician at the St. Peter Hospital for the Insane, his appointment being from June, 1898, until May, 1899. In September, 1899, he married Dr. Mary E. Ranson, also an assistant at the hospital, and moved to New Ulm. A brother, Dr. O. C. Strickler, practiced in New Ulm.

Sweet, A. A., came to St. Peter from Kasota, Le Sueur County, in March, 1891, and opened a drug store.

Tomlinson, Harry Ashton, was born July 3, 1855, in Philadelphia, Pennsylvania. He received his education in the common schools and was a bookkeeper before taking up the study of medicine. In 1880 he was graduated from the medical department of the University of Pennsylvania and, for the following eight years, he practiced in Muncie, Pennsylvania. He was assistant superintendent at the Friends Asylum at Frankfort, Pennsylvania, for three years and, in 1891, began his duties as first assistant at the St. Peter Asylum for the Insane. When Dr. C. K. Bartlett resigned as superintendent in August, 1892, he was appointed to the position, but did not begin work in this capacity until December or January. Largely through his efforts, the asylum was improved and enlarged. After twenty-one years of active service, he resigned to accept the position of superintendent of the State Hospital for Inebriates at Willmar, Minnesota. His poor health and the strain of building up a new institution led to his death May 30, 1913. Doctor Tomlinson was a Knight Templar and a member of the Loyal Legion. He served on the state board of charities and corrections, served as president of the Medical Alumni Association of Pennsylvania and was a member of the American Neurological Association. He was a member of his county medical society, the Minnesota Valley and the Southern Medical Associations and the state and national organizations.

Tuomy, Clark F., was born in Ann Arbor, Michigan, where he attended the public schools and the medical department of the University of Michigan, being graduated in 1896. He was appointed assistant physician at the St. Peter Hospital for the Insane and served there from September, 1898, until September, 1906. He moved to Genesee, Idaho, and operated a successful local hospital there. He took his postgraduate work at the Lying-In Hospital of New York City and, later, at the University of Vienna. He was local physician for the Northern Pacific railroad.

Valin, Honore, D., was born in Canada in 1858. He attended the public schools and Monnoir College, Marsieville, Quebec, and then entered the medical department of the University of Vermont, being graduated in 1879. He began practice in Chicago in 1880 and remained there for eight years. He was a member of the Academy of Science, in Chicago, and assisted with the *Chicago Medical Journal and Examiner.* He also published the *American Journal of Miology* and was demonstrator of physiology at the College of Physicians and Surgeons. From 1890 to 1894 he practiced in Kankakee, Illinois, and then became the pathologist

at the St. Peter Asylum for the Insane where, with the exception of one year spent in Mankato, he remained until 1915. At this time he went to Fort Wayne, Indiana. He was a member of the Minnesota Valley Medical Association.

Wicke, Joseph, was born in Lindeweazie, Silesia, Germany, in 1852. He attended the College of Meisse and followed several occupations before deciding to study medicine. He came to the United States and, in 1885, was graduated from the Minnesota College Hospital. The following year he began practice in Amboy, Blue Earth County. In August, 1887, he moved to Nicollet, Nicollet County. Apparently he had lived in the county, probably in St. Peter, before this date. In Nicollet he enjoyed a good practice and also ran a drug store. He was president of the village council for the terms 1893-94 and 1895-96, but died October 31, 1895, before the last term was completed. He was a member of the Nicollet County Medical Society and the Minnesota Medical Association.

Winter, Elizabeth, was a physician at the St. Peter Hospital for the Insane in 1892 or 1893. In 1893 she went to India where she took charge of a hospital in Bombay. On her return, in December, 1894, she was appointed resident physician at the Friends' Asylum for the Insane at Frankfurt, Pennsylvania.

(To be continued in July issue.)

COMPULSORY VERSUS VOLUNTARY HEALTH INSURANCE

What Are the Benefits?

Compulsory

No benefits whatsoever are *guaranteed* under the Compulsory Plan. But every rosy *promise* in the political book is made!

The sponsors wrap up their promises in this typically political language: "when funds are available"—"insofar as possible"—"when facilities permit."

Services could be restricted at the whim of Administrators—but there is *no tax limit!*

The only absolute guarantee is the guarantee of *a new payroll tax—the amount unpredictable!*

Voluntary

Under Voluntary Health Insurance, 55 million Americans have specific guarantees in writing, both as to costs and benefits.

They may have freedom of choice of doctor, hospital—and type of service.

They have dependable protection from financial shock in time of illness or accident—*under the finest health care system in the world today!*

Proof of satisfaction is in the mounting millions of enrollments throughout the Nation.

Is It Good for America?

Compulsory

In every great nation which has tried government-controlled medicine — Germany, Russia, France, England—the result has been:

Second-rate medical care
Decline of medical education and research
Invasion of the patient's personal privacy
Political control substituted for medical direction
A new hierarchy of Federal administrators
Constantly mounting tax burdens
Extension of controls over other professions

Voluntary

Unfettered, American medicine leads the entire world.

It has made Americans the healthiest, strongest, best cared for people on earth.

It furnishes daily proof that there is no need to import the medical systems of a sick, harassed Europe to a strong healthy America.

The scientific advances of American medicine in conquering disease and extending life are recognized as foremost by the entire world.

President's Letter

WHAT CHANGES MINDS?

There is no set formula for making up or changing people's minds. For bents of thinking differ from individual to individual almost as much as fingerprints and blood types.

Take your friend who is vice president of a manufacturing company. It will require cold logic and dollars-and-cents facts to change the direction of his thinking. His wife, on the other hand, may react to an emotional appeal, just as intellectually phrased, but dealing with the less tangible qualities of human feeling. The superintendent of nurses at the local hospital may yield before a combined economic and humanitarian presentation.

Our present and vital job is to find the correct approach to all the persons with whom we come in contact. It is not, in essence, a difficult job, for we are able to call to our assistance the lessons of history; we can show the subtraction of tax dollars from income and we can prove that government control subtracts from the medical care level of a nation; we can unfold the dramatic story of American medical progress, a story rich in human interest and the intangibles of devotion, trust and loyalty.

Or we can ask the simple questions: Do you value your health and the health of your neighbors and fellow citizens? Do you think it's good business to pay more for medical care and get less?

It is imperative that we avail ourselves of the material being prepared by Whitaker & Baxter, the public relations counsel hired by the American Medical Association, so that we are familiar with the facts and their implications in every phase of thought and endeavor.

Then we must faithfully transmit this information, in the form and manner most effective for each individual. It is only in this way—by the active and sincere participation of every member—that compulsory health insurance will be rejected by the American people.

Do not ask what the American Medical Association or the Minnesota State Medical Association or your county society is doing about socialized medicine. Ask yourself what you are doing about it.

President, Minnesota State Medical Association

VITAMIN B12

THE successful isolation of B12 from liver by the research laboratory of Merck and Company and almost simultaneously by the Glaxo Laboratories in England constitutes a milestone in the story of anemia. B12 is apparently the active principle in liver and liver extracts and is so powerful that five to ten thousandths of a milligram will produce a therapeutic response in pernicious anemia.

The discovery that liver contained some active substance which caused remissions in pernicious anemia was followed by the extraction of a water-soluble substance by Cohn in 1927, known as "Fraction G." The crude extract first contained only one or two units per cubic centimeter, but more refined extracts containing ten to fifteen units per cubic centimeter were later prepared.

The preparation of folic acid and the discovery that it too produced remissions in pernicious anemia was a further step in the study of the therapy of the anemias. Its failure in the prevention or successful treatment of neurological changes accompanying pernicious anemia did not permit its substitution for liver therapeutically. Folic acid, however, has been of special value in the treatment of other anemias such as that accompanying sprue, atypical macrocytic anemia, the pernicious anemia of pregnancy, and megaloblastic anemia of infancy. In these conditions response to folic acid is often better than to liver.

B12, being the active factor in liver and liver extracts, can be used in place of liver extracts in the treatment of pernicious anemia and has the same preventive and curative qualities in the treatment of neurological complications. It is non-toxic, and intramuscular and subcutaneous injections are not accompanied by pain, both routes of administration being equally effective. It should be noted, however, that so far there has been no experience as to possible deleterious effects following the administration of large doses over a long period of time.

The dosage of B12 is 10 to 15 micrograms hypodermically or intramuscularly, once or twice a week until remission occurs. Five micrograms once a week seems sufficient for maintenance. Inasmuch as patients' needs vary, larger doses (25 micrograms) once or twice a week are occasionally needed.

Extracted originally from liver, B12 is now obtained commercially as a by-product from *Streptomyces griseus* and has been found to contain cobalt in minute amounts. The significance of the cobalt content affords a field for further investigation. Therapeutic iron is said to contain traces of cobalt. On the other hand, the giving of cobalt to pernicious anemia patients has not proven effective.

The main significance of the availability of B12 for the practitioner lies in the fact that he now has a substitute for liver extracts for use in patients sensitive to these extracts. Until the cost of B12 is reduced and it is available in larger quantity, liver extracts will continue to be the remedy of choice in the treatment of pernicious anemia. Whether B12 eventually replaces liver remains to be seen.

It is just as illogical and unnecessary to administer B12 for secondary types of anemia as to prescribe liver. The unwarranted use of liver extracts for secondary types of anemia and a multitude of other conditions does not speak well for the knowledge or intellectual honesty of the profession and does not consider the patient's pocketbook. In secondary types of anemia, iron is indicated.

HEALTH BY COMPULSION

LIFE MAGAZINE in its May 2 issue has devoted its editorial page to a trenchant analysis of what it calls the Truman-Ewing "Health by Compulsion Program." With its ever-increasing circulation here and abroad, this weekly magazine, not designed for a platform for any particular economic or social group, is an unusual developer of public opinion. The weighing of the

arguments for and against central national health insurance is well and fairly stated, albeit the AMA received no credit for delay in meeting the issue of voluntary prepaid sickness and health insurance (Blue Shield).

There is, however, on the page opposite the editorial proper, one discordant item that calls for decisive rebuttal by practicing physicians, because no other group is as competent to give testimony concerning what is meant by the need for more doctors and for their more widespread dispersal in undeveloped and thinly populated districts. Says *Life*, "All hands agree that the United States needs a lot more doctors, and at best it cannot get them nearly fast enough." Here is a place to pause and weigh in the balance the older economists' distinction between "needs and wants." There is a fundamental difference, despite the fact that, as living scales advance, *wants* do tend to become *needs*. Naturally, most normal women would *want* a nice mink coat and most normal men would naturally *want* a Cadillac car, if in either instance these supposedly advantageous items for better living could be had for the asking. Indeed there are a few who might well *want* the moon! But, what authority is there, outside of prisons, reformatories or draft boards, that is able to make decisive rulings regarding what individuals may expect in terms of their *wants?* Hence the fairness in *Life's* reference to "Ewing's jail" as applied to doctors in their work; but the joker lies in the obvious fact that if the doctor is jailed, his patients will be in there with him—all tied up together in bureaucratic Utopia, where the idea of costs never obtrudes, as Oscar Ewing so naïvely demurs in all his public interviews.

Nevertheless, the experience in Britain amply testifies that the extravagant *wants* of people, pepped up by the grandiose propaganda that most diseases may be prevented and (in early stages) cured, give the political reformer an Aladdin's lamp with a perpetual battery: health and long life without cost or personal effort—just ask for it. Vote right, and you can have health, security and plenty of time to cultivate your most compulsive and favored sins.

To purvey this quite mechanistic type of healing acquired by universal healing could well require doctors at every crossroads, comparable to the slot-machines in Nevada—a respected and legal technique for painless tax gathering in that fair state. It is this huge withdrawal of the resources and earnings of our people that threatens our national economy even more than the basic integrity of our profession. Our medical schools should be doubly and triply cautious. If this great gamble in health is ventured, watch for a stealthy advance, with grants and aids to our schools contingent upon enlarging and graduating more students. Granted that some increase is needed, just give us a decade of peace and the professional ranks in all lines will be overfilled. But, if the reformers get their way with medicine on "a slot-machine basis," where the legions of neurotic, maladjusted complainers come and drop into the slot their individual *wants*, then, obviously, quantity and not quality of medical service will be the goal.

We are committed on a national scale to the techniques and purposes of mass production; under its aegis we have become engulfed with world power. If mass action in science was able to bring atom-smashing to successful performance in waging war, why, say the unwary, should not similar breathtaking efforts in science eliminate cancer as a health hazard and even limit the encroachments of age? It is in something of this spirit of an attempt at understanding that we should meet our critics, acknowledging that medicine is not an isolated discipline, that in the vital matter of its popularity and the percentage of the population seeking its benefits, it remains less of a science than an art. To point further to the critical situation facing all groups in the field of health, the motion picture industry presently offers an interesting exhibit. It was exceedingly popular up to less than a decade ago; it seemed to have gone not only into the field of science and education but even art and morals. What has happened to it now? Long before any threatened competition had advanced materially, mass production and pure volume for volume's sake have robbed the industry of much of its great possibilities for developing a healthy population with well-adjusted minds. Applying this last thought to the "Health By Compulsion Program," taking cognizance of a large number of well-fitted young men and women now seeking entrance to our medical schools, is it not possible that a decade ago many of them would have gone to Hollywood?

E. L. Tuohy, M.D.

GOVERNMENT COMPETITION WITH ITS CITIZENS

NEW HEALTH bills are being submitted to Congress so fast that it makes one's head swim trying to keep posted on all of them. A compulsory health insurance bill known as S5, submitted on January 5, 1949, was much like the Wagner-Murray-Dingell Bills which have been before Congress each year for the past ten years. This apparently has been superseded by the so-called Thomas Bill (S1679), submitted April 25, 1949, which is just as objectionable as any of the preceding ones. Interested readers may refer to a condensation of the Bill which appeared in the May 7, 1949, issue of the *AMA Journal* (page 114). The Taft Bill (S1581) provides, in brief, Federal subsidy to the states for the medical, dental and hospital care of those unable to pay the full cost, grants for school health services, et cetera. Then there is the Hill Bill (S1456) which provides, in brief, subsidies to the states to provide hospital and medical insurance policies in voluntary prepayment organizations for those deemed unable to purchase such policies for themselves. The question immediately arises as to who shall determine ability to afford such policies.

We believe that the recent appointment of a committee by the AMA to study the many bills being proposed in Congress and to determine the attitude of the profession to them is a very wise step. Editorially speaking, we are opposed to all four of the above mentioned bills, for the simple reason that it is not the function of the Federal government to provide medical care for our citizens. Care, medical or otherwise, that must be given the indigent, should be furnished locally by cities, counties, and states and should not be subsidized by the Federal government. There should also be a limit to what charity even local governments provide.

It is high time for the citizens of our country to decide whether the growing feeling that it is the function of government to support its citizens is proper, or whether such a function is beyond the purpose of government. Our Constitution originally provided for governmental functions designed to protect the citizens from their foes, foreign or domestic, so they could peaceably work out their own destinies without interference. Under the pretext of emergencies, the government has usurped powers never originally intended. Citizens are forced to contribute to social security, and the employers are forced to contribute an equal amount, which is essentially charity. The employer is also forced to contribute to unemployment funds for his employes. And now there is strong pressure to increase the number of citizens affected by social security to include the self-employed, whether they like it or not. Federal funds are being appropriated for supplying lunches for school children. Is there to be no end to what the government is to supply for its citizens, and will it eventually provide food, clothing, housing and entertainment just as was done in Rome before its fall? An administration that is generous in its "hand-outs" is difficult to dislodge, and a continuation of Federal subsidies and spending is now leading to a deficit of some $2,500,000,000, with bankruptcy on the horizon. Federal subsidies seemed the logical procedure because the Federal government had larger sources of income. The point has been reached where Federal government spending has exceeded tax collections, and citizens are crying for relief from high taxes.

It is interesting to note that a resolution is to be submitted to the AMA House of Delegates to the effect that whereas constitutional laws are designed to protect the property and enterprises of each citizen, and whereas many governmental agencies are now in active competition with individual enterprises, with every indication of further inroads by the government, the members of the AMA petition Congress to preserve the intent and purposes of the Constitution by initiating an amendment to the Constitution providing that the United States Government shall not engage in any business, or in professional, commercial or industrial enterprises in competition with its citizens except as specified in the Constitution.

The resolution brings to the foreground the question as to whether we are to continue to become more socialistic in our economy with the government competing more and more with private industry, or whether the government is to withdraw from activities not specified in the Constitution. Many such instances are the result of laws enacted by Congress, while some may well be illegal usurpation of power unchecked by the Department of Justice. The adoption of this amendment to the Constitution would of course make it impossible for Congress to legalize gov-

ernmental activities in competition with private industry and would put an end to the competition already in existence.

We shall follow the progress of the proposed amendment to the Constitution with considerable interest.

THE STATE MEDICAL MEETING, 1949

THE NINETY-SIXTH annual meeting of the Minnesota State Medical Association, held in Saint Paul, May 9-11, 1949, has now become history. The attendance, though not as large as that recorded last year in Minneapolis, was highly satisfactory, with 1,637 physicians registering, as well as nurses, dietitians, technicians, exhibitors, members of the Woman's Auxiliary and miscellaneous, bringing the total to 3,390.

Dr. Frank J. Elias, Council member from Duluth and recently president of the Council, was chosen president-elect for 1950. Dr. William F. Hartfiel, Saint Paul, was elected first vice president and Dr. C. W. Moberg, Detroit Lakes, second vice president. Dr. B. B. Souster, Saint Paul, was re-elected secretary and Dr. W. H. Condit, Minneapolis, was re-elected treasurer. The Speaker of the House, Dr. Charles G. Sheppard, Hutchinson, and the Vice Speaker, Dr. Haddon M. Carryer, Rochester, were re-elected. Councilors L. G. Smith, Montevideo, Justus Ohage, Saint Paul, and W. W. Will, Bertha, were re-elected to represent the Third, Fifth and Seventh Districts, respectively.

Dr. George Earl, Saint Paul, and Dr. A. E. Cardle, Minneapolis, were elected AMA delegates, with Dr. W. W. Will, Bertha, and Dr. E. M. Hammes, Saint Paul, alternates.

The Southern Minnesota Medical Association award for the best scientific exhibit went to Dr. T. J. Kinsella, Minneapolis, and Dr. W. W. Johnstone, Aw Gwah Ching, for their exhibit on Surgery of Intractable Pulmonary Tuberculosis. Honorable mention went to Dr. E. A. Boyden and his assistants of the University of Minnesota Medical School for their exhibit on Prevailing Patterns and Variation of the Bronchopulmonary Segment.

Dr. E. T. Bell, Chief of the Department of Pathology at the University of Minnesota Medical School, received the 1949 Distinguished Service Award of the Minnesota State Medical Association. The award received the hearty approval of his many admirers.

The following eleven physicians throughout the state were admitted to the Fifty Club, having practiced their profession for fifty years: William R. Bagley, Duluth; Charles W. Fogarty, Saint Paul; James H. Haines, Stillwater; O. C. Heyerdale, Rochester; P. L. Holm, Wells; Charles B. Lenont, Virginia; John S. Macnie, Minneapolis; William A. Miller, New York Mills; Gustav Schwyzer, Minneapolis; A. E. J. Sohmer, Mankato; O. S. Werner, Cambridge.

Among the resolutions passed by the House of Delegates at this session, the most important was the one whereby the Minnesota State Medical Association put itself on record to "do everything in its power to prevent enactment of laws intended to provide compulsory health insurance or any similar plan which would jeopardize the health of the citizens of the United States." The House of Delegates also went on record as opposed to the extension of the Social Security Act as proposed by Committees of Congress to include self-employed individuals, inasmuch as such individuals would pay amounts greatly in excess of the value of possible benefits. The House of Delegates also took action urging members of the Association to abstain from the use of prescription blanks with druggist's name attached in the interest of good public relations. It seems that such procedure in the minds of the laity too often indicates a commercial relationship between the physician and the druggist which does not exist. The House further went on record as approving the recent legislation for the improvement of the care of the mentally ill in the state, although the bill may not have fulfilled all desirable objectives, and urged the entire medical profession of the state to co-operate in every way in the carrying out of the new program.

One resolution passed by the House constitutes quite a liberalization in our past concept of ethical public relations in the matter of professional advertising and publicity and approved the change, providing it meets with the approval of the component medical societies. Because of its importance and the possibility of repercussions, the resolution is reproduced herewith in full:

Resolution

WHEREAS, your Committee on Public Health Education believes that there is an increasing need to secure closer understanding with the press of this state, and

WHEREAS, one criticism frequently heard from the press is that the medical profession expects the press to maintain the entire burden of indirect publicity from the doctor to the public, without any remuneration, and

WHEREAS, as long as this opinion exists, your committee believes that with county medical society approval, doctors may place a professional card stating only the name, address, telephone number and office hours of the doctor in the local newspaper, the said card not to exceed one column in width and two inches in depth; and likewise a component medical society may sponsor special greetings, messages or announcements in the name of the component society, or the members thereof, and announcements, messages and other material sponsored by the component society in co-operation with other groups, now therefore

BE IT RESOLVED, that the Minnesota State Medical Association go on record as approving such cards, announcements, messages and other material, provided the same meets the approval of the component medical society.

BB GUNS

The Minnesota Society for the Prevention of Blindness, which has been sparked by some of the state's outstanding oculists, has been sponsoring a bill submitted to the Legislature in recent years to outlaw the BB gun. Oculists, particularly, are conscious of the number of eyes that are lost from accidents due to the

George Earl, M.D., Chairman

HOUSE OF DELEGATES MAKES VITAL MOVES

Recognizing the importance of aggressive action in placing the medical profession beyond the reach of certain stereotyped criticisms, the Minnesota State Medical Association's House of Delegates translated some vital policy decisions into official record during the annual convention, May 9-11.

Unique among the conclusions reached by the medical governing group was a move to "secure closer understanding with the press of this state." In a resolution which admitted that "one criticism frequently heard from the press is that the medical profession expects the press to maintain the entire burden of indirect publicity from the doctor to the public without remuneration," the House of Delegates declared:

". . . as long as this opinion exists, . . . with county medical society approval doctors may place a professional card stating only the name, address, telephone number and office hours of the doctor in the local newspaper."

Only qualification in the resolution was that the card not exceed one newspaper column in width and two inches in depth.

Another type of advertising was also approved:

". . . a component medical society may sponsor special greetings, messages or announcements in the name of the component society or the members thereof, and announcements, messages and other material sponsored by the component society in co-operation with other groups."

Toward General Approval

On second look, the House found, in a time-honored business custom, another loophole for unfriendly comment from the public.

Outlining the problem, the House wrote:

"It has become a common practice, as a matter of business policy, for druggists to print prescription blanks for the convenience of physicians with the name of the drug establishment and the physician appearing thereon, and these prescription blanks are distributed to physicians and, in good faith, physicians have used these blanks freely in writing prescriptions for their patients."

Drawback to the custom, according to the House, is that "this practice has led to a mistaken and regrettable belief becoming fixed in the mind of many patients that a commercial relationship exists between the medical and pharmaceutical professions."

Members of the State Association were urged "in the interest of good public relations and the furtherance of public confidence in the high standards maintained by the medical profession as a whole" to use prescription blanks which are not identified with drug firms.

Evaluates Legislation

The work of the Minnesota State Legislature and, more particularly, the bill it passed to improve the care of the state's mentally ill, came under the scrutiny of the MSMA legislative body.

The mental health bill was received with moderate enthusiasm and annotated by the House: ". . . it may not fulfill all the desired objectives of the Minnesota State Medical Association in dealing with this problem."

Believing that something is better than nothing, however, the House of Delegates asked all doctors of Minnesota to co-operate in every way in carrying out the program and to assist with future efforts to implement existing legislation.

On National Level, Too

From the state scene, the House lifted its sights to the national level and protested against what it saw:

"Legislation is now under consideration in committees of the Congress of the United States which proposes extension of the Social Security act to include self-employed individuals. Such a measure is destructive of self-reliance in this group of individuals and such individuals would be found to pay amounts greatly in

excess of possible benefits to be derived and such legislation would constitute another step toward a completely socialistic state."

The House underlined its protest with the firm statement that: ". . . the Minnesota State Medical Association hereby expresses unalterable opposition to such legislation."

Copies of the resolution were forwarded to President Truman and to the senators and representatives from Minnesota.

To Dispel Any Doubt

The House of Delegates put its opposition to compulsory health insurance in resolution form:

"WHEREAS, under the system of private practice of medicine, the health of the people of the United States is better than that of any other people; and

"WHEREAS, voluntary, democratic ways have been found most satisfactory in meeting the need for medical care of persons in all income groups, NOW, THEREFORE,

"BE IT RESOLVED, that the Minnesota State Medical Association do everything in its power to prevent enactment of laws intended to provide compulsory health insurance or any similar plan which would jeopardize the health of the citizens of the United States."

Copies of the resolution were sent to President Truman and to senators and representatives from Minnesota who were "respectfully requested to use every effort at their command to prevent the enactment of such legislation."

CRISIS PAST; BUT IT'S ONLY FIRST ONE

Although health insurance, along with the civil rights program, has been lopped off the administration's "must" list, it's too soon to start celebrating—there'll be other sessions of Congress and, from all appearances, there'll be other proponents of compulsory health insurance, socialized medicine or whatever names the scheme adopts as it continues its unsettling path through history.

This is, assuredly, no time to relax medicine's all-out war against Federal control. Whitaker & Baxter, the public relations counsel hired by the American Medical Association, are accelerating the pace with which they produce the ammunition needed by every doctor in America to guarantee his freedom.

This material—posters, pamphlets, leaflets, letters—comes to the state office and is channeled on to every member through special mailings, the Newsletter and personal distribution. Obviously this does not or should not complete the circuit of this factual information. It will not have accomplished its purpose until it reaches a large proportion of the reading and thinking and voting public.

For Your Information

There is, of course, a certain amount of the material that is designed primarily for the doctor's own information, so that he will have quick and ready reference to the refutations that American medicine is voicing.

Among these are suggested speeches, which doctors may revise to fit individual situations, and deliver when asked to speak before various civic, service and social organizations. There is a blueprint of the campaign, citing the major objectives to be reached and an outline of the approaches being used and being contemplated for the future. Forms of resolutions against compulsory health insurance are available, too, and the doctor will find them useful when asked to serve as an adviser to a group which is formulating such a resolution. In this connection, the first of a series of lists of organizations and associations officially on record against compulsory health insurance has been prepared.

For the Public

An increasing number of brief, easy-to-read folders and pamphlets are ready now for doctors to make available in their waiting rooms or to send out with bills and other mailings:

A folder, illustrated with the famous Fildes painting of "The Doctor" and stating concisely in two parallel columns, headed "compulsory" and "voluntary," the differences between private and political medicine.

A statement by Dr. Elmer Henderson, chairman of the AMA Board of Trustees, entitled "American Medicine Replies to President Truman," printed on one sheet of paper and folded ready for insertion in the standard envelope used for sending bills.

Two attractive pamphlets have been received by the state office in quantities suitable for statewide distribution. They are: "Compulsory Health Insurance—a threat to health, a threat to freedom," and "The Voluntary Way Is the American Way," with fifty questions and answers about compulsory health insurance.

Localized Materials, Too

To supplement Whitaker & Baxter materials, the state office staff, under the direction of the

Public Health Education Committee, has prepared a selection of form speeches, containing Minnesota health and medical insurance information, news releases, rural and city editions of a tabloid, *Health News and Views,* radio scripts and other manuscripts and publications suitable for all media of communication.

In addition, the state office has gathered reprints, pamphlets and books in quantity lots which doctors may order, at no cost.

It's Not Enough

The interchange of information and literature is not enough unless the interchange is between doctors and public. This campaign is every doctor's job.

Julian F. DuBois, M.D., Secretary

Minneapolis Osteopath Pleads Guilty to Abortion

Re. State of Minnesota vs. George M. Wade

On June 1, 1949, George M. Wade, seventy-nine years of age, a licensed osteopath at 2103 Colfax Avenue South, Minneapolis, was sentenced by the Hon. D. E. La Belle, Judge of the District Court of Hennepin County, to a term of not to exceed four years in the State Prison at Stillwater for the crime of abortion. Judge La Belle suspended the sentence and placed the defendant on probation for two years on condition that the defendant surrender his basic science certificate and his osteopathic license for cancellation by the respective examining boards. Judge La Belle also ordered Wade to dispose of all of his medical and surgical instruments. The Court granted Wade permission to go to Tucson, Arizona, to live with a son of the defendant.

Wade was arrested on April 21, 1949, by Minneapolis police officers following the hospitalization of a twenty-nine-year-old divorcee suffering from the after effects of a criminal abortion. The patient gave a statement in which she alleged that she paid the defendant $300 for the abortion. The abortion was performed by the defendant by packing the uterus. When arraigned in Court on April 23, Wade waived a preliminary hearing and was held to the District Court under bail of $5,000 which was not furnished. On April 27, Wade was arraigned in the District Court of Hennepin County and entered a plea of not guilty. He was remanded to jail in default of $5,000 bail. The case was set for trial for May 5, 1949, but on May 4, Wade came into Court and entered a plea of guilty. The case was then referred to the probation officer for a pre-sentence investigation. Evidence that the defendant had performed other criminal abortions was furnished by the Minnesota State Board of Medical Examiners to the probation officer. A request was also made by the Medical Board that the defendant be required to surrender his basic science certificate and his osteopathic license for cancellation as a condition to the suspension of any sentence. The defendant told the Court that he was born in Nashville, Tennessee, on September 7, 1869, and that he had been a resident of Minneapolis since 1888, graduating from the Northern Institute of Osteopathy in 1900.

THE VALUE OF THE RORSCHACH TEST

(Continued from Page 624)

ship, but suffice to say this important therapeutic lead which was uncovered by the Rorschach analysis led the way to our psychotherapeutic approach. Mrs. O. was seen for three hours a week for four weeks, and when she left for her home town she felt very much better. Several letters from her indicated continued improvement after her return home. Two weeks ago she reported in person and stated that she was entirely free from pain, had gained weight, was active socially and enjoyed life.

This was a case in which, on the basis of the psychosomatic history alone and without special psychiatric investigation, we would have been unable to tell whether the patient's pain was psychogenic or whether she still had some organic somatic disturbance which was reflecting itself in the psyche as a mental depression. On the basis of the Rorschach diagnosis, psychotherapy was instituted and the patient was relieved of all of her physical and mental symptoms. In Case 1 psychotherapy would have been to no avail. In Case 2 it brought results that were eminently gratifying to the patient and, incidentally, to the physician.

Conclusions

1. The Rorschach test is a projective technique which furnishes us with a three-dimensional view of the personality structure.
2. The Rorschach test furnishes us with useful information and aids in diagnosis, prognosis, and treatment.
3. While most Rorschach tests are administered by clinical psychologists who are not involved in the treatment of the patient, it is advantageous both to the patient and to the psychiatrist if the Rorschach test is administered by the therapist.

STATEWIDE PASTEURIZATION NEXT YEAR

All milk, cream, and other fluid milk products sold in Minnesota on and after July 1, 1950, must be pasteurized (Chap. 403, Laws of 1949). Hitherto, only local pasteurization ordinances have been in effect, and these have been operative in fewer than thirty communities. The date set by the new law allows time for setting up pasteurization machinery in communities that do not yet have it.

Minnesota Academy of Medicine

Meeting of February 9, 1949

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, February 9, 1949. Dinner was served at 7 o'clock and the meeting was called to order at 8:15 p.m. by the President, Dr. John Lepak.

There were fifty-seven members and eight guests present.

Minutes of the December and January meetings were read and approved.

There being no business to be taken up, the scientific program followed immediately.

SOME CONSIDERATIONS IN INTESTINAL ANASTOMOSIS

CLARENCE DENNIS, M.D.
Minneapolis, Minnesota

Even a superficial inspection of the methods of present-day gastrointestinal surgeons shows them to be divided into a larger group who employ the old standard open anastomosis and a smaller one who use the closed or "aseptic" technique. Some value accrues from a brief review of the relative merits of the two disciplines.

Although the work of Halsted,[5] Mall,[8] Parker and Kerr,[13] Gatch,[4] and Holman[6] had featured the desirability of a clean method of intestinal anastomosis, one which would permit apposition of entirely unsoiled serosal surfaces for the purpose, it was not until the introduction of the two-clamp closed method by Martzhoff and Burget[9] in 1936 that any readily feasible means to achieve this end was presented to the clinical surgeon.

For decades prior to 1936 it had been almost universal practice to open the two segments of bowel to be joined, and to make the approximation by two or three layers of running catgut suture about these openings. In the case of the small intestine, in particular, side-to-side anastomoses in this manner had been necessitated by the observation that end-to-end procedures invert enough bowel wall to produce partial or complete obstruction at the suture line. The two unused ends were customarily closed by catgut inversion to produce blind pockets. Such a method was necessarily associated with spillage of bowel content and serosal soiling, even though elaborate techniques were developed to wash out the lumen and to try to limit the contamination to the immediate area.

Through the work of Poth and Knotts[11] and of Ravdin and Zintel,[14] among others, the past few years have shown that the number of bacteria in the bowel can be cut from over 200 million per gram of stool to less than 1,000, and that in some cases the bowel content could be rendered literally sterile. The stool under some circumstances, therefore, can be rendered far more nearly sterile than is pasteurized milk. In those cases which achieve such a reduction in fecal bacterial content, Poth[10] and his associates have shown that the healing at the suture line is almost free of inflammatory reaction and that mucosal continuity is established far more quickly than in unprepared cases, regardless of whether open or closed methods of anastomosis have been employed.

If, as this work has shown, the bowel can be prepared so that healing is by "primary intention" rather than "secondary," and if this is true regardless of whether an open rather than a closed method has been employed, then is there any reason for preference of the closed over the open method in routine elective surgery on the bowel?

Perhaps a satisfactory answer to this question can be best obtained by study of the situation seen in ileac obstruction. Here the surgery is ordinarily performed as an emergency measure, and sterilization of the bowel content is out of the question. Furthermore there is good evidence that the bacteria which one finds in such cases are more virulent than those seen in unobstructed intestine.[3]

Owings and Smith[12] obstructed the terminal ileum in dogs. At varying intervals thereafter they restored continuity by open anastomotic procedures, in which they were well trained and experienced. They found in a large series that any degree of success required the resection of all distended bowel above the obstruction to a point showing (1) normal color, (2) good muscular response to mechanical stimulation, and (3) good resistance to the surgeon's needle in the substance of the gut wall. Even when these requirements were satisfied, they reported a mortality rate over 30 per cent.

In the closed anastomosis one places narrow clamps across the ends to be sutured together and cuts the bowel (usually by cautery) very close to these clamps, which remain to hold the ends and to keep them closed during the placement of sutures. With proper technique, the clamps may be removed and the sutures drawn snugly and tied without loosening of the mucosal seal produced by the clamps. This seal may be easily loosened by manipulation at the end of the procedure.

In order to evaluate the closed method as against the open, a series of dogs was obstructed as Owings and Smith had done.[12] After a period varying from 3 to 8 days, continuity was restored by end-to-end closed anastomosis.[1] The mortality rate was 6¼ per cent, the single death being due to an obvious error of manipulation. These results were seen in spite of a decision not to resect bowel not satisfying the requirements of Owings and Smith as to viability. A small series restored to

From the Department of Surgery, University of Minnesota Hospitals.

Supported by a Research Grant from the Graduate School of the University of Minnesota.

continuity by the open method suffered a 50 per cent mortality.

Microscopic studies of the anastomatic areas in these dogs showed the healing process to proceed as if obstruction had not been present in those cases in which the closed method had been used. Following the open method, on the other hand, there was violent inflammatory reaction.

An observation of much interest is concerned with the size of the inturned cuff of tissue. In the open anastomoses it was wider and therefore a greater factor as a threat of intestinal obstruction. This same difference was observed in gastroenterostomies in dogs.

Finally, collected data indicate that the mucosa heals in six or seven days if a single layer of silk interrupted sutures is employed, but not until sixteen or seventeen days if a layer of running catgut is left beneath the silk. Furthermore, the presence of the running catgut has been found to be associated with delay or prevention of flattening out of the internal ridge at the suture line. Omission of catgut from the suture line is therefore a logical step.

What is the meaning of these observations in relation to the main question? It is undoubtedly true that if the bowel is already almost free of bacteria, as in gastrectomy for benign ulcer, or after suitable preparation with sulfasuxidine and oral streptomycin, the choice between methods is unimportant and dependent upon the preference of the surgeon. If the case is one in which it is not possible to undertake such preparation or in which such measures are unsuccessful (which occurs in a large portion of cases),[7] then the closed method is much safer.

The closed method with a single layer of interrupted silk sutures is more difficult to learn to do well than the open, and one requiring fairly frequent use to retain the desired dexterity, but with this familiarity it is one which can be done with less use of time and less trauma than the open method.[2] To the author it seems best to use this method routinely in order to retain the facility which will prove essential in the occasional unprepared case. It seems best to the author to use sulfasuxidine preparation regardless of the type of anastomotic technique, and to use the closed method whenever possible in view of the frequent failures of antibiotic preparation.

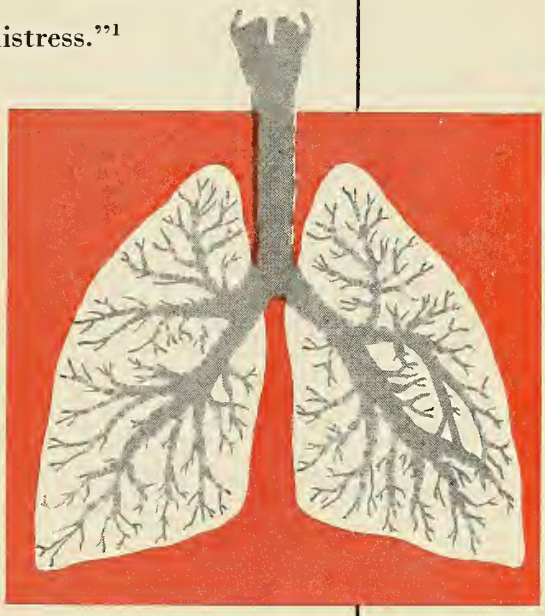
Discussion

Dr. Walter A. Fansler, Minneapolis: It was a pleasure to hear this fine presentation and I am always stimulated by Dr. Dennis' thoughts on surgical subjects. Unfortunately for a discussant, Dr. Dennis presents a situation in such a complete and unbiased manner there is little left to add and not too much room for difference of opinion.

Dr. Dennis has stated that he uses both the closed and open methods of anastomoses but that he usually employs the closed method. He has given some very valid reasons for this choice. I think each surgeon is entitled to use the method he prefers and can do the best. Contrary to Dr. Dennis, I have the past three years been employing the open method of anastomosis though I do not say that an occasion could not arise where I might revert to the closed type.

So far as I know, the chief objection voiced against the open method is the possibility of infection and peritonitis. If this is the case, it would be well to consider what the chief causes of postanastomosal peritonitis may be. Is it due to contamination at the time of the operation? I personally do not believe this to be the case. It should be pointed out that contamination is a matter of degree. No type of anastomosis is actually aseptic and, in some instances, contamination may be quite extensive. It must be admitted that the degree of contamination is usually less in the closed type of anastomoses. I would like to point out that the peritoneum is usually able to take care of a rather extensive single contamination without a general peritonitis resulting. Even in the presulfonamide pre-antibiotic days I do not believe that fatal peritonitis often resulted from a single contamination occurring at the time of anastomosis. It is my opinion and experience that, with the proper use of sulfonamides and antibiotics, serious or fatal peritonitis will not result from contamination occurring at the time of anastomosis. At least we have had no deaths from this cause in the past three years.

If this is true, what is the factor in anastomosis which may lead to serious or fatal results? I believe this to be a leak at the suture line which may produce a gross amount of contamination and one which may continue over a period of time. This leak may be caused by necrosis of the suture line caused by improper evaluation of the blood supply to the area of anastomosis, an improperly done anastomosis, or the pressure of gas or stool upon an anastomosis with an inadequate lumen.



I believe the average closed anastomosis results in a smaller immediate lumen than in the case of the open method. The resulting edema and swelling which occurs for a few days postoperatively may block off the opening entirely. At least in my cases of closed anastomoses I occasionally saw distention with active peristalsis lasting several days before gas or feces were passed per rectum. Uncertainty as to how well the suture line and blood supply of anastomoses were standing up under this strain was always a source of anxiety.

The open method of anastomosis presents no such problem— there is always an adequate opening. From a

SEARLE RESEARCH IN THE SERVICE OF MEDICINE

1. Murphy, F. D.: Treatment of Cardiovascular Emergencies in the Home, Wisconsin M. J. *42*:769 (Aug.) 1943

(Continued from Page 644)

technical standpoint, I am better able to judge the adequacy of the blood supply, to apply the anastomosing sutures more easily, and be more sure of a large lumen. This is particularly true of anastomoses done low in the pelvis.

If these assumptions as to the cause of peritonitis are correct, it would seem that we should not concern ourselves too much about the question of contamination at the time of anastomoses but should concentrate our attention upon a well-done anastomosis which has large and adequate lumen, and a blood supply which will insure proper nourishment to insure healing of the suture line. It is my belief that these three essential conditions can be more easily and surely accomplished by an open type anastomosis, at least in the hands of the majority of surgeons.

My remarks thus far have been intended to deal with those cases where no high degree of obstruction is present. While we ultimately employ the open method of anastomosis in all cases, there is a different method of approach in cases with severe obstruction. In the case of the small bowel, sufficient decompression can usually be accomplished by the Wangensteen suction or its several more recent modifications so that an open anastomosis can be done satisfactorily. In colon cases, where there is a complete obstruction or a very small lumen with accumulated feces above, a temporary colostomy is done above the site of the obstruction. If the amount of stool is small or liquid and there is not too much edema and thickening of the bowel wall, the gut may be decompressed with a trochar and suction and anastomosis done at once. Where a preliminary colostomy is done it is our custom, after a suitable interval, to do an open anastomosis at the site of the obstruction and to close the colostomy during the same surgical session, thus eliminating a third procedure.

In closing, let me again compliment Dr. Dennis upon his very fine presentation and express my appreciation to Dr. Wangensteen for his fundamental contributions which have been a great factor in reducing the mortality in intestinal surgery. Any difference of opinion I may have with the essayist is entirely a personal feeling as to method. However, to discuss the matter in an academic, non-personal, non-acrimonious manner is always pleasant, interesting and instructive.

Dr. M. B. Visscher, University of Minnesota: I am very pleased to hear Dr. Dennis' presentation for many reasons. I think the practical problems, aside from those of rotation of the gut for anastomosis, are not primarily physiological problems, but rather have to do with bacteriology.

Dr. R. L. Varco, University of Minnesota (by invitation): Dr. Dennis has given a scholarly and unprejudiced exposition of the advantages as well as limitations of both the open and the closed types of intestinal anastomoses. My personal preference is for the latter, though this may stem as much from provincialism as from any deep-rooted conviction. Upon occasion, particularly in the newborn where the bacterial flora is of relatively low virulence or even absent, the decision to perform an open anastomosis because of the lumenal dimensions, may be a wise one. An example of the other extreme is represented by an adult suffering from unrelieved high-grade small bowel obstruction. Here, the gut harbors myriads of pathogenic organisms and the performance of a closed type of anastomotic procedure decreases the hazards from inadvertent or coincidental soiling during the operation. In general, I believe that a man, his judgment, and his skill are wiser arbiters of a patient's surgical predicament than any attitude of inflexible adherence to a single technique.

Dr. Dennis, in closing: I wish first to thank the discussors of my paper. Usually as I listen to Dr. Fansler talk, I find that he has approximately the same ideas as I. If we do a closed anastomosis in the descending colon in a patient who already has a transverse colostomy, and if we defer the closure of that colostomy for a period of time, we have found on many occasions that the stoma of the anastomosis becomes progressively smaller as time passes. We have sometimes been concerned about the closure of the colostomy for this reason. I would rather relish having some idea from Dr. Fansler as to whether or not he has seen this same situation in open anastomoses made in the descending colon. In general, it seems to me that, except for the emergency indications that have been covered in the paper, the surgeon is best advised to do that type of anastomosis which he finds he can do most easily.

The meeting was adjourned.

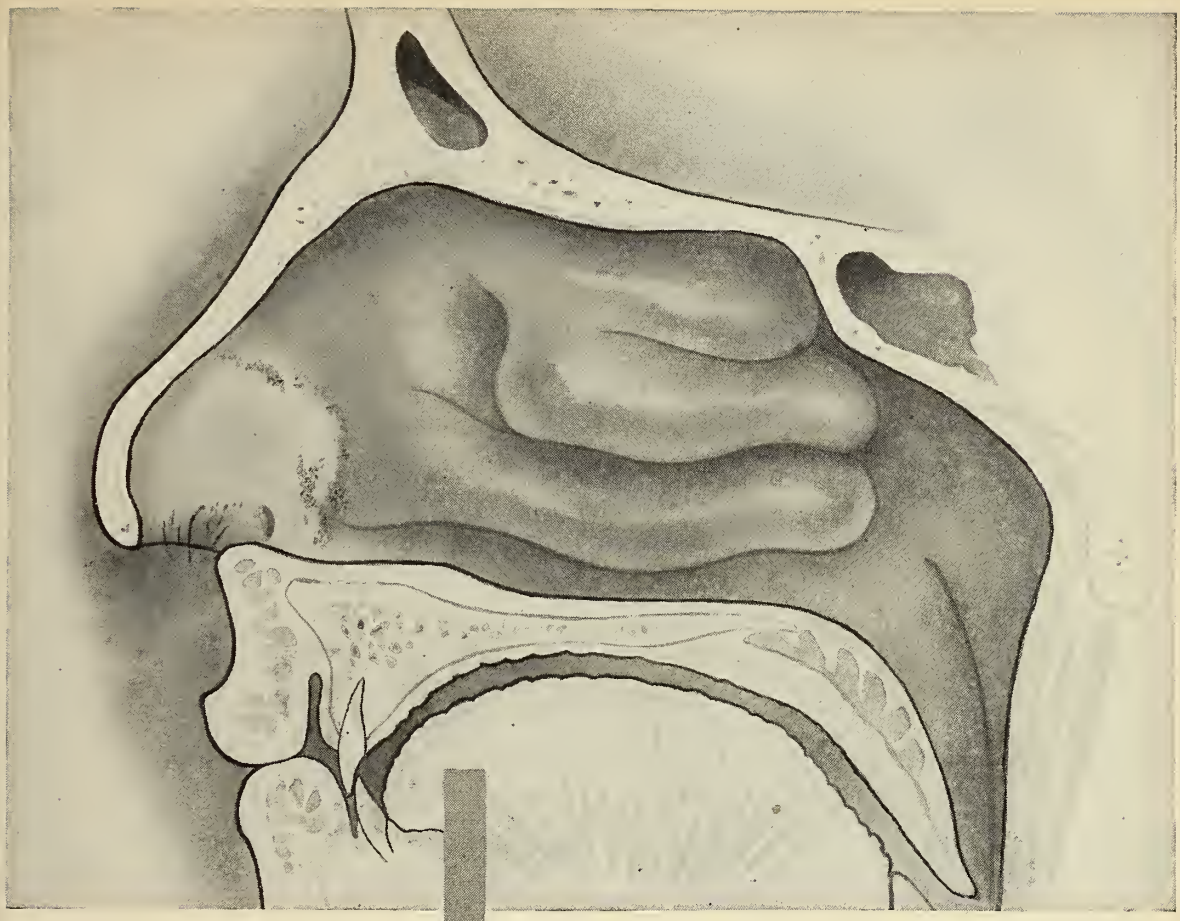
A. E. Cardle, M.D., *Secretary.*

BB GUNS

(Continued from Page 639)

unsupervised use of the BB gun by youngsters. Until this year the efforts of the Society have been ineffectual.

Active in drawing up the proposed bill this year for the Minnesota Society for the Prevention of Blindness were Mr. Amos S. Deinard, past president of the Society, Mr. Louis W. Hill, treasurer, and Joseph Prifrel, Jr., a past board member. Although the Society was particularly interested in an act completely outlawing the BB gun, it considers the passage of the so-called Sportsman's Bill (H. F. 930), which classifies the BB gun as a firearm, a step forward in its efforts to reduce accidents.



In brief, the bill provides:

It is a misdemeanor to aim firearms, whether loaded or not, at or towards any human being or to wilfully discharge any firearm, air gun or other weapon . . . in a public place or in any place where there is any person to be endangered, although no injury actually results.

No minor under the age of 14 years shall handle or have in his possession or under his control, except while accompanied by or under the immediate charge of his parent or guardian, any firearm or air gun of any kind for hunting or target practice or any other purpose. Every person violating any of the foregoing provisions, or aiding or knowingly permitting any such minor to violate the same, shall be guilty of a misdemeanor.

No person, in any city in this state, shall sell, give, loan, or in anywise furnish any firearm, or air gun, or ammunition, to a minor under the age of 18 years without the written consent of his parents or guardian, or of a police officer or magistrate of such city.

Any person who violates any provision of this section is guilty of a misdemeanor.

Reports and Announcements

CIVIL SERVICE APPOINTMENTS

The United States Civil Service Commission has announced a Medical Officer examination for filling rotating intern psychiatric resident, and surgical resident positions in St. Elizabeths Hospital, Washington, D. C. The salaries for rotating interns are $2,200 for the first year and $2,400 for the second year; the salaries for psychiatric resident range from $2,400 to $4,100 a year; and for surgical resident, from $3,400 to $4,150.

To qualify, applicants for the rotating intern positions must be third- or fourth-year students in an approved medical school. Applicants for psychiatric resident and surgical resident positions must be graduates of a medical school with the degree of doctor of medicine, and must have completed a full year in an approved rotating internship. In addition to the above requirements, applicants for appointment as surgical resident must have completed three full years as residents-in-training in surgery in an approved residency. No written test is required for this examination. The maximum age limit of 35 years is waived for persons entitled to veteran preference.

Further information and application forms may be obtained at most first- and second-class post offices, from civil service regional offices, or from the U. S. Civil Service Commission, Washington 25, D. C. Applications will be accepted by the Commission's Washington office until further notice.

UNITED STATES AIR FORCE MEDICAL SERVICE

Organization of the United States Air Force Medical Service within the Department of the Air Force has been announced.

Highlight of the plan for the service is the provision assuring career opportunities for personnel. Housing for medical officers and their families, stability of assignment and opportunities for medical and scientific advancement are features of the plan.

Medical specialists are assured of opportunities for advanced training in both clinical medicine and research in aviation medicine. Professional facilities of general hospitals and laboratories, approved civilian institutions and air force facilities will be used to provide regularly spaced training tours for members of the air force medical service.

The plans are designed to correct major objections of professional people to a career in the armed forces. Medical officers will be given every opportunity to pursue their specialties and doctors and dentists who volunteer to serve for more than one year will continue to receive the extra $100 a month. Officers, nurses, and enlisted technicians who qualify and are assigned flying duties will receive additional hazard pay.

The service will be manned by both regular and reserve officers, reserve officers having the prerogative of serving limited periods of active duty. Civilians desiring regular or reserve commissions may apply directly to the Surgeon General, U. S. Air Force, Washington, D. C.

Recognition of prior professional training and previous military service will be given in original appointments. Regular and reserve officers who have had duty with the army air force may apply to the surgeon general for transfer to the new air force medical service before July 26.

RESEARCH FELLOWSHIPS AVAILABLE

The American College of Physicians has announced that a limited number of fellowships in medicine will be available from July 1, 1950, to June 30, 1951. The fellowships are designed to provide an opportunity for research training either in the basic medical sciences or in the application of these sciences to clinical investigation. They are for physicians who are in the early stages of preparation for a teaching and investigative career in internal medicine. Assurance must be provided that the applicant will be acceptable in the laboratory or clinic of his choice and that he will be provided with facilities for the proper pursuit of his work.

The stipend will be from $2,200 to $3,200.

Application forms may be obtained from the American College of Physicians, 4200 Pine Street, Philadelphia 4, Pennsylvania. They must be submitted in duplicate not later than October 1, 1949. Announcement of awards will be made in November, 1949.

COURSE IN GASTROINTESTINAL SURGERY

The National Gastroenterological Association, in cooperation with the Postgraduate Division of Tufts Medical College School and the First and Second Surgical Services of the Boston City Hospital, announces a course in gastrointestinal surgery to be given at the Boston City Hospital on October 27, 28 and 29.

The course will be under the direction of Dr. Owen H. Wangensteen, professor of surgery at the University of Minnesota Medical School, assisted by Lord Alfred Webb-Johnson, president of the Royal College of Surgeons, London, and members of the surgical staff of the Boston City Hospital.

Enrollment in the course is limited to 250, with the fee $35 per person. Veterans may take the course under the GI Bill of Rights Further information may be obtained from the National Gastroenterological Association, Dept. GSJ, 1819 Broadway, New York 23, N. Y.

AMERICAN CONGRESS OF PHYSICAL MEDICINE

The American Congress of Physical Medicine will hold its twenty-seventh annual scientific and clinical session at the Netherland Plaza Hotel, Cincinnati, September 6 through 10. Two instruction courses, each consisting of ten lectures, will be offered during the session. One course will be limited to physicians, while the other

An Announcement of

BLOOD TRANSFUSION SERVICE

The organization of the Minneapolis War Memorial Blood Bank is now complete and its services are available to the people and physicians of this area.

The bank is a non-profit, self-supporting organization sponsored by the Minneapolis Junior Chamber of Commerce under the supervision of the Hennepin County Medical Society.

G. Albin Matson, Ph.D., Director of the bank, has been active in blood banking, Rh work and research for many years. When the American Association of Blood Banks was organized, Dr. Matson was elected as its first President and is now regional member of its Board of Governors.

Dr. Matson, backed by selected personnel and excellent physical equipment, is now available to help physicians and hospitals in their studies of Rh problems, preparation of Rh hapten, management of difficult transfusions, selection of special bloods, preparation of blood products (washed red cells, red cell paste, special plasma), genetic and paternity studies, and any similar blood problems.

Dr. Matson and his staff will assist hospitals or communities in organizing blood banks. The blood banking facilities of the Upper Midwest area are to be integrated for each other's assistance in normal times and for protection in case of public disaster.

The Minneapolis War Memorial Blood Bank is available to all laboratory people for consultation and refresher study.

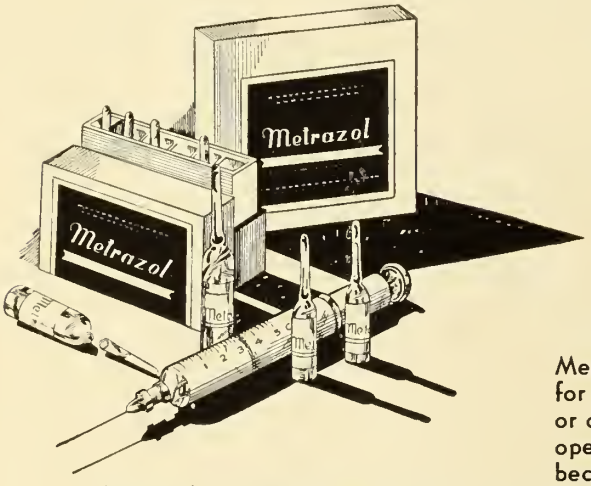
RED RIVER VALLEY SOCIETY

A meeting of the Red River Valley Medical Society was held in Warren on April 29. The principal speaker at the meeting was Dr. Harold F. Buchstein, Minneapolis neurosurgeon, who discussed brain tumors. Following his talk, Dr. Buchstein conducted a question-and-answer session on the same subject.

SCOTT-CARVER COUNTY SOCIETY

The Scott-Carver County Medical Society held a meeting in Waconia on April 22. Guest speakers at the meeting were Dr. A. I. Braude, Minneapolis, and Dr. Henry H. Young, Rochester.



SAINT PAUL SOCIETY OF INTERNAL MEDICINE

The history of the Saint Paul Society of Internal Medicine, now two years old, which grew out of a small group of Saint Paul physicians, forms an interesting account.

In the years 1945 and 1946, eight or ten Saint Paul internists formed a Journal Club to meet following the St. Lukes Hospital staff meetings. This group included Drs. J. F. Borg, J. F. Briggs, David Craig, Harvey Beek, W. Hollingshead, Dwight Martin, and Ben Sommers. During their meetings, a Saint Paul Society of Internists was discussed and planned, and a very informal meeting to discuss the formation of such a society took place in August, 1947, at the home of Dr. Ben Sommers.

The first actual meeting of the society was held Monday evening, September 29, 1947, in the Century Room of the Lowry Hotel. This meeting like those to follow was a dinner meeting, and Dr. Harold Richardson stated in a few introductory remarks that the arrival in Saint Paul, since the war, of well-trained internists had swollen the ranks to approximately fifty men specializing in this field. This number seemed sufficient to make the formation of a society both feasible and desirable for both scientific and social reasons. It was decided that the society should be open to all men limiting their practice to internal medicine, irrespective of certification by the board. Two types of membership were formed: the active membership for those men who had been certified by the board or who had practiced the equivalent of five years of internal medicine, and associate membership for those who had not practiced the full five years. Dr. John Lepak was nominated temporary chairman and was elected president at a subsequent meeting. Twenty-six members were present at this meeting.

The Saint Paul Society of Internal Medicine holds two regular meetings a year, in October and April. The meetings take place in the Lowry Medical Arts Building in the Ramsey County Library. Formal papers are presented by members of the society or by guests. Discussion of papers presented is usually active.

In Memoriam

FLORENCE A. RICHARDSON

Dr. Florence A. Richardson, for many years a practitioner in Minneapolis, died in Omaha, Nebraska, April 16, 1949.

Dr. Richardson was graduated from the University of Michigan medical school in 1895. She interned at Northwestern Hospital. She did not practice during her marriage to Dr. Oscar K. Richardson, but upon his death in 1909 resumed practice in Minneapolis.

Dr. Richardson was a member of the Alpha Epsilon Iota national medical sorority. She was a past president of the Women's Rotary Club, served as juvenile court physician and was on the health education staff of the YWCA.

Dr. Richardson is survived by a daughter, Mrs. Dorothy R. Wilbur, of Omaha.

OTTO FREDERICK SCHUSSLER

Dr. Otto F. Schussler, an orthopedic surgeon of Minneapolis, retired since 1930, died April 19, 1949.

Dr. Schussler was born at St. Cloud, Wisconsin, October 10, 1873. He attended Central High School in Minneapolis and obtained his medical degree from Hamline Medical School in 1905. His internship was served at Minneapolis City Hospital.

During the period of 1905 to 1920 he was a surgeon in contract practice in railroad construction and mining in the West. He spent a year in postgraduate study in Vienna and Berlin in 1912.

Dr. Schussler practiced orthopedic surgery in Minneapolis from 1920 to 1930 and was at one time vice president of the Fairview Hospital staff in Minneapolis. He was also a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations.

Dr. Schussler married Edith May LaMoreau. They had no children.

A few years ago the London *Spectator* offered a prize for the best philosophy of life which could be written on the back of a postcard. The entry that won the prize could almost have been written on the back of a postage stamp. There were just eight words in it: "Love, trust, dare, and go on doing it."

Woman's Auxiliary

NEW PRESIDENT EXTENDS GREETING

Mrs. H. E. Bakkila

During the next year I ask for the loyal support and help of every member of the Woman's Auxiliary to the Minnesota State Medical Association, for the work of the Auxiliary depends entirely on the effort of every individual member. If we all work together, Minnesota will have another successful year.

The Auxiliary, while not changing in its objectives and policy, has seen within the past several years, more stress placed on public relations or in a National Educational campaign. It is our duty and privilege to assist the AMA and our own Minnesota State Medical Association in an effort to educate the American public as to the advantages of voluntary health insurance and the disadvantages of compulsory or political health insurance. Each of us, if we are well-informed, can, through our many contacts with other women's clubs throughout our own counties, assist the doctors in this campaign by serving on committees, securing speakers, arranging programs, and doing such work as may be approved by the Minnesota State Medical Association.

I appreciate the honor you have shown me by electing me to serve as your president and representative. At all times I shall endeavor to carry on the high ideals set forth in the Auxiliary pledge.

MRS. WAAS NEW PRESIDENT-ELECT

Mrs. Charles W. Waas, Saint Paul, is the new president-elect of the Woman's Auxiliary, slated to move up to the presidency at the next annual meeting. Other new officers are: Mrs. Joseph M. Neal, Minneapolis, first vice president; Mrs. C. L. Sheedy, Austin, second vice president; Mrs. F. P. Moersch, Rochester, third vice president; Mrs. L. A. Stelter, recording secretary; Mrs. John Dordal, Sacred Heart, treasurer; Mrs. O. M. Heiberg, Worthington, auditor.

Mrs. Bakkila announced the following appointments May 10: Mrs. Harry Klein, Duluth, corresponding secretary; Mrs. S. S. Hesselgrave, Center City, parliamentarian; Mrs. T. O. Young, Duluth, historian; Mrs. T. N. Fleming, St. Cloud, archives; Mrs. W. H. Von der Weyer, Saint Paul, bulletin; Mrs. Mark E. Ryan, Saint Paul, cancer; Mrs. S. N. Litman, Duluth, editor, Minnesota Medicine.

Mrs. Henry Quist, Minneapolis, finance; Mrs. J. A. Cosgriff, Olivia, *Hygeia;* Mrs. L. Raymond Scherer, Minneapolis, legislation; Mrs. Virgil Schwartz, Minneapolis, medical and surgical relief; Mrs. Charles W. Waas, Saint Paul, organization; Mrs. N. O. Pearce, Minneapolis, press and publicity; Mrs. A. Christiansen, Saint Paul, printing; Mrs. David Halpern, Brewster, program and health education.

Mrs. E. W. Miller, Anoka, public relations; Mrs. H. H. Fesler, Saint Paul, resolutions; Mrs. George Penn, Mankato, revisions; Mrs. Karl Wold, Saint Paul, Mrs. O. I. Sohlberg, St. Paul, Mrs. P. S. Rudie, Duluth, Mrs. F. R. Kotchevar, Eveleth, Mrs. A. F. Giesen, Starbuck, Mrs. L. P. Howell, Rochester, social; Mrs. Leonard Arling, Minneapolis, Newsletter; Mrs. Harold C. Benjamin, Minneapolis, roster; Mrs. Reuben Erickson, Minneapolis, Workshop.

Mrs. Anthony J. Bianco, Duluth, Mrs. E. V. Goltz, Saint Paul, Mrs. F. S. McKinney, Minneapolis, Mrs. J. A. Thabes, Brainerd, Mrs. Melvin Henderson, Rochester, advisory committee; Dr. F. J. Elias, Duluth, Dr. E. M. Hammes, Saint Paul, Dr. A. E. Cardle, Minneapolis, Dr. R. N. Barr, Minneapolis, R. R. Rosell, Saint Paul, medical advisory council.

The Board approved a special Committee on Health Days, after which Mrs. Bakkila appointed Mrs. H. F. Wahlquist, chairman.

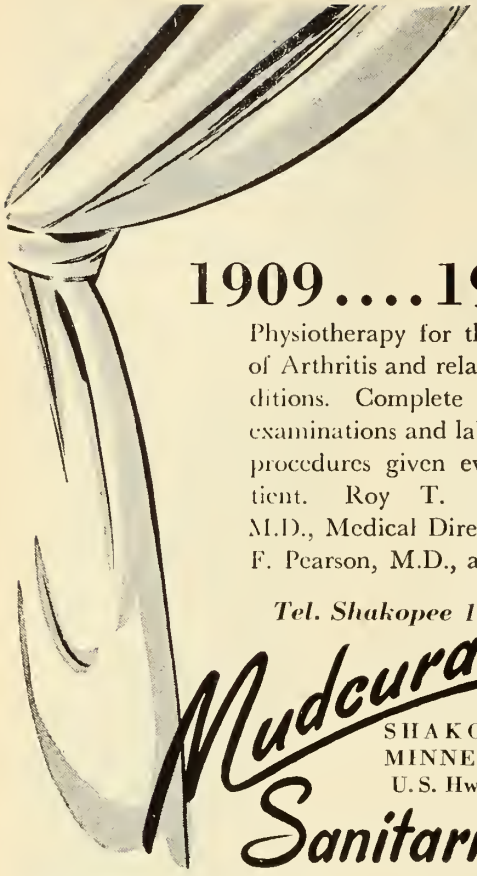
AUXILIARY OUTLINES HEAVY SCHEDULE

Meeting in annual session at Saint Paul, May 9-11, the State Auxiliary lined up a heavy schedule of work for the coming year, voting to continue projects begun this year and initiating new activities to further implement their program.

Continued will be the extensive educational campaign supplementing medical association work on three levels —national, state and county. Members will distribute informational material, fill speaking engagements and work with other groups in attaining complete public understanding of the problem of adequate medical care. At the suggestion of Mrs. O. B. Fesenmaier, the organization voted to authorize county Auxiliary presidents, with the assistance of their medical advisers, to write to presidents of other women's organizations in each county, requesting that letters opposing compulsory health insurance be written to President Truman and Minnesota congressmen.

The public relations workshop, inaugurated last fall, will be held again this fall, and Auxiliary members will continue their highly successful schedule of Community Health Days in Minnesota.

Many members attended the splendid exhibit on Auxiliary Health Days. Action was also taken to continue the *Newsletter.*



Mrs. Mark E. Ryan, speaking for the Cancer Committee, asked that a cancer chairman be appointed, whenever possible, in each county, thus further assisting the State organization's work in all fields of public health.

Growth of the Auxiliary itself was reported by Mrs. Bakkila, who listed three new county units and 539 new members, bringing the total membership to 2,048.

Mrs. S. S. Hesselgrave, who has served as a national officer, state president, parliamentarian and adviser, was made an honorary member, with all rights of membership and was presented with a gift in appreciation of her outstanding service.

AUXILIARY OUTLINES HEAVY SCHEDULE

(Continued from Page 654)

During the memorial services for deceased members, conducted by Mrs. J. F. Norman, Crookston, special tribute was paid to Mrs. James Blake, Sr., of Hopkins, past national president, former county and state president, and Mrs. A. MacLaren, St. Paul, founder of the State Auxiliary.

Fourteen past presidents attended the meeting: Mrs. Hesselgrave, Mrs. Adolph Passer, Mrs. Martin Nordland, Mrs. F. J. Elias, Mrs. E. M. Hammes, Mrs. J. F. Norman, Mrs. W. B. Roberts, Mrs. A. C. Baker, Mrs. J. J. Ryan, Mrs. F. S. McKinney, Mrs. Anthony Bianco, Mrs. E. V. Goltz, Mrs. M. S. Henderson and Mrs. J. A. Thabes.

Reports were given by county auxiliary presidents: Blue Earth, Mrs. J .D. Sjoding; Blue Earth Valley, Mrs. E. E. Zemke; Hennepin, Mrs. Reuben Erickson; Mower, Mrs. L. G. Flanagan; Olmsted-Houston-Fillmore-Dodge, Mrs. B. M. Black; Park Region, Mrs. C. A. Boline; Ramsey, Mrs. H. H. Fesler; Red River Valley, Mrs. Orlo K. Behr; McLeod, Mrs. A. M. Jensen; Renville, Mrs. J. A. Cosgriff; St. Louis, Mrs. P. S. Rudie; Southwestern, Mrs. W. J. Benjamin; Stearns-Benton, Mrs. Julius Buscher; Clay-Becker, Mrs. C. W. Moberg; Upper Mississippi, Mrs. I. L. Mitby; Wabasha, Mrs. B. A. Flesche; Winona, Mrs. A. E. Meinert.

Reports of presidents not present were filed. Practically every organized auxiliary had representation at either the Board sessions or the annual meeting.

The constitution was revised, in part, so that the Board of Directors now includes regional advisers, in addition to officers, presidents of county Auxiliaries, delegates or alternates, chairmen of standing committees and past-presidents. Section six, Article V of the by-laws was revised to read:

"Members-at-large shall pay to the state treasurer one dollar initial fee and annual dues of one dollar payable January 1, plus the per capita fee due the Woman's Auxiliary to the American Medical Association."

Mrs. H. F. Wahlquist, 1948-49 president, was given an enthusiastic ovation as she turned over the duties of her office to Mrs. Bakkila.

Said Mrs. Wahlquist: "I know of no other group I should be more honored to serve. The happiness you have given me through your loyalty and co-operation is inexpressible."

Referring to the work the Auxiliary has done, under the sanction of the State Medical Association, Mrs. Wahlquist pointed out, "With this (Auxiliary) membership go opportunities of service and leadership. We all recognize clearly now that an organization which is not behind worthwhile projects is not worthy of existing—social entertainment is not enough today."

STATE LEGISLATURE PASSES HEALTH BILLS

Mrs. Elmer M. Rusten

In the 1949 session of the Minnesota Legislature 1,665 bills were introduced in the Senate and 1,839 bills in the House, of which a total of 724 bills became law.

(Continued on Page 658)

WHEN OBESITY IS A PROBLEM

Clinicians have long noted that the forward bulk of the heavy abdomen with its fat-laden wall moves the center of gravity forward. As the patient tries to balance the load, the lumbar and cervical curves of the spine are increased, the head is carried forward and the shoulders become rounded. Often there is associated visceroptosis. Camp Supports have a long history among clinicians for their efficacy in supporting the pendulous abdomen. The highly specialized designs and the unique Camp system of controlled adjustment help steady the pelvis and hold the viscera upward and backward. There is no constriction of the abdomen, and effective support is given to the spine. Physicians may rely on the Camp-trained fitter for precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

STATE LEGISLATURE PASSES HEALTH BILLS

(Continued from Page 656)

Among the bills involving medicine to become law, the following seem particularly worthy of comment:

Multiple County Health Units Bill.—This was essentially the same bill which failed to pass two years ago. It makes permissible the establishment of multiple county health departments, with the use of federal funds allocated for this purpose, if and when they are made available.

Control of Incorrigible Tuberculosis Patients.—A great deal of confusion has existed up to the present time as to where responsibility resides in re-committing incorrigible tuberculous patients who leave, without authority, the sanatoria where they are undergoing treatment. This bill strengthens and clarifies present laws with respect to these undisciplined persons who can easily become public health menaces if they are not properly handled.

Pasteurization Bill.—No milk, cream, or fluid milk products may be sold unless pasteurized. (Casual sales on farms excepted). This bill was submitted primarily in the interest of better control of brucellosis. The morbidity rate from brucellosis has increased five times in the last ten years.

Cancer Statistical Research.—This legislation is designed to make cancer and tumor cases reportable to the State Health Department and to protect hospitals and physicians in their reporting of these cases.

Legislation to permit the use of unclaimed dogs in public pounds by the State University for research purposes. These animals have remained unclaimed in pounds for long periods and would otherwise be destroyed.

Legislation to expand the State Mental Health Program and provide an increased appropriation for that purpose. This legislation outlined principles and goals and dealt with the educational and preventive aspects of a strong mental health program for the State. It provided for a Commissioner of Health to direct the state program to be appointed by the head of the Department of Public Institutions, selected as the State Agency through which any state, federal or other funds are to be allocated. The Minnesota State Medical Association tried to amend the bill to stipulate that the preventive aspects should reside with the Minnesota Department of Health under the direction of its trained professional staff. It is hoped that the actual administration of the program will be so handled.

Control of the BB or Air gun was affected when the Minnesota legislature enacted into law legislation which classifies this weapon as a "firearm" and subjects the BB gun to the same controls as any gun, pistol, revolver or other firearm. Sight-saving groups were particularly interested and active in the passage of this measure.

Of General Interest

"Let's Talk About Health," the weekly quarter-hour radio program presented by Dr. Robert N. Barr of the Minnesota Department of Health, is now heard at a new time—7:00 p.m. on Mondays—over Station KUOM. During July, representatives of four divisions of the health department will give the following talks on this program: July 4—How to Enjoy a Holiday. July 11—The Story of Askov. July 18—Eating Without Regrets. July 25—Safety on the Farm.

* * *

Dr. Ralph J. Eckman Duluth, was the principal speaker at the annual ladies' night meeting of the Brotherhood of Lakeside Bethany Lutheran Church in Duluth, on May 10. Dr. Eckman spoke on "Socialized Medicine."

* * *

The Northwestern Clinic in Crookston acquired a new radiologist in April when Dr. George S. Boyer became a member of the staff. A graduate of the University of Oregon Medical School in 1938, Dr. Boyer served in the air forces from 1939 to 1946. For the past three years he has studied radiology at the University of Minnesota Hospitals.

* * *

Dr. Ernest Gellhorn, professor of neurophysiology at the University of Minnesota, has been invited to address the Royal Society of Medicine in London on September 13. The subject of Dr. Gelhorn's talk will be "The Physiological Basis of Shock Therapy of Mental Diseases."

* * *

Following the completion of the north section of a new medical clinic building in Northfield, Dr. Stanley T. Kucera opened his offices in the building on May 2. Dr. Warren E. Wilson and Dr. Bernard Street planned to move their offices into the new building as soon as the other wing of the structure could be completed.

* * *

Dr. Eugene L. Bauer has opened an office in the Lowry Medical Arts Building, Saint Paul, where he will specialize in otolaryngology. Dr. Bauer recently completed a fellowship in the Mayo Foundation in Rochester.

* * *

At the annual banquet of the University of Minnesota chapter of Nu Sigma Nu medical fraternity, held at the Minnesota Club, Saint Paul, on April 20, the principal speaker was Dr. Stuart Graves, dean emeritus of the University of Alabama School of Medicine. Dr. Graves was introduced at the banquet by Dr. Charles N. Hensel, Saint Paul, president of the board of governors of the Twin Cities Alumni Association of the chapter.

* * *

It was announced late in April that the practice of Dr. J. C. Klein in Shakopee had been acquired by Dr. Lawrence H. Heinz and his wife, Dr. Ivy B. Heinz, of Wabasso The husband-wife medical team planned to arrive in Shakopee about June 1 to take over the practice. Dr. Klein, a graduate of Marquette University, who has practiced in Shakopee since 1936, planned to spend the summer in northern Minnesota.

* * *

"Emotional Problems of Children," was the title of a talk presented by Dr. Edward D. Anderson, Minneapolis, at a meeting of the Lake Harriet Parent-Teachers Association in Minneapolis on May 10.

* * *

Dr. John J. Bittner, professor of cancer research and director of cancer biology at the University of Minnesota, was invited by the Vatican Academy of Science to participate in an international cancer conference in Rome in early June. Unable to make the trip to Rome, Dr. Bittner prepared a paper on "Etiology (Theory of Causation) of Mammary Cancer in Mice," which was read at the conference by Pietro Rondoni, professor of general and experimental pathology at the University of Milan, Italy.

* * *

At a meeting of the Mora Civic Club on April 22, Dr. Willard F. Nordman, as guest speaker, advocated the hiring of a county nurse, a move being considered in Kanabec County at the time. Dr. Nordman pointed out the value of having a county nurse, especially as an aid in the control of tuberculosis in the county.

* * *

Speaking at a meeting of the Monroe Parent-Teachers Association in Duluth on April 21, Dr. Karl E. Johnson, Duluth, said that the effects of compulsory health insurance would be similar to the abuses of "sick call" in the armed forces. Pointing out that the government health plan would promote complaints of insignificant ailments, the ex-navy physician said, "If the same proportion of civilians came in for medical attention as reported for sick call in our unit, we would have about 3,600 persons a day crowding our offices in Duluth under a system of compulsory health insurance."

* * *

Among physicians attending a six-day continuation course in proctology at the University of Minnesota, April 11 through 16, were Dr. Frederick W. Behmler, Morris; Dr. C. H. Holmstrom, Warren; Dr. Paul F. Meyer, Faribault, and Dr. Troy G. Rollins, Elmore. In addition to lectures at the Center for Continuation Study, clinics were held at Minneapolis General Hospital and the Veterans Hospital.

* * *

Dr. Nora M. C. Winther, Minneapolis, left for England on May 12 to attend an obstetrics and gynecology conference in London.

* * *

It was announced in April that Dr. H. K. Helseth of Fergus Falls had moved to Mott, North Dakota, where he intended to go into private practice.

According to an announcement on May 3, grants of $293,452 to support laboratory and clinical research and $79,853 for research facilities were recently made by the National Cancer Institute. The grants were approved by Surgeon General Leonard A. Scheele of the Public Health Service following recommendation by the National Advisory Cancer Council.

* * *

Two Rochester physicians were on the program at a meeting of the Southwestern Minnesota Medical Society in Worthington on April 25. Dr. David C. Dahlin spoke on "Carcinoma of the Uterus," and Dr. Charles F. Stroebel presented a paper on "Recent Advances in Hematology."

* * *

In April, Dr. Lester N. Dale, Red Lake Falls, announced that Dr. James Reinhardt would become associated with him in the Red Lake Falls Clinic early in July. Dr. Reinhardt, formerly of Detroit Lakes, is a graduate of Temple University. He served his internship at Northwestern Hospital, Minneapolis.

* * *

At a meeting of the Iowa State Medical Society in Des Moines on April 21, Dr. Arthur M. Olsen spoke on "Differential Diagnosis of the More Common Pulmonary Conditions."

* * *

Two Duluth organizations recently heard talks on government medicine by Dr. Arnold O. Swenson, Duluth. Speaking at a meeting of the Duluth Optimist Club on April 22, Dr. Swenson urged club members to oppose national compulsory health insurance. On May 6, at a meeting of the West Duluth Women's Club, Dr. Swenson spoke on "Socialized Medicine in Europe."

* * *

It is better to live well than long, Dr. Thurman B. Rice, head of the department of public health at Indiana University, told an audience at the Ramsey County Health Day in Saint Paul on April 21.

Saying that the important thing about living is to have fun, Dr. Rice stated that the average limit of human life will probably be the Biblical three-score-and-ten years and that it is better to enjoy a short life than endure a long one. Death for old people, he said, as a rule, is a relief, not a curse. He suggested that the way to grow old gracefully is to enjoy life as it comes, to realize it is right that changes in life come when they do.

* * *

Dr. Marjorie M. Pyle, of Mineral Springs Sanatorium at Cannon Falls, was one of six persons in the nation to receive a tuberculohis research fellowship, it was announced by the American Trudeau Society at a meeting in Detroit on May 1. The award was presented at the society convention, which was attended by 2,000 physicians' nurses and health workers from all parts of the country.

* * *

Announcement was made on April 17 that Dr. Jack E. Geist, Saint Paul, had been commissioned a first lieutenant in the regular army medical corps.

Members of the Rice County Medical Society, meeting in Faribult on April 27, heard Dr. M. W. Anderson, Rochester, speak on "Treatment of Coronary Heart Disease." On May 4, Dr. Anderson spoke on the same subject at a meeting of the Lyon-Lincoln County Medical Society in Marshall.

* * *

On May 2, Dr. G. Albin Matson, formerly of Salt Lake City, became director of the Minneapolis War Memorial Blood Bank. Dr. Matson, former president of the American Association of Blood Banks, has published eighteen papers on his investigative work concerning the blood Rh factor. In Salt Lake City he was director of the city's centralized blood banking system. The Minneapolis War Memorial Blood Bank was set up by the Junior Chamber of Commerce with the encouragement and assistance of the Hennepin County Medical Society.

* * *

A feature of the Faribault Lions Club meeting on April 21 was the presentation by Dr. James J. Kolars of a wire-recorded address on "Socialized Medicine" by the president of the AMA.

* * *

At a meeting in April, two Minneapolis physicians were honored by Fairview Hospital authorities for more than thirty-three years of service as members of the hospital staff. The hospital board presented honorary scrolls to Dr. Henry Lysne and Dr. Ivar Sivertsen, commending them for their years of "cheerful service, superior leadership, high standards and unselfish loyalty."

* * *

A Rochester physician, Dr. Russell Wilder, is one of the first two men to receive the Howard Taylor Ricketts award for outstanding medical work. The award was presented at the University of Chicago on May 23. The other recipient of the award was Dr. Ludvig Hektoen, who was the first chairman of the University of Chicago's pathology department.

The award was established by the wife of the late Dr. Ricketts, who died of typhus fever while investigating the disease in Mexico City. Dr. Ricketts identified the causative organisms of Rocky Mountain spotted fever and typhus fever.

Dr. Wilder worked with Dr. Ricketts in Mexico City and, after the death of Dr. Ricketts, remained to complete the typhus investigation.

* * *

One of the speakers at the annual convention of the Minnesota Society of Medical Technologists in Minneapolis on May 28 was Dr. George Moore, instructor in surgery at the University of Minnesota.

* * *

After a discussion of socialized medicine by three Hibbing physicians, the Hibbing Chamber of Commerce went on record on April 19 as opposing the government health plan and sent telegrams to congressmen to that

effect. The disadvantages of the government plan were discribed to the group by Dr. Bertram S. Adams, Dr. Francis W. Bachnik and Andrew Sinamark, all of Hibbing.

* * *

Hard-boiled treatment of the tuberculous person who, knowing he has the disease, exposes others, was recommended by Dr. Helen A. Dickie, of the University of Wisconsin School of Medicine, at the twenty-ninth annual meeting of the Tuberculosis and Health Association of St. Louis County in Duluth on April 19.

Such a person "is as much a homicidal criminal as the person who causes death violently," Dr. Dickie stated. "Kid-glove handling of problem cases is outdated. The public attitude toward such cases should not be just firm. It should be hardboiled," she told the association members.

Among the officers of the St. Louis County Tuberculosis and Health Association are Dr. G. A. Hedberg, Nopeming, first vice president; Dr. Robert P. Pearsall, Virginia, second vice president, and Dr. Mario Fischer, Duluth, treasurer.

* * *

At a meeting of the Lyon-Lincoln County Medical Society in Marshall on May 4, Dr. L. O. Underdahl, Rochester, presented a paper on "Present-day Treatment for Hyperthyroidism."

* * *

The regular spring chest clinic in Stillwater was conducted on April 25 by Dr. Karl H. Pfuetze, medical director of Mineral Springs Sanatorium at Cannon Falls.

* * *

Dr. R. F. Mears, Northfield, was elected chairman of the regional medical committee for the Saint Paul Red Cross Blood Center at a meeting in Saint Paul on May 10. As an advisory group, the committee will help direct the program in the 150-mile area covered by the blood-mobile which operates out of Sanit Paul. Other regional officers of the committee are Dr. A. G. Liedloff, Mankato, vice chairman, and Dr. E. V. Goltz, Saint Paul, secretary.

* * *

In Fairmont, Dr. E. A. Thayer has moved his offices into the former Bailey Hospital building, which he recently acquired. The building has not been used as a hospital for many years, but until recently it housed the offices of Dr. Robert Bailey, son of the founder, and Dr. Carl W. Krause. Dr. Bailey is no longer located in Fairmont, and Dr. Krause has transferred his offices to another building which he recently purchased.

* * *

Dr. D. R. Gillespie, Saint Paul, has been named chairman of the Saint Paul Area Public Health Council, a group composed of representatives of fifty-two private and public health organizations. One of the vice chairmen of the council is Dr. Robert B. J. Schoch, Saint Paul.

A continuation course in medicine for general practitioners was held May 12 through 14 at the University of Minnesota Center for Continuation Study. The general theme of the course was the study of blood and blood diseases and allergies. Among the guest speakers was Dr. Bruce K. Wiseman, chairman of the Ohio State University department of medicine.

* * *

Superintendents of the state's ten mental hospitals met with state officials in Saint Paul on May 2 to plan the start of Minnesota's $28,000,000 mental health program. The hospital heads conferred with Carl Jackson, state director of public institutions, and with Governor Luther Youngdahl to consider methods for improving the care of the state's 15,000 patients.

Among the superintendents who attended the conference were Dr. Stanley B. Lindley, Willmar; Dr. W. L. Patterson, Fergus Falls; Dr. E. J Enberg, Faribault; Dr. M. C. Peterson, Rochester; Dr. Burton P. Grimes, St. Peter; Dr. Henry Hutchinson, Moose Lake; Dr. R. J. Gully, Cambridge, and Dr. Ralph Rosen, Hastings.

* * *

The Otter Tail-Wilkin County Council of the American Legion, at a meeting in Henning on April 13, adopted a resolution that Minnesota members of congress be urged to push for a higher wage scale for medical employes of Veterans Administration hospitals and authorize the administration to meet outside competition in hiring physicians.

Dr. Louis E. Prickman, Rochester, was elected president of the Central Clinical Research Club at a meeting of the organization in St. Louis late in April.

* * *

A discussion on the topic, "Would We Benefit from a Compulsory Health Plan?" was held in the Hallie Q. Brown House, Saint Paul, on April 24. Speaking in favor of the plan were John C. Kidneigh, associate director of the University of Minnesota School of Social Work, and Dr. Max Seham, Minneapolis. Opposing the compulsory health plan were Dr. Herbert F. R. Plass, Minneapolis, and Dr. Charles E. Rea, Saint Paul.

* * *

The University of Minnesota was recently granted $2,940 by the American Heart Association to support the research of Dr. Roger M. Reinecke, assistant professor of physiology, who is studying the function of potassium in blood plasma in relation to contraction of the heart muscles.

* * *

In Austin it was announced in April that a committee had been appointed to study the feasibility of forming a county-city public health organization. The committee planned to meet with Dr. Paul C. Leck, Austin physician, who had previously worked on a preliminary survey of community health.

* * *

A former Saint Paul resident, Dr. Dean Clark, was recently named director of the Massachusetts General Hospital in Boston.

At a meeting of the International Falls Rotary Club on April 20, Dr. Edward B. Kinports discussed the history of the army medical corps and the scientific improvements that have enlarged the scope of its service during hostilities.

* * *

It was announced in April that Dr. Kirk Douglas, formerly of Tacoma, Washington, had joined the staff of the St. Peter Clinic and was associated in practice with Dr. E. G. Olmanson. A graduate of the University of Minnesota Medical School in 1939, Dr. Douglas served his apprenticeship at Tacoma General Hospital and later entered private practice in Tacoma.

* * *

A debate on compulsory health insurance was held in Rochester on May 2 under the sponsorship of the Association of Fellows of the Mayo Foundation. Engaging in the debate were Dr. J. W. Beeler, Dr. J. W. Faulkner, Dr. R. D. Miller, and Dr. E. E. Harnagel. Dr. James D. Rogers acted as moderator.

* * *

It was announced late in April that Dr. Allen G. Janecky of Warroad would soon become associated in practice with Dr. A. A. Brink and Dr. Leonard Prochaska in Baudette. The three physicians plan to construct a modern clinic building in Baudette to house their offices.

* * *

An outpatient mental hygiene service for children is expected to be available in Minneapolis by late summer. Known as the Washburn Memorial Clinic, the mental hygiene unit will occupy the first floor of the Martin wing of St. Barnabas Hospital.

The clinic is being established by the trustees of the Cadwallader C. Washburn estate, and the professional staff will be supervised by Dr. Donald W. Hastings, head of the department of psychiatry at the University of Minnesota. The plan to create the clinic is strongly supported by public and private agencies devoted to social work.

* * *

Dr. Robert S. Clark, recently discharged from the navy, has announced his association in practice with the Richards Clinic in St. Cloud. A graduate of the University of Minnesota Medical School, Dr. Clark served his internship at Ancker Hospital, Saint Paul. In St. Cloud he will be associated as a general practitioner with Dr. W. B. Richards and Dr. F. L. Vrtiska.

* * *

Dr. Olaf I. Sohlberg, Saint Paul, has been re-elected president of the Minnesota Medical Service. Other officers of the organization are Dr. Richard R. Cramer, Minneapolis, vice president; Dr. C. A. McKinlay, Minneapolis, secretary, and Dr. W. A. Coventry, Duluth, treasurer.

* * *

During May, approximately 4,000 Minneapolis high school seniors received tuberculin skin tests and chest x-rays. The free tests were part of a tuberculosis prevention program sponsored by the Hennepin County Tuberculosis Association.

TEACHING FACULTY — ATTENDING STAFF OF COOK COUNTY HOSPITAL
Address: Registrar, 427 S. Honore St., Chicago 12, Ill.

Dr. William B. Gallagher began practice in Waseca in April, taking the place of his father, Dr. B. J. Gallagher, who was confined as a patient in a Rochester hospital. A graduate of the University of Minnesota Medical School, Dr. William Gallagher served his internship at Milwaukee County Hospital, Milwaukee.

* * *

An effort to persuade thirty interns in Twin Cities hospitals to enter the state hospital system was made at a dinner meeting in Hastings on May 13.

The advantages of serving in state mental hospitals were pointed out to the interns by Governor Luther Youngdahl, Dr. F. J. Braceland, head of psychiatry at the Mayo Clinic, and his associate Dr. Howard Rome. Governor Youngdahl said that Minnesota can now pay "fairly decent financial remuneration." "In addition," he said, "we have a lot of fine men in the state hospital system, and we intend to get others who represent the best in the country."

Dr. Braceland stated that although epidemics are now fairly well controlled, "there is going to be an increase in nervous diseases because of the kind of world we live in. . . . But no matter what branch of medicine you choose to follow, you'll find it here in the state hospital."

Reminding the interns that emotional problems are a component of illness in a large percentage of patients, Dr. Rome said, "The frontiers of medicine lie in psychiatry. The fields of research and psychiatry are limitless."

A talk on socialized medicine was given by Dr. W. B. Richards, St. Cloud, at a joint meeting of the Women's Society of World Service and the Brotherhood of the Evangelical United Brethren Church in St. Cloud on May 12.

* * *

On March 26, Governor Luther Youngdahl signed a bill providing that unclaimed pound animals, which would otherwise be destroyed, be made available to biological institutions within the state. Minnesota thus became the first state to provide for statewide assistance in the procurement of animals for medical, dental and veterinary studies. About twenty municipalities had previously taken similar action.

The action of the Minnesota State Legislature is in contrast to the experience in Massachusetts, Pennsylvania and Illinois, where the opposition of the anti-vivisectionists is aided by the Hearst newspapers. The Minnesota law provides for licensing research institutions by the State Livestock Sanitary Board, which reserves the right to inspect or investigate at any time any institution that has applied for or received a license.

The Hebrew University—Hadassah Medical School, the first medical school to be established in the new state of Israel, opened its doors on May 17 as a joint undertaking of the Hebrew University and Hadassah, the Women's Zionist Organization of America. Until security conditions permit continuation of construction on Mt. Scopus, the school will be housed in four hospital units in Jerusalem. A campaign sponsored by Hadassah and the American Friends of the Hebrew University is presently engaged in raising the $5,500,000 needed to complete the school. Almost $4,000,000 has already been raised.

BLUE SHIELD NEWS

To date this year, Blue Shield had made payment on 6,734 medical claims in the total amount of $264,321.42. Payment was made for 1,857 cases during April amounting to $73,204.85. Medical payments for April totaled $18,600.50; surgical payments for April totaled $49,878.85, and obstetrical payments for April totaled $4,725.50. Approximately 100 claims for Blue Shield benefits are originated daily, the average weekly payment on such claims amounting to about $17,000,000. At the end of April, approximately 180,000 people in Minnesota were eligible for Blue Shield benefits.

Blue Shield is unique in that its business requires the close attention and co-operation of people outside the office itself. Its efficient administration is just as de-

pendent on the doctor and his office personnel as it is on the employes of Minnesota Medical Service, Inc. With this thought in mind, a series of luncheon meetings is being held to which doctors, nurses, secretaries, technicians, and other office personnel are invited. The benefits of the Blue Shield contract are reviewed and discussed, and the actual processing of medical claims is outlined. The most direct contact with the Blue Shield subscriber is through the doctor's office personnel; therefore, it is believed these meetings are of inestimable value to all concerned. Each doctor's office will be contacted relative to these meetings, and it is urged that every effort be made to have at least one representative of each office attend.

The Blue Shield office wishes to acknowledge the courtesy and interest shown its exhibit during the annual meeting of Minnesota State Medical Association. It was particularly gratifying to have an opportunity to meet personally many of the doctors with whom Blue Shield business is transacted.

PREOPERATIVE AND POSTOPERATIVE CARE OF SURGICAL PATIENTS. Hugh C. Ilgenfritz, A.B., M.D., F.A.C.S. 898 pages. Illus. St. Louis: C. V. Mosby Co., 1948.

This comprehensive book discusses preoperative and postoperative care with a somewhat different viewpoint than the average. There are extensive chapters on fluid and electrolyte balance, metabolism and nutrition, as well as the general preoperative, sedative and postoperative measures.

Shock, transfusions and systemic complications are treated separately and very thoroughly. The use of chemotherapy and antibiotic drugs are very fully discussed and are up to date in all its phases. The various systems are treated separately in regard to surgery except for urologic surgery. The only references to the urinary tract are in regard to complications of other diseases, and the reasons for its omission are not indicated in the book. This is a field in which many general surgeons are interested, and as it is assumed that this book is intended for that group of surgeons; its omission would appear ill advised.

The Appendix lists various aids to diagnosis in regard to x-ray, and illustrates various methods of intravenous infusion and oxygen therapy.

On the whole, this book is an excellent review of the subject with the exception noted of the omission of urinary tract surgical care.

C. M. Bagley, M.D.

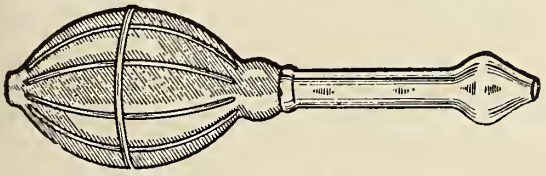
OPERATIVE SURGERY. By Frederick C. Hill, B.A., M.S. (Surg.), M.D., Associate Professor of Surgery, The Creighton University School of Medicine, Omaha, Nebraska. Foreword by Charles W. Mayo, B.A., M.S. (Surg.), M.D., Section on Surgery, Mayo Clinic, Rochester, Minnesota. Illus. 698 pages. $12.75. New York: Oxford University Press, 1949.

This book is designed primarily for the intern, resident and less experienced surgeon, and except for brief notes on preoperative and postoperative care and the lesions involving various organs, it deals purely with surgical technique. Diagnosis and indications are only lightly touched upon. The author, who is associate professor of surgery at Creighton University and received his formal training at the Mayo Clinic, claims no originality of material.



The first chapters are concerned with general principles, the handling of instruments, sutures and knot tying. Popular methods of suturing are illustrated. Subsequent chapters include descriptions of the more common operations performed in general surgery, gynecology and genito-urinary surgery. As a rule, one operation is described in detail for each surgical condition mentioned, preceded by a brief description of the gross pathologic condition concerned. These are standard procedures reflecting the author's preference and training.

The text is clear and concise, and the illustrations are well done but limited in number and detail. The sections on thyroid, breast, gastrointestinal tract and uterus are given special attention, and numerous drawings supplement these chapters. Otherwise only two or three figures appear with each operation.

This volume can be recommended to those entering the field of general surgery as an authoritative work on accepted surgical techniques. Nothing is included which does not have practical application and has not withstood the test of time.

What Is Mental Illness?

Mental illness is an ailment which causes us to act in a way which is not accepted as being normal by the society in which we live. Some people suffer from peculiarities of behavior which leave them in the full use of all their faculties. Mental illnesses of others make them dangerous to themselves and to people and leave them without the full use of their faculties at all times.

The psychosomatic price

The tensions of modern living demand a price that is frequently gastrointestinal injury, occasionally peptic ulcer. The prevention and cure of peptic ulcer embrace the application of hygienic, psychiatric, dietary, and therapeutic techniques to this problem.

Logically, therapy should include the administration of materials which will tend to reduce the acidity of the gastric content without producing alkalosis or other undesirable effects. Coincidentally, a demulcent effect should be sought to coat the ulcerated surfaces and protect them from erosion. *Lederle* research has found that a casein, low in sodium, high in calcium, in appropriate form, when given by mouth will accomplish these ends and provide the patient with prompt symptomatic relief.

LEDERLE LABORATORIES DIVISION

AMERICAN Cyanamid COMPANY
30 ROCKEFELLER PLAZA • NEW YORK 20, N. Y.

biliary "thaw"

In noncalculous cholangitis, stasis within the common duct often underlies ascending infection. Inflammation and narrowing of the lumen fosters partial obstruction and accumulation of purulent matter. The dynamic action of *Decholin Sodium* and *Decholin*—hydrocholeresis—overcomes this biliary stasis. Under hepatic pressure copious, watery bile sluices down the biliary ducts like a spring thaw, carrying off pus, debris, mucus and stagnant bile. With drainage thus re-established the systemic response is improved.

Therapy should be initiated with small, progressively increasing doses of *Decholin Sodium* given intravenously, followed by a course with *Decholin* tablets.

Decholin®

brand of dehydrocholic acid

Tablets of 3¼ gr. in bottles of 25, 100, 500, and 1000.

How mild can a cigarette be?

DOCTORS REPORT

In a recent test of hundreds of people who smoked only Camels for 30 days, noted throat specialists, making weekly examinations, reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION DUE TO SMOKING CAMELS!"

SMOKERS REPORT

"I MADE MY OWN PERSONAL 30-DAY TEST! NOW I KNOW—CAMELS ARE THE MILDEST, BEST-TASTING CIGARETTE I EVER SMOKED!"

Sylvia MacNeill SECRETARY

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

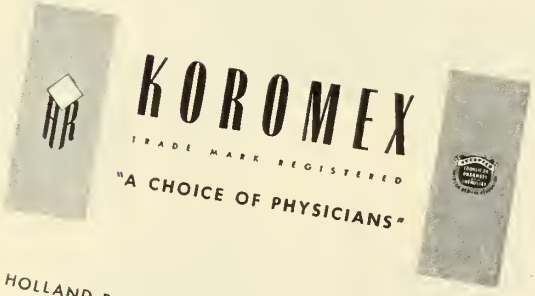
According to a Nationwide survey:

More Doctors smoke **Camels**

than any other cigarette

Doctors smoke for pleasure, too! And when three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel

INTRODUCING...



THE KOROMEX JELLY REFILLABLE UNIT

Physicians acclaim the new Koromex all inclusive contraceptive unit. This fine container is ivory-colored plastic, permanent, dust-proof, attractive for home use and ideal for traveling. It contains two regular size tubes of Koromex Jelly which rest in individual compartments . . . a Koromex Diaphragm stored in the ingeniously constructed cover compartment . . . and a Koromex Measured Dose Plunger Applicator that rests securely on its own rack.

Where pregnancy is contra-indicated, recommend the complete Koromex Jelly Refillable Unit to your discriminating women patients.

For those of your patients who require a slightly less lubricating but equally effective spermicidal preparation, a similar companion package containing two tubes of Koromex Cream instead of Koromex Jelly is also available.

ACTIVE INGREDIENTS: BORIC ACID 2.0% OXYQUINOLIN BENZOATE 0.02% AND PHENYLMERCURIC ACETATE 0.02%, IN SUITABLE JELLY OR CREAM BASES.

MEAT...

And This Protein Era

"Today we are in the protein era."* This terse but meaningful statement, made by an outstanding authority in a recent review on the progress of nutrition, reflects an accomplishment of utmost significance.

This résumé of modern nutrition concepts shows convincingly that the recognition of the vital role of protein in health and disease ranks among the great advances of medicine.

The therapeutic use of a high protein dietary has revolutionized the prognostic outlook in many hepatic diseases formerly considered resistant to treatment.

The use of high protein dietaries has resulted in a gratifying reduction of surgical morbidity and mortality, made possible by systematic presurgical nutritional build-up of the patient. Through this same approach, wound healing and general recovery are greatly promoted.

In nephritis and nephrosis, at one time considered absolute contraindications for animal protein in the dietary, the use of protein in liberal amounts can significantly reduce mortality and decidedly improve the clinical condition.

The benefits derived from high-protein nutrition in pregnancy and lactation are diversified and far-reaching, embracing both mother and offspring. For this reason, a generous extra serving of meat, given daily as a routine measure, has been strongly recommended as a means of improving the health of mother and child.

Meat is rightfully regarded as an outstanding protein source. It is notably rich in protein. The protein of meat is biologically complete, capable of satisfying all protein needs of the body from childhood to old age. And, particularly important in disease, the excellent digestibility of meat gives virtual assurance that its protein and other valuable nutrients become available for utilization.

many things to consider

The choice of an oral estrogen depends on many factors—potency, dosage, safety and cost. On the basis of cost alone, a sound choice is difficult. An oral estrogen that appears to "cost less" may be wanting in potency; another may provoke troublesome side actions. On the basis of potency, however, the differences among oral estrogens are enlightening.

ESTINYL

(brand of ethinyl estradiol)

is by far the most potent oral estrogen

in clinical use today. ESTINYL* is from 7 to 87 times as potent as the most active stilbenes in use. ESTINYL is given in almost incredibly small dosage—as little as 0.02 mg. (1/3200 gr.) which is sufficient to control menopausal symptoms in many cases.

This extraordinary clinical activity has practical importance. It is characterized by virtual freedom from untoward reactions. Such low dosage obviously results in lower cost.

There are many things to consider in choosing an oral estrogen. Duly considered, ESTINYL is an oral estrogen *of choice.*

ESTINYL Tablets, 0.02 or 0.05 mg., in bottles of 100, 250 and 1000.

ESTINYL Liquid, 0.03 mg. per 4 cc. (teaspoonful), in bottles of 4 and 16 oz.

THE HIGH-PROTEIN INFANT FOOD

The incidence of mild protein deficiencies in children, predisposing toward infections and edema, is reported[1,2] much greater than generally realized. Infant and adolescent requirements—not only for tissue repair and maintenance, but also for growth—are much higher than in adulthood.[3] To insure adequate protein intake in infancy, DRYCO—Borden's high-protein infant food—is ideally suited as a basis for formula building. It furnishes *all the essential amino acids.* Its low fat content minimizes gastro-intestinal upsets due to fat intolerance, while its intermediate carbohydrate content lends itself for prescription with or without added carbohydrate. Quickly soluble in cold or warm water, DRYCO contains adequate vitamins A, B_1, B_2 and D, plus essential milk minerals.

★ *Epileptic Men of Genius* ★

The famous English poet, Algernon Charles Swinburne, who began to show signs of epilepsy at the age of 25, is a prominent example that despite epilepsy a man may develop to true greatness.

Comparative studies have shown that in some cases better control of grand mal as well as petit mal seizures can be obtained with Mebaral than with corresponding doses of other antiepileptic drugs. Mebaral produces tranquillity with little or no drowsiness. It is particularly desirable not only in epilepsy but also in the management of anxiety states and other neuroses. The fact that Mebaral is almost tasteless simplifies its administration to children. Average dose for children ½ to 3 grains, adults 3 to 6 grains daily. Tablets ½, 1½ and 3 grains.

THERAPEUTIC PROBLEMS ENCOUNTERED IN ACUTE POLIOMYELITIS

ROBERT B. LAWSON, M.D.

Winston-Salem, North Carolina

MANY PEOPLE speak of poliomyelitis in the same way that they do of the weather, that is, we know a lot about it, but we cannot do anything to control it. In general, this may be true insofar as the control of epidemics is concerned, and it is also probable that we will be able to do little about this phase of the problem until a satisfactory method of vaccination is perfected. At present our main efforts are directed against the mortality and complications of the acute phase, and toward improved muscle re-education and rehabilitation of the subacute and convalescent stages. These latter phases of the problem are extraordinarily important but do not lie in the province of this paper. The aim of this paper is to review the therapy of the acute phase. It is particularly important that all practitioners be aware of the problems encountered in the acute case since decisions about therapy are frequently made while waiting for transfer of the patient to a "polio center."

Specific therapy against the poliomyelitis virus has not yet been found. Immunotherapy with antiserums from horses or convalescent serum from human cases no longer is accepted as being of real value. Convalescent serum is still used in a few places with the feeling that it might do some good but at least does no harm. However, the experience of the early thirties with comparisons of carefully controlled groups of treated and untreated cases has taught us the futility of serum therapy. This has been re-emphasized recently by the carefully controlled studies of Bahlke and Perkins, in which no therapeutic effect followed the administration of large doses of gamma globulin representing huge amounts of human plasma.[1]

Numerous drugs have been suggested in the past and have been tried in sporadic instances. In some cases coincidental improvement occurred, so that false hopes for a cure arose. The most recent drug to be given a clinical trial was phenosulfazole, or "darvisul," which came to attention this past summer. Because of some encouraging experiments with a mouse encephalomyelitis virus carried out by Sanders, this drug was used rather extensively in Texas and North Carolina in 1948. Unfortunately, the resultant publicity was a little premature, as well as somewhat overly optimistic, and the lay press assumed that a cure had been found. Our experience with phenosulfazole began somewhat late in our epidemic, but recognizing the need for a controlled study, we alternated early nonparalytic cases in order to compare the results in treated and untreated cases.† In a disease as variable as poliomyelitis it must be emphasized that the results of isolated treated cases have no significance, and that one cannot compare the results in different epidemics or patients treated at different periods during the same epidemic. Due to the limited supplies of the drug, at first we limited our cases to alternate nonparalytic children and to all patients with bulbar or respiratory

From the Department of Pediatrics of the Bowman Gray School of Medicine of Wake Forest College, and the Pediatric Service of the North Carolina Baptist Hospital, Winston-Salem, North Carolina.

From Onset	3.6 days	4.0 days
From Admission	2.2 days	1.6 days
Fever < 99.5°		
From Onset	4.6 days	5.1 days
From Admission	3.5 days	2.7 days
Bulbo-Respiratory Group		
Cases	12	19
Deaths	2 (16%)	6 (31%)

disease. The latter group was included since it was felt that some additional information might be gained if a decided difference in mortality rates was found. In all we treated forty-two patients; eighteen were nonparalytic on admission and were compared with eighteen alternate controls; twelve were bulbo-respiratory cases, and twelve were febrile paralytic patients who were treated without controls at the end of the epidemic (Table I). The results of treatment of the first group were evaluated by comparing the incidence of new paralysis in the two groups and by comparing the duration of fever in the two groups (Table II). It is obvious that no significant difference was found, although this group is still too small to have statistical significance. In comparing the deaths in the bulbo-respiratory groups there is an apparent improvement in the treated series. However, this improved mortality loses its significance when one realizes that these are not alternate cases and most of the untreated series were early in the epidemic at which time certain improvements in care were not in operation. Minor reaction to this drug was common, as shown by the incidence of vomiting. Only one serious reaction, a severe hemolytic anemia, was encountered. Although extensive controlled studies have not been made, it is now the impression of other groups also that phenosulfazole is ineffective in the treatment of poliomyelitis, and laboratory studies in experimental animals bear this out.

The newer antibiotics such as aureomycin and chloromycetin are also ineffective in experimental infections and almost surely are of no value in human cases. The search for a specific drug must be encouraged, but even if found it would be of very limited usefulness because of the rapidity of the destruction of nerve cells after infection occurs. Despite the fact that patients were hospitalized just as soon as the diagnosis was suspected, 65 per cent of our patients were already paralyzed by the time of admission. This rapid nerve cell damage offers an almost insurmountable obstacle to effective drug therapy.

The antibiotics, particularly penicillin, do have a place as prophylactic agents against secondary bacterial infection. We feel that all bulbo-respiratory cases should be treated with penicillin in order to decrease the incidence of pneumonia in these cases.

Another approach to the therapy of the acute stage has been an attempt to relieve the pain and muscle spasm that is present in most of the patients. This is not only for comfort, but also to decrease the disability caused by the muscle spasm, and to make easier the re-education of the muscles. The older techniques of prolonged immobilization in splints or casts have been almost universally abandoned in favor of hot moist packing or hot tubs. It is my impression that the variations of this regime to suit the individual patient that are now being practiced are definite improvements over the older methods. Various drugs have been used to help relieve this muscle spasm. Prostigmine was given an extensive trial in North Carolina in 1944, and elsewhere, but there never seemed to be a statistically significant difference in treated and untreated cases. Curare has also been advocated to relieve the excess muscular activity. It is possible that small doses of curare may have a place in relieving the occasional patient with respiratory embarrassment from spasm of the thoracic muscles. However, I have not been particularly impressed with the beneficial results reported from the use of this drug. Curare is a dangerous drug and should not be used lightly, but if the attending physicians are familiar with its use, there may be instances where muscle relaxation with curare might be attempted.

The most recent drug used for muscle relaxation is priscoline reported upon by Smith and his

TABLE III. BLADDER PARALYSIS IN POLIOMYELITIS, 1948

group last fall.[6] They believe that pain and spasm is due to persistent vasospasm set up by involvement of the sympathetic nervous system. With this in mind they treated poliomyelitis patients with intravenous procaine and then tried priscoline. A total of seventy-three patients were treated with priscoline hydrochloride by either intramuscular or oral administration. Symptomatic relief of spasm and pain was achieved in all cases in from one to fourteen days. It is too early to evaluate this drug at present since unfortunately this was not a controlled series of cases giving objective comparisons with untreated alternate cases. However, it does warrant further study and may prove to be a very significant advance in our treatment of this phase of the problem. We have not had an opportunity to treat enough children to have any opinion on its value. One child with severe pain and spasms was treated to the point of flushing for several days without noticeable improvement.

The complication of paralysis of the bladder has been treated very satisfactorily with one of the newer parasympatheticomimetic drugs, furmethide.*[3] Beginning in the 1944 epidemic we were impressed with the inconvenience and the danger of repeated catheterization in patients with paralysis of the bladder. At that time we were able to achieve satisfactory voiding in about 70 per cent of the twenty-one patients treated. Since then we have had an even better experience as we have learned more about the dosage. In 1948, 169 patients were admitted with acute poliomyelitis to the North Carolina Baptist Hospital, of whom forty (23.6 per cent) developed some difficulty with voiding (Table III). Of these, thirty-two (80 per cent) developed retention and failed to void after the usual nonspecific measures. Furmethide was administered to this group with satisfactory voiding in all but one adult. This man had been catheterized for four days before admission, and subsequently was discharged to the convalescent hospital with a retention catheter in place. This patient developed strong bladder contractions, but apparently sphincter spasm prevented voiding. In such cases the concurrent use of ergotamine tartrate has given release of sphincter spasm and resulting voiding, but this latter drug was not in use at the time this patient was seen. Our method of treatment has been to try to establish voiding by nonspecific measures if possible. When these measures are not successful, the smaller dose shown in the table is given subcutaneously, and the patient is then given the oral drug for two to five days (Table IV). If neither voiding follows nor other effects of parasympathetic stimulation such as flushing, sweating, or increased salivation, the dose is repeated in one hour or the larger dose is given. When strong bladder contractions follow but voiding does not occur, ergotamine tartrate is given with the repeated dose of furmethide. In some instances oral medication is sufficient to establish voiding. Undesirable reactions due to a generalized parasympathetic stimulation occurred in seven (22 per cent) of this series. Atropine sulphate immediately counteracts the effect of furmethide and was used for three of these patients. The one serious reaction that must be recognized is marked salivation in a patient with bulbar disease. In such cases one must be very cautious with this drug and be particularly careful to have atropine at hand in case an increase of salivation becomes troublesome.

TABLE IV. DOSAGE OF FURMETHIDE

Age of Patient (Years)	*Subcutaneous*	*Oral*
0—4	1.25-2.5 mg.	2.5 mg. t.i.d.
5—9	2.0 -3.0 mg.	5.0 mg. t.i.d.
10—14	2.5-5.0 mg.	5 to 20 mg. t.i.d.
15—19	2.5-5.0 mg.	
>20	2.5-5.0-7.0 mg.	

Almost all of the deaths in acute poliomyelitis are found in the bulbo-respiratory group so that one should pay particular attention to these patients. Except for occasional patients who die with signs of central envolvement only, these fatalities are due to direct paralysis of the respiratory muscles, or to secondary respiratory failure from interference with air exchange such as paralysis of the muscles of swallowing causing excess accumulation of mucus, involvement of the larynx, atelectasis, and pulmonary edema. It

*Kindly supplied for this study by Smith, Kline and French Co.

is very important to distinguish between these various factors, for the immediate treatment instituted will often mean the difference between life and death. For example, it is obviously important not to put a patient in a respirator whose difficulty is not respiratory paralysis but interference by mucus caused by pharyngeal paralysis. Extremes in postural drainage with the patient lying on his face, and careful suction of the pharynx are imperative for this latter type of case. In some instances of laryngeal obstruction and in the occasional patient where the excess mucus cannot be satisfactorily drained, tracheotomy may be necessary. The indications for tracheotomy have been re-emphasized recently by the Minneapolis group,[2,5] but we feel one should not be carried away in an overzealous use of this procedure. We surely do not feel that it should even approach being a routine in the treatment of bulbar cases.

There are some details in the management of respiratory paralysis that should be restated. Although many patients with paralysis of the respiratory muscles may get along without ever needing the help of the respirator, one should not postpone its use too long. The serious results of anoxia are well recognized, and if one waits for advanced anoxia to occur, permanent damage may have resulted. Oxygen therapy with or without the respirator is of great benefit. The improvements in the oximeter will make this instrument particularly valuable for following patient's oxygen saturation.

When a patient is put into a respirator, he must be observed very closely in order to prevent the complications of atelectasis or pulmonary edema. It is common experience to have a patient improve immediately as his inadequate respiratory efforts are taken over by the respirator, only to have him suddenly or gradually become anoxic again. One of the major reasons for this is the appearance of atelectasis or pulmonary edema. The main reason for this seems to be an increase in edema fluid due to the negative pressure, and the stagnation of edema fluid in the dependent portions of the lung. Much can be done to prevent these complications by careful attention to changes in the patient's position. Although we are all familiar with the need of changing the position of postoperative patients, one frequently sees patients in respirators left lying flat for days! Not only should the respirator be titled in a longitudinal plane, but the patient should also be turned frequently. We feel that the tilting of the bed is insufficient; therefore, we alternate the patient from back lying to complete face lying at least every two hours. One often hesitates to disturb the patient to this extent, but we feel that later difficulties can be avoided by doing so.

Another aid in preventing atelectasis and pulmonary edema is the use of a positive pressure mask using either oxygen or oxygen air mixtures.[4]† This technique was tried first in a patient who had gradually lost almost all air exchange after being in a respirator two days. Pharyngeal mucus was no problem, and bronchoscopy revealed no laryngeal obstruction nor bronchial plugging. Since positive pressure breathing will clear up pulmonary edema, this child was given positive pressure oxygen through an automatic cycling apparatus for several hours. Gradually the air exchange improved, and she was then alternated with the respirator and the positive pressure oxygen. Since that time we have continued to use this apparatus both therapeutically and also prophylactically. It is now our custom to give five to fifteen minutes of positive pressure breathing to all respirator patients every one to two hours. This device is also very useful to carry along a patient when the respirator must be opened for x-rays, bed changing, and other treatments. It does essentially the same thing as the new positive pressure domes, and can be used for several patients in rotation. We feel that the use of this positive pressure breathing during the first days in a respirator does much to prevent both pulmonary edema and atelectasis. Of course, once atelectasis has occurred, bronchoscopic drainage is necessary.

In summary I want to re-emphasize the two main facets of acute and convalescent care in poliomyelitis patients. Tremendous strides have been made in improved techniques of muscle re-education and the rehabilitation of paralyzed patients in the convalescent stage. However, most of this care falls into the hands of the orthopedic specialists and their able assistants, the physical therapy technicians. The care of the acute case is the province of the original family physician, the pediatrician or internist and the nose and throat specialist. By the co-operation of this latter team and the continual search for improved

†The positive pressure device used in this study was obtained from Mine Safety Appliances Company.

RECURRENCE FOLLOWING INGUINAL AND FEMORAL HERNIA OPERATIONS

Three to Seven and One-half Years Follow-up

DONALD J. FERGUSON, M.D.

Minneapolis, Minnesota

THE SURGICAL repair of an inguinal or femoral hernia, though not generally considered a difficult operation, is not 100 per cent successful. Recurrences plague nearly every surgeon who cares to look for them, and "new" operations are frequently described, indicating failures with the old.

It appears to be the general opinion of writers on hernia that if a recurrence can be successfully treated at a second operation, there must have been an error at the first one, and that an appreciable recurrence rate reflects on the ability of the surgeon more than on any other factor.[7,17,21] Hence a close study of any recurrences that may appear is probably the best approach to improved results in hernia operations.

A recurrent hernia which is not treated early may progress in size to the point where, at the second operation, it becomes difficult or impossible to determine where the initial defect was. Little or nothing, then, is learned about the error committed at the first operation. Moreover, if treatment is delayed, there is lengthened disability, some risk of strangulation for the patient, and a greater difficulty for the surgeon in the second repair. On the other hand, patients in whom operation has once failed may not be eager to return. It seems evident, therefore, that all hernia patients should be recalled for examination at regular intervals of a year or less for many years after operation.

Without the data obtained by such examinations, the presentation of new operations and the evaluation of old ones is unconvincing; yet a study of final results, based on medical examinations at a significant interval after operation, is a comparatively rare finding in the large literature on this subject. The difficulty which is responsible for this situation will appear in the present study. Suffice it to say that a follow-up period of even three years is likely to include less than 80 per cent of recurrences (Table IV), and fewer cases can be followed as the years go by. The present work was undertaken to discover what has occurred to the patients operated upon in this hospital, three to seven and one-half years afterward, and to analyze possible causes of failure in those cases with complications or recurrence.

From the Department of Surgery, University of Minnesota Medical School, Minneapolis, Minnesota.

Method of Follow-up

All patients operated on in this hospital for inguinal or femoral hernia between January 1, 1940, and June 30, 1944, are included in the study. The total number of patients was 264, with thirty of these having two operations. The follow-up was not complete. Altogether, 52 per cent of all the patients were followed by examination and an additional 11 per cent by letter. A further 9 per cent of patients were deceased at the time of study. Most of the examinations were done in the hospital, but in some cases the patient's doctor performed the examination elsewhere and sent in a report. In thirty-eight cases the patient was followed only by letter at first, and subsequently was seen for examination; the findings corresponded except in one case in which the patient was unaware of a recurrence.

A true recurrence is one in which the hernia reappears exactly as it was before operation, and is probably uncommon. A recurrent hernia is generally considered one which appears in the same inguinal-femoral region as that originally operated on,[21] and the broader definition is used in this study.

Results

Tables I and II.—The types of hernia encountered and the various operations used are noted in Table I. The relative incidence of bilocular hernias—direct-indirect inguinal (9 per cent) and inguinal-femoral (1 per cent)—is lower than would be expected. Usually, well over half of all hernias in patients over the age of thirty-five are bilocular;[7,11,18] 62 per cent of the patients in this series were over thirty-five. The high recurrence rates in those hernias diagnosed simple direct (31 per cent) or femoral (25 per cent) may therefore be in part due to overlooking of another locule. Some of them reappeared soon after operation.

TABLE I. RELATIVE FREQUENCY OF TYPES OF HERNIA AND OF TYPES OF OPERATION USED IN 294 HERNIAS

Also shows the number of times each operation was used for each type of hernia.

	Bassini	Halsted	Ferguson	*	Others	Total	%
Indirect inguinal	111	40	30		17	198	68
Direct inguinal	7	14	2		4	27	9
Direct-indirect	5	10	1		2	18	6

%	43	24	12	9	12		100

*The inguinal ligament was sutured to Cooper's ligament or to the pectineal fascia.

Three of the femoral hernias reappeared as inguinal, but this may have been due to displacement of the inguinal ligament,[16] which was used in the repair, rather than to overlooking another locule. Similarly, two patients developed femoral hernias after repair of large indirect inguinal hernias in which the inguinal ligament was utilized. One of these patients had the first operation ten years before, and only the second, after which there has been no recurrence, is included in this series. As noted in Table II, the recurrence rates in those hernias which were diagnosed bilocular were comparatively low.

The over-all recurrence rate was 10.8 per cent.

Table III.—Recurrences for each type of operation are listed in this table. The procedures designated Halsted,[8,9] Bassini,[2] and Ferguson[6] are those described under these names in textbooks of surgery[3,12] to avoid confusion with other operations described by these authors. The Halsted second operation for hernia is quite similar to the Ferguson and is listed as the latter in these tables. There were a number of other operations, including those of Andrews,[1] Downes,[4] Lotheissen[13] and Wangensteen,[20] each of which was performed in only one or a few cases in this series. These are grouped with the few cases in which the operative record was incomplete, as the numbers were too small to allow any conclusions.

It would be misleading in any case to interpret Table III as showing superiority of one operation over another; recurrences for each type of operation occurred predominantly with certain types of hernia and not with others. The Halsted operation was used more commonly than other

TABLE II. RECURRENCE RATES IN THE 186 HERNIAS FOLLOWED, IN RELATION TO TYPE OF HERNIA

Total	186	20	10.8

*The inguinal ligament was sutured to Cooper's ligament or to the pectineal fascia.

operations for direct and recurrent hernias, which have high recurrence rates with any type of operation. However, it is apparent that suturing of the inguinal ligament to Cooper's ligament or to the adjacent pectineal fascia has been an unsatisfactory method for repairing femoral hernias in this series.

Recurrences were listed for individual surgeons including ten staff members and thirty-three interns and residents. Although the experienced surgeons fared no better than the novices in the final figures, it should be remembered that the former group took care of nearly all the difficult cases.

Dr. Wangensteen, who had one recurrence in twenty-three followed cases, employed Halsted's operations I and II for the most part. He believes that, when properly performed, they give the best results. His own cases bear this out, in contrast to the findings in the rest of the series.

Altogether, forty-two patients in the series had bilateral hernias. Of these, nineteen (45 per cent) stated that the hernias had appeared on both sides at the same time. In the remaining twenty-three patients the contralateral hernia appeared at an interval of from one to thirty-two years, averaging eleven years, after the first. The incidence of a contra-lateral hernia in a patient who had recently developed one hernia was therefore 9.4 per cent in this series. If the patients

were followed longer, the incidence would doubtless be higher.

Of the patients who were followed, there were twenty who had bilateral operations and nine others who had bilateral hernias, only one of which was repaired during the period of study. In these twenty-nine patients, who had forty-nine operations, there were nine recurrences, a rate of 18 per cent. In the remaining 137 patients with unilateral hernias, there were eleven recurrences (8 per cent). The probability of this difference occurring by chance is such that its significance is doubtful ($p = 0.05$).

Of the twenty patients followed, in whom bilateral hernias were repaired, nine had them both operated on at the same time, and four of these eighteen hernias recurred, a rate of 22 per cent. In the remaining eleven cases where the two operations were done at different times, there were four recurrences, a rate of 18 per cent. The difference is insignificant.

The average time of recurrence was two years after operation.

It would be of interest to know the exact types of hernia which appeared as recurrences, in relation to the original hernias, in all patients. Information on this point is meager, however. In many instances the original diagnosis is obscure, the patient having been operated on elsewhere many years before. In others, the recurrence was so large that the original defect could not be precisely located even at operation.

It may be assumed that many early recurrences are due to failure to find accessory locules or to extirpate the sac completely. The mechanism of late recurrences is not well explained. One of our patients, for example, entered the navy after his operation and was examined at frequent intervals until his discharge four years later. Then, while a student, he noted the recurrence at five years.

Table IV.—The purpose of presenting this table is to illustrate the very considerable difference in recurrence rates depending on the length of the follow-up period. The first column shows the cases in the present series as they were on January 1, 1945, at which time all cases would have been followed at least six months, and some up to five years, after operation. The over-all recurrence rate at that time would have been 4.3 per cent, with 50 per cent of recurrences taking place within six months and all the rest within three years.

TABLE IV. RELATIVE INCIDENCE OF RECURRENCES AT VARIOUS INTERVALS AFTER OPERATION, AS MODIFIED BY LENGTH OF FOLLOW-UP PERIOD

Time after operation	Present series as of Jan. 1, 1945 (Fol. 6 mo.-5 yr.)		Present series on July 1, 1947 (Fol. 3-7½ yr.)		13* of 19 cases, recurrent hernia (Table I)	
	Recurrences	%	Recurrences	%	Recurrences	%
0-6 months	4	50	4	20	2	15
6 months-3 years	4	50	12	60	5	39
3-7½ years			4	20	3	23
7½-20 years					3	23
Total	8 (4.3%)	100	20 (10.8%)	100	13	100

*Time of recurrence not known in 6 cases.

The second column shows the present status of the same cases, now followed from three to seven and a half years after operation. Only 20 per cent of recurrences now appear to take place within six months, and 20 per cent occurred after three years. The general recurrence rate has more than doubled.

In the third column the patients represented are a different group, namely those with recurrent hernias already present who came for operation during the period of study. These recurrences took place as long as twenty years after operation. This random sample of recurrent hernias, which happen to have been followd for a longer period than that of this study, indicates further the trend noted in the first two columns. Only 54 per cent of the cases in Column 3 took place within three years.

Two factors bearing on the incidence of recurrence are age of the patient and the presence of chronic cough. The average age of patients with recurrence is eleven years higher than that of the other, and this is statistically significant ($p = 0.014$). Of five patients with persistent cough at the time of operation, four had recurrences, and this item is evidently important.

Table V.—The incidence of swelling of cord or testicle, including both hematomas and edema, was not associated with any one type of operation; after Bassini repairs it occurred in 11 per cent, after Halsted operations in 7 per cent, and after Ferguson operations in 12 per cent. One of the recurrences had this complication. Two of twelve cases subsequently examined had atrophy of the testicle on the affected side.

TABLE V. POSTOPERATIVE COMPLICATIONS AND MORTALITY FOR THE ENTIRE SERIES

278 operations at which 294 hernias were operated on.

Complications	Hernias	%
Swelling of cord or testicle	23	8
Wound infection	21	7
	Operations	**%**
Thrombophlebitis	4	1
Pneumonia	5	2
Decubitus ulcer	3	1
Atelectasis	1	0.4

Mortality: 8 postoperative hospital deaths, or 2.9%.

	Age	Cause of death
1.	60	Pulmonary embolism.
2.	70	Parotitis.
3.	57	Wound infection, sepsis, diabetes.
4.	73	Acute heart failure, 3 days after operation.
5.	78	Cerebral hemorrhage (heparin for thrombophlebitis), diabetes.
6.	81	Dissecting aneurysm.
7.	51	Acute liver failure.
8.	67	Peritonitis. Incarceration of hernia; repair 7 days after gastrectomy.

Wound infection was also present in only one recurrence, and was serious in only two cases.

The other complications, as well as the causes of mortality, are not peculiar to hernia operations. The average age of patients dying in the postoperative period was sixty-seven years, compared to forty-five years, the average age of all patients in the series.

Comment

Numerous follow-up studies beginning at six months after hernia operations have been reported. In the present series, 20 per cent of recurrences took place within six months. Fallis[5] found only 22 per cent occurring within six months and 48 per cent within three years. In a longer follow-up, on the other hand, of from six months to twenty-nine years, Taylor was able to find only 37 per cent of the patients operated on. Most of these were followed five years or less, and over half of them only by letter. Results are better where a surgeon follows all his own patients, living in the same locality, though the numbers are small. Veterans' hospitals have provided extensive follow-up studies,[7,18] but the patients are a selected group.

It is inevitable that some patients should be lost: 9 per cent of the present series were deceased; but the failure to follow other patients was partly due, as indicated by comments of many patients, to lack of understanding on their part that examination was advisable. Surgeons, confident in their success, had frequently advised the patient that no return visit was necessary.

Most of the statistics in this and other papers on the subject should be qualified by the obvious fact that any of the patients still living and apparently cured may yet have recurrences. The discrepancies in reported results of various operations for hernia are partly explained by this observation, as illustrated in Table IV. Similarly, the percentage of recurrences taking place within six months after operation becomes smaller as the period of follow-up is increased. Those authors presenting a short follow-up always have a high percentage of recurrences taking place within a short time, which mistakenly gives the impression that a longer study is unnecessary.

To obtain the correct incidence of recurrence and relative time of recurrence would require that all patients in the series be followed at regular intervals until they died or developed recurrence. In a more ideal study than the present one, this requirement would be complemented by more thorough diagnoses, especially by accurate descriptions of recurrences in an early stage, and by planned variations in operative procedure.

From the present work, however, we may learn that excellent results can be obtained by an experienced surgeon using a time-tried operation. Much improvement can be expected, therefore, from a study of avoidable errors contributing to recurrence with established methods., in contrast to the emphasis often placed on new types of operation. Many writers[4,10,11,15,18] have pointed out the advisability of opening the peritoneum at the internal ring and making a thorough digital exploration for accessory locules, regardless of the type of hernia diagnosed before operation. Operative records in the present series do not always mention such exploration. Some of the femoral hernias were repaired entirely from below the inguinal ligament, a method which restricts examination of the inguinal region.

Finally, it may be remarked that the problems of femoral hernia, femoral recurrence of inguinal hernia, and late recurrences of all types may not be solved even by the best performance of the classical operations. It is possible that certain procedures, not used in the present series, involving more radical reconstruction of the inguinal and femoral regions without suturing the inguinal ligament,[13,16] or the use of autogenous fascial sutures,[14] would offer better protection against these types of recurrence. Of two different operations having the same recurrence rates early

in the follow-up, one might prove more effective against late recurrences. Information on this matter is not at present available.

Summary

Two hundred and sixty-four patients, having undergone 294 operations, formed the basis for this study. Of these, 63 per cent were followed from three to seven and one-half years after operation.

The over-all recurrence rate was 10.4 per cent. Rates were highest in direct inguinal (31 per cent) and femoral (25 per cent) hernias.

The operation giving the highest recurrence rate (31 per cent) was that of suturing the inguinal ligament to Cooper's ligament or to the pectinal fascia. This was used for femoral and recurrent hernias.

The more experienced surgeons, though dealing mainly with difficult cases, had as a group the same recurrence rate as interns and residents.

A contralateral hernia developed at an appreciable interval, averaging eleven years, after the first one in 9.4 per cent of the patients. Bilateral hernias appeared at about the same time in 7 per cent of patients. The recurrence rate for bilateral hernias was 18 per cent, compared with 8 per cent for unilateral hernias. The recurrence rate for bilateral hernias repaired at the same time did not differ significantly from that when the two operations were done at different times.

The present series of cases, if reported as a six-month to five-year follow-up, would have had 4.3 per cent recurrences.

Other factors contributing to recurrences were older age, and persistent cough at the time of operation.

Swelling of the cord or testicle developed after 8 per cent of herniorrhaphies. It was not associated particularly with any one of the operations used. Testicular atrophy occurred in 17 per cent of the affected cases.

The mortality was 2.9 per cent. Causes of death were unrelated to the hernia operations as such. The average age of patients dying after operation was sixty-seven years, compared to forty-five years for the whole series.

Conclusions

1. Thorough exploration of every inguinal and femoral region should be carried out when operating for hernia in patients over thirty-five, regardless of the type of hernia diagnosed before operation.

2. Suturing the inguinal ligament to Cooper's ligament or to the pectineal fascia for the repair of femoral or recurrent hernias has been an unsatisfactory operation in this series.

3. Surgical experience improves results in hernia repairs. Excellent results can be obtained by practiced surgeons using the standard types of operation.

4. About 10 per cent of patients with a single hernia may expect to develop a contralateral hernia.

5. The recurrence rate was not increased by the performance of bilateral repair at the same operation.

6. Length of follow-up period, even up to twenty years, has an important bearing on over-all recurrence rates and on the apparent percentage of recurrences which take place early.

7. Patients who are in the upper age groups at the time of operation have higher recurrence rates.

8. Chronic cough at the time of operation predisposes to recurrence.

9. Appreciable mortality after herniorrhaphy appears in older patients, though unrelated to the hernia operation as such.

10. More adequate information than is contained in this and in similar studies, if it is to be obtained, will require that all patients operated on for hernia be persuaded to report regularly for follow-up examinations.

11. Many early recurrences can be eliminated by avoidance of well-known errors. The problems of late recurrences, femoral hernia, and femoral recurrence of inguinal hernia require more study.

DIAGNOSIS AND TREATMENT OF COMMON FORMS OF RESPIRATORY ALLERGY

F. W. WITTICH, M.D.

Minneapolis, Minnesota

WHEN ONE considers that respiratory allergy in both the seasonal and nonseasonal types is the most common form of allergy and that approximately 60 per cent are cases of allergic rhinitis, the true significance of respiratory allergy can be realized. The incidence of nasal allergy in the general population is about 3.5 per cent, which according to the present estimated population of the United States would constitute over five million individuals. There are no accurate statistics on the occurrence of bronchial asthma due to allergy. According to Army statistics, there were twelve asthmatics per thousand among the veterans receiving compensation, whereas two veterans per thousand had been previously eliminated before induction. About 1 per cent in this entire age group of eighteen to thirty-five suffered from asthma of the allergic type.

The common forms of respiratory allergy are, in the order of their frequency, seasonal hay fever or pollinosis, perennial allergic rhinitis or hyperesthetic rhinitis, bronchial asthma and allergic bronchitis. Any of these clinical disorders with common features of heredity, common periodicity, temporary disappearance, and eosinophilia should arouse the suspicion of their being allergic in origin.

The diagnosis of respiratory allergy is based first upon a thorough and painstaking history. In seasonal hay fever the symptoms should coincide with the common offending pollen antigens in the atmosphere in sufficient concentrations in the patient's environment. All practical textbooks on allergy contain charts or maps showing the geographical distribution of various species of offending pollens and at what time of the year they are of clinical significance in any particular locality. The pollinating season in Minnesota is relatively clearly defined. There are sixteen pollen groups in Minnesota causing hay fever. The trees of clinical significance blossom from the middle of April to the last of May. The grass pollens bloom from June until July and again the latter part of August and September. The weeds, such as pigweed, Russian thistle and the sages, prevail in the middle of July, but the ragweeds not before the second week in August, and continue until frost.

Skin tests with these sixteen pollen groups should be done by scratch testing, using the powdered pollen extracts or a 5 per cent glycerin extract. A reaction consisting of a wheal, particularly with pseudopods and with a zone of erythema, can be determined as positive in various degrees. Stock treatment mixtures containing these pollens in proper proportion for various sections of the country are furnished now by the various biological houses. Otherwise, a special treatment mixture may be made consisting only of the pollens to which the patient reacted in proper proportion. Patients sensitive to the common offending pollens may not react to skin tests, so that other methods involving the use of the mucous membrane or conjunctiva, or direct exposure to the suspected offender may have to be used. Sometimes the intracutaneous test on the arm will reveal an offender when a scratch test is negative. The back should never be used for intracutaneous testing with pollen extracts. Passive transfer or indirect skin testing is sometimes necessary when the skin is unsuitable for direct testing. In the perennial nasal allergies a careful history of the patient's occupation and home environment is essential. This will determine whether house dust and its various components, the common air molds, or industrial dusts are the chief offenders. Scratch or intracutaneous tests are then done with those inhalant allergens to which the patient is exposed in appreciable amounts.

Diagnosis of Nasal Allergy

The making of an accurate diagnosis of allergy of the nose and paranasal sinuses requires careful consideration and correlation of the following points:

Symptoms.—The typical symptoms of nasal allergy are similar but in varying degrees, whether seasonal or perennial. They consist of sneezing, itching, nasal discharge and obstruction. Atypical

Read before the Minnesota Chapter of the American College of Chest Physicians, at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

cases, however, are characterized by stuffiness and postnasal discharge with little or no sneezing. These can be easily overlooked. Frequent recurring colds, particularly in children, must be differentiated from allergy.

Nasal Changes.—Although the typical allergic mucosa is characterized by pallor, bogginess, and sometimes edema or polyposis, there are many instances in which the mucosa appears normal or somewhat reddened.

Cytology of the Secretions.—Nasal secretions and, when available, sinus secretions should be stained and examined microscopically for eosinophiles, neutrophiles or both. The cytologic picture is frequently the most important factor in diagnosis. It must be emphasized that the common cold is an ever-present complication, and the cytologic changes are the most important guide in its recognition. A nasal smear revealing more than 10 per cent eosinophiles, which appear in clumps, indicates a nasal allergy.

It is sometimes necessary to make other tests, as previously mentioned, such as the mucous membrane test or the ophthalmic test or direct exposure to the suspected offender.

X-Ray of the Sinuses.—Various degrees of cloudiness are the rule rather than the exception in allergic sinuses. Changes may be of short duration and transitory. A cloudy sinus, therefore, does not always indicate infection. When the history of allergy is present and there is a bilateral clouding, the chances favor the diagnosis of an allergic condition, whereas a unilateral clouding may indicate an infection but not necessarily so. X-Ray findings should be correlated with the cytologic picture and bacteriologic cultures.

Bacteriology.—To secure reliable nasal cultures and avoid contamination, sinus cultures must be taken under strict aseptic precautions. The findings should be correlated with the cytology, and acute, subacute and chronic complicating infections should be carefully evaluated.

Histopathology.—All tissues removed from the nose and paranasal sinuses should be examined routinely, and the findings correlated with all the diagnostic factors already enumerated.

Time will not permit the enumeration of the other associated manifestations in this field of respiratory allergy, such as: (1) involvement of the external ear, eustachian tube, middle ear, cochlea and labyrinth, resulting in deafness, tinnitus and dizziness; (2) recurring swellings of the parotid and submaxillary glands; (3) involvement of the larynx and esophagus; (4) allergy of the eye, and (5) allergic headache.

Nasal allergy may be associated with gastrointestinal allergy, bronchial asthma, allergic bronchitis, skin allergy—urticaria, eczema, angioneurotic edema, purpura, contact dermatitis—urogenital allergy and even serum disease. In the observation of children with frequent recurring colds and bronchitis, the otolaryngologist and pediatrician must determine whether allergy or infection or both are the cause of symptoms. Among the allergic patients in this group too many tonsillectomies are unnecessarily performed.

Clein has recently shown that when allergic symptoms are properly treated in children who require tonsil and adenoid removal, the incidence of regrowth of lymphoid tissue in the tonsil fossae is negligible—3 per cent compared to 27 per cent in undiagnosed, untreated, allergic children.

Persistent bronchitis in children, not infrequently in the absence of nasal symptoms, is of allergic origin and often precedes the development of asthma. Chronic disease of the paranasal sinuses in children is often allergic and not primarily caused by infection.

In adults nasal stuffiness and postnasal discharge even in the absence of sneezing may be allergic in origin. Although a submucous resection is sometimes necessary in these cases, it may fail to give adequate relief. Allergic management should always be tried before resorting to the use of the cautery or escharotics.

Treatment

By and large, prevention is the ideal treatment of the various forms of allergy. In order to obtain this objective, specific or immunologic measures should be instituted based upon all the investigative methods at hand, as well as a detailed history taking, cutaneous tests, and clinical trials with suspected excitants. Preventive measures should be taken in the preclinical, as well as the clinical, phase of allergy. A preclinical phase of allergy occurs usually before the age of ten years and such an individual may possess only a latent or potential capacity to become sensitized. This

can only be suspected and not demonstrated, based upon the familial allergies and a demontsration of positive skin reactions before symptoms are manifest. Where the child has not shown allergic respiratory symptoms and there is a strong family history of allergy accompanied by relatively strong skin test reactions to inhalants and foods, every effort should be made to remove the known cause or causes by rearrangement of the environment or the patient's diet, or if there is a focus of infection, by surgical removal.

Crowe and Ward's method of irradiation of the hyperplastic and infected tissue of the nasopharynx may be helpful. In the control of nasal allergies, practical avoidance measures and immunization measures frequently result in 80 per cent relief. When infection is present, the antibiotic agents may be tried according to the type of infection present, but it must be remembered that these antibiotics may themselves sensitize the patient and cause distressing symptoms. The antihistaminic drugs, owing to their local and cerebral sedative action, prevent or inhibit clinical symptoms by blocking or lessening the effects of the offending histamine type of substances. They do not, however, block the offender from continuing to invade the sensitized mucous membranes, and patients receiving antihistaminic therapy alone for upper respiratory allergy without concompitant immunization measures may later develop asthma. Unless the patient is receiving simultaneous immunization, the shock organ merely changes from the upper to the lower respiratory tract. The most beneficial effects are obtained when used in conjunction with immunization measures, by preventing systemic reactions from high doses of pollen or the inhalant extracts by administering 25 to 50 mg. about a half hour before the antigen injection.

Diagnosis of Bronchial Asthma of the Allergic Type

It is usually relatively easy to diagnose bronchial asthma. The history is most important and frequently sufficient. No other disease simulates recurrent attacks of bronchial asthma, which is characterized by dyspnea, wheezing, orthopnea and coughing with more or less complete freedom from symptoms between paroxysms. Where there are little or no intermissions as in chronic asthma, there may be some doubt as to its allergic origin. The presence of generalized wheezing and prolonged expiration, eosinophilia in the blood and/or sputum, the presence of other allergic conditions in the same patient or the presence of allergy in the immediate family, the demonstration of relief from epinephrine, the roentgen findings of increased hilus shadows and a depressed diaphragm with a poor excursion, and the presence of positive skin tests confirmed by clinical tests usually substantiate the diagnosis, although any one of these alone may occur in nonallergic cases. In the chronic asthmatics the presence of emphysema and chronic bronchitis is common.

The specific diagnosis depends mainly on a careful history with questions, particularly referrable to orthopnea, wheezing, coughing and expectoration during the attacks. When a cough is present with or without asthmatic spells, there may be an associated complication, such as chronic bronchitis or bronchiectasis, or some chronic infection such as pulmonary tuberculosis. The expectoration in uncomplicated asthma is usually colorless, scanty, and present only toward the end of the attacks. If there is an excessive amount of early morning sputum, particularly when mucopurulent, bronchiectasis should be suspected; an iodized oil roentgen film may confirm the diagnosis. Various types of bronchitis may have continuous expectoration of purulent sputum. Slight hemoptysis may occur in severe asthma with hard coughing. Large amounts of blood should cause one to suspect bronchiectasis or pulmonary tuberculosis, or both. Fever is commonly present in asthma in children and may also occur in adults, especially if there is an intercurrent infection. Loss of weight does not usually occur except in the presence of chronic asthma, such as status asthmaticus with inability to eat. Loss of weight in patients with a mild asthma may be the result of carcinoma or pulmonary tuberculosis. The presence of pain in severe attacks is frequently due to the use of accessory muscles of the chest and does not necessarily mean heart disease or pleurisy.

Cohen described a type of allergic asthma in children commonly diagnosed as pneumonia. Children with asthma frequently retain the mucous secretions which become inspissated into tenacious plugs as a result of dehydration from the loss of fluid in vomitus or through the expired air. Children frequently have nausea and vomiting with their attacks and get relief when these mucous plugs are coughed up. There may be various grades of atelectasis present in this type. Poor

drainage may result in a low grade pneumonitis. In these cases impaired resonance, distant breath sounds, bronchial breathing, and moist and dry râles may be heard accompanied by a temperature of 103° to 104° F. The roentgenogram reveals transient areas of atelectasis and pneumonitis. A baby with allergic asthma may manifest very little labored breathing. A simple way of eliciting wheezing or sibilant râles on expiration is to have the child try to blow out a candle.

Cardiac asthma is characterized by the following: attacks are very few; there is pulmonary edema; the onset is usually after forty years of age; there is associated hypertension, coronary disease, aortic regurgitation, or chronic nephritis; eosinophilia of the blood and sputum are absent; there is no prolonged expiration, and the moist râles are located usually at the lung bases with some wheezing; there is cold, clammy skin; the heart is dilated and the pulse is often thready and irregular; epinephrine produces ill effects; skin tests are negative; the circulation time is usually prolonged. Cardiac asthma is also sometimes confused with other cardiac conditions such as chronic decompensation. Hysterical dyspnea may sometimes resemble serious heart failure.

Bronchial asthma on the other hand is characterized by the following: there is a history of previous attacks; there is obstruction in the lower air passages; the onset is early in life; there is allergy in the patient and family; eosinophilia is present in the blood and sputum; there is wheezing, and prolonged expiration all over both lungs; there is warm perspiration; the heart is usually small; the pulse is good; the fear complex is not as great as in heart failure; morphine is dangerous and epinephrine usually gives some relief; skin tests are positive; elimination of cause gives relief, sometimes complete; the circulation time is normal.

Treatment

The most annoying form of respiratory allergy which disturbs the general practitioner or the chest specialist is bronchial asthma, particularly in the acute form or status asthmaticus. When this is present, symptoms are treated first, and following relief the investigation of causative factors is commenced. The patient usually is very apprehensive and should be reassured that patients rarely die of an acute attack of asthma. Status asthmaticus is considered to exist when all the usual orthodox forms of therapy have failed. Unlike chronic intractable asthma, it is an acute condition which is usually reversible.

The older the patient with bronchial asthma, the greater the chance of both extrinsic or intrinsic infective factors being present. In the chronic infective type, the use of antibiotics sometimes are startlingly beneficial. Aerosolization may be used with the antibiotics alone or preferably combined with concentrated epinephrine or Isuprel, with the flow meter set between 4 and 5 liters per minute on the oxygen tank when oxygen is used as a conveyor. Higher pressures with the proper nebulizer such as the DeVilbiss No. 40 may also be used. Foot and hand pumps generating compressed air are now available and less expensive. In any event the nebulized particles should be so fine as to be practically invisible. The patient should be told to breathe in gently and not forcibly, with the mouth wide open, while the nebulization is taking place, and to hold the breath if possible momentarily and not to exhale forcibly. By this method, the finer particles penetrate the lower respiratory tract. Ten per cent glycerin added to the aerosolization mixture helps to stabilize the particles. For an aerosol solution, the author obtains very satisfactory results with a combination of daily inhalations, from five to seven days in succession, of 25,000 to 50,000 units of crystalline pencillin in isotonic saline solution to which has been added 0.1 c.c. of concentrated epinephrine or Isuprel and 0.1 c.c. of glycerite of peroxide. Instead of penicillin, a combination of streptomycin and tyrothricin (1:2,000 dilution) has not produced any toxic reaction. Bacitracin has also been employed. Also for aerosol therapy other remedies such as a 5 per cent solution of sodium sulfathiazole may be used.

In the treatment of status asthmaticus, sedation and hydration are paramount. For sedation, a retention enema of 2 to 3 drams of paraldehyde in 1 ounce of warm water, introduced high into the rectum by means of a male catheter attached to a closed syringe, results in a very satisfactory sedation and does not cause the irritation produced by ether in olive oil. Also 100 mg. of Demerol, to be used only in acute cases of asthma, may be very helpful. Hydration consists of an intravenous injection by the slow drip method of a liter of 5 per cent (isotonic) dextrose, or in some cases, 500 c.c. of 10 per cent dextrose in distilled water. Dextrose in greater concentra-

tions up to 50 per cent has repeatedly been advocated. It is more desirable to use 5 per cent dextrose which is isotonic, and furnishes both water and calories. This solution should also contain 3¾ grains (10 c.c. ampoule) of aminophyllin and 0.5 to 1.0 c.c. of 1:1000 solution of epinephrine and should be given at the rate of 60 to 80 drops per minute. Distilled water is preferred to isotonic sodum chloride solution since there has been ample evidence furnished that sodium chloride will make asthma worse. This mixture may again be administered in six to eight hours if necessary. One should not follow dextrose with insulin. Some form of vitamin B complex and vitamin C may be given in the saline or dextrose solution or intramuscularly, especially in those patients who are very weak from inability to take proper nourishment. If necessary to maintain nutrition, blood plasma or a blood transfusion of 250 to 500 c.c. may be necessary. Oxygen or preferably oxygen and helium may be administered by means of a tent or mask or nasal catheter.

In the treatment of bronchial asthma of the less acute type, each patient presents an individual problem. There is no treatment that is always best nor any that must always be used first. The management of these patients depends upon a careful examination and continued observation of the patient. A thorough general examination should be made of all the domains of the body when determining influencing factors. When possible, there should be a change of environment, preferably to a hospital and in an allergen-free room. When treating a patient at home every measure should be taken to make the room as allergen free as possible by using allergen-proof bedding or encasings. Any articles which may collect dust, such as drapes and rugs should be eliminated. There is now on the market a preparation known as "Dust-Seal" which when applied to specific surfaces (floors and primarily fabrics, such as carpets and upholstered furniture and blankets) imprisons or seals the particular matter known to allergists as house dusts, preventing their dissemination and contamination of the air. The dust particles are immobilized by this procedure, and the preparation is harmless to fabrics.

For immediate relief the sympathomimetic amines, epinephrine or ephedrine, or a combination of epinephrine and ephedrine, as well as the various epinephrine-like (synthetic) group such as ephetonin, neosynephrine, propadrine, Orthoxine and Isuprel are used. In this group also is included tyramine and amphetamine (benzedrine sulfate). The group of xanthines which have a local action on smooth muscle without nerve transmission and which are very beneficial in a large number of cases are theophylline-ethylenediamine (aminophyllin); theophyllin (theocine); theobromine, and theocalcin. These xanthines are frequently combined with one of the sympathomimetic amines and one of the barbiturates in capsule or tablet form. Where the secretions are scanty, potassium iodide or potassium iodide in combination with apomorphine makes a very effective expectorant as well as a cough sedative. Aminophyllin is best given in concentrated form when treating the acute asthmatic. As a rule, 3¾ grains is first given to determine the patient's toleration; 7½ grains may then be used. These come prepared in 10 and 20 c.c. ampoules and should be administered slowly intravenously. Precautions should be taken in administering aminophyllin to patients who may have coronary disease. A feeling of warmth or flushing in the face is an indication to administer more slowly. Aminophyllin may also be given in suppository form. This form is particularly useful when continuing the effect of the aminophyllin. The use of aminophyllin will often relieve the epinephrine "fast" state.

As pointed out by Davison, a mixture of epinephrine hydrochloride, 0.5 to 0.8 c.c. with Demerol 50 to 100 mg. and apomorphine hydrochloride, grains 1/120-1/100-1/80-1/60, mixed together in the same syringe and given one-third every ten to fifteen minutes until all is given or until relief is obtained, may be very efficacious.

In relieving nervousness or apprehension when the patient is not sensitive to the barbiturates, injections of sodium phenobarbital are preferable. This drug should be administered in doses of 2 to 5 grains, as often as necessary, if the patient is sensitive to barbiturates, chloral hydrate, chloretone or bromides may be used in appropriate doses orally or by rectum.

In the treatment of acute asthmatics, bronchoscopy has been very effective in a number of cases. By means of this method the removal of mucous plugs may be life saving.

When treating some of the complications of acute or prolonged bronchial asthma particularly where there are signs of heart failure, 5 grains of citrated caffeine may be given orally, or caffeine sodium benzoate, grains 7½, by hypodermic

injection, may be tried, or Coramine, 5 c.c. intramuscularly or intravenously as a cardio-respiratory stimulant. Digitalis is used for impending right or left sided cardiac failure, and the dose should be enough to digitalize. It may be necessary to use the Levine tube through the nose to relieve gastric distention. Intestinal distention may be relieved by the use of a salt and soda enema and rectal tube. Pituitrin in small doses may also be given. Some patients respond well to the use of a saline laxative or particularly to a half to one teaspoonful by mouth of heavy magnesium oxide.

Recently, a 5 per cent solution of ethyl alcohol has been recommended intravenously when treating asthmatic paroxysm, but its use is not advocated since it is irritating to the veins, causes some pain, and is unpleasant to most patients. There is no specific indication for its use. Sometimes whiskey in two or three ounces, or a whisky, combination with aspirin, ten to fifteen grains, has been given when other medication is not available, but one must be sure that the patient is not sensitive to whiskey or to aspirin.

Roentgen (X-ray) Therapy.—For some patients with asthma who have not responded to careful allergic management, x-ray therapy has been beneficial, giving temporary relief for a few weeks or months. Marked relief has been obtained in about a fourth of selected cases, and reports of moderate relief in the hands of various roentgenologists ranged from 16 to 75 per cent.

Treatment by Hyperpyrexia.—It has been a common observation that asthmatics may show temporary improvement during or following fever resulting from typhoid or malaria, or even following an infection such as a large carbuncle. The best method is that described by Stoesser, treating asthmatic children in a room with heat and moisture.

Vaccine Therapy.—Vaccine therapy should be used with caution, especially in infective asthma, since our immunologic and bacteriologic knowledge is still vague. Skin tests with vaccines are of little or no value. The most favorable results are noted in patients who obtain relief with very small doses gradually increased weekly to a desired maximum followed indefinitely by this dose every two to four weeks. Overdosage is dangerous. The results are sometimes very gratifying but as a rule not dependable. The best role of vaccine therapy is the prevention of recurrences after removal of focal infection.

In cases of infective rhinitis associated with nasal allergy, vaccine therapy with stock vaccines or autogenous vaccines from cultures of the sinus, nasal or bronchial secretions may be tried, and the procedures are the same as described for infective asthma.

Nonspecific Therapy.—Such forms of therapy as injection of milk, liver or spleen extract, stock bacterial vaccines or other foreign protein, gold and other substitutes, autohemotherapy, or autogenous urinary proteose all have their advocates, with little or no proven or substantiated beneficial results.

Surgical Treatment.—The various surgical procedures consist of sympathetic block, extirpation of sympathetic bronchial ganglia and resection of the posterior pulmonary plexus. The surgical treatment of intractable bronchial asthma was initiated by Kümmell in 1923, who performed a unilateral cervical sympathectomy and removed a portion of the stellate ganglion. Leriche and Fontaine later advocated stellate ganglionectomy only. Various modifications of the operation have been developed, mostly in the European clinics. In this country, Rienhoff and Gay reported their results with bilateral resection of the pulmonary plexus with gratifying results.

Miscall and Rovenstine have more recently developed a more rational procedure in the surgical treatment of bronchial asthma. They stress the importance of differentiating the two types of asthma—the one with definite allergic sensitivity to which surgery offers little and which is best treated by hyposensitization, and the other in which there is no demonstrable sensitivity to foreign protein and where afferent stimuli produce an irritation as a result of recurrent or chronic infection of the respiratory tract. Their procedure is based upon the belief of numerous authorities on the subject, that in many asthmatics bronchial asthma is a reflex mechanism resulting from stimuli arising in an irritated focus in the respiratory tract. Impulses are transmitted over the afferent or sympathetic fibres to the central nervous system where broncho-constrictor impulses commence and return over efferent or parasympathetic

fibres to the bronchioles. These authors suggest that a novacaine block of the stellate and upper four thoracic ganglia is a definite diagnostic procedure in determining the role which the sympathetic system plays. They caution against the use of barbiturates or morphine before a novocaine block since the former produces bronchial constriction, and the latter depression of the respiratory center. Scopolamine may be used, however. If a patient is benefited by a unilateral cervicodorsal sympathetic block with novocaine, it can be followed by alcohol. Time will not permit describing the other surgical procedures.

When preventing recurrence of attacks, one must endeavor to give the patient the benefit of the following: (1) adequate treatment by diet and hyperimmunization and avoidance of overwhelming amounts of allergens; (2) prevention or treatment of infection; (3) relief of psychosomatic factors by proper training; (4) endocrine treatment when indicated, and (5) avoidance of physical and chemical precipitating factors as much as possible.

Finally, it may be proper to mention certain precautions which should be used in the treatment of bronchial asthma. One should never use morphine and never overtreat with any sedative drugs. When a patient requires 0.5 c.c. subcutaneously of epinephrine every two hours, he is becoming epinephrine "fast" and is not obtaining the physiologic effects of the drug but the toxic effects, which may be very harmful. The use of too large doses of aminophyllin is contraindicated, and it should never be administered too fast intravenously, especially in patients with coronary disease. Since patients are frequently allergic to many drugs, one should first determine whether the patient is sensitive to the drug to be administered. One should not use prostigmine for distention, and never use soap enemata, since the patient may be sensitive to the materials in the soap.

Psychosomatic Factors

In conclusion, owing to the increasing evidence that psychosomatic factors may play a prominent part in allergic diseases, some comment is probably necessary. Although allergic asthma is due in the large majority of cases to an immunologic reaction, it is obvious that other mechanisms and the variations in immunologic specificity contribute to producing a state of altered reactivity or allergy. Psychodynamics must be included to explain the changes of neurovascular reactions, either when acting independently or when combining with with immunologic reactions. With our knowledge of the role played by allergic factors in the etiology of bronchial asthma, our attention has been diverted from asthma's frequent association with emotional disturbances. Early medical literature frequently mentioned cases where asthmatic attacks seemed to have been directly provoked by sudden and violent emotion. It, therefore, becomes more difficult to evaluate the relation of psychogenic factors to the allergic factor. We must never depreciate the role that allergic factors play in respiratory allergy and in certain cases at least should consider that possibly psychogenic factors may hold a complimentary relationship to the allergic factors. There is no question in the minds of allergists that in order to precipitate the attack, even when exposed to an adequate dose of allergen, it is sometimes necessary to have supplemental emotional disturbances, fatigue, the menstrual cycle, and so forth, as it would appear that emotional conflicts might play a very important role in determining the threshold of sensitivity to the specific antigens. On the other hand, it may be possible that psychologic factors might be effective alone by lowering the patient's threshold of sensitivity to substances present in the patient's environment.

There has been much speculation concerning the physiologic mechanism by means of which emotional conflicts precipitate asthmatic attacks. Violent emotion such as fear, rage, sexual excitement and so forth cause a marked stimulation, just as overexertion or hurry will precipitate an attack. Muscular exertion, intense emotion and hurry all cause increased respiratory stimulation. It is then possible that the asthmatic shows a tendency to respond to increased respiratory stimulation with subsequent attacks. There are also a number of reported incidents which would suggest that an asthmatic attack is initiated when the respiratory system is subject to contradictory and unco-ordinated innovations which may result from abrupt inhibition or an intense emotional upset. On the other hand, there is strong evidence that these emotional disturbances are the effect rather than the cause. Psychotherapy has been helpful in some cases of bronchial asthma, particularly in psychoneurotics with asthma. This type of asthmatic patient obtains considerable relief when

THE SYMPTOMS OF CHOLECYSTITIS

NATHAN A. WOMACK, M.D.

Iowa City, Iowa

THE development of the effectiveness of a particular therapeutic procedure often is an expensive and laborious process. While such development may follow many pathways, the following is more or less characteristic of that which has taken place in the evolution of the treatment of cholecystitis. Often certain symptoms are noted to occur concomitantly, and after a period of time these are found to be associated with definite morbid anatomical aberrations. If this association is found to be present consistently in an adequate number of instances, a definite clinical syndrome becomes established. This becomes effected by virtue of statistical association and, likewise, the accuracy is determined by virtue of the pertinency of this association.

If the etiologic factor or factors are not readily apparent, therapeutic procedures often are instituted, being based either on the nature of the symptoms or the pathologic findings or both. Again, the effectiveness of these therapeutic procedures becomes a function of statistical association with amelioration of the symptoms or the underlying lesion. By virtue of the effectiveness of the results obtained, the particular therapeutic procedure becomes an established treatment or is thrown into discard.

Many students of logic would find much to criticise in such an approach at the solution of a problem. However, when a patient is in great distress or his physician is frantically seeking out something that will give relief, systems of logic often are referred to the halls of academic scholasticism. Relief of pain in its bald simplicity is more to be desired than the perfection of pure reason.

Yet, in moments of calm, it may be well for us to consider critically some of the established therapeutic procedures, particularly when some of these procedures are not always associated with complete relief of symptoms.

The operation of cholecystectomy in the treatment of the symptoms of cholecystitis now has become a well-established therapeutic procedure. By and large, the results are most satisfactory. Occasionally, however, one may encounter a patient who has a persistence of these symptoms for which such treatment has been instituted, either in their entirety or with some amelioration. In order to understand why this is so, it probably would be advantageous for us to review some of the underlying factors involved in the production of the complaints related to the pathologic processes seen in cholecystitis.

The symptoms generally complained of in cholecystitis are basically those of pain and dyspepsia. The extent and the intensity of these symptoms, however, may vary within wide limits. The digestive disturbances may consist mainly of a fullness after meals, associated with gaseous eructations and bloating, particularly after specific foods. As the symptoms become more severe, nausea and even vomiting may intervene. The digestive disturbances are suggestive of altered gastric motility with an inability of the stomach to empty itself adequately, particularly of swallowed air. As a rule, however, there is no roentgenologic evidence of pyloric obstruction present in such situations.

The pain also varies in degree. It may consist of subcostal soreness, which is aggravated on pressure and sudden motion, to intense excruciating colic. The usual picture is a combination of the two, although episodes of colic may occur in individuals totally lacking in interval symptoms. The colicky pain is located in the region of the gall bladder, although it often is referred to the region of the right shoulder blade. These colicky attacks often are sudden in onset and may last for a few minutes to a few hours. At other times they may persist for a longer period and, as a rule, when they do the gall bladder becomes tender and palpable and generally is associated with evidence of inflammation at such a time. Digestive disturbances become more marked, and there is seen, not infrequently, fever and leukocytosis. As a general rule, the clinical picture seen in biliary colic is the result of smooth muscle spasm or tension, either in the gall bladder or the cystic and common bile ducts. Such spasm

Presented at the annual dinner of the Minneapolis Surgical Society, February 4, 1949. From the Department of Surgery, University of Iowa Medical School.

or tension also generally is associated with the presence of a stone. It seems hardly likely then that gall-bladder colic should be considered as being due to the passage of a stone, for, indeed, the picture can be reproduced easily by sudden distention of the gall bladder or the common bile duct without the presence of stone.

Considered in the above light, then, the picture of cholecystitis is best not divided into various categories such as chronic, subacute, and acute. We see it here as a continuum. Whether or not the clinical picture seen in chronic cholecystitis will be associated with exacerbations of biliary colic, depends, as a general rule, upon the presence or absence of spasm of the gall bladder or cystic duct. Whether or not the picture of biliary colic will be carried on into that of acute cholecystitis will depend upon the extent and length of time in which obstruction of the cystic duct is present as well as upon the type of bile distal to the obstruction. Thus, the inflammatory picture in cholecystitis may be mild or may be severe, just as the symptoms may be slight or severe. Fundamentally, however, we are dealing with a single disease process.

Since the days of antiquity, at least some of the symptoms which we have described above have been associated with stones in the gall bladder. The frequency of this association was enough to attach to it statistical significance. It therefore was natural to give the association pertinency and to reason that if the stones were removed the symptoms would be relieved. When laparotomies became safe enough to make them elective procedures, it was natural for the operations of cholecystotomy or cholecystostomy to be developed, and toward the end of the last century the removal of stones with drainage of the gall bladder was being performed by many surgeons. The fact that many people had stones in the gall bladder without symptoms was passed over without serious consideration. Likewise, the fact that a patient could have gall-bladder symptoms with a damaged stoneless gall bladder also was ignored. It was not until the clinical results of a large number of such operations were studied that it was found that this apparently logical procedure was not the procedure of choice. It was settled statistically.

Shortly after the first cholecystostomy was performed, the gall bladder was removed by Langenbeck, and the operation of cholecystectomy, therefore, appeared upon the scene. You here in the Twin Cities may well be proud of the fact that the first cholecystectomy performed in this country was done at St. Joseph's Hospital in Saint Paul by Dr. Justus Ohage, the father of one of the members of this surgical society. As time has elapsed and experience has been evaluated, this procedure now, in the great majority of instances, has replaced the operation of cholecystostomy. We thus have reasoned, and again statistically, that it apparently is the gall bladder wall that is responsible for the symptoms under treatment.

In a small number of instances, however, ranging from 5 to 15 per cent, there are people with the classical picture of cholecystitis who, when the gall bladder has been removed, will note that a few or all of their symptoms persist. What shall be our explanation for this, and how shall they be taken care of? It is in an effort to answer this question that it would seem wise for us to examine again this symptomatology and try, if possible, to elicit the cause of the symptoms of cholecystitis in the beginning and why these symptoms are alleviated when the gall bladder is removed.

When we attempt to explain the symptom of pain in the viscera of the upper right abdomen, we find that this is mediated almost entirely through the sympathetic nervous system. Occasionally, one will encounter fibers from the phrenic nerve on the right side that enter into the region of the biliary tract, but these, as a rule, are few in number and posteriorly located. If one stimulates these sympathetic fibers directly, pain is reproduced. If one stimulates these fibers by sudden distention of the gall bladder or sudden distention of the common bile duct, pain is reproduced. If the nerves are sectioned proximal to these areas and these maneuvers repeated, there is no pain. If the greater and lesser splanchnic trunks are sectioned on the right side, pain is not reproduced except in rare instances in which it may be necessary to section some of the fibers on the left side. We may make the statement then, I think, that the sensation of pain as related to biliary tract disease, except where the parietal peritoneum is involved, is a function of the sympathetic nervous system.

Let us now consider the symptoms relating to

dyspepsia and, in particular, how they concern the vagus nerves. The clinical observations of Kocher on cord injuries showed as early as 1896 that the vagi have no pain-carrying fibers from the abdomen (de Takats[2]). Vagal fibers, however, are concerned in the control of gastrointestinal motility. If either the right or the left vagal nerves are stimulated in the neck of a dog, one notes marked contraction of the duodenum with increase in tension within the lumen of the abdomen. If pressures within the lumen of the gall bladder and within the common duct are determined, there also is noted a considerable rise in intracystic and intraductal pressures. When tension within the gall bladder and common bile duct occurs, one should anticipate other evidence of vagal stimulation. Such has been found to be the case in observations on animals made by Schrager and Ivy[8] and by Davis, Hart and Crain,[1] and in the human by McGowan, Butsch and Walters[5] and by others. Besides the pain produced by such a procedure, which would be mediated through the sympathetic system, these observers also noted that there was salivation of the animal, followed by nausea and vomiting. The secretion of saliva, as is well known, is to a considerable extent dependent upon vagal stimulation.

The process of vomiting, however, is a complicated one, and to think of it purely in terms of increased tone around the antral and pyloric portions of the stomach probably is oversimplification to the point of inaccuracy. That such increase in tone, however, may interfere with normal emptying of the stomach is highly probable, and this can be shown to occur with mild vagal stimulation. It thus would be safe to state that severe vagal stimulation can be made to initiate the complicated muscular co-ordination which results in vomiting, although it is quite obvious that vomiting also may be produced through other mechanisms. Where the stimulus is not so great or where the threshold of stimulation of the nerve supply is only slightly lowered, one may anticipate less dramatic effects of such stimulation, which would show itself in abnormal emptying of the stomach, chiefly insofar as swallowed air is concerned.

Both clinical and experimental evidence seem to point to the fact that the symptoms generally encountered in cholecystitis, be they mild or severe, can be explained on the basis of nervous impulses passing through the sympathetic and parasympathetic nervous systems.

Our next problem is to determine whether or not there is an adequate distribution of these fibers along the course of the bile ducts and the gall bladder to participate in such a function as we have described above.

Many studies have been made on the course and distribution of vagal fibers to the stomach and biliary passages. One of the very good studies was that by Swan as early as 1834, and during the ensuing years numerous other studies relating to gross dissection have been described. There is considerable disagreement, particularly as related to the details of distribution of the smaller fibers, and we therefore must conclude that there is much individual variation in the human. It seems now to be fairly well established that as the vagi enter the abdomen both nerves supply fibers to anterior and posterior trunks. These anterior and posterior trunks may form actual plexuses. The main gastric branches of the anterior trunk generally course along the lesser curvature of the stomach and supply the anterior surface of the stomach as far as the pyloric antrum. It is questionable whether the pyloric canal and sphincter receive branches from this anterior plexus. The anterior trunk gives off branches to the liver, however, and as these branches cross the lesser omentum, they apparently, at times, communicate with sympathetic fibers. The posterior vagal trunk apparently sends fibers to the pyloric sphincter and the pyloric canal along with the upper portion of the duodenum.

The posterior trunk also may be traced to the liver, the pancreas and celiac plexus. Its hepatic branch passes to the liver through the gastrohepatic ligament where it is joined by a branch apparently from the anterior plexus. These fibers here, and also as they pass through the celiac ganglia, become incorporated in the same trunk with the sympathetic supply. It is questionable whether true synapses occur in the celiac ganglia, insofar as vagal fibers are concerned.

The majority of the nerve fibers which are distributed to the biliary tree are derived from the sympathetic system and reach the liver by way of the celiac plexus (Kuntz[3]). These fibers are derived from the greater splanchnic nerves which have their origin predominantly from the T6-T9 sympathetic ganglia, and the lesser splanchnics

which arise from the T10-T12 sympathetic ganglia.

In the final distributions of the sympathetic plexuses, one again encounters considerable dis-

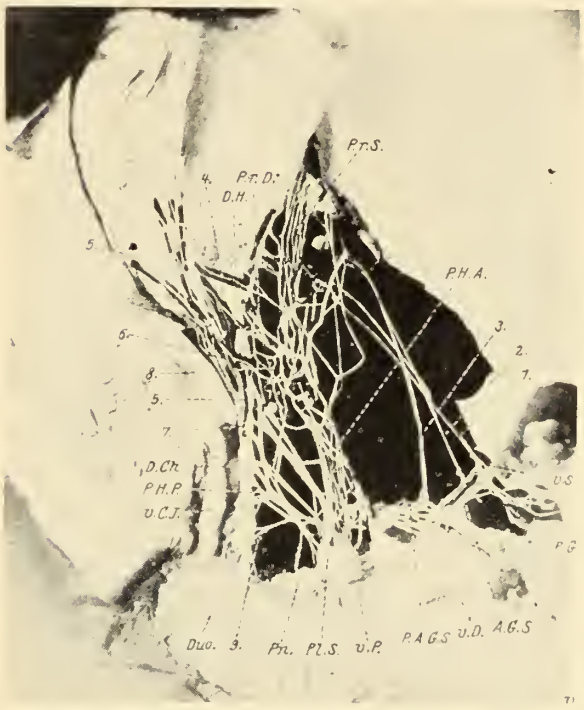

Fig. 1. Dissection of nerve supply to gall bladder and bile ducts (after Raigorodsky).

agreement in anatomical dissections. In our experience, the studies of Raigorodsky[7] have, for the most part, held true. He divided the fibers which enter the liver and biliary passages from the celiac plexus into anterior and posterior divisions. The anterior hepatic plexus usually follows the hepatic artery, the pathway changing as the path of the artery varies. The posterior hepatic plexus, with its nerves, passes to the right and superiorly in the portal area, where it first is seen behind the lower third of the portal vein and crosses over on the under surface. It then is found lying in the outer groove between the right periphery of the portal vein and the common bile duct, where it sends filaments to the bile ducts and gall bladder, finally passing to the liver, which it enters in the region of the end-branches of the right hepatic artery. Along the course of the right hepatic artery it anastomoses with ramifications of the anterior hepatic plexus. An illustration of one of the dissections by Raigorodsky is shown (Fig. 1).

It is worth while to call attention to two of the main nerves supplying the gall bladder which are of considerable clinical interest. The medial nerve arises from the anterior plexus, passes over the anterior surface of the common hepatic ducts, and anastomoses with the posterior hepatic plexus in the triangle of the cystic and hepatic ducts and passes through the medial superior surface of the gall bladder. It often is seen running close to the cystic artery and can be very easily incorporated in the ligature which is placed around the cystic artery during cholecystectomy.

The lateral nerve of the gall bladder arises from the posterior plexus and passes along the lateral surface of the gall bladder and during its course comes relatively close to the cystic duct. It also can be easily incorporated along with the cystic duct in a ligature during cholecystectomy. While there are numerous other smaller fibers reaching the gall bladder and common bile duct, one cannot help being impressed with the size of these two nerves described above.

Latarget[4] has described what is termed the pancreaticocholedochus nerve which is derived from the posterior hepatic plexus and which passes distally to the retroduodenal and intraduodenal portions of the common bile duct. As can be readily seen, this nerve also is of considerable clinical importance.

The common bile duct is surrounded by a plexus of delicate nerve fibers throughout most of its extent. This plexus has connecting branches between the anterior and posterior hepatic plexuses. The posterior surfaces of the cystic, hepatic, and common bile ducts are in close proximity to the posterior hepatic plexus, which contains many large nerve fibers.

Having demonstrated that many of the symptoms seen in cholecystitis can be produced by stimulation of the sympathetic and parasympathetic nerve supply to this region, and having shown that there is an adequate distribution of such nerves to the gall bladder and bile ducts, our next problem comes as a demonstration of a mechanism for the production of such stimulation. In elucidating this mechanism, I shall refer briefly to a contribution of several years ago.[9]

There are numerous ways in which a nerve may be stimulated. So far as the viscera with which we are concerned are affected, stimulation by stretching, ischemia or inflammation plays the most important part. Often there is a

combination of two or three of these factors at the same time. Observation of these phenomena are commonplace in the experience of most surgeons. The production of pain by the stretching of visceral nerves is a frequent observation clinically when the mesentery is pulled upon during an operation under local anesthesia. It also is noted during the spasm of smooth muscles. Here also ischemia plays a part. One sees the fact of ischemia at play as a result of an embolus to an important artery, but here again the formation of acid bodies in the tissues following ischemia might be instrumental also in the production of nervous stimulation. That this actually does take place in the case of lactic acid has been demonstrated by Moore.[6]

Besides lactic acid, another potential chemical stimulant in inflammatory areas is potassium, which is liberated in areas where there is considerable cellular breakdown. It will be readily recalled that in the acute phase of cholecystitis the inflammatory picture is one of necrobiosis. This is associated with considerable increase in capillary permeability, with ensuing edema. Where the process is severe, there may be focal areas of necrosis, not only involving the mucosa but also the wall of the gall bladder. These permeability changes may be so great that there will be a transudation of red blood cells throughout the wall of the gall bladder. In such situations the stimulation of the nerve supply will most likely consist of tension from the edema, upon which is superimposed the chemical stimulation resulting from cellular breakdown.

As the process ages and the edema subsides, there occurs a massive dense collagenous fibroplasia throughout the gall-bladder wall. A constant stretching and ischemia follows this proliferation, with an ensuing lowered threshold of stimulation along the nerve fibers and at the nerve endings. While inflammation is still present, as can be seen evidenced by the accumulation of lymphocytes around such nerve trunks, this scarring probably is the most important factor in the so-called chronic stage of cholecystitis.

We have called attention to the fact in previous publications that this considerable desmoplasia is typical of that seen following injury from the cholesterol and cholic acid derivatives found in bile. Indeed, in one study by Haffner and myself,[10] we were able to demonstrate microscopic evidence of some of the components of bile in gall-bladder walls in routine sections in approximately one-third of the instances of chronic cholecystitis.

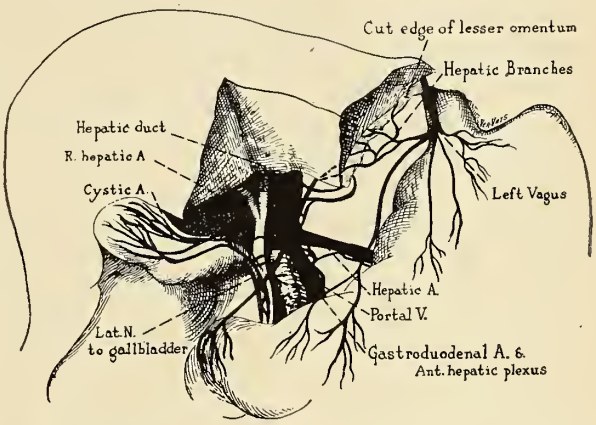

Fig. 2. Diagrammatic representation of nerve supply to gall bladder and bile ducts as often seen in our experience.

Thus, we see that there is present in the gall-bladder wall adequate means of producing a markedly lowered threshold of stimulation of the nerve supply. This will explain why in such damaged viscera stimuli that ordinarily would not be noted now produce symptoms. This can be simply illustrated by the observation that the normal gall bladder is not tender to pressure, whereas the damaged gall bladder, even in the fibrotic state, is tender on deep pressure.

When we consider, therefore, that the symptoms in cholecystitis are related to stimulation of the sympathetic and parasympathetic nerve supply, that this nerve supply is abundant in the gall-bladder and biliary tract regions, and that there does exist a mechanism in the disease state in which these pathways can be stimulated, the rationale of cholecystectomy becomes obvious. In removal of the gall bladder we destroy a considerable number of these fibers. We remove fibers and nerve endings that are damaged, and wherever stones are present we remove a trigger point, so to speak, of stimulation. When so considered, the operation of cholecystectomy in many of its aspects is essentially that of peripheral neurectomy.

If the gall-bladder wall is not involved in inflammation and scar, even though stones are present in the gall bladder, they often will not produce symptoms because the threshold of stimulation of the nerve supply has not been lowered. The

only exception to this is when such a stone obstructs the cystic duct. In a similar manner, we now can understand why a stoneless gall bladder may at times produce symptoms. This approach also sheds light on why certain patients will have a persistence of part or all of their preoperative symptoms, for if these nerve trunks become involved in scar around the cystic artery or cystic duct and are held tense over the common bile duct, changes in intraductal tension will serve as a method of stimulation.

When such consideration is given, it becomes obvious that the technique of cholecystectomy must carry with it the destruction of the nerve supply to the gall bladder. This means that the cystic artery and cystic duct must be stripped clean before ligation. It also means that, wherever possible and safe, the nerve supply mesial to the common bile duct should be interrupted. The extent to which we carry out this type of careful dissection often will determine the completeness of the curability of our therapeutic procedure.

COMMON FORMS OF RESPIRATORY ALLERGY

(Continued from Page 708)

confessing his disturbing impulses, and his asthmatic attacks recur when he is unable to unburden himself of his conflicts by confession. Psychotherapy gives the patient an opportunity to confess whatever is disturbing him. Sometimes he will remain free from attacks for a considerable length of time until some new disturbing impulse arises. It does not require a psychiatrist always to aid these people, and even the family physician who understands his patient may be able to discover the particular matters that are disturbing the patient at the time of his attacks, get him to confess them, and when relief is obtained, reassure his patient until another attack occurs. Winning the patient's confidence and talking over his problems freely do much to help many asthmatics.

PERIARTERITIS NODOSA (ESSENTIAL POLYARTERITIS)

Clinical Data on Thirty Cases Proved at Necropsy

LESTER E. WOLD, M.D., and NELSON W. BARKER, M.D.
Rochester, Minnesota

STARTING with Kussmaul and Maier's case of periarteritis nodosa reported in 1866, numerous single case reports of this disease have been published in the medical journals of the United States and foreign countries. The average reader may be somewhat confused by these descriptions of isolated cases because the clinical manifestations in periarteritis nodosa are both numerous and highly variable.

In 1936, Spiegel reported on seventeen cases of periarteritis nodosa. In his group, abdominal pain not adequately explained by the involvement of any single organ was the most prominent presenting symptom. Five of his seventeen patients had had operations for "acute appendicitis." Two additional patients had had exploratory abdominal operations, and an eighth patient had had a ruptured duodenal ulcer. Spiegel was impressed by the combination of abdominal pain with apparently irrelevant symptoms of arthritis, neuritis, nephritis or cardiac failure. Such a combination of signs or symptoms, he felt, should make one suspicious of periarteritis nodosa.

Harris and co-workers, in 1939, reviewed the records of eighty-seven cases of periarteritis nodosa in which necropsy was performed. He noted the widespread involvement, and described the occurrence of the lesions in the following organs with the indicated frequency: kidneys, 87 per cent; heart, 84 per cent; liver, 71 per cent; spleen, 31 per cent, and lungs, 25 per cent.

In a series of articles on periarteritis nodosa written from 1938 to 1944, Boyd[1-7] discussed the various clinical manifestations of the disease under the following headings: cutaneous symptoms, neuromyositic manifestations, abdominal manifestations, renal and cardiac manifestations, cerebral and ocular manifestations and pulmonary manifestations. Jones reviewed records of fourteen pathologically proved cases of periarteritis nodosa in 460,000 admissions to the University Hospital of the University of Michigan in 1942. Diaz-Rivera and Miller reported on seven similarly proved cases in 1946. These authors emphasized the varied clinical picture. The ultimate criterion for the diagnosis is still the histopathologic finding of typical and characteristic lesions.

Rich,[13-16] and Rich and Gregory, on the basis of animal experiments and observations on cases of human periarteritis nodosa, felt that at least some cases of the disease resulted from hypersensitivity and were actually allergic vascular reactions. They felt that sensitivity to sulfonamides and other drugs and serum sickness were etiologic factors. Zeek, Smith and Weeter produced lesions in rats which were very similar to those seen in human periarteritis nodosa by removing one kidney and producing perinephritis of the other kidney by wrapping it in silk. Hypertension also developed. They considered that human periarteritis nodosa and human hypersensitivity angiitis are two types of necrotizing panarteritis whose pathogenesis is different and which can be distinguished by careful pathologic studies. It is quite possible that there may be multiple etiologic factors in the entity described as periarteritis nodosa and that we are not dealing with one rare disease but with a group of even rarer diseases.

The Present Study

This paper is based on an analysis of data on thirty patients who were studied during life at the Mayo Clinic and who subsequently died, and in whom the diagnosis of periarteritis nodosa was made or confirmed at necropsy. We have studied the clinical features encountered in these thirty cases in some detail.

Age, Sex and Occupation.—The average age of the patients at the time of death was 43.4 years. The youngest patient, a female child, died at the age of three and one-half years. The oldest patient was seventy-one years old when he died. Two-thirds of the patients were more than forty years old (Table I). There were twenty-seven males and three females. Three of the thirty patients were physicians and a fourth patient was a dentist; otherwise, the occupational representation was not significant.

This paper was written while Dr. Wold was a Fellow in Medicine, Mayo Foundation. Dr. Barker is Chief of a Section in Medicine, Mayo Clinic, Rochester, Minnesota.

TABLE I. DISTRIBUTION OF THIRTY PATIENTS WITH PERIARTERITIS NODOSA ACCORDING TO AGE AT TIME OF DEATH

Age in Years	Patients
0-9	1
10-19	2
20-29	3
30-39	4
40-49	8
50-59	3
60-69	8
70-79	1

Duration.—The duration of symptoms was calculated from the date of onset of a presenting symptom or group of symptoms which probably were due to periarteritis nodosa (Table II). It is noteworthy that the majority of patients had symptoms referable to the disease of less than six months' duration. Only four patients (13 per cent) had had symptoms for one year or more.

Allergy.—Only three (10 per cent) of our patients gave a definite history of asthma. One patient gave a history of vasomotor rhinitis.

Sulfonamide Therapy.—Eleven patients (37 per cent) had received sulfonamide therapy just prior to registration at the clinic or were treated with one of the sulfonamides during the time they were being studied. It is possible that more of the patients had received the drug, without knowing its nature, as part of their treatment at home before coming to the clinic. One of the patients had received abundant topical applications of sulfonamides for the treatment of a severe burn involving 50 per cent of his body area four months prior to admission. Another patient had a fever two weeks prior to his death which was thought to be due to sulfadiazine which he was receiving intravenously at the time. Administration of the drug was discontinued. Sulfadiazine was started orally two days prior to his death. In another instance a patient had received sulfonamide therapy for a sore throat four weeks prior to admission. The patient's sister had received the same drug for a similar condition at the same time. "Bright's disease" developed in the sister. Our patient died seven weeks later with periarteritis nodosa. Five patients received sulfonamides during the terminal state of their illnesses at the clinic. Three patients gave a history of having received one of the sulfonamides within six months prior to the date of their registration at the clinic.

TABLE II. DURATION OF SYMPTOMS OF THIRTY PATIENTS WITH PERIARTERITIS NODOSA

Duration	Cases	
	Number	Per Cent
Less than six months	18	60
Less than one year	26	87
One year or more	4	13

TABLE III. ORGANS OR SYSTEMS WITH WHICH CLINICAL MANIFESTATIONS WERE ASSOCIATED

Organ or System	Cases	
	Number	Per Cent
Gastrointestinal organs	23	77
Peripheral nerves	22	73
Kidneys	21	70
Heart	17	57
Central nervous system	14	47
Lungs	14	47
Skin and subcutaneous tissue	13	43
Skeletal muscles	12	40

Clinical Manifestations.—A great variety of clinical symptoms and signs was noted in the different patients. Fever was common and occurred in twenty-one patients (70 per cent). Twenty of the patients (67 per cent) had hypertension as indicated by a blood pressure that was greater than 150 mm. of mercury systolic and 90 mm. diastolic. Frequently the hypertension developed during the time that the patient was being observed for his illness. Data as to the involvement of the various organs or systems are summarized in Table III.

Twenty-three of the thirty patients (77 per cent) had gastrointestinal symptoms, of which abdominal pain was the most frequent. Vomiting, abdominal distention, melena, nausea, hematemesis and jaundice occurred less frequently.

Renal involvement was interpreted to exist when the blood urea measured in excess of 60 mg. per 100 c.c. or when significant albuminuria and urinary casts were present. In fifteen cases (50 per cent), definite azotemia or uremia was encountered. In six additional cases (20 per cent) hematuria was noted.

In fourteen of the thirty cases, there were symptoms which were referable to the central nervous system. Hallucinations, disorientation, unresponsiveness, stupor and coma were noted. In eight of the patients presenting such symptoms there was no associated renal insufficiency or uremia.

Twenty-two of the thirty patients were found to have evidence of peripheral neuritis. This was manifested by muscular weakness, pain along the distribution of nerves, paralysis localized to regions supplied by specific nerves, paresthesias,

hyperesthesias and impaired or absent deep reflexes.

Twelve patients had evidence of myositis as indicated by local tender spots in skeletal muscles, but myositis did not occur without evidence of peripheral neuritis.

Seventeen patients had symptoms of cardiac failure. The cardiac symptoms most often encountered were dyspnea on exertion or while at rest, cyanosis, peripheral edema and ascites.

Fourteen had pulmonary symptoms. Cough was the most often noted, along with pain in the chest and hemoptysis. Three patients had asthma. One patient died of respiratory failure.

Nineteen patients had anemia, as indicated by a hemoglobin determination which was less than 10 gm. per 100 c.c. of blood or an erythrocyte count that was less than 3,500,000 per cubic millimeter of blood. Occasionally, the anemia was severe, but when the value for hemoglobin was less than 4 gm. per 100 c.c., gastrointestinal hemorrhage had occurred previously. Leukocytosis was noted in 80 per cent of the cases, as indicated by a leukocyte count in excess of 10,000 per cubic millimeter of blood. Usually, the leukocyte count ran between 10,000 and 25,000, although in one patient a count of 46,600 was noted. In five cases (17 per cent), eosinophilia was noted. In three of these five instances there was a definite history of asthma, and in these three cases the eosinophils constituted 29 to 73 per cent of the leukocytes; in the fourth patient, who was without a history of any allergic manifestations, 14 per cent of the leukocytes were eosinophils; and in the fifth patient, who had vasomotor rhinitis, the eosinophils made up 20 per cent of the leukocytes, according to counts made elsewhere prior to admission. The eosinophil count was normal during the time the fifth patient was studied at the clinic.

In thirteen of the thirty patients the sedimentation rate of the erythrocytes was determined by the Westergren method. No values below 40 mm. in one hour were recorded, and there was only one value below 67. In four instances the value was more than 100. The average of the values for the thirteen patients was 90.

Thirteen of the thirty patients had lesions of the skin or subcutaneous tissue; however, an analysis of the dermatologic conditions presented shows that in several cases the lesions encountered were probably unrelated to the disease. One patient had hyperkeratotic lesions of the skin. A second patient had a dermatitis of the hands following exposure to formaldehyde. A third patient had a draining sinus, and Actinomyces were found in the purulent drainage. We feel that these dermatologic conditions were probably unrelated to the periarteritis nodosa. Only four patients had subcutaneous nodules. In one instance a few scattered discrete nodules were found. In another, tender nodules were found over the course of a brachial artery. In a third, there were small, subcutaneous nodules in the region of the left biceps. In a fourth, the nodules were palpated over the elbow. In each instance in which nodules were observed, one was removed for biopsy.

Purpuric or hemorrhagic areas in the skin were more common than were subcutaneous nodules. The purpuric spots were observed in six patients (20 per cent of thirty cases). In one patient, discrete red spots 1 cm. in diameter or less were found on the lower extremities in association with subcutaneous nodules along the course of a brachial artery. A second patient had discrete red areas measuring 0.1 to 1.0 cm. in diameter and distributed generally over his body. Some of the areas were ulcerated and some had fluctuant centers. Purpuric spots and infarctions of the skin were noted in two patients. In another patient small petechial hemorrhages and abscesses developed over the dorsal surface of the wrist during the terminal stages of the illness.

Biopsy.—Biopsy had been done in eleven of the thirty cases. In one instance the specimen was from the liver, and in one a kidney was removed, but in neither of these were lesions of periarteritis nodosa found. Subsequently, re-examination of the kidney did show such lesions. In the other nine cases the specimen was from skeletal muscle, skin or both, at the site of a nodule, skin lesion or painful spot. In two cases periarteritis nodosa was diagnosed from biopsy. In one there was mild periangiitis and in one there was marked thickening of arterial walls without periarteritis or necrosis of the medial coat. In two cases the picture was that of dermatomyositis. In the other three cases no diagnosis could be made from the biopsy specimen.

Clinical Diagnosis.—A decade ago the antemortem diagnosis of periarteritis nodosa was rare-

TABLE IV. CLINICAL DIAGNOSIS IN THIRTY CASES OF PERIARTERITIS NODOSA FOUND AT NECROPSY

Case	Year	Clinical Diagnosis
1	1926	Multiple neuritis. Lead poisoning.
2	1931	Hypertension. Chronic glomerulonephritis. Hepatic or subphrenic abscess.
3	1936	Malignant hypertension. Acute retinitis with detachment of both retinas. Myocardial degeneration with congestive heart failure. Renal insufficiency. Pericarditis.
4	1937	Respiratory paralysis.
5	1938	Obscure fever. Cardiac neurosis.
6	1939	Indeterminate. Dermatomyositis. Osteomyelitis. Peritonitis.
7	1940	Indeterminate.
8	1940	Periarteritis nodosa.
9	1942	Cerebral vascular accident. Thrombosis of basilar artery with infarction of pons.
10	1942	Acute glomerulonephritis. Dermatomyositis. Neuronitis.
11	1942	Chronic glomerulonephritis. Malignant hypertension.
12	1942	Periarteritis nodosa.
13	1942	Periarteritis nodosa.
14	1943	Periarteritis nodosa.
15	1943	Indeterminate. Periarteritis nodosa.
16	1944	Indeterminate. Brain abscess? Nephritis?
17	1944	Pneumonia. Cardiac failure. Anemia.
18	1944	Septicemia. Miliary tuberculosis. Brain abscess?
19	1945	Systemic actinomycosis. Peripheral neuritis.
20	1945	Malignant hypertension.
21	1945	Massive gastrointestinal hemorrhage. Cause undetermined.
22	1945	Periarteritis nodosa.
23	1946	Periarteritis nodosa.
24	1946	Periarteritis nodosa. Lupus erythematosis? Coccidiomycoses? Leukemia?
25	1946	Periarteritis nodosa with multiple mesenteric thrombi and gangrene of bowel.
26	1946	Periarteritis nodosa.
27	1946	Malignant hypertension. Hypertensive heart disease. Congestive heart failure. Azotemia.
28	1947	Periarteritis nodosa.
29	1947	Malignant hypertension. Pulmonary embolism. Bronchopneumonia. Cerebral vascular accident.
30	1947	Malignant hypertension

ly made. The clinical diagnosis of the disease still may be very difficult because of the protean manifestations and the great variability in the location of the organs or systems involved.

In eleven of the thirty patients in our series (37 per cent), the diagnosis of periarteritis nodosa was made before death. Table IV gives the year of death and the clinical diagnosis which was made in all of the cases included in this series. It shows the increased frequency with which the correct clinical diagnosis has been made in recent years. It also indicates that an increasing number of cases of periarteritis nodosa have been found at necropsy since 1940.

In Case 25, the diagnosis was confirmed at the time of surgical exploration of the abdomen. Periarteritis nodosa was suspected prior to the operation which was performed because the pancreas was felt to be a possible source of severe abdominal pain. Infarction of loops of bowel was found and these loops were exteriorized. It was noted at operation that there were thrombi in many of the mesenteric vessels.

In four instances, the correct diagnosis was ventured on clinical evidence alone. No biopsy was done.

Comment

It is worthy of comment that the clinical diagnosis was made in only eleven of this series of thirty cases in which the diagnosis was established at necropsy. In seven cases the clinical diagnosis of malignant hypertension or chronic glomerulonephritis was made. This suggests that periarteritis nodosa may commonly produce a clinical picture very similar to that seen in the terminal stages of malignant hypertension and chronic glomerulonephritis. It is known that a widespread necrotizing panarteritis may occur in the terminal stages of malignant hypertension and glomerulonephritis, but the arterial lesions are not considered to be identical with those of periarteritis nodosa. It is also worthy of comment that the information obtained from biopsy in the eleven cases in which it was done was for the most part disappointing and in several instances confusing. A positive result on biopsy is generally regarded as the best diagnostic evidence, but a negative result does not exclude the diagnosis. Also it would appear that in periarteritis nodosa a muscle biopsy may occasionally show the picture of dermatomyositis, which in some instances may be a closely related disease. It has been our experience that the so-called blind muscle biopsy or biopsy of a skeletal muscle in a region where there is no pain, tenderness, nodule, or other evidence of lesion is almost never of value for demonstration of the vascular lesions. However, during the past seven years we have known of a number of cases in which necropsy was not done but in which the diagnosis of periarteritis nodosa was established by biopsy of a nodule or a painful or tender spot in muscle or a lesion of the skin. Some of these patients are still alive.

Analysis of the clinical data in our thirty cases re-emphasizes the protean clinical manifestations of the disease known as periarteritis nodosa and the previous observation that one or several organ systems of the body may be affected. The combination of protracted fever, anemia, gastrointestinal disturbances, renal disease, peripheral neuritis and muscle pains is very suggestive, but to have all those manifestations in one patient with periarteritis nodosa is not common. The outstanding manifestations may be in the skin or central nervous system.

It is worthy of comment that in the thirteen patients in our series for whom the sedimentation rate of the erythrocytes was determined, it was increased in all cases and quite rapid in almost all.

Only three (10 per cent) of our patients had a definite history of asthma. This compares with Rackemann and Greene's finding of nineteen cases of asthma in 229 cases of periarteritis nodosa (8.3 per cent). In addition to the three cases of asthma, there was one case of vasomotor rhinitis and one questionable instance of drug fever (sulfonamide) in our series. There was no instance of serum sickness in our thirty cases of periarteritis nodosa. Rich[15] found a few cases of periarteritis nodosa, which had been overlooked previously, by reviewing the data on all cases of serum sickness which were available to him. However, attempts by us to find periarteritis nodosa in cases of fatal serum sickness in the Section on Pathologic Anatomy of the clinic were unsuccessful.

Eosinophilia in our series occured infrequently; it was found in only five patients. In three of these there was also a history of long-standing asthma. This is consistent with Rackemann and Greene's finding of a high eosinophil count in twelve of nineteen cases (63 per cent) of periarteritis nodosa with asthma, and in only 15 per cent of cases of periarteritis without asthma.

Summary

The clinical findings in thirty cases in which a diagnosis of periarteritis nodosa was made at necropsy have been carefully reviewed. History or evidence of allergic reactions or drug sensitivity were infrequent. The symptoms and clinical findings were variable and involved different organ systems in various combinations. The gastrointestinal organs, kidneys and peripheral nerves were most frequently affected clinically. The sedimentation rate of the erythrocytes was significantly increased in all of the thirteen cases in which it was determined.

A clinical diagnosis of periarteritis nodosa was made in eleven of the thirty cases. In seven others the diagnosis was malignant hypertension or chronic glomerulonephritis.

INVASION OF BLOOD VESSELS BY SOFT TISSUE FIBROSARCOMA

Report of Three Cases

HENRY W. MEYERDING, M.D., and ARNULF R. PILS, M.D.
Rochester, Minnesota

FIBROSARCOMA represents the majority of the primary malignant lesions of the soft tissues of the extremities;[18] it occurred in 65.5 per cent of the 232 cases which we have studied at the Mayo Clinic.

The subcutaneous and intermuscular tissues were found to be the favorite sites for the development of this type of lesion.[7] Frequently it appears dense but sharply separated from the surrounding tissues, as its growth mainly by expansion and encapsulation is a characteristic feature. In some cases, however, an infiltrating growth may be found, with the tumor densely attached to the surrounding parts. Not infrequently, the lesion completely surrounds the blood vessels, nerve trunks and other important structures, incasing them within solid masses of tumor tissues.[5]

The clinical course of fibrosarcoma is progressive, and even after local excision of the mass, the tumor often recurs. On recurrence, the lesion is found to be well circumscribed and still encapsulated in the region of the original growth, but the lesions may also be multiple and scattered throughout the tissues at some distance from the site of operation.[12] Muscle appears to be a favorable soil for secondary invasion. With each recurrence, the disease involves more and more of the surrounding tissues, usually produces metastatic lesions and finally causes death from hemorrhage or emaciation. The duration of life after the onset of symptoms varies with the degree of malignancy and averages about five years.[3] The most frequent cause of death is metastasis to the lungs, and this may occur in patients in whom the grade of malignancy is relatively low. The very cellular hyperchromatic spindle-cell lesion, in particular, shows a tendency to metastasize to the lungs. The less frequent sites of metastasis are the skin and subcutaneous tissues, the regional lymph nodes, the muscles, the skull, the vertebrae and ribs, and the liver and brain. Although dissemination of metastatic sarcoma by the venous route is common enough, the actual observation of invasion by direct extension into a blood clot is rather rarely seen by the surgeon.

In the three cases which will be reported, the patients were operated on recently and the blood vessels were secondarily involved. The extension of malignant cells into the minute clot in Case 1 clearly demonstrates how metastasis may occur through blood vessels. Case 2 demonstrates extension of fibrosarcoma into several veins of the dorsum of the foot (Fig. 1), while Case 3 illustrates the formation of an aneurysm as a result of destruction of the wall of the femoral vein by fibrosarcoma.

Tumors of veins may be benign or malignant, primary or secondary. As to *benign tumors*, reference is made to four cases of benign myoma reported by Aufrecht, Böttcher, Schnijder and Cernezzi. Also, secondary myxomas and cartilaginous tumors occur, and the latter especially are not infrequently seen to invade blood vessels. Egdahl in 1921 reported a case of *primary malignant* intravascular tumor, probably spindle-cell sarcoma; this growth was entirely intravascular. A similar case is that reported by van Ree, in which the sarcoma originated in the intima of a vessel wall and simulated thrombosed varices. A thrombosed mass showing sarcomatous degeneration was reported on by Razzaboni in 1920. In the literature there are many reports of cases of carcinoma in which primary, but more usually secondary, masses formed by direct extension within veins. Other malignant tumors, such as chondrosarcomas, invade large blood vessels; examples are the cases of Warren and Ernst. Very rare are sarcomas originating from the vessel wall. Three cases of sarcoma originating from the wall of the aorta were reported by Brodowski, Miura and Auffermann.[1,6] Also, Tillmanns reported a case of angiosarcoma (?).

Davis' case of fibrosarcoma, in which extensive invasion of the cephalic vein had occurred, was the only one found reported in the literature. This lesion belonged to the group of desmoids, which are much less malignant than fascial fibrosarcoma, especially fascial fibrosarcoma of the thigh.

Dr. Meyerding is with the Section on Orthopedic Surgery, Mayo Clinic, and Dr. Pils is a Fellow in Orthopedic Surgery, Mayo Foundation, Rochester, Minnesota.

Report of Cases

Case 1. Fibrosarcoma, Grade 3, of the Leg Showing Malignant Cells Growing in a Blood Clot of a Vein in a Patient with Diabetes.—A man sixty-two years of age was admitted at the clinic with a principal complaint of pain in the left foot and leg of five months' duration. He had first noticed, about five months prior to admission, numbness and tingling in the left foot at night, which disappeared in the daytime. This pain had continued to bother him. It was described as sharp and knifelike in character and was located in various parts of the left leg and foot. Concomitant with the pain, he had noticed swelling of the left foot which did not disappear with rest in bed. About a month prior to his admission the pain had become much worse; it had been present both night and day, and he had had occasional nocturnal cramps in the legs. Also, he had noticed some weakness in the left foot and inability to dorsiflex the left great toe; he was unable to wear his shoe on this foot, and the leg felt better when in a dependent position or when cool. Roentgenograms made early revealed no abnormality but later roentgenograms disclosed a soft tissue shadow between the tibia and fibula. He had had influenza and pneumonia followed by pleurisy in 1918, and he had suffered from a stone in the left kidney with hematuria in 1942. The family history was noncontributory. The patient had been married for forty-eight years and had four healthy children.

This patient had had diabetes mellitus for six years with a possible onset nine years prior to admission, as at that time he had had polyuria, polydipsia and loss of weight. He had lost 10 pounds (4.5 kg.) in the four months prior to admission. At the time of his examination at the clinic he was taking insulin daily. He appeared to be a well-developed and well-nourished man, who walked with a limp on the left. His height was 5 feet 8½ inches (174 cm.), and his weight was 181 pounds (82.1 kg.) without clothes. The blood pressure was 134 systolic and 70 diastolic, expressed in millimeters of mercury; the pulse rate was 84 beats per minute. The physical examination gave essentially negative results except for the extremities; edema of the left ankle and foot was graded 3, that of the right foot, grade 1. There was a firm mass, 6 by 3 inches (15.2 by 7.6 cm.) located along the lateral aspect of the middle third of the left tibia; it was not attached to the skin but was fixed to the deeper structures. The muscles of the calf were tender, the left foot was warmer than the right but no color changes were noticed. The pulsation of both posterior tibial arteries was normal, but neither dorsalis pedis artery could be felt. There was a noticeable weakness of dorsiflexion of the left foot, especially in the great toe. The left ankle jerk was absent.

The hemoglobin measured 16.6 gm. per 100 c.c. of blood, the erythrocytes numbered 4,600,000, and the leukocytes, 5,200 per cubic millimeter of blood. The result of the flocculation test for syphilis was negative. The value for blood sugar was 144 mg. per 100 c.c.

The sedimentation rate was 27 mm. in one hour by the Westergren method, and ten days later it was 67 mm. The results of urinalysis on two occasions were negative. The test for Bence Jones protein gave negative

liferation of bone at the medial and lateral aspects of the upper third of the shaft of the left tibia and vascular calcifications. The bone otherwise appeared to be normal. The anteroposterior and lateral roentgeno-

results. The roentgenograms of the chest showed a rounded mass, 2 cm. in diameter, at the level of the sixth interspace posteriorly; it was felt that this possibly was the result of an inflammatory process but that the possibility of a malignant lesion, either primary or metastatic, should be excluded. There was minimal fibrosis at the level of the first anterior interspace on the right and calcification of the arch of the aorta. The roentgenograms of the left leg revealed slight periosteal programs of the lumbosacral region showed hypertrophic changes in the lumbar part of the spinal column. There was evidence of multiple small calculi just to the right of the body of the second lumbar vertebra and also multiple rounded areas of increased density in the pelvis.

At operation on November 22, 1946, through an incision 2 inches (5 cm.) in length a specimen was removed for microscopic examination by the fresh frozen tissue

method. The tumor was exposed and found to lie underneath the tibialis anticus muscle; it was grayish yellow in color and hard and it felt gritty. Microscopic examination revealed fibrosarcoma, grade 3, invading muscle and blood vessels which contained organized blood clots with nests of malignant cells (Fig. 2, *A*, *B* and *C*). The patient was informed of the malignant nature of the lesion and of the lesion in the lung, which probably was metastatic, although there was a possibility that the pulmonary lesion was of an inflammatory character. Surgical treatment was felt to be justified, and the patient decided to have an amputation.

On November 28, amputation at the juncture of the middle and lower thirds of the femur was performed with the patient under spinal anesthesia. The pathologic examination of the specimen revealed an infiltrating fibrosarcoma, grade 3, 10 by 7 by 7 cm., deep in the soft tissue of the leg with involvement of the periosteum of both the tibia and fibula, the interosseous membrane and the anterior muscles of the leg. The tumor had invaded several blood vessels and had produced a metastatic nodule, 1.5 cm. in diameter, which was attached to the popliteal vein. The patient was given dicumarol postoperatively, and he had an uneventful convalescence. He was dismissed on December 12, 1946. He reported by letter, July, 1947, that three months after he had returned home he had had pleurisy. The physician reported that death had occurred about eight months subsequent to operation as a result of pulmonary metastasis.

Case 2. Fibrosarcoma, Grade 2, of the Foot with Malignant Extension into Blood Vessels.—A patient forty-six years of age first noticed a painless swelling over the instep of his right foot in January, 1946, and remained under the observation of physicians until May 31, 1946, at which time biopsy and microscopic examination of tissue removed revealed fibrosarcoma. The roentgenograms of the chest at that time disclosed no abnormality. The patient had had a "sensitive feeling" in the ball of the right foot in 1941, but nothing abnormal had been found on examination; this sensation gradually had disappeared, there had been no trauma and he had served in the armed forces for six months without complaint. The father of this patient had died at the age of sixty-two years from hypertensive cardiovascular disease; the mother had died at the age of thirty-six years from a tumor of the brain; four sisters were living and well, but two brothers had died in infancy.

Examination at the clinic, June 10, 1946, revealed a firm swelling over the dorsum of the second and third metatarsal bones of the right foot with a small postoperative scar in this region; a separate mass, 1 cm. in diameter, could be palpated over the head of the fourth metatarsal bone. Hard pencil-like veins extended proximally from these tumors. There was a third mass on the plantar surface of the foot, which was larger than either of the two masses on the dorsum. The whole foot revealed diffuse edema and felt warmer than the left one. Sections of the tissue removed prior to his admission at the clinic and brought by the patient revealed fibrous hemangioma.

The examination further revealed essentially negative urinary findings, 14.4 gm. of hemoglobin and 5,800 leukocytes. The flocculation test for syphilis gave negative results. The sedimentation rate was 22 mm. in one hour by the Westergren method. The roentgenograms of the chest disclosed no abnormality, those of the right foot showed calcaneal spurs and there was no evidence of neoplasm of bone.

On June 11, 1946, excision of the tumors was performed with the patient under pentothal sodium anesthesia. The tumor of the dorsum of the foot consisted of two masses. The medial mass, 1½ by ¾ inch (3.8 by 1.9 cm.) in size, was intimately connected with the dorsalis pedis artery, which was thickened to about five times its normal size and the lumen of which contained friable tumor tissue. The artery was dissected upward until a level was reached at which it appeared normal, which was just below the ankle joint. The second mass on the lateral aspect of the dorsum of the foot, overlying the fourth metatarsal head, was ¾ inch (1.9 cm.) in diameter and there, too, a thickened vessel containing similar friable tumor tissue was found. This vessel was ligated 5 inches (12.7 cm.) proximal to the tumor and excised. Both tumors were removed. Tumor tissue was found to extend through the metatarsal bones to the plantar mass. As the tissue was very friable, a curet was required to scoop it out; this resulted in breaking it into several pieces, some of which were whitish and some whitish yellow or gray. The pathologist deferred diagnosis of the fresh frozen sections, but later, after a more detailed study, reported a degenerating and hyalinized fibrosarcoma, grade 2. The tumor had invaded large blood vessels and weighed about 30 gm. (Fig. 1).

The plantar tumor was extensive and it was obviously impossible to excise it completely. Amputation above the knee at the junction of the middle and lower thirds of the femur was performed June 14, 1946, with the patient under spinal anesthesia, and examination of the foot showed additional tumor tissue in the plantar region which we knew could not be successfully removed at the previous operation. There was no apparent extension of the tumor beyond the foot. The patient made an uneventful recovery. Roentgenograms of the thorax made in January, 1947, and in September, 1947, revealed no abnormality, and in January, 1948, the patient said he was well and had no trouble.

Case 3. Fibrosarcoma, Grade 4, of the Left Thigh.—A woman fifty-six years of age was seen in January, 1947, at which time she gave a history of sustaining a fall and landing on her buttocks in October, 1946. She stated that no roentgenograms had been made but that three weeks after this fall she had noticed a swelling on the inner aspect of the left thigh which became painful and that a diagnosis of thrombophlebitis had been made. The popliteal vessels had been prominent but there was no edema of the lower part of the leg. She stated that she had been treated with sitz baths and that her symptoms had subsided, but three weeks prior to admission at the clinic her symptoms had recurred.

Examination January 13, 1947, revealed an obese healthy-appearing woman, whose weight was 148 pounds (67.1 kg.) and whose blood pressure was 120 systolic and 80 diastolic. Palpation revealed a firm mass, 4 inches (10 cm.) in diameter and about 2 inches (5 cm.) deep, on the anteromedial aspect of the upper part of the left thigh, which appeared fixed to the bone or to the deep muscles.

The urinalysis gave negative results. The value for hemoglobin was 11.2 gm., the erythrocytes numbered 3,740,000 and the leukocytes, 5,400. The sedimentation rate was 49 mm. in one hour by the Westergren method. The roentgenograms of the left thigh showed a mass in the soft tissue involving the muscles of the anteromedial aspect of the middle third of the left thigh; the bone appeared to be normal.

At exploratory operation January 16, 1947, the mass was found to be bluish in color, and the femoral artery and vein were stretched so tightly across the anterolateral surface of the tumor that the artery was not pulsating. The femoral artery was then dissected out and reflected laterally, after which it was ligated above and below. The adductor brevis muscle seemed to end in the mass and was cut across after which it was possible to dissect down the fascial plane to the medial lip of the linea aspera and then to deliver the mass in toto. The femoral vein was found intimately bound with the tumor and apparently "was continuous with the inside of the saccular mass"; the artery appeared undamaged. A careful examination of the specimen was made, and the surgeon expressed the belief that the tumor had formed an aneurysm in the wall of the femoral vein. The lumen was filled with old, organized blood clots. The pathologist made a diagnosis of fibrosarcoma, grade 4.

The patient made an uneventful recovery after her operation and was given two deep roentgen ray treatments on the eighth and eleventh postoperative days. Examination on May 14, 1947, revealed no signs of recurrence or of metastasis to the lungs. She had gained weight, and the sedimentation rate was 40 mm. No further roentgen therapy was thought advisable at that time. In August, 1947, however, the patient's physician reported metastasis to the right lung, and death occurred on October 27, 1947.

Comment

We have previously stated that about 50 per cent of fibrosarcomas appear encapsulated and that the results of treatment are directly proportional to the degree of malignancy. The surviving patient in Case 2 had a grade 2 fibrosarcoma. We believe that better results will be obtained when the true nature of the tumor is diagnosed earlier. In the early stages of the disease, wide excision, or amputation if this is possible, is advisable. We have found these tumors very highly radioresistant, and it is our opinion that favorable results do not follow such treatment. Thus, the surgeon must determine the type and degree of malignancy and the operability of the lesion as indicated by its site and size; the duration and rapidity of recent growth are important factors to be considered. Furthermore, the treatment will be determined in part by whether or not there has been extensive invasion to important structures, that is, nerves and blood vessels. Roentgenographic examination of the thorax should be made in all cases to exclude the possibility of pulmonary metastasis. Amputation is often performed as a palliative measure because the patient may be suffering from intense pain resulting from a rapidly growing tumor that has failed to respond to other methods of treatment.

MEDICAL PUBLICATIONS AND REPRINTS REQUESTED

Requests have been received from Japanese medical institutions for medical literature in the form of reprints particularly, but also medical journals and text books published since 1941. Literature on tuberculosis is especially desired. Physicians wishing to contribute may send such literature to Professor Quigley at the Department of Political Science, University of Minnesota, Minneapolis 14, Minnesota.

THE RELATION OF THE PATHOLOGIST TO THE GENERAL PRACTITIONER

L. W. LARSON, M.D.
Bismarck, North Dakota

THE SUBJECT of this discussion seems extremely elementary at first glance. However, calm reflection demands that first, we define "pathologist" and "general practitioner"; second, that we review the relationship which exists at present between these two branches of the practice of medicine; and, third, that we speculate as to what can and should be done in the future in order that the two may be of greater service to each other and particularly to the patient.

Pathology is defined as the science of the origin, nature, and course of diseases. A pathologist is one who limits his practice to that of pathology. As such, he is a specialist in the practice of medicine. The so-called "clinical pathologist" has developed during the past quarter of a century. Salter,[1] an internist, has defined clinical pathology as "merely the adaptation of the fruits of fundamental research to concrete problems in medical practice." Sanford,[2] in his presidential address before the section on pathology and physiology of the American Medical Association in 1930, said, "A clinical pathologist is a physician who devotes all or the major portion of his time to diagnosis of disease by laboratory methods. He is a histopathologist and a microscopist. He must be a serologist, a bacteriologist, and somewhat of a chemist and physicist. In this field of varied interests he must always be up-to-date and must serve chiefly as a consultant in interpreting and evaluating laboratory data for his medical brethren." This is a large order, but it indicates the diversity of the clinical pathologist's interests today and suggests the extent of his usefulness in the practice of medicine.

Someone has said that a specialist is one who knows more and more about less and less. If the pathologist is a specialist, and generally he is so considered, the definition does not apply to him. During the past twenty-five years, the pathologist has emerged from the individual who too often was primarily interested in "deadhouse" pathology to a consulting specialist worthy of the name. He has become interested in the patient, and, as a result, is playing an important role in clinical diagnosis and in the determination of the proper form of treatment. To do so he must be familiar, not only with advances in his own specialty, but also with those of medicine in general. Truly, the pathologist of today needs to know more and more about more and more.

The same wit who defined a specialist defined a general practitioner as one who knows less and less about more and more. Certainly those of us who know general practitioners will not agree with this definition. Some prefer to call him a practitioner of general medicine, others a specialist in the general practice of medicine. Whatever his title, he remains the backbone of medicine today and its hope for the future. To be successful he must combine the art and science of medicine more effectively than any limited specialist. He also has come a long way from the horse and buggy days when he spent most of his time on the road to and from his patients, and carried all his diagnostic facilities and therapy in one or, at the most, two bags. Today, more and more of his patients are being seen in the office, and a high percentage of them are under his care in a large or, more often, small hospital. He is confronted daily with problems in pediatrics, obstetrics, internal medicine, fractures, general surgery, and last but not least, geriatrics. Surely, he like the pathologist, needs to know about more and more.

It is generally agreed that pathology is the foundation of the practice of medicine. The practitioner, general or limited, must have an understanding of the pathology of a disease in order that he may correctly diagnose it and outline its treatment. Pathological anatomy is stressed in the undegraduate training of the medical student so that the graduate in medicine, especially in these days, has a good theoretical knowledge of its contents. However, the scope of pathology has become so broad, with the developments in pathological physiology, physiological chemistry, bacteriology, immunology, serology, and hematology, that the average medical graduate cannot hope to retain more than a minimal knowledge of the subject. If he becomes a general practitioner he is too busy caring for patients with all kinds of

The Arthur H. Sanford Lectureship, sponsored by the Minnesota Society of Clinical Pathologists, delivered at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 11, 1949.

complaints to pursue his study of these subjects except as one or possibly two of them intrigue him or, of necessity, demand his attention. The role of the pathologist is to provide this knowledge in order that the clinician may apply it in the diagnosis and treatment of his patients.

The multitude and variety of clinical laboratory tests available today is phenomenal. Which tests are of real value? Which tests should be used in a given case? These are questions which the general practitioner cannot always be expected to answer. Unfortunately only a relatively few laboratory tests are diagnostic. The presence of amebae histolytica in the stool is diagnostic of amebiasis; a fasting blood sugar of 125 mg. per cent or more invariably means diabetes; a positive Friedman test usually denotes pregnancy; and the presence of blast forms in the blood smear suggests leukemia. The well-trained chemist or technologist can and does perform most of these tests, but it requires the opinion of one who is specially trained to evaluate them properly in a given case. The general practitioner cannot be expected to do so in every instance and he needs someone to do it for him. The pathologist can and should provide this service. The large hospital or teaching institution has facilities for performing most of the laboratory tests available today. However, the small hospital, in which the majority of the general practitioner's patients are taken care of, rarely provides such complete service. Here again the pathologist can be of great service to the general practitioner in outlining the minimum laboratory procedures of value in a given case and also of suggesting other tests if the basic tests do not supply the answer. The technician is not qualified to do this and should not be relied upon to do so.

With the growth in the number of laboratory tests, the technical difficulties in their performance have multiplied. Time and training are necessary if the results of tests performed by technicians are to be reliable. The evaluation of the newer tests requires time-consuming study. The average general practitioner does not have the time to attend to these details nor does he have the training to supervise the work of the laboratory technician. Here, again, the pathologist can be of service to him.

Undoubtedly the most important fields in which the pathologist can be of assistance to the general practitioner are in tissue diagnosis, both surgical and postmortem, hematology, bacteriology, and serology.

More and more surgical procedures are being performed in the smaller hospitals, especially in rural areas. It is just as essential, for the protection of the public and the professional growth of the surgeon, that tissues removed at operation in the small hospital be examined by a pathologist as in a large hospital. Likewise, the postmortem examination is as necessary a procedure in the small hospital as in the large hospital if the staff members are to profit by errors in diagnosis, evaluation of therapeutic measures employed, and a discussion of the pathogenesis, symtomatology, diagnosis, and treatment of a given disease. The clinical-pathological conference, conducted by the pathologist, who has the surgical or postmortem material at hand for demonstration, can be as stimulating an event in the small hospital as in the large hospital. Again, the pathologist can be of great service to the general practitioner in this respect.

Forensic medicine is a field which has not been given the attention it deserves. The quality of the testimony of the medical expert in court is being questioned, and the accumulation of medicolegal data concerning the investigation of deaths in which there is a suspicion of criminal, traumatic, or occupational origin, leaves much to be desired. Too many postmortem investigations of such cases are being performed by practitioners who are neither trained in pathology nor in medical jurisprudence. The pathologist can relieve this situation if he is asked to perform the autopsy and to consult with the practitioner who is interested in the case.

The role of the general practitioner in the early diagnosis of cancer is more fully appreciated than ever before. The American Cancer Society is stressing the advisability of periodic physical examinations by the family physician. Usually the family physician is a general practitioner. The Society has developed a broad program of progressional education beamed at the general practitioner, for if he sees the patient first he must be "cancer minded" and it is his duty to give the patient a thorough physical examination. Fortunately a large percentage of cancers can be seen or felt. Those beyond these two senses can usually be detected, even in their early stages, if the examining physician has a high degree of suspicion and is willing to refer his patient to others who

have special diagnostic facilities at their command. More and more general practitioners in my area are doing biopsies of skin, mouth, and cervical lesions. From there on the services of a pathologist are essential.

The diagnosis of exfoliated cells, as popularized by Papanicolau, has placed a potent weapon in the hands of the medical profession in the war on cancer. Any general practitioner who takes the time to learn the simple technique of obtaining smears from the vagina and cervix, or of collecting sputum and urine, can complete the first step in a most valuable screening test for cancer. The next step is that of interpretation of the cells present in the prepared specimen. This requires the services of one who is trained in histology and histopathology. Undoubtedly technicians can be trained to eliminate the specimens which contain normal cells, but it requires an expert to recognize the abnormal cells. The general practitioner should understand the complexity of this problem and not be led to believe that the procedure is simple and can be delegated to a technician, no matter how well trained he or she may be. Furthermore, it should be emphasized that a cytologic diagnosis of exfoliated cells is not always the final answer. Failure to recognize malignant cells in a smear will lull the physician and patient into a sense of false security, and a positive diagnosis of malignancy may be disastrous unless it is confirmed by other examinations. The role of the well-trained and experienced pathologist in this procedure is obvious. The method will fall into disrepute unless clinicians, and the public, realize that it is primarily a screening test for cancer, the results of which depend on the ability of the examiner to recognize individual malignant cells.

Postmortem examinations are as important in the practice of the general practitioner as in that of the specialist. A few general practitioners perform a very good autopsy, especially those who have taken an interest in the procedure during student and intern days. But the number is limited, and most general practitioners with whom I come in contact are reluctant to perform a postmortem examination because they realize their inability to do it properly. They appreciate having a pathologist available to perform the autopsy for them. Most pathologists are glad to co-operate even though it may require much of their time. The problem of compensation for the pathologist who performs an autopsy on patients who have not been patients in his hospital is difficult because it is usually done for scientific reasons and the relatives cannot be charged for it. Clinicians must recognize this problem and give it due consideration when the financial agreements between the pathologist and the small hospital are being discussed.

The general practitioner is often confronted with problems in hematology. Advances in the diagnosis and treatment of the diseases of the blood have been phenomenal during recent years. The pathologist can be of inestimable service because of his knowledge of the peripheral blood picture in the anemias and leukemias. He supplements these studies with those of the bone marrow. Most general practitioners are not trained to do this work and, if they rely on the final judgment of the technician, they will fail to give the patient all that modern medicine has to offer. The treatments of the deficiency anemias and of pernicious anemia are well standardized at present, but a correct diagnosis must be made first unless the clinician is content with "trial and error" methods of treatment.

The development of chemotherapeutic agents and the antibiotics has revived an interest in bacteriology. Even the small hospital laboratory can perform the simpler bacteriological procedures, provided the technician has someone competent to supervise her work. This is also true of serologic tests for syphilis, brucellosis, mononucleosis, et cetera.

Blood transfusion is becoming a routine procedure even in the smaller hospitals. The danger of transfusion reactions can be minimized if the laboratory technician is well trained in the determination of the blood groups and the performance of compatability tests. These procedures require the use of potent testing sera and a thorough knowledge of the importance of painstaking cross matchings in order that disasters may be avoided. This is particularly true in patients who have had previous transfusions or when female donors are used in whom sensitization to the Rh factor has occurred. It is true that a patient's condition may be so critical that the taking of chances by hurried perfunctory tests of the patient's and donor's blood is justified, but such instances are rare. It is far better to take a little more time and be safe. The practitioner should realize that time is required to do careful work. The pathologist, who is trained in this field, can establish standards of performance in the laboratory under his super-

vision and serve as a consultant when perplexing problems arise. The growth in importance of the Rh factor in blood transfusions, as well as in pregnancy and in the newborn, demands that facilities for its study be available in every hospital regardless of size. This is not a simple problem, as every pathologist will testify. Constant care must be exercised in order that incorrect results are not obtained through lack of training and experience on the part of the technician or because of the impotence of the anti-Rh serum being used. Here again, a pathologist can supervise the work of the technician and unsnarl the difficult problems that invariably arise. Few general practitioners are competent to do so.

From the foregoing I believe we can agree that the average general practitioner cannot be expected to be competent in the field of laboratory medicine and that the pathologist can be of great service to him. However, we have not discussed the availability of the pathologist to the general practitioner, and the willingness of the general practitioner to seek the services of the pathologist. There are approximately 6400 registered hospitals in the United States. About 1600 pathologists have been certified by the American Board of Pathology to date. Of this number many are doing research work exclusively; many are teachers who do a limited amount of actual practice, and a few are engaged in a limited field in the specialty. A small number of pathologists are not certified, either by choice or through inability to qualify. Quite a number of clinicans work in pathology on a part-time basis. From these figures it is apparent that the ratio of hospitals to pathologists is about four to one. The 6400 registered hospitals includes many with less than fifty beds. However, there are a large number of hospitals with a bed capacity of 75 to 150 which do not have the services of a pathologist, even on a part-time basis. The reasons for the shortage of pathologists are numerous. It is true that a different temperament is required of the pathologist than the clinician. Too often medical students and interns have been discouraged from going into pathology because the pathologists with whom they have come in contact have been of the "recluse" type and have not manifested sufficient interest in the patient or in the welfare of the profession. The American Society of Clinical Pathologists has recognized this problem for several years and has taken steps to correct it through an educational campaign among its own members and also directed toward hospital interns and residents. The recently organized College of American Pathologists is stressing the same program. The greatest deterrent, however, has been the economic insecurity of the pathologist, at least until the past decade, and the reluctance of many clinicians to accept the pathologist as a full-fledged member of the hospital staff. Pathologists in general have done well financially of late, but there still exists a tendency on the part of hospital authorities to exploit the pathologist and to make the clinical laboratory cover the deficits incurred elsewhere in the hospital. Clinicians can help to remedy this situation by insisting that the pathologist be adequately compensated for his work, commensurate with his ability. They can also contribute to his financial security by refusing to patronize commercial laboratories operated by laymen, and by discouraging the use, development and expansion of so-called "free" laboratory services in institutions owned and operated by governmental agencies through tax funds. No one will deny that the public health laboratory has a legitimate function in the diagnosis and control of communicable diseases, but it should not be permitted to offer other diagnostic tests free of charge for patients who can afford to pay for such services. The pathologists of Minnesota and of my state are willing to perform laboratory tests and tissue examinations on any patient certified as medically indigent by his physician provided he is also contributing his services.

Clinicians generally are awakening to the danger of governmental intrusion in the fields of pathology, radiology, and anesthesiology because it may well serve as the entering wedge to a complete socialization of the practice of medicine. Much is being said these days by planners, in and out of government, about "diagnostic centers" and "diagnostic facilities." Ostensibly the purpose is to provide facilities for diagnosis, such as x-ray and clinical laboratories, where they do not already exist. If so limited, they would undoubtedly be of great service to the practitioners located in rural and the smaller urban areas. However, they must be subject to local control, as they may be the means by which an ambitious bureaucracy will gradually encroach upon the practice of medicine. Pathologists are vitally interested in this subject, for they realize that a

government sponsored and subsidized facility may develop into a vast system of similar facilities located everywhere, including those areas which are adequately served by private facilities and thus replace the present system of private enterprise. Clinicians, especially the general practitioners who might be tempted to look with favor on such a form of government subsidy becauses it promises to offer facilities which are not presently available to them, should scrutinize this movement carefully before endorsing it. Many small communities in the north central states are demonstrating, by co-operative effort, under the guidance of local lay and professional leaders, that they can solve their own problems of providing adequate hospital and diagnostic facilities. More communities should be encouraged to do likewise.

If the number of pathologists increases, and there is every indication that it will, what can be done to locate them where they are needed? The American Medical Association is stressing the importance of the general practitioner in the practice of medicine, and its committee on rural health, with the assistance of the organized farm groups, is co-operating in every way possible to provide more practitioners in the rural areas. The Hill-Burton Construction Act has stimulated interest in the building of hospitals and health centers where they are needed. These facilities will provide the general practitioner with a place in which he can care for a large majority of his patients. But what about the supply of nurses, technicians, anesthetists, and especially pathologists? The answer would seem to lie, so far as the pathologist is concerned, in a coordinated network of health centers, rural hospitals and district hospitals, in which the pathologist would have his headquarters in the district hospital. He would supervise the laboratory work in the rural hospitals and health centers through regular visits. With modern methods of transportation the pathologist could answer emergency calls within an hour or two. Perfection of such a system would place the pathologist within easy reach of the practitioner, and those tests, including the preparation of tissues for diagnosis, which are not performed in the smaller laboratories, would be done in the central district hospital laboratory. This plan conforms to the general outline of the federal government's planning. The details of finances would have to be worked out, but this would be relatively simple if all concerned, including the practitioners and the hospital authorities, agree that the pathologist is a physician and must be adequately compensated for his services if he is to remain in the area. If successful, the plan would result in better medical service in the rural and small urban areas, where the clinical work will undoubtedly be performed, primarily by the general practitioner.

It is a common observation that the level of medical practice in a community is dependent, to a large degree, upon the quantity and quality of pathological service available. Decentralization, rather than centralization, is the present emphasis, and the general practitioner is the key figure in this movement. He must have every assistance possible, in order that he may offer his patients the very best in medical service. The pathologist can play an important role in this development. However, the practitioner must appreciate his worth and his ability to contribute to the practice of scientific medicine, and he must desire his services. In the final analysis the practitioner has the patient; the pathologist has only his ability to serve when called upon by the clinician. It is the earnest desire of pathologists to join in a co-operative effort with practitioners everywhere in order that all the people may enjoy the benefits of modern medical practice. We are all practitioners of medicine. We are all dedicated to the prevention of disease and the relief of suffering. United we cannot, we will not, fail to fulfill our mission and to preserve our heritage of a free and unfettered profession.

RADIOGRAPHIC EVIDENCE OF INTERMITTENT PROTRUSION OF AN INTERVERTEBRAL DISC

Case Report

C. C. CHATTERTON, M.D., F.A.C.S., and LEO A. NASH, M.D., M.S. (Radiology)
Saint Paul, Minnesota

INTERMITTENCY of symptoms of backache and the sciatic syndrome, produced by ruptures of the intervertebral discs, is one of the characteristics of these cases. Relief of pain has often been effected by manipulation or postural changes. Macey[1] speculated on the probability of reduction of the prolapsed nucleus into the intervertebral space in these patients with intermittent pain.

The following is a case report showing this phenomenon.

The patient, a white woman, age thirty-nine, had had episodes of back and left leg pain for five years. The present siege was initiated by lifting her small child a few days before hospitalization, when she felt "something snap in her back," followed by inability to move for a short while and continued back pain radiating down the left leg. During the next few days she received relief of pain for periods up to several hours after chiropractic manipulation, followed by recurrence of pain, more manipulation with pain relief and then further recurrence.

She was admitted to St. Luke's Hospital on February 8, 1948, complaining of back pain with radiation to the left leg and some twitching of the lower leg muscles and numbness in the toes. Her remote past history was non-contributory, as were the general physical examination and routine laboratory tests. The knee jerks were present; the ankle jerks were absent. Straight leg raising produced pain at 45 degrees on the left, with an area of hypesthesia on the dorsum of the foot extending to the great toe.

Following the use of extension applied to the left leg for forty-eight hours, an opaque myelographic examination was made. Preliminary radiographic study revealed bilateral spondylolysis between the fourth and fifth lumbar segments and Grade I spondylolisthesis at the lumbosacral joint, with isthmus defects at these levels. Using 5 c.c. pantopaque intrathecally, later removed, a rare observation was made fluoroscopically and recorded radiographically. With the patient prone and the left side raised, no appreciable abnormal findings were seen on the first caudal excursion of the media. On the second excursion with the patient standing on her left foot, pain suddenly became manifest and a classical extradural defect in the column of media, characteristic of protrusion of an intervertebral disc, became apparent at the level of the lumbosacral joint on the left side.

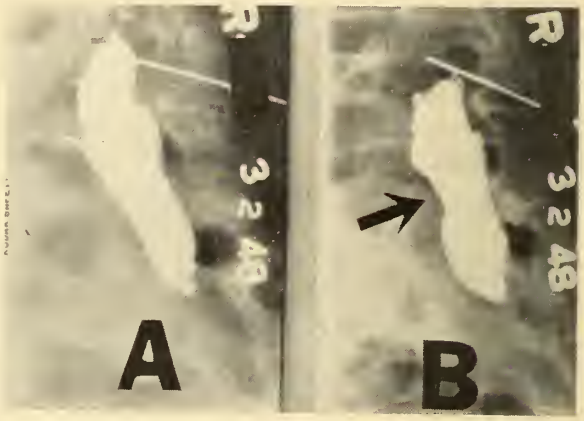

Fig. 1. (*A*) The pantopaque-filled lumbosacral subarachnoid space, with patient lying in a prone position with the left side slightly raised, revealing normal myelographic findings. (*B*) An extradural defect (black arrow) due to protruded intervertebral disc, which finding occurred after the patient experienced pain during the examination.

Figure 1*A* shows the radiographic findings before pain and Figure 1*B* after the pain. It was felt that the deformity was due to protrusion of a ruptured intervertebral disc rather than to any change caused by the spondylolisthesis.

On March 8, 1948, an operation for removal of the ruptured intervertebral disc and spinal fusion was performed by one of us (C.C.C.). A protruded intervertebral disc was found on the left side between the last lumbar and first sacral segments and was removed, and fusion from the levels of the fourth lumbar to the first sacral vertebrae was effected with bone grafts taken from ilium. Convalescense was uneventful, and the patient has had no further back pain.

Comment

It is probable that the spondylolisthesis and spondylolysis contributed to the mobility of the protruded disc, to the intermittent character of symptoms and to the relief obtained by manipulation in this case. Fairly good radiographic evidence, however, has been produced to show that intermittent protrusion of a ruptured intervertebral disc does occur, accounting for a cause of intermittent symptoms.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

"History is the essence of innumerable biographies."
Thomas Carlyle (1795-1881): On History

The first to record the general history of Olmsted County, Minnesota, it is believed, was William H. Mitchell, a newspaper publisher of Rochester, who in 1866, after several years of research and compilation, brought out his *Geographical and Statistical History of the County of Olmsted, together with a General View of the State of Minnesota, from the Earliest Settlement to the Present Time.* The history is a paper-bound booklet of 121 small pages, to which are affixed some eighteen pages of regional advertising, with lists of lawyers and physicians of Rochester.

In glowing phrases Mitchell described the beauty and promise of this county of some 650 square miles, most of it tillable, whose mean elevation is 1180 feet; the warm black soil, deep and rich; the gently rolling prairies and the lush meadows; the abundant waters of the Zumbro,* Root and Whitewater Rivers, of Cascade, Bear and Silver Creeks and lesser tributaries, and of ever-flowing springs; the picturesque bluffs and rocky dells along the water courses; the varied timber bordering the streams, the upland groves and, in the northwestern part of the county, the heavy hardwood growth that locally was called the "Big Woods." He pictured vividly the blue distances, the incomparable summer verdure and bloom, the native fruits, the gorgeous autumn coloring, and the wild animal life that contributed to the food supply of the early settlers, and he stressed the moderate climate and exhilarating atmosphere. "Perhaps the eye of man never rested on a spot of earth which for fertility of soil, beauty of landscape and healthfulness of climate and location, was better fitted to meet his material wants, and to supply the necessities of his nature, since shut out from the original Eden." He continued:

> Looking backward for only a few short years, and we see no signs of civilization, neither of habitation, save the wigwams of the red men and their trails as they make their way to their hunting grounds farther west, their council fires, and their bark canoes gliding over the water of the various streams, and we have a truthful picture of Olmsted County as it was previous to 1854, ere the hand of civilization had disturbed its wilderness and primitive state. Today we look again. Twelve years have passed away, and behold what a change. The magic wand of civilization has been waved over the broad prairies and openings, and art, science and commerce, combined with the real western energy, have covered the wide expanse with cultivated fields and golden harvests; have made roads and built bridges, and dotted the prairies with pleasant dwellings, busy villages and the bustling city.

Mrs. Guthrey was a member of the Editorial Department of the Mayo Clinic, 1916-1919, and personal secretary and assistant to the late Dr. William James Mayo, 1919-1939.

*The name of the Zumbro River is a corruption of "La Rivière des Embarras," meaning river of hindrances, which was given this stream in Wabasha County by early French explorers because floating driftwood hindered their canoes. Early spellings of *Zumbro* were *Zombro* and *Zumbra.* In Goodhue County the Sioux Indians early called the Zumbro River "Wazi Oju," meaning "planted pines," because of a grove of large white pines on its banks near the site of the present village, Pine Island.

Olmsted County, once part of the original great Wabasha County, which was established on October 27, 1849, and which comprised most of southeastern Minnesota, was created by act of the territorial legislature on February 20, 1855. The first meeting of the county commissioners was held at Oronoco on August 27, 1855. The county was named for the Hon. David Olmsted (1822-1861), who was an early and important figure in Minnesota history. A native of Fairfax, Vermont, David Olmsted in 1844 came as an Indian trader to Iowa and in the next two years was instrumental in drawing up a constitution for state government of Iowa. In 1848 he established a trading post in Todd County, Minnesota; in 1849 he became a member of the council of the first territorial legislature and was president of the legislature at its first session. Subsequently he settled in Saint Paul, where he founded the *Minnesota Democrat*; in 1854 he was the first mayor of the city. A year later he removed to Winona; soon afterward, his health having failed, he returned to Vermont, where his death occurred.

Olmsted County is in the second tier of counties above the Iowa line and is bounded on the north by Goodhue and Wabasha Counties, on the east by Winona County, on the south by Fillmore and Mower Counties, and on the west by Mower and Dodge Counties. Its eighteen townships, each of eventful history, were organized in the period between May, 1855, and May, 1859. They are listed here in four tiers from south to north, the individual townships from east to west: (1) Elmira, Orion, Pleasant Grove, High Forest and Rock Dell; (2) Dover (originally Whitewater), Eyota (originally Springfield), Marion, Rochester and Salem (originally Lexington); (3) Quincy, Viola (originally Washington), Haverhill (originally Zumbro, then Grant, then Sherman), Cascade and Kalmar; and (4) Farmington, Oronoco and New Haven. Olmsted County owes its deviation from rectangular shape to the fact that, for political reason, soon after organization of the county, two townships in the northeastern corner were detached and given to Wabasha County, and that on May 22, 1857, a strip of land one mile wide and twelve miles long, comprising Sections 1 to 6, inclusive, in Township 104, Ranges 14, 15 and 16 in Mower County, was attached to the southwestern corner of Olmsted County, forming part of High Forest Township and bordering Rock Dell Township on the south. For many decades after its transfer to Olmsted County this addition was known as the "Mile Strip" or the "Panhandle."

In recent articles (Guthrey) on early medicine and its practitioners in Houston and Fillmore Counties, there was given brief description, which is not repeated here, of conditions of living in southeastern Minnesota during the early decades of the nineteenth century, beginning with the first penetration of the region by white men and touching on the opening of navigation on the Mississippi River and the first fringe of settlements along the river; the establishment of the territorial government, followed by treaties with the Indians and opening of regional federal land offices; and the trickle of immigration westward that by 1854 had become a tide.

Settlements sprang up in Olmstead County, created by pioneers of all types, classes and occupations and of various nationalities, who came to the land of hope intent on realizing economic independence and, many of them, improved social condition. Although many of the townships of the county were settled largely by Scandinavians, others by Germans, and lesser localities by Irish, in the influx of immigration, which continued unabated well into the late sixties, Olmsted County received a larger proportion of English than did near-by counties. Many of the English came directly from England and many more from New England. New England, it has been said, furnished the ferment that did much to Americanize

the diverse peoples who settled the county. Some of the physicians who came from New England were among the best educated of the pioneers for citizenship and for their profession. Many of them spoke several languages; some of those from northern Vermont were well versed in French, having learned the language in preparation for practice among the French who had come into Vermont from Canada. Relatively few of the pioneers, of whatever descent, except those who came as part of certain groups of colonists that had been organized in the East or in Europe, made an unbroken journey from the Atlantic States to Minnesota. The recurring note in biographical accounts has been of gradual westward travel. A typical family history tells of removal from New England to Pennsylvania, to Ohio, to Illinois, and on to Wisconsin, before final settlement in Minnesota. Most of the pioneers traveled in covered wagons drawn by oxen, and the newspapers of Rochester and other settlements commented enthusiastically in each issue, well into the seventies, on the fleets of prairie schooners that daily were passing through, carrying families who were bound for prairie farms. The influence of all nationalities is apparent in names given to villages, townships and topographical features.

Although one history (1883) mentions a pioneer clergyman in the future Olmsted County as early as 1850, an accepted account is that late in 1852 or early in 1853 Jacob Goss settled on land in what was to become Pleasant Grove Township. There came into the region before him, however, in the spring of 1852, a little band of explorers from Wabasha Prairie (Winona) led by Dr. John L. Balcombe. This physician of the regular school, never a resident of Olmsted County, made such expeditions an avocation, it is said, and his habit of close observation, together with a photographic memory for topography, gave him an especial advantage. On the trip in 1852 he discovered and located as a timber claim the site of High Forest Village in High Forest Township. It was not until March, 1854, that he again guided to this spot some of the men who formerly had accompanied him and sold them his rights; these men, soon followed by other pioneers, founded the permanent settlement. Other communities were established in 1853 and 1854 in various parts of the county, and from then on the work of settlement and improvement was rapid. Trails and roads were opened and mail service was established. Stagecoaches, drawn by four horses or more, had their long term of vital usefulness, during which numerous inns, at crossroads and in settlements, offered hospitality to man and beast. The Old Territorial Road between Dubuque and Saint Paul crossed the county, passing through Pleasant Grove, Rochester and Oronoco. By 1864 the railroads were coming into the county, at first supplementing the stagelines and eventually supplanting them. Olmsted County, like its neighbors, has its phantom villages, most of which are the remnants of settlements that sprang up in those early years around millsites or other vantage points. When natural water power diminished in the course of years, or when the railroads left the ambitious villages to one side, they became ghost towns.

The site of Rochester, the county seat, in Rochester Township, received its first settlers in the spring of 1854, in what became North Rochester. In the same season a band of surveyors staked a claim near the falls of the Zumbro River, a cascade that they called the Falls of Wazi Oju; a few weeks later this claim was jumped by pioneers seeking a location. In that summer George Head named the settlement Rochester, after Rochester, New York, and it is said that he established the main street, Broadway,† by having a log dragged through the

†In this history the names of streets in Rochester are the original names, unless otherwise stated. About 1919, for the convenience of transient visitors who found the unrelated names of streets and avenues confusing, the city was divided into sections, Northwest, Northeast, Southwest and Southeast, and most of the streets and avenues were renamed numerically and geographically in each section. The streets run east and west, the avenues north and south. Broadway retained its name.

hazel brush by an ox team. The first celebration of the Fourth of July in the county was held in Rochester in 1854 by the three adults and the two children then resident there. Rochester was platted in October, 1855. In that year Dr. Jesse N. McLane, of Rochester, was appointed the first register of deeds of the county, and in 1856 Dr. Ira C. Bardwell, also of Rochester, became the first clerk of the district court. Rochester became the county seat in the spring of 1857, winning the honor over Oronoco and Marion in a hard fought political contest, and on August 5, 1858, it was incorporated as a city.

Olmsted County kept step with the neighboring counties in all matters of settlement and civic progress, in establishment of businesses and manufactories, and in founding newspapers, churches and schools. In Rochester, strange to say, there was apathy about public schools; the only schoolhouse of the settlement for several years was a little log house, which doubled as a public meeting house, east of the Zumbro River. By 1861, however, the city was redeeming itself in this respect, and in the next twenty years it achieved not only excellent and ample public schools, largely through the influence of local physicians, many of whom served in turn on the board of education, but had a numerous succession of private "select" academies and seminaries. Of the private schools the Rochester English and Classical School or "Niles Academy," of Professor and Mrs. Sanford Niles, endured longest and had well-deserved prestige. Most of the local young people of the late seventies who aspired to education higher than the rural schools and the Rochester High School could offer, were at some time pupils at Niles Academy; many of the young men became merchants, lawyers or physicians in the county or elsewhere.

Rochester might have been a college town. In 1870-1871, when Hamline University was about to leave Red Wing and made overture to Rochester for a site of ten acres and financial aid to erect a building costing $75,000, the city, in spite of the earnest efforts of a few citizens of vision, among them Dr. W. W. Mayo and Dr. E. C. Cross, rejected the opportunity in order to avoid increase in taxes.

Once aroused to educational and cultural needs, Rochester in the early sixties organized a library association, in which Drs. E. C. Cross, E. W. Cross and W. W. Mayo and prominent lay citizens were active, and instituted a course of lectures open to the public. There were brought to Rochester public speakers, artists and scientists notable in their day, among them Dr. A. L. Sperry, of Carleton College, who talked on physical science, and the eminent Wendell Phillips, Roger A. Pryor, E. P. Whipple and E. L. Youmans. A Negro contralto, "The Black Swan," came, as did Ole Bull, the great Norwegian violinist. When outside talent was not available, local citizens who had a varied fund of information and a bent for public speaking lectured before various groups; among these early speakers were Drs. J. A. Leonard, W. W. Mayo, L. H. Kelley, Hector Galloway, E. C. Cross and E. W. Cross. Perhaps not sponsored by the Library Association were Jane G. Swisshelm, Phoebe Couzens, Mary Livermore, Elizabeth Cady Stanton and Susan B. Anthony, all of whom spoke on women's rights. In certain villages of the county also courses of lectures were organized, and Dr. Alexander Grant, of High Forest, was a speaker and patriotic orator much sought. There was occasional entertainment. The famous dwarfs, Colonel Tom Thumb, Lillie the Fairy Queen, Commodore Nutt and Minnie Warren were heralded, and there were miscellaneous phrenologists, magicians, ventriloquists and clairvoyants, traveling theatrical troupes and "gigantic" circuses, over a long period. The audiences were drawn from all over the county.

A rapidly moving epochal film of the county from 1854 would show wandering bands of Sioux Indians, puzzled by enforced removal of their tribes westward,

who lingered in the county, especially in and around Rochester. Between 1854 and 1856 they occasionally camped 200 strong in favorite sites on the banks of the Zumbro and struggled in groups through the settlement, pressing their faces against the windows of the pioneers' cabins and then stalking in to demand, or to take, food. Perhaps the first practitioner of medicine in Olmsted County was their medicine man, Muzomoney. In the autumn of 1854 a disease believed to have been smallpox broke out among the Indians. When a squaw died, Muzomoney said that she had eaten some honey and with it had swallowed a bee, which stung her in the throat or in the stomach and killed her. Her body was placed in the old Indian burying ground on Indian Ridge north of town; vestiges of Indian skeletons were found there until the cyclone of 1883 swept away all macabre remnants. Other incidents of illness among the Indians have been recounted. The last red men known to have passed through the city were some Winnebagoes who in 1862 camped on Zumbro Street near the site of the present county court house.

A Golden Era would be flashed on the screen. In 1858 gold was discovered along the Zumbro River at Oronoco and at Rochester. The Oronoco Mining Company was organized, and sluices and equipment were installed at Oronoco. Enough gold was recovered for Mr. Eleazer Damon, pioneer jeweler of Rochester, to make a set of waistcoat buttons for Dr. E. C. Cross and to fashion several wedding rings before flood waters washed away the sluices and ended the enterprise. A little later marl and peat were discovered not far from Rochester, and oil was proclaimed at High Forest. Nothing notable came of these discoveries.

Attention could be given to native products of healing value, real or supposed. In the fifties and sixties, and much later to some extent, the gathering of the fleshy, bifurcated ginseng root became a minor industry in southern Minnesota, chiefly in the region of the Big Woods, but also in the southeastern counties. Whole families, to eke out their income, devoted time and effort to gathering ginseng, of supposed medicinal value, for sale to local dealers, usually druggists, for export east and to China. By the sixties the common snakeroot, of the milkwort family, of proved medicinal worth, became the object of interest locally for its commercial value. The *Rochester City Post* on August 1, 1863, said:

> "A medicinal plant, the Seneka Root (Polygala senega) has become quite an article of export hereabouts. J. D. Ameigh and Co. of this city have, during the month of June last, purchased and shipped upwards of 800 pounds of this article, designed for use in eastern cities, in the preparation of expectorants and cough remedies. The price paid for use in eastern cities has been from 50 to 60 cents per pound, and in some seasons readily brings from 75 cents to $1 per pound. This plant grows everywhere throughout our fields and pastures, is easily gathered and prepared for market, and with the inducement that Messrs. Ameigh and Co. intend to offer next season the Seneka trade will bid fair to outrival the ginseng excitement of the 'Big Woods'"

About a product of another sort, a story in 1909 called attention to a bed of "medicated clay" near a medicinal spring in West Salem Township. It was said that the Indians had been frequenters of the spot in earliest years and that they had taught the pioneer settlers the uses of the smooth, oily-feeling clay in curing swellings, rheumatism, inflammation and bee stings.

A picture could be shown of the streets of Rochester thronged with men in army blue. During the Civil War, Olmsted County sent to the Union Army 1,250 men from its total population of 12,000. All the villages and rural communities were represented. There were, for example, the Oronoco Guards and the Dover Guards, the Olmsted County Tigers and the Olmsted County Volunteers, and Sanborn's Guards, of which lesser groups became part. The service of men

from Olmsted County, laymen and physicians alike, in different regiments of Minnesota is a matter of official record. Some of Rochester's physicians played useful parts. Dr. L. H. Kelley offered his professional services free of charge for the period of the war to the wives and children of men in the armed forces from Olmsted County. Dr. Hector Galloway, of Oronoco, was an organizer of the Oronoco Guards and in 1864, then in Rochester, became surgeon of the Thirteenth Regiment, Minnesota State Militia. Dr. E. C. Cross helped to organize the Olmsted County Volunteers and was chosen to tender the services of the company to the governor of the state. Dr. E. W. Cross went to war in 1861 as assistant surgeon of the Fourth Regiment of Minnesota Volunteers and in 1863 became surgeon. When the Enrollment Board of the First Minnesota District was established in 1863, with headquarters in Rochester, Dr. W. W. Mayo, who had seen service in defence of New Ulm against the Sioux Indians in August, 1862, came to Rochester in April, 1863, on appointment as surgeon to the board. In this work Dr. Galloway shared, as did Dr. E. C. Cross, who succeeded Dr. Mayo on the board in 1865. Throughout the war the local newspaper lauded the patriotic, inveighed against laggards, deplored the "shinplaster nuisance" and called for new postal currency, and praised women for sending boxes of food and clothing to military hospitals for the benefit of the wounded. The Red Cross Society was to come to Olmsted County much later, as will be shown. The headlines, especially about women at work in fields and offices and stores (office work and salesmanship were daring undertakings for women in those days), except for dated rhetoric, could be those about women at work during World War II. All the regional press abounded in notices to soldiers and to the widows of deceased soldiers from agents who made a business of collecting bounties, back pay and pensions. Long after the war was over, the blue of the Union Army was a familiar sight; the uniforms, the long-visored caps, the long coats with shoulder capes, were casually combined with civilian clothing by men on the street or at work in the fields.

The picture would have a background of fertile fields. Olmsted County always has been primarily devoted to agriculture, stockraising and dairying, and it early won its title as one of the great food baskets of the "bread-and-butter" state. Fruit trees that could withstand the climate were imported. Farmers year by year expanded their wheat fields. The farmers most able financially brought in fine breeds of hogs, sheep, cattle (beef and dairy), and blooded horses (draught animals, roadsters and racers) from within the United States and from Europe. From the beginning, most of the established physicians of the county owned fine farms and were distinguished for their horses, especially the roadsters that were vital to transportation in medical practice, and, some of them, for their racing stock. The county fair was instituted early, featuring livestock, agricultural and dairy products and the domestic arts, with the usual contests and amusements. For several years in the sixties and again in 1882 the Minnesota State Fair was held at Rochester. In 1870, in a running race for boys, Maitland E. Cross, son of Dr. E. W. Cross, and William J. Mayo, son of Dr. W. W. Mayo, won first prize and second prize respectively; Leonard, in his county history of 1910, said about this event, "This was the only instance in which Dr. Mayo has been known to come out second best." The coming of fine livestock brought cattle thieves and horse thieves, who long caused much trouble. The county anti-thief society was formed in 1863. All communities were aroused. The Viola Anti-Horse-Thief Society, organized in 1874, functioned long after the turn of the century.

As agriculture became established, the abundant native growth of hazel nuts, wild plums of exceptional size and flavor, and the superior wild strawberries that covered large areas began to disappear. The wild animals, some of them per-

nicious, more of them gentle and harmless, were exterminated. The skins of wolves and wildcats brought bounties. Deer soon were unknown; the last elk seen in the county was shot in 1859 a mile or two from Rochester. The vast flocks of prairie chickens, the prairie sharptailed grouse, whose drumming or booming was the first sign of spring, soon diminished. There was a time, an old settler has said, when these birds were so tame that they perched on fences near farmyards "looking, with their feathers puffed out, as big as turkeys." Their nesting grounds became plowed fields, and the birds, trapped and hunted, became so scarce that in 1876 the editor of the *Rochester Post* declared that the county had become too old and too highly specialized for first rate chicken shooting. The beautiful passenger pigeons met tragedy in this region. Like mourning doves, but much larger and more brightly colored, they came annually in May and June, in their flight day after day filling the sky from southeast to northwest and darkening it from horizon to horizon, returning to their nesting places or "roosts," which extended for miles in the woods in various parts of the county.* Although the birds were doomed, they returned in vast flocks to Goodhue, New Haven, Chatfield, and Pleasant Valley (west of High Forest) as late as 1873. In 1877 a Rochester editor said that the wild pigeons were "almost as numerous as the pigeon hunters"; after that year they were mentioned seldom, if at all, in the Rochester press. Strangely enough, when the passenger pigon was forever gone from Olmsted County, there arrived the ubiquitous English sparrow, in Rochester in January, 1887, and thereafter, the newspapers reported annually for several years, "came out as bright and quarrelsome as ever."

The population of Olmsted County, from a sparse scattering of settlers in 1854, increased rapidly until in 1865 it was 15,178, comprised of 8,019 males and 7,159 females; there were 2,711 families. In 1865 the largest individual annual income in the county was $5,000, and the average income of the best established citizens, in business, in law and in medicine, was about $1,000. The county census of 1870 was 19,700, in 1875 it was 20,940, and in 1880 it was 21,553. Thereafter there was some fluctuation until, after the turn of the century, steady growth began. In 1900 the population was 23,149, with about one-third resident in Rochester. Rochester by 1858 had 1,500 residents; in 1874 it was a city of 5,000, described as being in the interior of a new state on the frontier of a new country. By 1896 the population was 6,000 and for some years, until after 1900, it remained at about that figure. In 1947 it was nearing 30,000.

---

*The writer is indebted to Dr. E. A. Hagaman, of Rochester, for the privilege of reading the memoirs. *At the Turn of a Century*, of the late Charles Nicholas Ainslie, several times quoted in this history. In that book Mr. Ainslie gave a vivid account of the flights of the passenger pigeons, of the birds alighting in wheat fields, and of the wanton slaughter of adult birds and squabs by hunters who from dusk to dawn thronged the woods that were the roosts. A son of the Rev. George Ainslie, Indian missionary and the first Presbyterian minister in Rochester, in 1861, Charles N. Ainslie spent his childhood and early adult life in Rochester. From 1906 to 1930 he was a member of the Federal Bureau of Entomology in Washington, D. C.

(To Be Continued in August Issue)

President's Letter

WHO WANTS TO KNOW?

A very popular medical science writer, Steven Spencer, associate editor of the *Saturday Evening Post* said recently, with insight and truth, "The private practice of medicine is much more medicine and much less private than it was ten or fifteen years ago. The doctor, striving to familiarize himself with and to evaluate the parade of new drugs and techniques, finds an eager public looking over his shoulder—and sometimes breathing down the back of his neck. Etiology, diagnosis and therapy no longer form a mystic trinity of knowledge to which only the medical profession has access and which the patient must accept on faith."

I think that we doctors have come to recognize and co-operate with the public's desire for medical knowledge and, perhaps belatedly, we realize the power of an informed public in dispelling socialized medicine propaganda.

We have feared overly optimistic reporting of medical advances; we have, with some justification, been apprehensive about mistakes and distortions of medical news. But medical journalism has advanced a long way since 1494, when, it is believed, the first medical news story was printed. A number of journalists have specialized in this field, training themselves to be scientifically accurate, yet phrasing material in lay language. Alert editors are working to slake this general thirst for medical knowledge.

As one Minnesota newspaper editor wrote in his paper last month: "What every newspaperman would endorse would be a working arrangement between the medical profession and the press. Every newspaperman worthy of the name receives and respects confidential information. Every doctor becomes a receptacle for professional secrets known only to his patient and himself. When two agencies, medicine and press, both of them allied to the high principles of confidence, could correlate their work on a non-personal basis, mutual good would result. This . . . is an opportunity for public relations at its highest level."

The Minnesota State Medical Association has scored some noteworthy advances this year in furthering a close relationship between doctors and journalists, for the good of the two professions and the public.

The State-Wide Medical Press Conference brought editors and doctors together to discuss mutual problems. Now, by individual and group effort, these problems are being resolved. The House of Delegates, meeting in annual session at Saint Paul, erased an old area of misunderstanding when it approved a program of ethical advertising by doctors and medical societies. While the income from such advertising probably will not be appreciable, newspapermen recognize the resolution for what it is, a genuine interest in working with the press. County medical societies would do well to devise ethical advertising programs, along the lines suggested by the House of Delegates, as well as to demonstrate an increased awareness of medical responsibility for informing and educating the public.

DOCTOR FISHBEIN TO RETIRE

ONE OF THE most publicized events of the AMA convention at Atlantic City in June was the announcement by the trustees that Dr. Morris Fishbein, editor of the *Journal,* is to be gradually relieved of his duties. The announcement came as a surprise to most members of the House of Delegates, the profession at large and the public in general. The name of Dr. Fishbein has been closely linked with the AMA since 1924 when he became editor of the *Journal,* and his many public appearances have led to the impression that the AMA and Dr. Fishbein are synonymous. Perhaps that is why he has aroused so much antagonism within the ranks of the association, which ultimately led to this action on the part of the trustees.

Dr. Fishbein began his medical career in the office of the AMA soon after his graduation from medical school. Under the tutelage of Dr. George H. Simmons, who was not only editor of the *Journal* but general manager of the AMA for twenty-five years preceding his resignation in 1924, Dr. Fishbein received his training in affairs of the organization, acting as assistant editor. In 1924 the administration affairs of the association were divided, Dr. Olin West being made general manager, Mr. Will C. Braun, business manager, and Dr. Fishbein, editor. *Hygeia* was having tough sledding in 1924, and in 1925, Dr. Fishbein was appointed editor also of this lay medical journal and he made a success of it. For one who claimed to have had no natural literary ability this was a large order. He at one time remarked that while in college he was asked by a professor what he intended to do after graduation and was warned he would never be able to write. As a result of practice he trained himself so that he became not only a voluminous writer but an eloquent orator and an authority on medical writing. Although technically only an editor in the national organization, it was he who was chosen to represent the AMA and address lay and medical meetings. That he was outstanding as an entertaining and informative speaker, those who ever heard him can testify. His able services to the AMA in its scientific and organizational spheres have been invaluable. It will take two or three men of no mean ability to supplant him. Dr. Austin E. Smith, secretary of the Council on Chemistry and Pharmacy of the AMA, is slated to succeed Dr. Fishbein as editor of the *Journal.* Dr. Fishbein's successor as editor of *Hygeia* has not yet been announced. Since February, 1949, Dr. Fishbein has been one of the chief editors of *Excerpta Medica,* the monthly abstract journal of the medical journals of the world, published in Amsterdam since 1947. As if he did not have enough to occupy his time without this additional appointment!

One who has followed the daily activities of Dr. Fishbein as recorded in "Dr. Pepy's Diary" must have been impressed by the strenuosity and variety of his activities in recent years. Many will miss his guidance in the selection of books. That any human being can stand up under such a load without wearing out at an early age is inconceivable. Possibly his retirement is a godsend in disguise.

In any event the medical profession owes a great debt of gratitude for the phenomenal service Dr. Fishbein has given American medicine, and for this reason we are expressing our appreciation.

EXTENSION OF SOCIAL SECURITY

THE PROFESSION has not been unmindful of the proposed legislation being seriously considered by Congress for the extension of social security to include the self-employed doctors, dentists, lawyers, druggists, butchers, bakers, et cetera. The bill, H.R. 2893, now being considered by the House Ways and Means Committee, is about to be submitted to the House of Representatives for debate. It provides in brief for a tax of 2.5 per cent on the first $4,200 or $4,800 of income of all self-employed persons for old age insurance. This would amount to $120 a year if

the figure of $4,800 is used, with the liklihood that the rate and base will soon be raised. At the age of sixty-five a physician would have to give up his practice if he wished to collect $25 to $50 a month. If he were earning at sixty-five as much as $14.99 a month, he would be ineligible for the government annuity even though he had paid his taxes for thirty-five years. Even if a physician continues to earn after sixty-five, he will be forced to pay his social security tax for old-age insurance benefits he is not likely to collect. What physician would voluntarily take out a policy, paying $120 a year during his years of practice with the probability only of a return of $50 a month after sixty-five if he quit practice entirely? The farmers have been so vociferous in their denunciations of such a proposal that they are to be excluded. Their votes count.

Another feature of the bill is that its increase in scope includes the domestic and gardner. The employer will be required to pay these taxes.

The AMA and our State Medical Association have both passed a resolution voicing their disapproval of this legislation. It remains to be seen how much our votes count with a government that needs more revenue.

Much severe criticism has been directed at the government's handling of Social Security. Aside from the fact that it is at present class legislation, funds collected have not been set aside to meet eventual obligations but have been spent by the government, the government substituting nonnegotiable governmental interest-bearing bonds to replace the money spent. What happens when the government needs the billions collected and spent to meet the obligations incurred? More taxes obviously. If private business were to withhold a portion of its employe's salaries to hold for the rainy day needs of the employes, and then should spend the money for expansion or otherwise, simply giving its I.O.U. as security, we imagine someone would be sent to the penitentiary for crookedness. Now the proposal is to expand this badly managed Social Security.

In this connection we are reproducing an editorial which recently appeared in the *Chicago Daily News* which shows that others are cognizant of government high finance.

Treasury Advertising

A leaflet circulated by the Treasury Department to promote the sale of savings bonds, contains this information:

"Question: Why is the government selling savings bonds?"

"Answer: To keep a financially sound America as the best insurance for national security."

When a private concern sells its securities to the public it is required to prove to the Securities & Exchange Commission that it is disclosing the full truth about its financial condition, from which the soundness of its management may be judged.

It is highly improbable that the SEC would approve of new bond selling by an organization already spending beyond its income and whose managers were clamoring for more expansion.

The representation that the way to a "financially sound America" is in the sale of bonds, rather than in prudent management of resources, is impudent hokum. U. S. bonds are a thrifty buy for the average small investor, but not for the reason given by the Treasury.

That there is some recognition of the fact that the federal government cannot go on indefinitely extending the scope of federal taxes and withal spending more than its income is indicated by an editorial which appeared June 20, 1949, in the *Washington Daily News*. Reference is made to a speech made June 18 by James F. Byrnes at Washington and Lee University in Virginia. Besides being a former senator from South Carolina and member of the Supreme Court he was appointed Secretary of State by President Truman two months before V.E. Day. He said in part:

"Every segment of society is demanding special privileges. Too many people want more pay for less work. Too many people are trying to transfer power to the government.

"We are not only transferring too much power from the individual to the government, but we are transferring too many powers of state governments to the federal government.

"Where we will wind up, no one can tell. But if some of the new programs seriously proposed should be adopted, there is the danger that the individual, whether farmer, worker, manufacturer, lawyer or doctor, soon will be pulling an economic oar in the galley of the state "with" the federal government regimenting our lives from the cradle to the grave.

"Our first line of defense is a sound, solvent American economy. The only wise course is to reduce expenditures and live within our means."

And he went on to advocate that government spending for purposes other than fixed obligations and national defense should be cut or deferred. This from the man who was most effective in steering New Deal measures through Congress during President Roosevelt's administration is the more remarkable and merits serious consideration.

We urge every reader to write to each member of the House Ways and Means Committee listed below, voicing his disapproval of the proposed extension of

Social Security to include the self-employed. Personal letters count fully as much as society resolutions.

CHLOROMYCETIN

CHLOROMYCETIN, a crystalline substance derived from liquid cultures of a certain species of streptomyces, has proven to be a valuable addition to the list of antibiotics. The mold was first obtained by Dr. Paul R. Burkholder of Yale from a specimen of soil from Venezuela, and an extract was found to have antibacterial properties. The mold was referred to Parke, Davis and Company where the crystalline form was isolated by Drs. I. R. Bartz and John Erlich and named chloromycetin.

The crystalline chloromycetin is relatively insoluble in water but is well absorbed from the gastrointestinal tract and is well tolerated orally. Found to have rickettsiostatic properties when tested in infected chick embryos, the new antibiotic was found by the Army to be highly efficacious not only against epidemic typhus but also against the rickettsial agents of murine typhus, spotted fever, Q fever, rickettsial pox and several viruses of the psittacosis-lymphogranuloma group. It has also been found to be of value in brucellosis, but not in typhoid fever.

While endemic typhus is not common in the northern part of our country it does occur with some frequency in the South. The epidemic form of typhus is of serious importance in many parts of the globe and in areas where thousands of our troops still are located. Up to the present there has been no known remedy for the disease. DDT proved invaluable during World War II in the prevention of typhus, and vaccination was doubtless of value. The Army is undertaking trial of synthetic chloromycetin on natives in order to ascertain whether it is as effective as the mold derivative.

In recent years it has been found that the disease known as Rocky Mountain spotted fever is not limited to the Northwest; it is not uncommon in the East, Mexico and South America. The name "spotted fever" is therefore more logical. Vaccination, while of value, is of short duration and requires yearly administration. While para-aminobenzoic acid has proven to be of some therapeutic value in this disease, treatment on the whole has been unsatisfactory. Chloromycetin has proven highly effective in the treatment of this disease.

NEW YORK COUNTY MEDICAL SOCIETY AGAIN REVERSES STAND

WE MADE editorial comment in our May issue of the opposition of members of the New York County Medical Society to the $25 assessment and the twelve-point program of the AMA. While in January the majority voting favored the assessment, a later vote showed 432 against and 333 for the assessment out of a total membership of nearly 6,000. Evidently the "agins" turned out in force, for at a later meeting on March 28 with a "huge attendance," the vote showed an overwhelming approval of the assessment and the present policies of the AMA.

That there would be no dissenting voice among the 140,000 physicians in the county on any proposition would be too much to expect. Those who believe that the advantages of the socialization of our economy, including the medical profession, outweigh the disadvantages cannot in all probability be converted. We wish that all such could have had the opportunity of hearing the two Englishmen who addressed the National Conference of County Medical Society Officers on June 5 at Atlantic City. The vivid portrayal of what has happened to the medical practice in England as a result of the program of socialization of medical care, which became effective July 1, 1949, would undoubtedly make some converts. These addresses will doubtless appear in print and should be watched for and read by any who are still unconvinced of the importance of avoiding the mistake that England made.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics

George Earl, M.D., Chairman

BRITISH DOCTOR, AUTHOR DENOUNCE SOCIALISM

A British doctor and a British writer analyzed socialism for the benefit of doctors attending two sessions of the American Medical Association's annual convention at Atlantic City, New Jersey.

Dr. Ralph J. Gampell felt so deeply and bitterly about the socialistic distortion of medical practice that he left his native country, applied for American citizenship and is interning in California to qualify for a license to practice medicine in this country.

In tracing the gradual encroachment of socialistic doctrines, Gampell told county medical society officers the answer to the ever-recurring question of "Why didn't the English doctors do something?"

In the first place, Dr. Gampell pointed out, medical public relations were very bad. "In fact, public relations, vis-a-vis, were nonexistent."

Pledged to Silence

Secondly, and adding to the debacle, the doctors signed a so-called "security pledge" which enabled the government to keep from the public developments in the move to socialize medicine until four months before the beginning of the program.

Finally, according to Gampell, "British medicine had no alternative."

He explained this statement in economic terms: For nearly forty years a government program to provide medical care on a tax-paid basis had been growing steadily. At first the program included manual laborers whose wages equalled $1,200 a year. The income limit was increased to $2,200 and, of course, last year, the plan was expanded to take in virtually every British citizen. With this ever-increasing bulk of panel patients, the monetary value of a doctor's practice rose or fell according to its panel component. According to the British custom of buying and selling practices, loans up to 100 per cent could be made to buy a practice that had, say, a 50 per cent panel component.

When socialized medicine was announced, doctors were forced by what Gampell termed "bitter economic compulsion" to sign the agreement, for the doctors were faced with the loss of their panel patients, as well as the loss of their investment in a practice. Government spokesmen craftily announced that there would be no more buying and selling of practices, *but the government would reimburse those doctors who signed up to practice medicine according to the new program.*

Trap Was Economic

The doctors held out until the eleventh hour, Gampell declared, then they capitulated for they had no strength—no unity in the profession, no hope of arousing public sentiment and no financial means to break through the toils of the government's ingenious, dollar-baited trap.

Describing the aftermath of this legislation, Dr. Gampell said, "I have *dealt* with twenty patients in an hour and made thirty-six house calls in a day. If that is medicine, then we're not doctors."

From the standpoint of a layman, albeit a highly specialized, trained observer, Cecil Palmer of London told of the impact of socialized medicine on the British physician and his patient.

"Socialized medicine has revolutionized the status of the doctor and destroyed the relationship between doctor and patient," he stated flatly.

No Privacy Left

Indicative of the way government medicine operates, he believes, is the manner in which private case records became public property:

"A statutory instrument was issued by the Minister of Health three weeks after his promise of privacy and secrecy, requiring records of diagnosis and treatment of all patients to be made available to local lay councils."

Scoring the propaganda that urged free medi-

cal care for "the common man," Palmer declared, "I don't believe a common man exists."

"The program has tried to strengthen the weak by weakening the strong, and the people of England are now contributing two million, eight hundred thousand dollars a week for *free* medical care."

The quality of this medical care was also a target of the British newspaperman's criticism. "It is not possible to give more than five minutes for the diagnosis and treatment of any one patient."

WHITAKER AND BAXTER REPORT PROGRESS

Speaking before the Medical Societies Executives Conference, June 8, at Atlantic City, Leone Baxter, general manager of the AMA's national education campaign, said:

"The doctors of America, by taking their case direct to the people in a co-ordinated, nationwide move, have scratched the surface of an adverse, or at least an apathetic, public sentiment—a sentiment which proponents of compulsory health insurance have built and nurtured for years."

"The pattern of your national campaign to get the facts to the people has four main facets," she stated. "Distributing literature carrying medicine's story, organizing and directing speakers' bureaus, originating valid news stories and securing endorsements from public organizations respected for their views."

"Forty great national organizations, encompassing millions of members, have studied the facts and taken formal action against compulsory health insurance," said Miss Baxter, listing as examples, the American Legion, the General Federation of Women's Clubs, the National Grange, the American Farm Bureau Federation, the American Bar Association, the D.A.R., the National Fraternal Congress, the United States Chamber of Commerce and the National Association of Small Businessmen.

"The first emergency is over, because the Truman forces decided to bench their ball carriers for the season," Miss Baxter summarized. "But anybody who thinks that medicine may now relax in the bleachers simply caught the wrong signal! The backfield already is in motion—far ahead of time. The compulsory health insurance advocates announce they are going to make this issue a *major* issue in the coming congressional campaigns throughout the United States. They frankly admit that they need to do some groundwork in the congressional districts before they can afford to propose such a bill again."

FILDES PAINTING TO SHOW UNITY

American doctors have been asked to display the famous Fildes painting of "The Doctor" in their offices, as part of the AMA national education campaign.

Portraying as it does the intangible, but nonetheless valuable, relationship of doctor and patient, the painting has a further significance, it was revealed at the Atlantic City convention. By displaying the poster, American doctors will demonstrate, beyond question, their participation in the struggle against socialization and their unified belief in the freedom of medical practice.

The painting, chosen to keynote the educational campaign, shows Sir James Clark, personal physician of Queen Victoria, caring for the child of a forester in the Queen's service near Balmoral Castle, North Scotland.

Fildes said of his painting: ". . . an attempt to put on record the status of the doctor, than whom no more noble figure could be imagined—the grave anxiety of the doctor, and the faith of the parents who, almost overcome with dread, stand in the background, trusting the doctor even when their hearts failed."

TELEVISION AIDS SCIENTIFIC PROGRAM

AMA convention goers, who at the St. Louis session saw operations televised, witnessed another dramatic development in video science at Atlantic City. This time surgical, diagnostic and other medical procedures came on the screen in natural color.

Television was also put to work interpreting x-ray films, thereby increasing the usefulness and accuracy of roentgenograms.

Doctors saw a combination of new techniques when, by television, they observed the use of radioactive isotopes in treating patients. Progress of the isotopes through the body was tallied by means of Geiger counters.

Television programs for the convention were transmitted over a closed circuit, making it impossible for the public to "tune in."

Minneapolis Laundry Driver Pleads Guilty to Violation of Basic Science Law

Re State of Minnesota vs. Ralph W. Walsh

On June 20, 1949, Ralph W. Walsh, forty-six years of age, 2601 Fourth Avenue South, Minneapolis entered a plea of guilty in the District Court of Hennepin County to an information charging him with the crime of practicing healing without a basic science certificate. Walsh was arrested on June 17, 1949, following an investigation by Minneapolis police officers under the direction of Inspector Eugene Bernath. Information had been received by the Police Department that Walsh had stated that he was available for the performing of abortions. An appointment was made with Walsh by detective Don Johnson and policewoman Adelaide Noffke. The parties met at a loop hotel where Walsh offered to perform an abortion for $75. He had in his possession, at the time, instruments for the performing of an abortion, sulpha tablets and other medicinal preparations. He was immediately arrested and placed in the city jail.

Walsh stated that he drove a laundry truck and for eighteen years had worked for a Minneapolis linen supply firm. Part of the time Walsh had the route that included the Medical Arts Building. He denied that he had attempted to perform any abortions prior to the case in which he was arrested. He stated he wanted to make a "little easy money" and thought this was the way to do it. His career as an abortionist was nipped in the bud through the efficient work of the Minneapolis Police Department. Walsh was sentenced by the Hon. Arthur W. Selover, Judge of the District Court, to a term of one year in the Minneapolis Workhouse, the sentence being suspended and the defendant placed on probation for one year. Judge Selover denounced the defendant for his activities and warned him of the danger of the work that he was about to engage in. Upon being questioned by the Court, Walsh stated that he was born in Minneapolis in 1903, and lived there all his life. He stated that he had always been in the laundry business and had no training in medicine. Walsh stated to the Court that he was glad that he was arrested and that he had been pretty nervous about the whole affair.

ALL BABIES NOW GET "BIRTH NUMBERS"

In Minnesota, as in every other state, all babies born on or after January 1, 1949, now receive an identifying "birth number," the Division of Vital Statistics announces.

The new national plan for numbering birth certificates will give every American-born child a single identifying number for reference during his life. To illustrate: The first child born in Minneapolis on January 1, 1949, has the birth number 122-49-000001. The first figure 1 designates the United States, the 22 indicates Minnesota. This first section of the whole number was assigned by the National Office of Vital Statistics, which has arranged the states and the District of Columbia alphabetically. The figure 49 refers to the year of birth.

The third part of the birth number, consisting of six digits, represents the consecutive number of births occurring in the state. Blocks of serial numbers have been assigned to Minneapolis, St. Paul, Duluth, and each of Minnesota's eighty-seven counties. Goodhue County, for instance, has the series 131001-133000. A child born in Goodhue County during January, 1949, might have as his birth number 122-49-131005.

Number Gives Identification

This system will make it possible to determine, from a person's birth number, the country, state, county, and year of birth for that person. Each baby will have his own individual number, and no two will have the same number. Therefore, the birth number will serve as a means of identification.

The birth number system was recommended by the American Association of Registration Executives and the Association of State and Territorial Health Officers. The natioinal agencies now employing serial numbers, such as the Social Security Administration and the Office of Defense, have indicated that they will accept the new plan and discard their old numbering systems, if the plan proves satisfactory in the states. All states adopted the new system as of January 1, 1949, and some states are even adapting it to births occurring before that date.

Each child's identifying number will appear on his birth certificate, which is required for school entrance, working papers, automobile licenses, entrance into military service, marriage, insurance, and Social Security benefits. It is possible that in future the birth number will also appear on a person's Social Security card, driver's license, and other identifying items.—*Minnesota's Health*, March, 1949.

Minnesota Academy of Medicine

Meeting of March 9, 1949

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, March 9, 1949. Dinner was served at 7:00 p.m., and the meeting was called to order by the President, Dr. J. A. Lepak, at 8:25 p.m.

There were forty-eight members and two guests present.

Minutes of the February meeting were read and approved.

The President announced there would be election of new members at the April meeting. The scientific program followed.

Dr. Martin Nordland, Minneapolis, reported two cases concerning gastric resection for carcinoma.

Dr. Vernon L. Hart, Minneapolis, presented a paper illustrated with lantern slides and a motion picture.

RESECTION OF STOMACH FOR CARCINOMA

Report of Two Unusual Cases

MARTIN NORDLAND, M.D., and MARTIN A. NORDLAND, M.D.
Minneapolis, Minnesota

Case 1.—Mrs. A. S. was an elderly appearing, frail, sixty-four-year-old white woman who came in with the complaint of epigastric distress post cibum, becoming progressively worse for the past twelve months. Associated with this, she complained of decrease in appetite, and a tendency to constipation. She was sleeping poorly and had lost about 12 pounds in weight in the last year. In addition to this, she had noticed an increased bloating, which if severe enough caused abrupt vomiting of clear mucus, not associated with nausea. There was no history of jaundice, hematemesis, or melena.

Past History—Past health had been excellent. There was no history of serious illness, injury, or previous surgery. Systemic review was negative.

Physical Examination—Physical examination revealed an elderly white woman who appeared quite ill. There was no abnormality of the head, neck, or chest. The heart did not appear to be enlarged, but a faint low-pitched systolic murmur was present at the apex. Blood pressure was 160/80 and the pulse was 120. There was a definite mass palpable in the left upper quadrant which was slightly tender. No other organs or masses could be palpated. Rectal examination was negative, as well as examination of the extremities.

Laboratory Studies—Urinalysis was negative; hemoglobin, 12.9 gms. per cent; sedimentation rate, 53 mm. in 60 minutes; blood urea nitrogen, 9 mg. per cent; carbon dioxide combining power, 59 vols. per cent; chlorides, 620 mg. per cent.

X-ray examination of the stomach showed an infiltrative lesion along the lesser curvature in the middle third of the stomach, with associated ulceration. The lesser curvature was somewhat stiffened due to a mass in this area. There was a duodenal ulcer deformity (Fig. 1).

Fig. 1. X-ray of the stomach showing a lesion and filling defect from pressure of a palpable mass.

The patient came to operation on October 26, 1948, at which time a total gastrectomy with an esophagoduodenostomy was done. At the same time, a large cyst was removed from the tail of the pancreas; and, in doing the procedure, it was found necessary to remove the spleen because of the mechanics of the procedure involved.

The stomach contained a pale, hard ulcer, 5 by 5 cm. and 3 mm. deep, on the proximal portion of the lesser curvature, bordering the proximal line of resection. There was a shallow, less indurated ulcer, 4 by 4 cm., on the middle third of the lesser curvature of the stomach. This appeared to be separated from the main tumor by about 2 cm. of grossly normal mucosa. The large ulcer was a tumor that was 10 to 12 mm. thick on section and was firm and white. It extended through to the serosa and made it pale and puckered. Several pink lymph nodes up to 10 mm. in diameter were present in the fat of the lesser curvature near the tumor, but they appeared grossly benign. The spleen, weighing 190 gm. and appearing grossly normal, was also present. In the portion of the pancreas removed, there was a cyst, 6 by 7.5 by 5 cm., that had a tough fibrous wall 1 to 2 mm. thick and was filled with a grey semisolid material. On the outer surface of the cyst wall, there was a patch of pancreatic tissue 8 by 6 cm. and up to 8 mm. in thickness.

The microscopic specimens revealed the ulcerated tumor of the stomach to be a scirrhous carcinoma. The spleen was found to be normal. The pancreatic tissue suggested a true cyst of the pancreas which was undergoing malignant change, and the tumor was very different in appearance from that of the stomach, inasmuch as the pancreatic tumor was forming very definite glands.

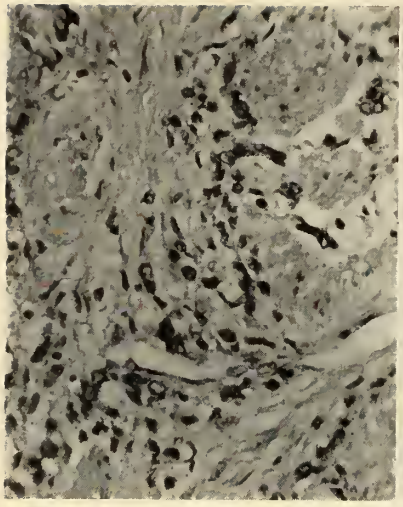

Fig. 2. Microscopic section of the lesion in the stomach.

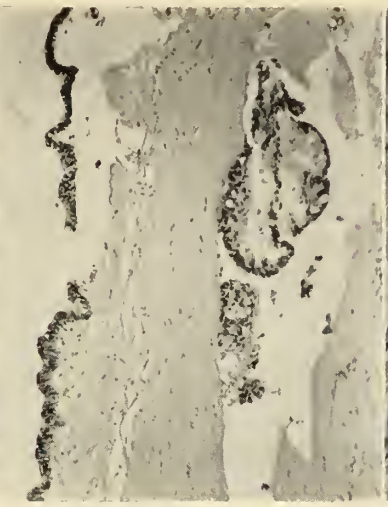

Fig. 3. Microscopic section of the lesion in the pancreas, showing the cyst wall and beginning overgrowth of glandular structure.

Fig. 4. Microscopic section of the lesion in the pancreas, showing carcinomatous invasion of the lesion.

Fig. 5. Postoperative x-ray showing peristalsis in the esophagus immediately above the anastomosis, a pocket formed by extravasation from a leak at the anastomosis, and a diverticulum of the duodenum.

Final pathological tissue report revealed adenocarcinoma (scirrhous) of the stomach, grade 4, with metastases to regional lymph nodes, pancreatic cyst with adenocarcinoma, grade 3, and spleen (Figs. 2, 3 and 4).

The patient's postoperative course was relatively uneventful, and she was able to resume her duties as a housewife after an interval of approximately two months. Her ultimate prognosis is hopeless; but at the present time, she has shown no appreciable deterioration (Fig. 5).

Comment

This case is of interest because of the presence of multiple primary carcinomata in the same patient: (1) adenocarcinoma (scirrhous) of stomach, grade 4; (2) adenocarcinoma of a true cyst of the pancreas at junction of body and tail.

The most common cyst of the pancreas is not a true cyst. The common cyst has no epithelium, has a rigid lining and contains a mass of necrotic pancreatic tissue. This is usually the residue of a pancreatitis from which the patient has recovered or is the result of trauma.

The cyst of the pancreas in this case was a true cyst, lined by columnar cells, the same as found in infants. While these rare cysts in adults are usually benign, this one had one small area of malignant change. Ninety per cent of carcinoma of the pancreas occurs in the head, causing a solid jaundice.

It is seldom possible to unite the esophagus to the duodenum in a total gastrectomy. Due to the mechanical factors present in this case, it was possible to do this in this patient with a very satisfactory result.

Case 2.—Mr. L. K. was a forty-nine-year-old white man who went to his local physician on October 1, 1948, for a routine physical checkup. He had been in excellent physical health with the exception of occasional slight abdominal cramping after meals. This was noted especially with rich and fried foods. There was no history of weight loss, nausea, vomiting, or bowel disturbance.

In the course of the checkup, physical examination was essentially negative; but, in view of the minor presenting complaint, an x-ray of both the gall bladder and stomach was done. The gall-bladder x-ray was normal. However, during fluoroscopy there was noted a fairly large polypoid type of defect on the posterior wall of the stomach in approximately the middle third. The lesion was quite constant in appearance and was strongly suggestive of a fairly large polypoid tumor, probably a polypoid carcinoma. The lesion extended from a point just below the incisura up to a point about 2 inches below the esophageal orifice and involved chiefly the posterior wall. The lower third of the stomach was normal. A barium enema was normal.

Past History.—The patient had had a tonsillectomy in 1938, diphtheria as a child, the usual childhood diseases and a minimal arthritis of the lumbar spine for the past several years. There was no history of carcinoma in the family.

In view of the results of the stomach x-rays, which were reviewed by other roentgenologists, the patient was urged to have a gastric resection (Fig. 6).

Fig. 7. Microscopic section through a sessile polyp—low power.

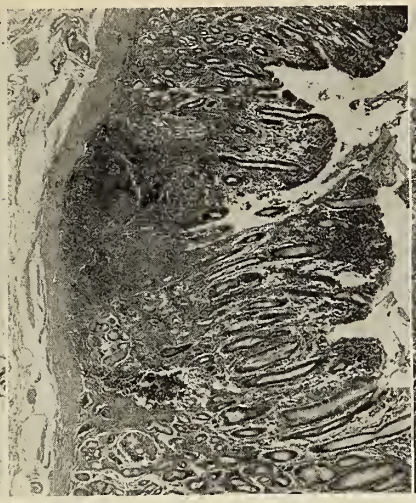

Fig. 8. Microscopic section showing hemorrhagic gastritis in the region of the polypi—higher power.

Fig. 9. Microscopic section showing mucous gland cells in the gastric mucosa.

The patient came to operation on October 13, 1948, and about 85 per cent of the stomach was resected. On opening the abdomen, no gross evidence of metastases could be found in the liver or the proximal glands. The tumor described on x-ray could not be palpated grossly through the stomach wall, and there was no evidence of any metastases in the peritoneal cavity. A posterior polya type of resection was carried out without incident.

The macroscopic report by the pathologist of the specimen revealed "the mucosa of the pyloric canal to be of average appearance and thickness. However, the mucosa of the upper three-fourths of the specimen was tremendously hypertrophied and thrown into tall closely packed wide rugae, whch could not be stretched out. There were about ten small sessile polypoid-like lesions from 4 to 8 mm. wide and 1 to 3 mm. high on the tops of some of the prominent rugae. There were no pedunculated polyps. There were no indurated areas suspicious of malignancy."

The microscopic report by the pathologist revealed "the mucosa of the pyloric canal to be moderately infiltrated with lymphocytes but not atrophic. The mucosa of the fundus also showed a diffuse lymphocytic infiltrate of moderate degree. The polypoid lesions were largely due to numerous microscopic cysts in the gastric glands. Nothing suggestive of malignancy was seen."

The final pathological tissue report was that the stomach had severe chronic hypertrophic gastritis and multiple polyps (Figs. 7, 8 and 9).

The postoperative convalescence was uneventful except for a short period immediately after operation of the "dumping syndrome" which receded without incident. At the present, the patient is in good condition.

Fig. 6. X-ray of the stomach preoperatively.

Comment

This case was thought to be of unusual interest because of (1) the preoperative diagnosis of carcinoma by two competent roentgenologists, (2) the findings at operation, and (3) the findings of a benign lesion by the pathologist.

As stated above, the fluoroscopy revealed a fairly large polypoid type of defect on the posterior wall of the stomach in approximately the middle third. The lesion was quite constant in appearance and was strongly suggestive of a fairly large polypoid tumor, probably a polypoid carcinoma. The lesion extended from a point just below the incisura up to a point about 2 inches below the esophageal orifice and involved chiefly the posterior wall. The lower third of the stomach was normal.

No evidence of metastases could be found in the open abdomen. The tumor described on x-ray could not be palpated, and grossly the entire stomach appeared to be normal. Only upon opening the stomach could a polypoid lesion be felt.

The report given by the pathologist was benign hypertrophic gastritis with polypoid lesion due to numerous microscopic cysts in the gastric glands. These were sessile, polyp-like lesions, which differ from true polyps in that there is no new gland formation. True polyps of the stomach which are potentially malignant are not as serious as the same lesions in the colon. The type

of hypertrophic gastritis found here with polypoid lesions differs from the ordinary hypertrophic gastritis in that the tissue cannot be "stretched."

Discussion

Dr. Owen H. Wangensteen, University of Minnesota: The case histories of these two patients which Dr. Nordland has presented in such an interesting manner are unusual. With reference to Dr. Nordland's first patient, the most pressing question is: what is the relationship, if any, of the gastric to the pancreatic neoplasm? It is distinctly unusual that Dr. Nordland's patient should have survived total gastrectomy in the light of the circumstance that a large fistulous tract communicated with the anastomosis. On that score, I would like to say that I once was very sensitive over my mortality in total gastrectomy. This was almost twenty years ago. Unfortunately, some of my colleagues were even more troubled over it than I. In consequence, it was a difficult period for them as well as for me. Time, the great artificer and healer, takes care of most things, however. And it is surprising how the hurts and disturbances of yesterday, when viewed from the broader perspective of today, seem far less important.

In the intervening years, my colleagues and I have learned to do total gastrectomy with an operative mortality which begins to rival that of subtotal gastrectomy for cancer. Whereas twenty years ago, in the experience of the leading exponents of gastric surgery of that time, the mortality of total gastrectomy was approximately 50 per cent, the situation is much better today. With some minor modifications in the technique of performance of the procedure, my colleagues and I (eight surgeons) did twenty-eight total gastrectomies over a two-year interval with one hospital death (3.5 per cent mortality). An esophagojejunal or esophagogastric anastomosis is the only anastomosis in the alimentary tract which must be done by the open method; the reason is that esophageal mucosa may retract, and if the mucosa retracts from the edge of the tissues apposed when the suture is made, it is obvious that a stricture may form.

Concerning operations on the pancreas coincidental to operations upon the alimentary tract, some points might be emphasized. An air vent suction drain of the Pump or Chaffin variety should be placed down to the splenic bed. My colleague, Dr. Ivan Baronofsky, has shown that the fluid collection is pancreatic in origin. In other words, in splenectomy, it may be virtually impossible to separate the pancreatic tail from the hilum of the spleen without causing a temporary pancreatic fistula. Moreover, this circumstance may be responsible for the febrile episodes which now and then accompany simple splenectomy. My associate, Dr. John Lewis, has the impression from some work which we have been pursuing jointly in the laboratory that the generous parenteral administration of penicillin may be the best therapeutic agency with which to thwart the potentially serious consequences of acute pancreatic necrosis. At least in the dog, in which the injection of bile into the pancreatic duct is the activating agency, this appears to be true.

With reference to Dr. Nordland's second case, much could be said. The pathologist's diagnosis of multiple polypi certainly justifies partial gastrectomy as Dr. Nordland carried it out. Gastric polypi are precursors of cancer but probably not as quick precursors of malignancy as are colic and rectal polyps. At the moment, we are trying to assess this factor in a number of patients with polyps and achlorhydria now under observation in a "Gastric Cancer Precursor Group Study," under way at the University Hospitals.

If we surgeons are going to make a more indelible impress upon the subject of gastric cancer than we have, it must be through the agency of earlier diagnosis. We can now bring the larger number of patients with gastric cancer submitted to operation safely through the ordeal. What we must learn to do is to recognize gastric cancer earlier than we do. Increasing experience is teaching all of us that visceral cancer is silent in its early phases. In other words, it is not enough to be on the lookout for early symptoms alone. No, we must be scrutinizing patients who may unknowingly harbor the disease. The sident interval in gastric cancer, during which the villain lurks there without causing symptoms, is probably from fifteen to twenty months. We know that from the case histories of patients undergoing radical operation for gastric cancer, in whom cancer is detected by the pathologist in the proximal line of resection on careful microscopic study of the excised tissues. Obviously, such patients should be submitted to early reoperation. Moreover, in Borrman IV types of gastric cancer, total gastrectomy should be carried out more frequently than it is now.

We know that the presence of lymph node metastases decreases considerably our opportunity of curing cancers of any kind. On that score, in patients presenting lymph node involvement in malignancies of the stomach and colon, in which we feel that we have done an otherwise complete operation, I have been suggesting to my colleagues that we re-enter the abdomen after an interval of approximately four months to do a "wiping-up" operation. In other words, a Dukes' Group C lesion, like the patient with microscopic cancer in the proximal line of resection, should be looked upon as harboring residual cancer which is incubating and growing slowly. The reassertion of clinical symptoms in such patients may not be expected for another fifteen or twenty months.

The tragedy of the situation is that early gastric cancer is difficult to diagnose and easy to cure, whereas the late gastric cancer is very easy of recognition but very difficult to cure.

Dr. Leo Rigler, University of Minnesota: I was most intrigued by Dr. Nordland's second case as it illustrates a problem that we have been confronted with many times. I am not clear as to what he decided the second case was. I would say, from the first slide, that it was the condition called "giant rugae." So far as we know, they are not neoplastic in nature, although it has been reported that papillomata become superimposed on these. In the series of symptomless patients on whom we did routine examinations, we ran into this three times, and the problem of differentiation from carcinoma or polyposis was very difficult. I have seen at least four patients who have been sent to Dr. Wangensteen from various places for an operation for carcinoma of the stomach, none of whom had carcinoma—merely these giant rugae. The distinction can be made but it is not an easy one. There may be hyperplastic mucosa overlying these large folds which are almost invariably seen on the greater curvature of the stomach, usually without specific symptoms.

We feel very strongly that polypi in the stomach become malignant, but this thesis is almost impossible to prove. If the tumor is removed and it is benign, malignancy cannot develop. If it shows malignant cells, there is no way of proving that these were not present from the beginning. Some patients may live for ten or fifteen years and nothing happens. The lesions remain the same, but one never knows which ones are going to remain benign and which ones will become malignant. I just saw a patient the other day at the Veterans Hospital. He had pernicious anemia, no gastric symptoms, but routine x-ray examination was done. A tumor thought to be a benign polyp both roentgenologically and gastroscopically was found. At operation it proved to be a carcinoma *in situ*. The relationship of giant rugae to carcinoma is not well established, and we would be inclined to follow the patient for a time.

Dr. Moses Barron, Minneapolis: It is well to remember that these giant rugae are not very likely to become malignant. It is, therefore, important to establish the diagnosis of hypertrophy of the rugae and not confuse it with extensive carcinoma which it sometimes resembles in the x-ray. These patients may go to a chiropractor who may cure them with celery or other vegetables after a physician has made a diagnosis of an inoperable carcinoma. Exploratory operations are therefore indicated in these patients. I saw one with such a condition at St. Mary's Hospital in whom a diagnosis of extensive carcinoma of the stomach had been made from an x-ray and who at operation proved to have perfectly benign giant rugae.

Dr. Nordland (in closing): I am very thankful to the gentlemen for their discussions. The case with the polypoid disturbance of the gastric mucosa illustrates the difficulty encountered in the preoperative diagnosis. While the patient may have continued in relatively good health, Dr. Barron has pointed out a good reason for surgical interference. An important observation in this case was the fact that with the abdomen open, a thorough palpation of the entire stomach revealed no evidence of a lesion. This illustrates that we cannot always depend upon the judgment of the surgeon, and how much we depend upon the findings of the roentgenologists.

The second patient, with two distinct types of carcinoma, illustrates the increased safety of extensive surgery in the aged sick. Possibly without the aid of antibiotics it would have been difficult to do a total resection of the stomach, uniting the esophagus to the duodenum, excising a portion of the pancreas, and removing the spleen.

CONGENITAL DISLOCATION OF THE HIP

Early Recognition and Treatment During the First Six Months of Life

VERNON L. HART, M.D.
Minneapolis, Minnesota

The motion picture which I will present is part of an educational program against the usually late recognition and treatment of congenital dislocation of the hip. My purpose is to encourage the general practitioners, the pediatricians, the roentgenologists and the obstetricians to renew their interest in this serious congenital malformation with dislocation, so that it will be recognized and treated, not late when there is a limp, telescoping and obvious shortening, but early before the function of weight bearing or during the first six months of life. Weight bearing begins with creeping and generally the infant starts to creep during the seventh month. Before the function of weight bearing, displacement of the femoral head from the socket usually is not complete or a dislocation, but is partial or a subluxation.

A fundamental teaching of orthopedics since the time of Nicolas Andry (1658-1742) has been early recognition and early treatment of congenital deformities. All physicians are familiar with the importance of the application of this basic principle in the treatment of congenital talipes, torticollis and other congenital malformations which, either directly or indirectly, are caused by contracture of muscle, tendon and fascia. Most cases of club feet and wry neck caused by contracture can be cured by simple and conservative measures if recognized and treated soon after birth. This statement holds good for congenital dislocation of the hip since it, too, is related, either directly or indirectly, to contracture of muscle, tendon and fascia. Actually, during early infancy and before weight bearing, the only constant and positive clinical finding of congenital hip displacement is caused by contracture of the adductor muscles of the hip (Fig. 4).

Generally, congenital dislocation of the hip is recognized about the age of two years because someone observes that the child walks with a limp. The recognition is very late and, unfortunately, it is often too late for successful treatment. Every child with congenital dislocation of the hip which is recognized at the age of one, two or three years, had positive clinical findings and roentgenological features before weight bearing or during the first six months of life. In fact, the findings were present at birth.

Clinical and roentgenographic findings which may seem insignificant at the age of one, two or three months of life, might become major and serious deformities at the age of two or three years because of the very extreme activity and growth or endochondral ossification of the skeletal structures of the hip joint during this early period.

A prominent pediatrician recently informed me that, although he tested the hip joints of every infant for telescoping, he had never found a displacement of the hip during infancy before weight bearing. He assumed that telescoping of the hip is an early and positive clinical finding. Indeed, it is a positive finding but usually not an early one; it is a very late clinical finding. This physician—like most physicians, I believe—does not understand the pathogenesis of this serious congenital malformation with dislocation. During early infancy this malformation with dislocation is rare; with subluxation, common.

Our concept of the pathogenesis of congenital hip dislocation has changed considerably during the past several years. In fact, the term "congenital dysplasia of the hip joint," with and without displacement of the femoral head from the acetabulum, should be the title of this discussion. Dislocation is a secondary phenomenon and need not necessarily occur. The actual or potential primary malformation is a dysplastic and inadequate acetabulum with an insufficient or aplastic roof or buttress for stability of the head of the femur. Dislocation may or may not emerge as one of the many dysplastic sequelae. Every complete displacement of the femoral head from the socket, or dislocation, at one time passed through a stage of partial displacement or

Fig. 1. Roentgen study of a woman, a school teacher, forty-one years of age, who had no disability of the left hip until at the age of thirty-nine years. I did not appreciate the true etiology until the patient informed me that her sister was disabled with bilateral congenital dislocation of the hips. Previous to this experience I did not understand the relationship between congenital subluxation and congenital dislocation of the hip. This patient's severe pain and disability were the result of osteo-arthritis secondary to the trauma of joint incongruity. Observe (1) the primary flat inadequate dysplastic socket, (2) subluxation, (3) malformation of the femoral head, (4) interruption of Shenton's line and (5) extensive osteoarthritis of the weight-bearing portion of the head of the femur and acetabulum, with bone sclerosis, narrowing of joint space and areas of cystic rarefaction. Congenital subluxation of the hip is a common cause of disability during early adult life. In fact it is the most common cause of arthritis deformans, malum coxae senilis or degenerative hip disease.

Fig. 2. The most convincing evidence of relationship between dislocation and subluxation is found in patients who present positive roentgenographic features of the two entities involving both hip joints. The above roentgen study is of a housewife, thirty-eight years of age. The dislocated hip had caused trouble since childhood. The opposite hip was considered "normal" until the age of thirty-six years, when pain began secondary to osteoarthritis resulting from the traumata of incongruity. This patient's hip joints were never treated previous to her examination.

subluxation during its development. Dysplastic hips form during embryonic or fetal life and, relatively, very few dislocate during intra-uterine life. The great majority of dysplastic hips with displacement of the femoral head are in the stage of subluxation during early infancy or the first six months of life. As a result of weight bearing, abnormal muscle pull and hip joint instability, the subluxated femoral head may continue to migrate and become completely displaced from the acetabulum. Only this situation should be described as congenital dislocation of the hip. Most subluxated hips, without treatment, never dislocate but remain as subluxations throughout the life of the individual and frequently cause no disability until osteoarthritis is superinposed soon after young adult life (Fig. 1). Some individuals, born with hip joint dysplasia, may continue throughout life with a shallow and incompetent acetabulum but with no displacement of the head of the femur and with no complaints until later in life when the trauma of hip joint incongruity produces a traumatic osteochondrosis of the articulation. And, finally, many dysplastic hips either during intra-uterine life or during infancy, return to normal, without treatment, because of the remarkable phenomenon of spontaneous recovery.

Dysplasia, a temporary or permanent, partial or complete, mild or extreme, inhibition and alteration of the normal growth forces of mesodermal tissue, or endochondral ossification, is not limited to the acetabulum but may involve all hip joint structures. Epiphyseal dysplasia should not be confused with aseptic or avascular necrosis of the femoral head. There are several causes of coxa plana; congenital dysplasia of the hip is one of them.

Our knowledge of the etiology and the pathogenesis of this serious hip joint malformation with dislocation is still very incomplete. Only a clear understanding of the newer knowledge will enable us to apply the old but fundamental teaching that congenital deformities should be recognized and treated soon after birth.

1. The true etiology of congenital dysplasia of the hip joint, with or without femoral head displacement, is unknown. Genetic, biological and mechanical influences need further investigations.

2. If a dysplastic and inadequate hip forms during embryonic or fetal life, then there are six possibilities for subsequent development of the joint:

(a) The hip joint may return to normal during intra-uterine life or early infancy, with no treatment, as a result of the remarkable phenomenon of spontaneous recovery.

(b) The dysplastic hip with only a flat socket may persist as such throughout the life of the individual with no displacement of the femoral head from the socket.

(c) The femoral head may be partially displaced from the acetabulum as a subluxation which may persist as such throughout the life of the individual.

(d) Displacement of the femoral head may gradually increase from a partial to a complete displacement or dislocation.

(e) Rarely extreme dysplasia with irreparable malformation of all structures of the hip joint and marked shortening of the shaft of the femur develops.

(f) Coxa plana or epiphyseal dysplasia may be the only expression of hip joint dysplasia.

3. Congenital subluxation is a common entity during the age periods from infancy to late adult life.

Fig. 3. Congenital dysplasia of the right hip joint with slight displacement in an infant of six months. Clinical examination demonstrated limitation of hip joint abduction because of contracture of the adductor muscles, asymmetry of the thigh folds and creases and slight shortening from pelvis to knee.

The x-ray study reveals the following findings of hip joint dysplasia: (1) inadequate bony socket with sloping acetabular roof, (2) delayed development of the center of ossification of the femoral head, (3) delayed closure of the ischio-pubic juncture, (4) slight upward and lateral displacement of the femoral epiphysis or head, (5) adduction attitude of the extremity, (6) mild disturbance of Shenton's line, (7) hypoplasia of the pelvis.

Dysplasia means abnormal growth. Normal growth of the skeletal structure of the hip is by endochondral ossification. Therefore, dysplasia of the hip joint means abnormal endochondral ossification.

4. Congenital subluxation is the precursor of congenital dislocation.

5. Both entities, subluxation and dislocation, frequently affect the two hip joints of a single patient (Fig. 2).

6. Subluxation, like dislocation, is more common in the female.

7. Weight bearing begins with creeping, usually in the seventh month of life.

8. During the first six months of life:

(a) Dislocation is rare.

(b) Subluxation is common (Fig. 3).

(c) All clinical findings are related to contracture of the adductor muscles of the hip (Fig. 4).

(d) Roentgenographic features are present and positive (Fig. 3).

(e) The clinical and roentgenographic findings, which frequently are considered insignificant, may become major, permanent and irreversible at the age of two or three years.

(f) Treatment with the Frejka abduction pillow splint (Fig. 5) is simple, dynamic and effective, and eliminates (1) hospitalization, (2) anesthesia, (3) traction, (4) manipulation, (5) trauma, (6) plaster immobilization, and (7) abduction frames. It prevents (1) subluxation, (2) dislocation, (3) contractures, (4) adhesions, (5) growth malformations of bone and cartilage, (6) aseptic necrosis of bone and cartilage, (7) traumatic osteochondroses, and (8) traumatic osteoarthritis.

9. Educational propaganda is essential.

10. Co-ordinated research should be encouraged.

11. At present there are no valuable statistics of congenital dysplasia of the hip during the first six months of life.

12. The dysplastic hip can be recognized during early infancy by clinical examination. There are several clinical findings, but only one of these is constant and definite. Abduction of the flexed hip joint is limited because of contracture of the adductor group of muscles.

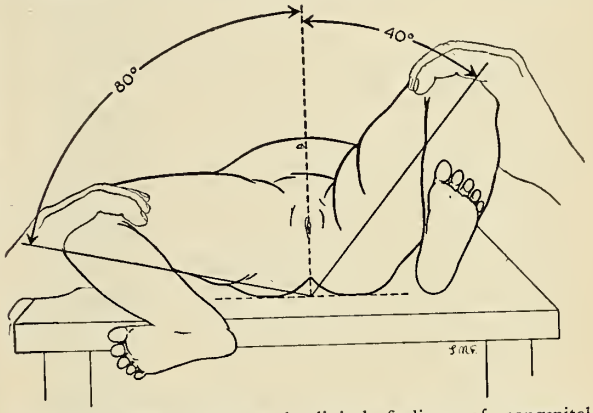

Fig. 4. There are several clinical findings of congenital dysplasia of the hip during early infancy, but only one, limitation of hip joint abduction, is constant and positive. Abduction is limited because the adductor thigh muscles are in a state of contracture. In a normal infant with the hips and knees flexed ninety degrees, the knees may be spread apart and the hips abducted about eighty degrees. The knees almost touch the examining table. Limitation of abduction is an early and constant clinical finding of congenital displacement of the hip joint.

In a normal infant, with the knees and hips flexed 90 degrees, the knees may be spread apart and the hips abducted about 80 degrees. The knees almost touch the examining table. Limitation of abduction is a constant clinical finding of congenital displacement of the dysplastic hip joint (Fig. 4). Shortening from the pelvis to the knee is frequently demonstrated by comparing the knee levels with knees and hips flexed 90 degrees. The shortening may be increased when the knees and hips are flexed because the acetabular defect is often more posterior than superior. This test is not constant and not always positive since it can be influenced by the examiner's enthusiasm. Contracture of the adductor muscles with flexion-adduction attitude of the extremity,

Fig. 5. Treatment of congenital displacement of the hip during early infancy before weight bearing is the secret for improving our results of treatment of congenital dislocation of the hip. Treatment at this early age period prevents dislocation and other serious secondary changes of all hip joint structures. The Frejka abduction pillow splint treatment eliminates hospitalization, traction, manipulation, trauma, plaster immobilization and passive abduction frames. The splint provides active and functional immobilization.

Professor Frejka, of Brno, Czechoslovakia, described this splint at the annual meeting of the American Academy of Orthopaedic Surgeons in Chicago, January, 1947. The main feature of the splint is a pillow which is placed in an envelope-like portion of the splint. This pillow section fits firmly between the thighs. The pillow pressure gradually overcomes the adductor contracture, abducts the hips completely and levers the femoral head to its natural position within the dysplastic socket. The adductor contracture and the limitation of abduction usually are corrected two or three weeks after the splint is applied. The splint is made of twill or mattress ticking. Both white and colored materials are used—blue for boys and pink for girls. The pillow is filled with kapok or feathers. A waterproof material is placed between the splint and diapers.

The mother is instructed in the application of the splint and care of the infant. Examination and roentgen studies are made at the office monthly. The splint is altered as the infant grows. Standing and walking are not delayed. The splint treatment is continued until roentgen study demonstrates an adequate acetabular roof and a stable hip joint. Treatment usually continues over a period of about four months; however, some infants require less and others more time in the splint. The hip joint usually returns to normal because of three factors. (1) spontaneous healing, (2) favorable mechanical and functional stimuli, (3) early treatment before the addition of serious secondary pathological changes.

which is a position of hip joint instability, plays an important role in the production of femoral head displacement from the socket with resulting shortening of the extremity.

Other common clinical findings are extra skin folds and creases or just deeper and more cephalad inguinal and gluteal folds. The asymmetrical skin folds and creases are the result of adductor muscle, tendon and fascia contracture and skeletal shortening from pelvis to knee. They are frequently observed in normal infants also, but their presence should cause suspicion of the hip joint malformation. There is frequently an adduction attitude of the extremity secondary to the adductor muscle contracture of the thigh. Pain, swelling, atrophy, and muscle spasm are absent. A mother may be concerned because of her observation that one knee does not spread as far as the opposite one when changing diapers, that there is a difference in the rotational attitude of the extremities, that the baby powder remains in one unusually deep skin crease, or that a clicking sound is present at the hip level. The great majority of these malformed hips, however, will not be found during early infancy unless the obstetricians, pediatricians, general practitioners, interns, residents, and nurses routinely examine the hip joints during the first days and weeks of life.

The presence of contracture of the adductor thigh muscles, tendons, and fascia, must be emphasized since it is related to all of the clinical findings.

13. Every infant should have this simple examination.

14. Routine mass x-ray studies of all newborn babies without clinical studies would create confusion and should not be encouraged. Co-ordinated clinical and roentgenological studies of large groups of infants at birth and at several intervals during the first year of life should be encouraged in our hospitals.

15. The first diagnosis should be a clinical diagnosis and then confirmed or rejected by proper x-ray study.

16. Congenital dysplasia of the hip during early infancy is primarily a problem of the general practitioners and the pediatricians. Obstetricians may recognize the dysplastic hip immediately after birth.

17. Roentgenologists have an essential part in the academic and in the practical course of this program.

18. The only "secret" to improve the results of treatment of congenital dislocation and subluxation of the hip is early recognition and atraumatic treatment during the first six months of life before weight bearing.

Discussion

Dr. R. T. La Vake, Minneapolis: I would like to ask Dr. Hart whether I could discover this condition at birth?

Dr. Hart: Yes, the clinical findings and the x-ray features are present at birth. The obstetrician should routinely test abduction of the flexed hips by separating the knees. Limitation of abduction may be present because of contusion about the buttocks following breech presentation. The hip joint may be normal but x-ray study should always be made if hip abduction is limited, just to make certain that the hip is not displaced.

Dr. Leo Rigler, University of Minnesota: would you think it worth while to make routine x-rays of the pelvis of all newborns before they leave the hospital?

Dr. Hart: I would discourage a program of routine x-ray studies of all newborns because confusion would result. I certainly would encourage such a program, however, if co-ordinated with clinical examination.

Dr. Rigler: The clinical findings are not common until later. Radiologists would have to learn to interpret the films. It is really more a matter of whether the incidence is sufficient to justify routine examination. How often would you find this abnormality in the newborn population?

MEDICAL BROADCASTS

The Minnesota Department of Health radio schedule for July and August is as follows:

July 4—Let's Have a Safe and Sane Summer
July 11—Polio in Minnesota
July 18—Two Centuries of Vaccination
July 25—Safety on the Farm
August 1—Keeping Babies Well
August 8—The Story of Askov (Dr. Jordan)
August 15—Blood Banks
August 22—Eating Without Regrets (Mr. Adams)
August 29—How Healthful Are Our Schools?

With the exception of the talks on August 8 and 22, these programs will be given by Dr. R. N. Barr, chief of the Section of Special Services. "The Story of Askov" will be given by Dr. W. A. Jordan, director of the Division of Dental Health. On August 22, Harold S. Adams, director of the Division of Hotel and Resort Inspection, will give the talk on "Eating Without Regrets."

AHA PURCHASING INSTITUTE CANCELLED

The American Hospital Association cancelled the summer Institute on Hospital Purchasing. The institute was originally set for July 11 through July 15 at the University of Michigan, Ann Arbor, Michigan.

Less than twenty-five registrations were received five weeks before the institute was to begin, so limiting the administrative budget that it was deemed impractical to continue with the program. In addition, it did not seem feasible to have the outstanding purchasing experts who had agreed to serve as faculty members travel to Ann Arbor to address such a small group.

One Institute on Hospital Purchasing was held from April 18 through April 22 in Washington, D. C. No other purchasing institute is scheduled for 1949.

AMERICAN COLLEGE OF CHEST PHYSICIANS MINNESOTA CHAPTER

At a recent meeting of the Minnesota Chapter of the American College of Chest Physicians, the following officers were elected for the ensuing year:

President, John F. Briggs, M.D., Saint Paul.

Secretary-Treasurer, Karl H. Pfuetze, M.D., Cannon Falls.

At the request of Dr. Hilbert Mark of the State Department of Health, the Chapter decided to establish a speakers' bureau on chest diseases. These speakers will be called upon by Dr. Mark to address county medical society meetings, luncheon clubs and various lay groups regarding the different phases of tuberculosis control work in the state.

The Chapter voted to collaborate with the University of Minnesota in sponsoring a postgraduate course in diseases of the chest which will be held at the Center for Continuation Study on the University Campus next fall.

NORTHERN MINNESOTA MEDICAL ASSOCIATION

The Northern Minnesota Medical Association will hold its annual meeting at Alexandria on September 9 and 10, under the direction of its officers, Dr. R. H. Puumala, Cloquet, president; Dr. W. J. Deweese, Bemidji, vice president, and Dr. C. L. Oppegaard, Crookston, secretary-treasurer.

The program for the two-day meeting is as follows:

September 9

9:00 a.m.—"Epidemic Diarrhea of the Newborn" by Dr. R. O. Bergen, Duluth.

10:00 a.m.—"Applied Surgery of the Stomach, Duodenum and Biliary System" by Dr. C. H. Mead, Duluth.

11:00 a.m.—"A Clinical Appraisal of the Present-Day Methods for the Treatment of Essential Hypertension" by Dr. Howard M. Odel, Rochester.

12:00 noon—Business Meeting.

12:30 p.m.—Luncheon, with the Park Region District and County Medical Society as hosts.

2:00 p.m.—"General Consideration of Carcinoma of the Cervix and Corpus" by Dr. Leonard Lang, Minneapolis.

3:00 p.m.—"The Roentgen Diagnosis of Diseases of the Urinary Tract" by Dr. Harold O. Peterson, Saint Paul.

4:00 p.m.—"Recent Therapeutic Advances in Dermatology" by Dr. Francis Lynch, Saint Paul.

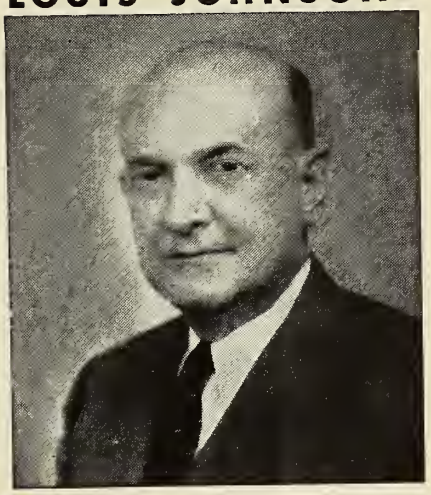
7:00 p.m.—Annual Banquet, at Blake's Hotel.
Presiding: Dr. R. H. Puumala, president, Northern Minnesota Medical Association.
Remarks: Dr. F. J. Elias, president-elect, Minnesota State Medical Association.
Address: The Honorable Edward J. Thye, Senator from Minnesota.

September 10

8:00 a.m. to 12:00 p.m.—"Clinico-Roentgen-Pathological Conference" led by Dr. E. L. Tuohy and Dr. H. G. Moehring, of Duluth.

Woman's Auxiliary

On September 9 at 12:30 a luncheon for the Woman's Auxiliary to the Northern Minnesota Medical Association will be held at the Alexandria Golf Club. In charge of the arrangements will be Mrs. E. R. Sather, Mrs. H. L. Stemsrud and Mrs. C. E. Carlson, all of Alexandria.



CARDIOVASCULAR GROUPS MERGE

As a result of preliminary steps taken at a meeting in Atlantic City, June 5, 1949, the American Foundation for High Blood Pressure will be merged with the American Heart Association. The high blood pressure

(Continued on Page 756)

FROM SECRETARY OF DEFENSE LOUIS JOHNSON—

AN URGENT APPEAL TO YOUNG DOCTORS!

Your personal help is needed to avert a serious threat to our national security!

By the end of July of this year we will have lost almost one-third of the physicians and dentists now serving with our Armed Forces. Without an increased inflow of such personnel, the shortage will assume even more dangerous proportions by December of this year.

These losses are due to normal expiration of terms of service. The professional men who are leaving the Armed Forces during this critical period are doing so because they have fulfilled their duty-obligations and have earned the right to return to civilian practice.

Without sufficient replacements for these losses, we cannot continue to provide adequate medical and dental care for the almost 1,700,000 service men and women who are the backbone of our nation's defense.

Normal procurement channels will not provide sufficient replacements!

To alleviate this critical, impending shortage of professional manpower in the three services, I am urging all physicians and dentists who were trained under wartime A. S. T. P. and V-12 programs under government auspices or who were deferred in order to complete their training at personal expense, *and who saw no active service*, to volunteer for a two-year tour of active duty, at once!

We have written personally to more than 10,000 of you in the past weeks urging such action. The response to this appeal has not been encouraging, and our Armed Forces move rapidly toward a professional manpower crisis!

Many responses have been negative, but worse—a great number of doctors have not replied. It is urgent that we hear from you immediately!

We feel certain that you recognize an obligation to your fellow men as well as to your profession in this matter. We are confident that you will fulfill that obligation in the spirit of public service that is a tradition with the physician and dentist.

There is much to be said for a tour of duty with any of the Armed Forces. You will work and train with leading men of your professions. You will have access to abundant clinical material; have the best medical and dental facilities in which to practice. You will expand your whole concept of life through travel and practice in foreign lands. In many ways, a tour of service will be invaluable to you in later professional life!

Volunteer now for active duty. You are urged to contact the Office of Secretary of Defense by collect wire immediately, signifying your acceptance and date of availability. Your services are badly needed. Will you offer them?

Louis Johnson

CARDIOVASCULAR GROUPS MERGE

(Continued from Page 754)

group will thus become a section of the American Heart Association's Scientific Council and will be known as the Council for High Blood Pressure Research. Other sections within the Association's Scientific Council now include the Section on Circulation and the American Council on Rheumatic Fever.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

The Southern Minnesota Medical Association will hold its annual meeting on Monday, September 12, at Red Wing, Minnesota.

The program for the meeting is as follows:

"Recognition and Management of Urinary Infections in Children"—R. S. RODGER, M.D., Minneapolis.

"Physical Medicine in the Home Treatment of Rheumatoid Arthritis" (45-minute movie)—G. M. MARTIN, M.D., Rochester.

"Vitamin B-12 in the Treatment of Pernicious Anemia"—D. C. CAMPBELL, M.D., Rochester.

"Some Aspects of Pediatric Surgery"—TAGUE C. CHISHOLM, M.D., Minneapolis.

"The Cancer Detection Center at the University of Minnesota Hospitals"—D. STATE, M.D., Minneapolis.

"Maternal and Infant Mortality Study in a Small General Hospital"—R. R. WRIGHT, M.D., Austin.

"Vesicovaginal Fistula—Cured Without Major Surgery" (Case report)—R. C. RADABAUGH, M.D., Hastings.

"A Review of Major Surgical Operations in a Small Hospital"—D. P. ANDERSON, M.D., Austin.

"The Painful Shoulder Resulting From Trauma"—E. H. JUERS, M.D., Red Wing.

"Diagnosis and Treatment of Polycythemia Vera"—CHARLES STROEBEL, M.D., Rochester.

"Congenital Atresia of Esophagus in Infancy. Diagnosis and Treatment" (colored movie)—S. D. MILLS, M.D., Rochester.

All physicians are welcome at the meeting and applications for membership will be considered during the business meeting. Additional information may be obtained from W. A. Merritt, M.D., Secretary, Rochester, Minnesota.

AMERICAN CONGRESS OF PHYSICAL MEDICINE

The twenty-seventh annual scientific and clinical session of the American Congress of Physical Medicine, will be held September 6, 7, 8, 9 and 10, 1949, inclusive, at the Netherland Plaza Hotel, Cincinnati, Ohio. All sessions will be open to members of the medical profession in good standing with the American Medical Association.

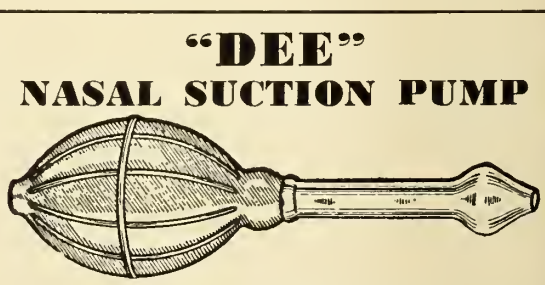
In addition to the scientific sessions, the annual instruction courses will be held September 6, 7, 8 and 9. These courses will be offered in two groups. One set of ten lectures will consist of basic subjects and attendance will be limited to physicians. One set of ten lectures will be more general in character and will be open to physicians as well as to physical therapy technicians who are registered with the American Registry of Physical Therapy Technicians.

Full information may be obtained by writing to the American Congress of Physical Medicine, 30 North Michigan Avenue, Chicago 2, Illinois.

CONTINUATION COURSES

Anesthesiology

The Department of Postgraduate Medical Education of the University of Minnesota Medical School announces a continuation course in anesthesiology to be held September 12, 13, 14. The course is not intended for full-time anesthetists but is rather directed toward those physicians who spend a portion of their time as anesthetists. Emphasis will be placed on anesthetic agents commonly used by part-time anesthetists. Clinical problems frequently encountered in anesthesiology will be stressed. Distinguished visiting physicians who will participate as members of the faculty for the course include Dr. Stewart Cullen, professor of anesthesiology, University of Iowa Medical School; Dr. John Adriani, director, Department of Anesthesia, Charity Hospital, New Orleans; and Dr. J. S. Lundy, chief of anesthesia at the Mayo Clinic, Rochester, Minnesota. The remainder of the faculty of the course will be made up of full-time and clinical members of the staff of the University of Minnesota Medical School.



Psychosomatic Medicine

A course in psychosomatic medicine for general physicians will be presented by the University of Minnesota Medical School at the Center for Continuation Study, September 12 to 24. Emphasis will be placed upon interview techniques and the actual care of patients with emotional problems. A major part of the teaching will be done in the Out-Patient Department of the University of Minnesota Hospitals where the registrants will gain clinical experience under the supervision of experienced advisors. Faculty members for the course will include full-time and clinical staff of the University of Minnesota Medical School and the Mayo Foundation.

WASHINGTON SOCIETY

Through an error in type-setting, the name of Dr. E. Sydney Boleyn, secretary of Washington County Medical Society was omitted under the heading Secretary in the County Society Roster published in the May issue. His name does head the alphabetical list of society members in Washington County. Dr. Boleyn was unanimously re-elected secretary of the Washington County Medical Society on December 12, 1948, and we hasten to correct the omission.

In Memoriam

JOHN G. ERICSON

Dr. John G. Ericson of Minneapolis died May 14, 1949, at the age of eighty-one.

Dr. Ericson was born in Sweden and came to Minneapolis at the age of sixteen. He obtained his medical degree from the University of Minnesota Medical School in 1892 and specialized in eye, ear, nose and throat diseases. He was associated in practice with his son, Dr. Reinhold M. Ericson, at the time of his death.

He was a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations, the American College of Surgeons, the Swedish Art Institute, the AF and OM and the Zuhrah Temple of the Shrine.

Dr. Ericson is survived by his wife, a daughter, Mrs. Winston E. Sandeen of Minneapolis, and his son.

IGNATIUS J. MURPHY

Dr. Ignatius J. Murphy, a resident of Saint Paul who practiced radiology in Minneapolis and Saint Paul, died June 2, 1949, at the age of sixty-four.

Dr. Murphy was born February 1, 1884, in Victor, Iowa. He obtained his medical degree from the University of Minnesota in 1909, interned at St. Barnabas and Minneapolis General Hospitals and practiced from 1910 to 1915 in Duluth. He was executive secretary of the Minnesota Public Health Association from 1915 to 1919, when he took postgraduate work in radiology at Harvard. He maintained x-ray laboratories in both Minneapolis and Saint Paul. He was a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations.

Surviving are his wife, the former Marion A. McCartin, three sons, Jack, Ned and Gregory, and three daughters, Virginia, Delores and Muriel.

BENJAMIN FRANKLIN SWEZEY

Dr. Benjamin F. Swezey of Buffalo, Minnesota, died at Eitel Hospital, Minneapolis, on June 2, 1949. He was seventy-five years of age.

Dr. Swezey was born in Fremont, Nebraska, on November 1, 1873. He received his medical degree from Keokuk Medical College at Keokuk, Iowa, in 1903 and practiced with a brother in Iowa before coming to Minnesota in 1906. He practiced first in Nassau and Bellingham before locating permanently at Buffalo.

Dr. Swezey was a member of the Wright County Medical Society, the Minnesota State and American Medical Associations. He served at one time as coroner of Wright County and as Buffalo health officer. He was president of the city's first automobile club in 1921, and devoted much time to civic and lodge activities. He was a Mason and Knight Templar and a member of the Christian Church.

He is survived by his wife, the former Antonie S. Sommermeyer, whom he married in 1910, one son, Benjamin F. Swezey, Jr., and two grandsons.

CAMP

SCIENTIFIC PRENATAL SUPPORTS

Designs developed over many years, in full consultation with obstetricians, insure ample support for the abdominal musculature, pelvic girdle and lumbar spine without constriction at any point. All Camp Supports are accurately fitted about the pelvis. Thus the uterus is maintained in better position, the abdominal muscles and fasciae are conserved and there is support for the relaxed pelvic joints. The patient is assisted in maintaining better balance in the course of the postural changes of pregnancy. Physicians may rely on the Camp-trained fitter for precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

THIS EMBLEM is displayed only by reliable merchants in your community. Camp Scientific Supports are never sold by door-to-door canvassers. Prices are based on intrinsic value. Regular technical and ethical training of Camp fitters insures precise and conscientious attention to your recommendations.

Woman's Auxiliary

STATE PRESIDENT REVIEWS YEAR

Mrs. Harold F. Wahlquist

(The following summary of Woman's Auxiliary activities during 1948-49 was prepared by Mrs. Wahlquist for presentation at the National Convention in Atlantic City, June 6-10.)

Minnesota is proud to be one among forty-eight component auxiliaries forming the Woman's Auxiliary to the American Medical Association. The members of the Woman's Auxiliary to the Minnesota State Medical Association extend greetings to Mrs. Luther H. Kice, our national president, the members of the National Board, and members of the Auxiliary everywhere. We congratulate all for a most effective and energetic year.

Minnesota has just completed its twenty-seventh annual meeting. The past year has been a challenge to us, and we have worked untiringly to meet it.

We are gratified in having 539 new Auxiliary members, a total membership of 2,048 in twenty-nine counties. Three new counties have been organized. We have members-at-large in the three remaning unorganized groups. Organization has been effected through nine regional advisors and members of the Organization Committee. At least six counties are credited with 100 per cent membership.

This past year all of our activities, classified as they may have been, related directly or indirectly to public relations. We wanted people in our communities to know their interests were our interests.

Last September to attain Auxiliary unity and complete comprehension of our undertaking, we set up with the assistance of the Minnesota State Medical Association the first Minnesota Public Relations Workshop Conference in conjunction with our fall Board session. It consisted of a panel discussion on "Mediums for Furthering the Community Health Program"; round table discussions for county presidents, treasurers, and program chairmen; talks by authoritative speakers on timely topics such as public relations and legislation. One hundred members attended this Workshop Conference. We appreciated keenly the visit of Mrs. Kice at this time.

Concurrently, area Health Days became a reality. Minnesota has had nine Health Days since their inception a little over a year ago. They have been co-sponsored by the State Auxiliary, the State Medical Association and the State Department of Health. Through them we have attempted to inform the public about health problems by presenting panel discussions, speakers who spoke with authenticity, exhibits by voluntary health organizations, health movies. Direct results of these Health Days are already evident: they are the formation of County Health Councils, the employment of county health nurses, the active participation of laity in Food Handlers Schools, the enactment of necessary health legislation. The intangible results will never be revealed completely. They are apparent in the increased community appreciation of the contribution to public health of the private practitioner. Said one county Auxiliary president. "Health Day was considered an outstanding day in this community because people felt that the medical people were working with them." In addition to Health Days many cities and towns have had guest days or reciprocity meetings to which representatives of all community organizations have come as guests of the Auxiliary members. The state president was invited to attend state Auxiliary meetings in Iowa, Michigan, Indiana, and North Dakota to present Health Day plans. An exhibit on Health Days was prepared for the convention; now it will be available to Auxiliaries sponsoring Health Days.

Constantly aware that our most important objective is health education, all Auxiliaries have had intensive educational programs to enable all members to be "better informed." Many packets of material have been distributed to county groups with the co-operation of the State Association. In smaller groups the names of all members were listed on the cover of each piece of literature. The member checked her name when she had read the material and subsequently sent the pamphlet to the next member on the list. In addition, one Auxiliary sponsored a weekly radio program using "live" broadcasts and discs from the American Medical Association.

All voluntary health organizations and the Auxiliary have worked very closely this year. During the Heart Drive, hundreds of plastic hearts were distributed by members. The Woman's Auxiliary conducted its eighteenth year of sponsoring the high school speaking project on tuberculosis, with the donation of two trophies and ten medals as prizes. Through the efforts of Auxiliary members and the Minnesota Public Health Association which conducted the project, an estimated 10,000 high school students prepared talks. Further assistance to tuberculosis work consisted of staffing Christmas Seal booths, stuffing seal envelopes and helping the mobile x-ray unit.

During April more than 12,000 children entered the cancer essay poster contest co-sponsored by the Minnesota Division of the American Cancer Society and the Auxiliary. The Auxiliary contributed toward the prizes. In addition, members made hundreds of cancer dressings every month for distribution by county nurses. Members also attended the annual cancer school at the University of Minnesota.

Varying and original activities have been planned to suit the needs of the Auxiliary and its community. To promote friendship in its group, one Auxiliary encouraged members to write and take part in skits depicting the life of families of physicians. The skits were used for entertainment for the state convention.

STATE PRESIDENT REVIEWS YEAR

(Continued from Page 760)

Philanthropic Funds of Auxiliaries were swelled by rummage sales, white elephant sales, Calico Balls, Easter Monday Benefits. One Auxiliary raised $2,650 at a luncheon and style show. All profits have been used to support essay contests, provide loan funds and scholarships for nurses and medical students, purchase *Hygeias* and assist with clinics.

Many groups had special hospital interests; they assisted with sewing and purchasing of sterilizers and hospital beds. Special planned itineraries by several county Auxiliaries made it possible for nurses who are trained speakers to present nurse recruitment to high school seniors. Two Auxiliaries conducted sales of articles made by patients undergoing rehabilitation. Members instructed Red Cross classes, volunteered for duty at Blood Donor Centers. One Auxiliary set up a program to assist in an educational program for patients requiring long-term hospitalization.

Medical and surgical relief and *Hygeia* are uninterrupted projects in Minnesota. Every Auxiliary realizes the value of the promotion of *Hygeia.* They promote it by selling subscriptions, supplying subscriptions to schools and libraries, and giving it as gifts. Mower County placed third in Group I in the National contest. Medical and surgical relief drives have continued, with new outlets being made available through missionaries and Indian Reservations.

Cook County Graduate School of Medicine
ANNOUNCES CONTINUOUS COURSES
SURGERY—Intensive course in Surgical Technique, two weeks, starting July 25, August 22, September 26.
Surgical Technique, Surgical Anatomy and Clinical Surgery, four weeks, starting July 11, August 8, September 12.

General, Intensive and Special Courses in all Branches of Medicine, Surgery and the Specialties
TEACHING FACULTY — ATTENDING STAFF OF COOK COUNTY HOSPITAL
Address: Registrar, 427 S. Honore St., Chicago 12, Ill.

Pending national health legislation has given Minnesota members much concern. They have worked diligently this year learning about voluntary and compulsory plans and what the effects of the latter will be on our democratic form of government. At the recent convention, members took 3,000 pieces of literature to distribute in their communities, passed a resolution against compulsory health legislation, acted to have each member contact twenty people, asking them to write their legislators, and to have each county president contact all heads of organizations in her county, asking them to study and support our stand on compulsory health insurance where possible.

On the state level several means have been used to co-ordinate our efforts. Besides the Workshop Conference, our State Association underwrote a quarterly *Newsletter* and allotted the Auxiliary two pages in Minnesota Medicine every month for Auxiliary news and informative material. In addition, all state officers and chairmen were supplied with *Handbooks* and notebooks which contain material relating to their special department. Many subscribed to the *Bulletin.*

Finally, it would be remiss not to mention the important role many Auxiliary members played in our state as leaders in health projects and co-ordinators of efforts of lay leaders. They have served on state, county and local health committees, prepared talks and acted as judges in essay contests. Thus the entire national program has been covered by one county group or another.

Minnesota members were delighted to elect to honorary membership Mrs. S. S. Hesselgrave, a former national secretary, state president, parliamentarian and advisor.

Members in Minnesota grieve the loss of Mrs. James Blake, Sr., former county state and national president, advisor and guide; and Mrs. Archibald MacLaren, the founder of our State Auxiliary. To emphasize our appreciation of Dr. William O'Brien, a long-time advisor to the State Auxiliary, each county is contributing to a memorial which will be placed in his honor in the Dr. O'Brien Memorial Seminar Room in the Mayo Memorial Building at the University of Minnesota.

Any increased activity in Minnesota this year has been made possible through national leadership and the loyal and wholehearted co-operation of our awakened Auxiliary members. Throughout the year we have tried to work as one, guided constantly by our own State Medical Association. For our incoming president, Mrs. H. E. Bakkila, and her Board our earnest wish is a most commendable year. To all I extend sincere appreciation. To this national meeting we wish to bring the assurance that Minnesota is working!

Of the deaths from respiratory tuberculosis in 1947, 32.1 per cent occurred outside of institutions, and 67.9 per cent occurred in institutions. Of the total respiratory tuberculosis deaths, 25.8 per cent occurred in general hospitals, 30.9 per cent in tuberculosis hospitals and sanatoria, and 9.0 per cent in mental hospitals. Sara A. Lewis (biostatistician) *Public Health Reports,* April 1, 1949.

Communication

The Minneapolis Star
Minneapolis, Minnesota
Editor:

The news item on the front page of the *Star* under date of May 25, 1949, reporting the illness of the late Lord Leverhulme, contained some statements which are in error. The reporter stated that "The train conductor wired ahead for a physician to meet the train at Glenwood, Minn. After a cursory examination of the viscount in the patient's compartment, the Glenwood physician advised the family to continue to Minneapolis. . . . The physicians (in Minneapolis) said the viscount's temperature and blood pressure were subnormal and that he had lost a 'considerable quantity of blood.'"

The facts are these: The Soo Line agent at Glenwood, Minnesota, states that he has no record of having received a request for a physician from the train conductor, nor was any actually received. Furthermore, the physicians in Glenwood all deny having seen the viscount. Though without evidence, we understand that the viscount was not seen en route by any physician in Minnesota but by one in another state.

This correction is being requested because of the criticism which is being rained upon all medical facilities at Glenwood by individuals throughout the state, the inference being that someone was negligent in not advising prophylactic measures, that the reported recommendation that "the family continue to Minneapolis" was ill-advised. Although the prognosis in a bleeding peptic ulcer in a man of sixty-one is admittedly poor, we would have been aware of the need for supportive measures to correct the existing shock, from which he probably succumbed, before it became irreversible.

We join the world in regretting the outcome but feel that we should not bear unjust criticism for failure to render proper service. We are asking you to publish this correction.

Very truly yours,

Wayne C. Rydburg, M.D.
Acting Chief of Staff
Glenwood Community Hospital

Editor's Note: The above letter is a copy of one sent to the *Minneapolis Star Journal* and is self-explanatory.

Carefully documented studies on the use of streptomycin in clinical tuberculosis have established the fact that this new anti-bacterial agent exerts a beneficial therapeutic effect on several forms of tuberculosis. At its best, however, it is only an auxiliary part of the general treatment in most forms of the disease, and is partially dependent, for its full effect, upon other more common therapeutic measures, such as bed rest, pneumothorax, and chest surgery. (Recommendations of the Subcommittee on Streptomycin of the Expert Committee on Tuberculosis of the World Health Organization, January, 1949.)

One of the speakers before the Minnesota Dietetic Association, meeting in affiliation with the Upper Midwest Hospital Conference in Minneapolis on May 26 and 27, was Dr. Russell M. Wilder, Sr., Rochester, who spoke on "The Nutritional Status of the People of Newfoundland."

Among the physicians who attended a three-day continuation course in cancer at the University of Minnesota, June 2 through 4, was Dr. David M. Potek, International Falls.

* * *

The 1949 Southern Minnesota Medical Association award for outstanding work in the clinical fields of medicine and surgery at the University of Minnesota Medical School went to John K. Meinert, a senior from Winona. Dr. Harold S. Diehl, dean of medical sciences, made the presentation.

* * *

Dr. Arthur H. Wells, Duluth, was elected president of the Minnesota Society of Clinical Pathologists at its meeting in Saint Paul on May 11. The session was held in conjunction with a testimonial dinner for Dr. E. T. Bell, who recently retired as head of the pathology department of the University of Minnesota Medical School.

* * *

Little Falls acquired a new physician in early May when Dr. Robert A. Stoy became associated in practice with Dr. R. V. Fait and Dr. D. L. Johnson. Dr. Stoy is a graduate of Loyola University. Prior to moving to Little Falls he was located at LaFayette, Indiana.

* * *

Construction work on a new clinic building in Baudette began on May 9. When completed, the building will house the offices of Dr. A. A. Brink, Dr. Leonard Prochaska and Dr. A. G. Janecky. Dr. Janecky is moving from Warroad to Baudette. The new clinic will contain eighteen rooms, including examining rooms, reception room, x-ray room, laboratory, and a room for minor operations.

* * *

Dr. Edgar V. Allen, Rochester, was elected vice president of the American Heart Association at the organization's twenty-fifth annual membership meeting in Atlantic City early in June.

* * *

The Hennepin County Medical Society has conducted a survey of its members, by secret ballot, to determine the attitude of society members on several controversial issues, among them compulsory federal health insurance.

In May, 829 ballots containing six important questions were sent to society members. The 608 replies that were received were counted by an impartial board of judges.

A total of twenty-nine members voted in favor of governmental compulsory sickness insurance supported by compulsory payroll deductions or income taxes. A total of 565 voted against it, and fourteen checked neither answer.

Results for the five other questions were as follows:

Medical co-operatives (by lay groups, consumer co-operatives).—79 favor, 494 oppose, 35 no opinion.

Blue Cross and Blue Shield plans.—572 favor, 18 oppose, 18 no opinion.

Federal grants-in-aid to states for increasing educational facilities to produce more doctors, nurses and technicians (under state control).—296 favor, 287 oppose, 25 no opinion.

Federal grants-in-aid to states to help share cost of health care for the indigent, medically indigent, mentally deficient, tuberculous, the halt, lame and blind (under state control).—436 favor, 157 oppose, 15 no opinion.

Federal grants-in-aid to states to share cost of hospital care for those unable to assume any or all of this cost (under state control).—408 favor, 183 oppose, 17 no opinion.

A number of physicians added individual comments to their ballots, some saying that Blue Cross and Blue Shield benefits are too limited, others favoring only the Blue Cross plan. Three physicians were in favor of governmental compulsory insurance for low income groups only.

* * *

At a meeting of the Minnesota Academy of Ophthalmology and Otolaryngology in Saint Paul on May 11, Dr. O. E. Hallberg, Rochester, presented a paper written in collaboration with Dr. J. W. Begley, also of Rochester, entitled "Osteoma of the Paranasal Sinuses and Its Treatment."

* * *

Three International Falls physicians were appointed to the Koochiching County Welfare Medical Board on May 10. They are Dr. F. H. Walter, Dr. R. D. Hanover and Dr. F. G. Chermak, and their appointments are for one year.

Members of the Lake City League of Women Voters and the Lake City Chamber of Commerce, at a meeting on May 17, heard three British physicians describe what has happened in Great Britain under socialized medicine.

The speakers were Dr. Harold Rodgers, professor at Queen's College in Belfast, Ireland; Dr. Arnold Aldis of Cardiff, Wales, and Dr. William Capper of Bristol, England. The three physicians described the unhappy lot of the general practitioners, the increase in complaints of nonexistant or slight ailments, the oppressive taxation, and the steadily mounting cost of the plan.

* * *

Dr. Howard K. Gray, head of a section in surgery at the Mayo Clinic, received a doctor of science degree at the Lafayette College commencement exercises on June 10.

* * *

It was announced on June 3 that Dr. B. O. Mork, Jr., planned to leave the Worthington Clinic, after seventeen years as a staff member, to enter public health service. Dr. Mork said that he would remain as medical director of Minnesota Public Health District 5 while completing studies to qualify for the public health service.

On May 17, Dr. Mork was guest speaker at the organizational meeting of the Wilkin County Health Council in Breckenridge. To a group of fifty representatives of township and villages Dr. Mork explained

the purposes and organization of county-wide health councils. He also led a panel discussion on public and community health topics.

* * *

During the middle of May, Dr. Frank D. Gray of Marshall attended a reunion of his medical class (1899) at Northwestern University, where he received a diploma of merit commemorating his fifty years of medical practice.

Following graduation, Dr. Gray spent several years in practice at Vesta, then moved to Marshall to help found a hospital there. He has conducted his practice in Marshall for the last thirty-eight years. He has two sons, both physicians: Dr. Robert Gray, now doing postgraduate work at the University of Chicago, and Dr. Frank Gray, Jr., an instructor at the Yale University Medical School.

* * *

Two Rochester physicians presented papers at a meeting of the North Dakota State Medical Association in Minot on May 16. Dr. J. R. McDonald spoke on "Cytologic Diagnosis of Cancer with Reference to Various Smears and Stains." Dr. C. S. MacCarty discussed "Surgery of the Sympathetic Nervous System."

* * *

Pointing out that the principal advocates of socialized medicine are playing politics with the issue, Dr. J. Arnold Malmstrom, at a meeting of the Virginia Kiwanis Club on May 24, painted a dark picture of what would happen in the United States under a system of progressive socialism. Following his talk, Dr. Malmstrom conducted a question and answer session on the same subject.

* * *

Every Wednesday night, two dozen members of the "Lost Cord Club" meet in the University of Minnesota Hospitals to learn to talk by esophageal speech. Each club member is a person who has had his larynx removed because of cancer.

Under the direction of Dr. Sherman O. Strand, each of the members learns how to swallow air and then release it slowly from his esophagus, controlling it with his throat muscles to produce sound. Only two persons have dropped out of the class so far, and most are determined to learn to speak again. A few members, star pupils who have overcome their own handicap, return to the class to help others learn the trick of "burping" out words. Some persons learn to speak fairly well within a few weeks; with others several months may be necessary.

New members can be admitted to the club if they are referred by their own physicians.

* * *

Dr. John Hall O'Leary, a resident physician at Ancker Hospital, Saint Paul, was married in Saint Paul on June 11 to Miss Enid Lois Keene, an occupational therapist at Minneapolis Veterans Hospital. Attendants of the couple at the ceremony were Dr. O'Leary's brother-in-law and sister, Dr. and Mrs. Milton B. Sorem of Saint Paul.

* * *

At a joint meeting of the Range and St. Louis County Medical Societies in Ely on June 28, the principal speaker was Dr. J. Dewey Bisgard, professor of surgery at the University of Nebraska, who spoke on "Cancer—Ulcer Problem of the Stomach."

While visiting at the University of Minnesota Hospitals early in June, Dr. L. J. Witts, professor of clinical medicine at Oxford University, told staff physicians that Britain's nationalized health service has had a beneficial effect on medical schools.

"Instead of discouraging students from entering the medical profession, the health service demand for more doctors has built up a heavy competition for entrance to British medical schools," Dr. Witts said. "There are ten, twenty or thirty applicants for every opening."

* * *

Four members of the University of Minnesota Medical School staff described the University's Cancer Detection Center on June 10 at the annual meeting of the American Medical Association in Atlantic City. The report on the center was presented by Dr. David State, Dr. David Gaviser, Dr. Thomas B. Hubbard, Jr., and Dr. Owen Wangensteen.

After two weeks of progress, a hospital fund-raising campaign in Parkers Prairie had collected one-fourth of its $25,000 goal on May 29. The campaign was seeking funds to purchase a fourteen-bed hospital that has been closed since last December. The fund raisers plan to turn the hospital over without charge to whatever church organization offers the most advantageous terms.

* * *

Combination resuscitator-inhalator and aspirator machines were presented to Loretto and Union Hospitals in New Ulm on May 13 by the New Ulm Lions Club.

* * *

Launching of a drive for $250,000 to remodel the old Riverview Hospital in Saint Paul and construct an addition took place at a dinner in the Riverview Commercial Club on May 23. The hospital, which is the only one on the west side of the Mississippi River in Saint Paul, is the former West Side General Hospital.

At the dinner meeting, Dr. George Earl, past president of the Minnesota State Medical Association, and James Hamilton, professor of hospital administration at the University of Minnesota, stressed the need for a hospital in the area. Dr. E. K. Endress, chief of staff of the hospital, announced that the hospital staff had pledged 20 per cent of the $250,000 and that $37,000 of that pledge had already been collected. It was expected that the entire $250,000 would be raised by July 2.

Of the total, $150,000 will be allotted to the new wing, which will include major operating rooms, urological room, laboratory, x-ray room and twelve beds; $70,000 will be used to purchase the old hospital, and $30,000 will cover remodeling and fire-proofing the old section. When completed, the structure will be an eighty-four-bed hospital.

* * *

Construction work on a hospital at Carlton resumed in May after being virtually at a standstill during the winter. In spite of the slow progress and rumors about the noncompletion of the hospital, the Carlton Chamber of Commerce voted on May 18 to support the hospital committee in its plan to proceed with construction. The committee reported that much material, already paid for, was on hand and that there was still a cash balance of $4,500 in the hospital fund. It was expected that considerable progress would be made during the summer.

* * *

Hospital administration personnel from five states and Canada met in Minneapolis May 26 through 28 for the annual Upper Midwest Hospital Conference. Speakers at the meeting covered such subjects as trends in hospital administration, recruitment and education of nurses, medical staff problems, food cost control, hospital liabilities and responsibilities, hospital public relations and public health.

Among the speakers at the meeting were Dr. G. Albin Matson, director of the Minneapolis War Memorial Blood Bank; Dr. Cyrus Barnum, Dr. Gaylord Anderson and Dr. George Moore, of the University of Minnesota.

* * *

A fund drive for $450,000 to complete the expansion program of St. Luke's Hospital, Duluth, and to add a 150-bed annex to the hospital began at a dinner meeting in Duluth on June 1. The new annex will be constructed across the street from the main hospital and will be connected by underground and overhead passages. The annex will serve as an infirmary for patients with chronic diseases.

On the night before the drive began, Duluth physicians, meeting at the hospital, pledged themselves to a $50,000 goal in the campaign.

BLUE SHIELD NEWS

To date this year (May 31, 1949) Blue Shield has made payment on 9,101 cases in the total amount of $354,948.42. Payment was made for 2,367 cases during May amounting to $90,627.00.

At the annual meeting of the Minnesota State Medical Association which was held in Saint Paul this year, Blue Shield was discussed at some length both with the Medical Councillors and with the House of Delegates. The annual report of Minnesota Medical Service Inc. was presented by Dr. O. I. Sohlberg, president, at the Sunday evening meeting of the House of Delegates. At this meeting Dr. Elias, chairman of the Council, distributed typewritten copies relative to recommendations by the Board of Directors of Minnesota Medical Service Inc. to the Council at a meeting held on January 16, 1949. Due to the lateness of the hour discussion on the recommendations was postponed until Monday, May 9, at 1:30 p.m.

At the Monday afternoon session of the House of Delegates on May 9, 1949, Dr. Frank J. Elias, chairman of the Council, presented a brief report of the Minnesota Medical Service Inc. including the proposals which were submitted by the Board of Directors of Minnesota Medical Service Inc. which were as follows:

The Board of Directors of Minnesota Medical Service Inc. wishes to consider the possibility of increasing the income limits of unlimited subscribers from $1,500 to $2,000 per year for single subscribers, and from $2,500 to $3,000 per year for family subscribers.

The Board of Directors also wishes to consider the possibility of adjusting certain payments to doctors included in the schedule of payments which at the present time may be inequitable, a standing committee of the Board of Directors being available for this purpose.

Dr. Elias stated that a resolution was passed by the Council, approving in principle the proposals presented by Minnesota Medical Service Inc. as outlined above, provided, however, that they be presented to the House of Delegates of the Minnesota State Medical Association.

Dr. O. I. Sohlberg, president of Minnesota Medical Service Inc., was then called upon to give further information necessary. He advised the members of the House of Delegates that if they agree to raise the income limits of the unlimited subscribers it would still have to be referred to the participating doctors of medicine before such could be put into effect. Dr. Sohlberg also mentioned that of the seventy-three Blue Shield Plans in existence today there are only three plans that have as low income limits as we have at present.

After the subject had been considerably discussed action was taken by the House of Delegates regarding the following resolution:

"Expressing our confidence in the Board of Directors of the Minnesota Medical Service Inc., and to promote the social welfare of the people who are within the unlimited income group, the House of Delegates agrees in principle to the increase in limits for unlimited subscribers from $1,500 to $2,000 per year for single subscribers and from $2,500 to $3,000 per year for family subscribers."

The resolution was unanimously approved.

It was understood that before these changes would take place a letter would be submitted to all participating doctors throughout Minnesota for their opinions on this proposed change. These letters went out to all the Blue Shield participating doctors of medicine in the middle of May with the request that if there were any comments or suggestions they be returned to the Blue Shield office not later than the 15th of June, 1949. As of that date very few letters had been received.

TAILORS TO MEN SINCE 1886

The finest imported and domestic woolens such as **SCHUSLER'S** have in stock are not too fine to match the hand tailoring we always have and always will employ.

Mailing tubes and price lists supplied upon request.

1111 NICOLLET AVENUE MINNEAPOLIS 2 MAIN 2350

All of the letters received stated that the physician would be very happy to continue as a participating doctor of medicine irrespective of the income status of the Blue Shield subscriber, and some admitted that they had been working on this basis prior to the present time. It was assumed that the physicians that did not respond were in accord with this change and consequently would continue as Blue Shield participating doctors of medicine.

At the time that these changes will go into effect, all of the participating doctors of medicine will be advised and they also will be advised of any contract changes or changes in the Blue Shield schedule of allowances. A committee of the Board of Directors is now studying the present schedule of payments to doctors with the anticipation of correcting any inequitable payments.

It is the intention that by increasing the present income status Blue Shield can more completely demonstrate its benefits insofar as a service contract is concerned. Also it is felt that by being able to offer a service contract to more people it would be a very definite indication as to what a nonprofit medical care plan operated by the medical profession could do and establish, thus proving that nongovernment health insurance is doing the most for the least cost with the support of the American public and the American medical profession.

We are very pleased to notice the change that has transpired the last month as a result of our luncheon meeting with the physicians' office personnel, and it would appear that we have received fewer phone calls regarding various cases. As the office personnel knows the Blue Shield procedure, we find that we do not have to contact the physician's office as frequently as we did before to obtain necessary and additional information for a claim to be processed. We are very satisfied indeed with the results and appreciate the interest the physicians have shown in having their office personnel attend these luncheons. Many of the doctors have contacted us to thank us and comment on what an assistance this has been to their people, and they are also very pleased with the interest we have shown in the physician, in that he doesn't feel that he is out in the cold but that he is a part of his own prepaid medical care plan.

AT HOME OR AWAY SPOT TESTS SIMPLIFY URINALYSIS

No Test Tubes • No Measuring • No Boiling

Diabetics welcome "Spot Tests" (ready to use dry reagents), because of the ease and simplicity in using. No test tubes, no boiling, no measuring; just a little powder, a little urine—color reaction occurs at once if sugar or acetone is present.

Galatest . . . Acetone Test (DENCO)

FOR DETECTION OF SUGAR IN THE URINE

FOR DETECTION OF ACETONE IN THE URINE

SAME SIMPLE TECHNIQUE FOR BOTH

1. A LITTLE POWDER
2. A LITTLE URINE

COLOR REACTION IMMEDIATELY

A carrying case containing one vial of Acetone Test (Denco) and one vial of Galatest is now available. This is very convenient for the medical bag or for the diabetic patient. The case also contains a medicine dropper and a Galatest color chart. This handy kit or refills of Acetone Test (Denco) and Galatest are obtainable at all prescription pharmacies and surgical supply houses.

Accepted for advertising in the Journal of the A.M.A.

WRITE FOR DESCRIPTIVE LITERATURE

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

MEDICINE OF THE YEAR. John B. Youmans, M.D. (Editor). Dean, College of Medicine, University of Illinois. 143 pages. Price $5,00, cloth. Philadelphia: J. B. Lippincott Co., 1949.

NEW YORK ACADEMY OF MEDICINE—Its First Hundred Years. Philip Van Ingen. 573 pages. Illus. Price $10,00, cloth. Morningside Heights, New York: Columbia University Press, 1949.

OBESITY. Edward H. Rynearson, M.D., F.A.C.P., and Clifford F. Gastineau, M.D., of the Mayo Foundation of Rochester, Minnesota. 144 pages, 9 figures and 16 tables. Price $3.50. Springfield: Charles C Thomas, 1949.

This excellent monograph takes in the many aspects of obesity, stressing the importance of this condition on the general health of the population, and endeavors to stimulate members of the medical profession to take a more active and aggressive interest in this affliction than they have in the past.

There is a well-written chapter on the physiology of obesity, where the many factors produced by the condition are pointed out, and in which the authors state that the various abnormalities associated with obesity are probably the result of the obesity rather than causative factors.

A large chapter is devoted to the many theories of the etiology of obesity, and each factor is clearly presented and discussed. The research findings and results of many investigators are evaluated in a clear and concise manner. Many of the theories propounded have not been proven, and the author's opinion is that obesity is directly due to an individual's overeating, but they stress that many theories still exist relative to the problem of obesity and its causes.

The chapter devoted to diet and reduction therapy, giving details and reasoning, is very worthwhile. It contains several tables and charts by which one can evaluate reduction, and it gives a clear-cut method of procedure in handling obese individuals.

The final chapter deals with such subjects as psychotherapy, various drugs used in curbing appetites, treatment of obesity, and the mechanical physiotherapy methods employed in some atttempts in reduction.

There is a complete bibliography for ready reference on various aspects of the subject, listing 422 articles.

E. W. MINTY, M.D.

CONGENITAL DISLOCATION OF THE HIP

(Continued from Page 752)

DR. C. N. HENSEL, Saint Paul: I would like to take exception to Dr. Rigler's suggestion that all newborns have a routine x-ray of the hip before leaving the hospital. It seems that there is a growing tendency to want the x-ray department and laboratory to make our diagnosis for us, all of which tends to blunt diagnostic acumen. As I have seen from these pictures tonight, the clinical signs of subluxation are easily recognized and should be sought for, and only when they are found should x-ray be ordered.

DR. RIGLER: I don't think that x-ray examination is a laboratory procedure. It is just a part of the physical examination. It is artificial to try to distinguish between one kind of physical examination and another. You might as well decry the use of the stethoscope because clinicians no longer learn to hear the heart with the ear itself. It is a matter rather of which examination is most easily done and gives you the most information with the least trouble on the part of the patient. I think the important thing is to make a diagnosis.

DR. HART (in closing): The dysplastic hip with displacement usually is not dislocated but is subluxated during early infancy. There is considerable chance for error in the x-ray interpretation. Both the clinical physician and the roentgenologist must be enthusiastic about the subject of hip dysplasia if routine x-ray studies are made at birth and at several periods during the first six months of life. Co-ordinated clinical and x-ray studies are important because at present there are no valuable statistics in this country on this interesting subject.

The meeting was adjourned.

What Is Mental Illness?

Mental illness is an ailment which causes us to act in a way which is not accepted as being normal by the society in which we live. Some people suffer from peculiarities of behavior which leave them in the full use of all their faculties. Mental illnesses of others make them dangerous to themselves and to people and leave them without the full use of their faculties at all times.

There is only one Pablum. It was originated in 1932 by and is made by Mead Johnson & Company. "Pablum" is the registered trademark of Mead Johnson & Company for this pioneer vitamin-and-mineral-enriched precooked mixed cereal food.

Pabena was introduced by Mead Johnson & Company in response to numerous requests by the medical profession. "Pabena" is Mead Johnson's registered trademark for this vitamin-and-mineral-enriched precooked oatmeal food.

MANY PHYSICIANS RECOGNIZE MEAD JOHNSON AND COMPANY'S PIONEER EFFORTS IN THE FIELD OF INFANT CEREALS BY SPECIFYING "PABLUM"—AND ALSO THE NEW PABLUM-LIKE OATMEAL CEREAL KNOWN AS "PABENA"

Contact of a sensitized body cell with an allergen and subsequent release of histamine is considered to be the mechanism of allergic disorders.

Blocking the action of histamine, BENADRYL prevents reaction in cells that have been sensitized. Relief of symptoms is gratifyingly rapid, usually occurring within an hour or two after the first dose. And treatment with BENADRYL is simple, convenient, and inexpensive.

BENADRYL®

BENADRYL has been found highly effective in a wide variety of allergic states, ranging from seasonal, such as hay fever, to the non-seasonal, such as acute and chronic urticaria, angioneurotic edema, vasomotor rhinitis, contact dermatitis, erythema multiforme, pruritic dermatoses, dermographism, serum sickness, food allergy, and sensitization to drugs, such as penicillin and the sulfonamides.

BENADRYL hydrochloride (diphenhydramine hydrochloride, Parke-Davis) is available in a variety of forms to facilitate individualized dosage and flexibility of administration, including Kapseals®, Capsules and a palatable Elixir.

The usual dosage of **BENADRYL** is 25 to 50 mg. repeated as required. Children up to 12 years of age may be given 1 to 2 teaspoonsful of Elixir Benadryl.

LOOKING TOWARD NEW HORIZONS

The day of adventure and experimentation is by no means past. But current accomplishments are often overlooked in the zeal to scan the horizon for something better. It's sage advice that suggests that we take advantage of and nail down the present maximum accomplishments. It is also sage advice that suggests that you turn to your Association's investigated and tested plan of Accident and Sickness Insurance. The horizon holds no greater value.

Income protection should have priority over all other forms of insurance, for you are not able to maintain anything that you own nor reach that Utopia without income.
Please call us today.

when reducers stray from the dietary path . . .

. . . DESOXYN Hydrochloride provides a safe, simple and effective curb on the wayward appetite. At the same time, the stimulating action of DESOXYN increases the patient's sense of well-being and desire for activity. To depress the appetite, one 2.5-mg. tablet an hour before breakfast and lunch is usually sufficient. A third tablet may be taken in midafternoon, if needed, and if it does not cause insomnia. • It has been shown that weight for weight DESOXYN is more potent than other sympathomimetic amines so that *smaller doses* may be used effectively. In addition, DESOXYN has a *faster action, longer effect* and *relatively few side-effects*. • Orally, DESOXYN is an effective cerebral stimulant with a wide variety of uses. Parenterally, it helps to restore and maintain blood pressure during operative procedure. For more detailed information, write to ABBOTT LABORATORIES, NORTH CHICAGO, ILLINOIS

WHEN THE DIET

Needs Supplementation

Comparison of the accompanying two columns of nutritional values clearly shows why Ovaltine in milk has been so widely accepted as a highly effective *multiple dietary food supplement.*

Column A lists the National Research Council's Recommended Daily Dietary Allowances for each *100 calorie portion* in the diet of a 154-pound man of sedentary occupation. Column B lists the amounts of the same nutrients provided by a *100 calorie portion* of Ovaltine in milk.

	A N.R.C. Diet	B Ovaltine in Milk*
CALORIES	100	100
CALCIUM	40 mg.	166 mg.
IRON	0.5 mg.	1.8 mg.
PHOSPHORUS	60 mg.	139 mg.
VITAMIN A	208 I.U.	444 I.U.
THIAMINE	0.05 mg.	0.17 mg.
RIBOFLAVIN	0.08 mg.	0.30 mg.
NIACIN	0.5 mg.	1.0 mg.
ASCORBIC ACID	3.1 mg.	4.4 mg.
VITAMIN D		62 I.U.
PROTEIN	2.9 Gm.	4.7 Gm.

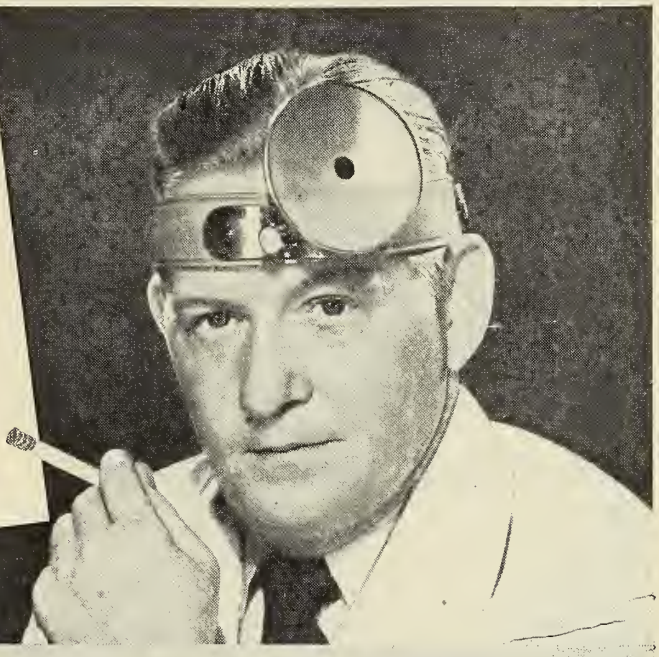
The easy digestibility and appealing flavor of Ovaltine in milk enhance its value as a dietary supplement. Chocolate Flavored Ovaltine is especially liked by children.

*Based on average reported values for milk. Three servings of Ovaltine, each made of ½ oz. of Ovaltine and 8 fl. oz. of whole milk, the daily dosage recommended for diet supplementation, provide 676 calories.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine

Two kinds, Plain and Chocolate Flavored. Serving for serving, they are virtually identical in nutritional content.



How mild can a cigarette be?

DOCTORS REPORT

In a recent test of hundreds of people who smoked only Camels for 30 days, noted throat specialists, making weekly examinations, reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION DUE TO SMOKING CAMELS!"

SMOKERS REPORT

"I MADE THE CAMEL 30-DAY TEST AND I **KNOW!** CAMELS ARE THE MILDEST CIGARETTE I'VE EVER SMOKED—AND SO GOOD TASTING, TOO!"

Rita Edwards

TELEPHONE OPERATOR

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

According to a Nationwide survey:

More Doctors Smoke Camels

than any other cigarette

Doctors smoke for pleasure, too! And when three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel!

Soft Diet

trying your patients' patience?

— try palatable Swift's Strained Meats

Tempting, natural source of complete protein

6 varieties:
Beef, lamb, pork, veal, liver, heart

The things some patients on soft, smooth diets have to eat! It's no wonder appetites lag.

To perk up patients' interest in foods, many doctors now prescribe specially prepared Swift's Strained Meats when soft foods are indicated in a high-protein, low-residue diet. They help two ways. *One*, Swift's Strained Meats taste so good. Few patients can turn down real meat goodness. *Two*, an excellent source of B vitamins, Swift's Strained Meats help restore patients' natural appetite for all foods.

Originally prepared for infant feeding, Swift's Strained Meats are soft, smooth (may easily be used in tube-feeding), slightly salted—cooked to retain all their delicious meat flavor. Six kinds for variety: beef, lamb, pork, veal, liver, heart. Each one 100% meat, they provide an excellent, palatable source of complete, high-quality proteins and hemapoietic iron. These meats make available *simultaneously* all known essential amino acids . . . for optimum protein synthesis. Convenient — Swift's Strained Meats are ready to heat and serve.

The makers of Swift's Strained Meats invite you to send for your copy of "The Importance of Protein Foods in Health and Disease"—a physician's handbook of protein feeding, written by a doctor. Send to:

SWIFT & COMPANY
Chicago 9, Illinois

ACCEPTED COUNCIL ON FOODS AND NUTRITION AMERICAN MEDICAL ASSOCIATION

All nutritional statements in this advertisement are accepted by the Council on Foods and Nutrition of the American Medical Association.

For patients who can take foods of less fine consistency —Swift's Diced Meats offer tender morsels of nutritious meat with tempting flavors patients appreciate.

Having a wonderful vacation

Wherever your pollen-sensitive patient spends his vacation, TRIMETON* may add to his enjoyment and rest by alleviating his symptoms of pollinosis. TRIMETON is an unusual antihistaminic. Essentially different in chemical composition, it is so potent that only one 25 milligram tablet is usually required to attain the desired relief in fifteen to thirty minutes. Best of all, your patient isn't likely to sleep away his vacation because the small milligram dosage lessens side effects. Your patient will also appreciate that the high potency of TRIMETON also means lower cost of therapy.

Trimeton

Dosage: One 25 mg. tablet one to three times daily.

TRIMETON, brand of prophenpyridamine, 25 mg. tablets, scored, are available in bottles of 100 and 1000.

The Luzier Facial Service

This service includes a comprehensive range of types, variations and shades of preparations for dry, normal and oily conditions of skin. A balanced service includes preparations for cleansing, conditioning and makeup. Dry skins need lubricating creams and emollient lotions. Oily skins need astringents and suitable makeup bases. Normal skins deserve the protection afforded by suitable creams and lotions.

We believe that artistically applied makeup improves the appearance of any type of skin. Loveliness thrives on intelligent care.

ACCEPTED FOR ADVERTISING BY THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

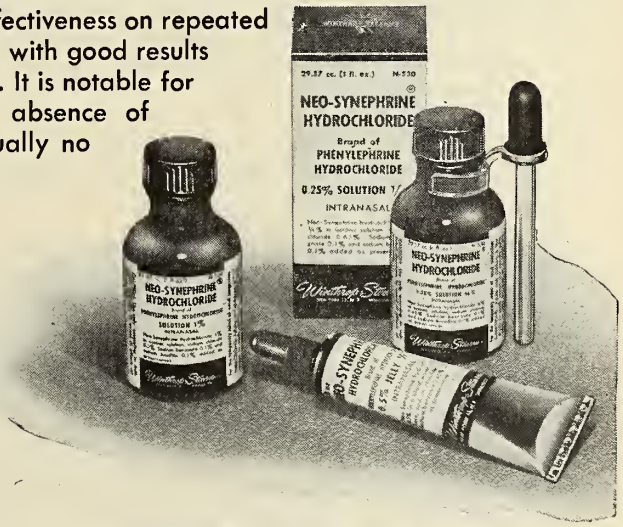
in hay fever...

...Nasal Engorgement Reduced
...Soreness, Congestion Relieved
...Aeration Promoted
...Drainage Encouraged

with

NEO-SYNEPHRINE®

HYDROCHLORIDE



Brand of
Phenylephrine Hydrochloride

When Neo-Synephrine comes in contact with the swollen, irritated mucous membrane of the nose, the patient soon experiences relief.

This powerful vasoconstrictor acts quickly to shrink engorged mucous membranes, restoring easy breathing, and promoting free drainage.

The prolonged effect of Neo-Synephrine makes fewer applications necessary for the relief of nasal congestion — permitting longer periods of comfort and rest.

Neo-Synephrine does not lose its effectiveness on repeated application . . . It may be employed with good results throughout the hay fever season . . . It is notable for relative freedom from sting and absence of compensatory congestion . . . Virtually no systemic side effects are produced.

Supplied as:

¼% and 1% in isotonic saline solution —1 oz. bottles.

¼% in aromatic isotonic solution of three chlorides—1 oz. bottles.

½% water soluble jelly—⅝ oz. tubes.

Winthrop-Stearns INC.

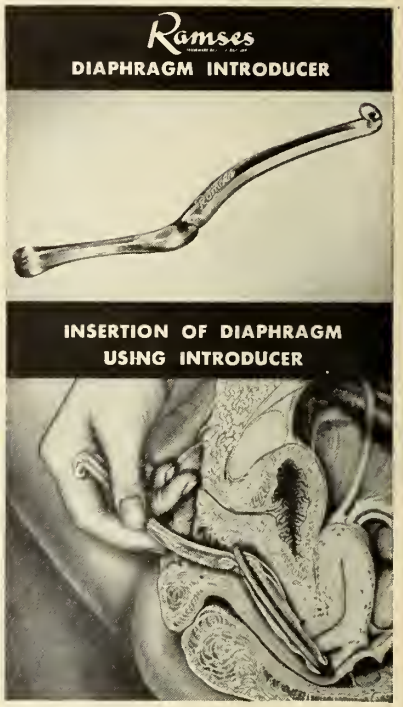
Facts About Conception Control



THE USE OF THE DIAPHRAGM INTRODUCER

Use of a diaphragm introducer is favored by many patients who find manual manipulation objectionable or difficult. It facilitates the insertion and correct placement of the diaphragm, as well as its removal.

The "RAMSES"* Diaphragm Introducer provides the following features:

- Simplicity and convenience in use
- Safety – design minimizes possibility of injury to the cervix or accidental insertion into the urethra
- Smooth surface lessens bacterial proliferation – makes for easy cleaning
- Ease of removal assured by bluntly hooked end

The "RAMSES" Diaphragm Introducer is supplied in the Physician's Prescription Packet No. 501, without charge

Ramses
TRADEMARK REG. U.S. PAT. OFF.

PHYSICIAN'S PRESCRIPTION PACKET NO. 501

A complete unit for conception control. Contains (1) a "RAMSES" Flexible Cushioned Diaphragm of the prescribed size, (2) a "RAMSES" Diaphragm Introducer of corresponding size, and (3) a tube of "RAMSES" Vaginal Jelly† (regular size).

* The word "RAMSES" is a registered trademark of Julius Schmid, Inc.

† Active Ingredients: Dodecaethyleneglycol Monolaurate 5%; Boric Acid 1%; Alcohol 5%.

quality first since 1883

"RAMSES" Vaginal Jelly is accepted by the Council on Pharmacy and Chemistry of the American Medical Association. The "RAMSES" Diaphragm and Diaphragm Introducer are accepted by the Council on Physical Medicine of the American Medical Association.

Tissue repair is the keystone of the recovery process. It makes little difference if the infection is halted, the fracture reduced, or the metabolic imbalance adjusted—it is the patient's own cells that must complete the cure.

While true hypoproteinemia is comparatively rare, nevertheless hypernutrition with essential amino acids during the recovery process has been shown empirically to speed the patient upon the road to normal health. Amino acid preparations should be supplemented by moderate amounts of vitamins.

Lederle research has for some time been concerned with such mixtures of amino acids and vitamins and their application in the field of nutrition.

CAMP

for POSTOPERATIVE and POSTPARTUM NEEDS

Basic design and the unique system of adjustment make a large variety of Camp Scientific Supports especially useful as postoperative aids. Surgeons and physicians often prescribe them as assurance garments and consider them essential after operation upon obese persons, after repair of large herniae, or when wounds are draining or suppurating. A Camp Scientific Support is especially useful in the postoperative patient with undue relaxation of the abdominal wall. Obstetricians have long prescribed Camp Postoperative Supports for postpartum use. Physicians and surgeons may rely on the Camp-trained fitter for precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

THIS EMBLEM is displayed only by reliable merchants in your community. Comp Scientific Supports are never sold by door-to-daar canvassers. Prices ore bosed on intrinsic value. Regular technical and ethicol training of Comp fitters insures precise and canscientious ottention to your recommendations.

THE MINNESOTA CENTENNIAL—ITS MEDICAL HISTORY

E. M. HAMMES, M.D.
Saint Paul, Minnesota

IN 1928 the Council of the Minnesota State Medical Association appointed an historical committee whose duty it was to collect material pertaining to the history of the Minnesota State Medical Association, its pioneer physicians and other interesting facts.

Under the chairmanships of the late Dr. A. S. Hamilton, the late Dr. John Armstrong and our present chairman, Dr. Monte Piper, extensive research and study were made and, as a result, our Association has on file a large volume of important and interesting history of the Association which is celebrating its ninety-sixth anniversary.

A considerable portion of material has been published at monthly intervals in MINNESOTA MEDICINE, and it is the hope that in the near future this will appear in book form, accessible to every member of our Association for his library.

I want to express the appreciation of our Association to this committee and especially to the chairmen for their untiring efforts during these many years and for the very accurate work they have done. Personally, I want to thank Dr. Monte Piper and his present committee for their permission to utilize freely their available historical material. Without this, this presidential address, "The Minnesota Centennial, its Medical History," could not have been written.

The Organic Act of Minnesota, establishing the Territorial government, was passed by the United States Congress, March 3, 1849. On April 9, 1849, the first steamer from "below" brought to the levee at St. Paul the good news that the Territory of Minnesota had been created.

May I take a few minutes to refresh your memory about some interesting events? In 1836 the Territory of Wisconsin was organized, its boundaries extending from Lake Michigan to the Mississippi River. Ten years later, in 1846, the Territory of Wisconsin became a state, with its western boundary on the St. Croix River.

When Minnesota became a territory, its boundary extended from the Mississippi River west to the Missouri River, excluding the areas between the St. Croix and Mississippi.[1] This area was a sort of no-man's-land without law or government, but was finally included in the Territory of Minnesota. This small area had been acquired as a white settlement from the Sioux Indians by treaties in 1837, but all lands west of the Mississippi still belonged to the Indians. The first seal of the Territory of Minnesota amply expressed the great desire of its citizens to obtain this large area west of the Mississippi, known as the "Suland," and it was finally purchased from the Sioux Indians July 23, 1851.[2] The treaty was signed by thirty-five chiefs and thirteen witnesses and comprised all their lands east of the Red River and down to the Minnesota River, with a small area excluded around Lake Traverse and along the Minnesota River. Thus was opened this large area for settlement and development by white people.

The problem of designing a territorial seal was assigned to Governor Ramsey and Mr. Sibley, the territorial delegate. The seal well expresses

President's Address at the Annual Meeting of the Minnesota State Medical Association, Saint Paul, May 10, 1949.

the sentiment of these settlers, "Westward." Although the draftsmen erred in placing the Indian on the east side of the Mississippi and riding eastward toward the setting sun, the mistake did

Christopher Carli

not dull the keen message of the seal, along with the Latin motto (misspelled) *Quae sursum volo videre*, "I fain would see what lies beyond."

This sentiment was also well expressed in a poem written by the wife of Captain Seth Eastman. The first eight lines are as follows:

"Give way, give way young warrior
Thou and they steed give way.
Rest not, though lingers on the hills
The red sun's parting ray.
The rocky bluff and prairie land
The white man claims them now
The symbols of his course are here
The rifle, ax and plow."

The State Medical Association

In 1841, eight years before the Minnesota Territory was organized, Dr. Christopher Carli paddled up the St. Croix River and opened an office in the Dakotah Territory where Stillwater now stands. He was the first civilian physician in Minnesota. He practiced his profession in this territory till his death in 1887. Dr. Carli was an Italian, had been educated at Heidelberg and practiced for a time at Buffalo, New York, before coming to Stillwater.

The next civilian physician was Dr. John J. Dewey, who came to Ramsey County in 1847. In 1849 Dr. Thomas R. Potts, first president of the Minnesota State Medical society, located in Ramsey county. In the same year Dr. John H. Murphy came to St. Anthony Falls and was the first civilian physician in what is now Minneapolis.

The Minnesotan, a Saint Paul newspaper, July 16, 1853, contained the following note:

"We are requested to state that the medical profession of the Territory will hold a convention at St. Paul the twenty-third instant."

This is the earliest record found and represents the first attempt to hold a medical meeting in the district known as the Minnesota Territory.

On July 23, 1853, the convention of physicians in Minnesota met at the courthouse in St. Paul. Nine men were present, seven of them residing in St. Paul or St. Anthony. Dr. A. W. Daniels of St. Peter and Dr. O. P. Marsh of St. Paul were marked present by request. A constitution and by-laws were adopted, but these evidently were not preserved as they have not been found. Dr. Thomas R. Potts of St. Paul was elected president and the society was called the Minnesota Medical Society. Dr. John H. Murphy was elected delegate to the next meeting of the National Medical Association and journeyed to St. Louis in 1854 as our delegate.

Two subsequent meetings were held in 1856 and 1857. After that period the Society was allowed to languish. Civil war broke out and many medical men entered the military service. No further meeting was held until February 1, 1869—a lapse of twelve years.

This meeting took place at the International Hotel, St. Paul, "to consider the expediency of reviving the old society or of organizing a new one." Minnesota was admitted as a state on May 11, 1858. At the medical meeting of 1869, the society is referred to as the Minnesota *State* Medical Society. The reorganization of the society took place at this convention, and Dr. Samuel Willey of St. Paul was elected president. The annual assessment was to be $2 per member.

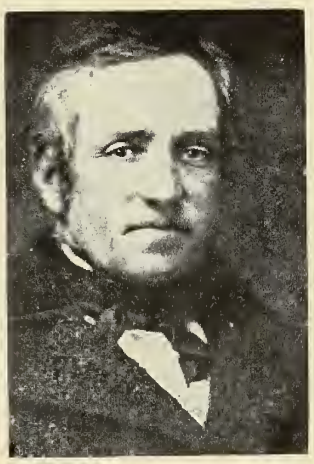
The first semi-annual meeting was held in Owatonna in June, 1869. Dr. Kimball's essay, a treatise on the subject of rheumatism, was read in his absence by Dr. W. F. Hutchinson. At this meeting a resolution was adopted which prohibited the admission to membership of anyone who could not produce satisfactory evidence of being a legal practitioner of medicine. A special committee reported that there were 119 regular and

ninety-three irregular practitioners in the state. The evening session was devoted to a discussion of quackery. The program for the next semi-annual meeting was to consist of the origin, nature and treatment of typhoid fever.

Regular annual meetings of the Minnesota State Medical Association have been held since 1869. In 1872 the membership was about 150; today it is 3,248.

All annual meetings until 1876 were held on the first Tuesday in February. The month of February was originally selected because the Legislature would be in session at that time and the medical men could meet the members and make representations to them. Evidently, in those early days, there was no public policy committee that was effective, as the results were not encouraging and the date of the annual meeting in 1876 was changed to June.

At the tenth annual meeting, held at St. Peter in June, 1878, Dr. Adams announced that Dr. J. H. Murphy had been elected as one of the vice presidents of the American Medical Association. Thus our society received some national recognition even in its early youth.



On March 31, 1851, a complete code of laws for the Territory of Minnesota was passed. The same code included a law authorizing the formation and regulation of county medical societies. No provision was made to form a Minnesota Medical Society, although this society was organized July 23, 1853, apparently without any legal standing. Two years later, on June 20, 1855, the Union Medical Society, which was the precursor of the Hennepin County Medical Society, was founded, with Dr. A. E. Ames as president—the first county medical society in this territory.

In 1860 the second county medical society was organized—the St. Paul Academy of Medicine and Surgery, with Dr. Thomas R. Potts as president. The initiation fee was $20. This was reorganized in 1869 and became the Ramsey County Medical Society.

In that same year Dakota, Goodhue and Winona Counties established their local county medical societies. This sudden burst of activity was associated with the reorganization of the Minnesota State Medical Society during this period.

In 1872 Dr. Franklin Staples, in his presidential address at the annual meeting of the Minnesota State Medical Society, stated:

"There are now six county medical societies organized in the state, all of which have become auxiliary to this society by complying with the conditions prescribed by the constitution."

Thomas R. Potts

However, not all of the county societies were willing to affiliate with the state society. Occasionally one was quite hostile, and for a time the Hennepin County Medical Society was scarcely on speaking terms with the state society. Problems and misunderstandings were gradually ironed out, and by 1900 fifteen local and county societies, including Hennepin, were recognized as auxiliary to the state society. Today the Minnesota State Medical Association comprises thirty-two county societies.

Women Physicians

At the semi-annual meeting, in 1870, Dr. A. B. Stuart moved that Miss Harriet E. Preston of Rochester, a graduate of the Women's Medical College of Philadelphia, be invited to participate in the deliberations of the society. Dr. W. W. Mayo endorsed this woman as a fairly competent and qualified practitioner. There was a heated discussion, and the motion to admit Miss Preston was finally tabled, partly because the American Medical Association was not admitting women physicians and partly because their respect for female delicacy would prevent them from discussing a case, about to be presented, of congenital malposition of the bladder in a male patient. This patient proved to be a baby of nine months in its mother's arms. Dr. John H. Murphy recognized the inevitable in his comments,

"This female woman question is looming up and you cannot stop it."

Dr. A. J. Stone, however, felt that "physiological disability is the only true ground upon which women can be rejected from a calling which the good sense of the mass of mankind still teaches them to believe her to be unfitted for."

Opinions change and hearts soften, for on June 17, 1898, the same Dr. Stone seconded the nomination of Dr. Mary Whetstone as vice president of the Minnesota State Medical Society. In 1871, at the San Francisco meeting, the AMA finally adopted a resolution to admit female physicians, properly qualified, as members of the Association.

However, it was not until 1880 that the Minnesota State Medical Society altered its constitution and admitted to membership three women physicians, all members of the Ramsey County Medical Society, namely: Dr. Harriet E. Preston, Dr. Clara E. Atkinson and Dr. Edith M. Gould.

These are a few of the interesting highlights in the development of this great organization, the Minnesota State Medical Association.

Licensing Physicians

When the territorial laws were adopted in 1851, the county societies were empowered to license physicians. The applicant had to be 21 years of age, have a good English education and must have studied three years with some respectable practitioner, and passed the required examination. The duty of examining students was made the responsibility of the censors of each society.

In 1869 the Medical Practice Act in Minnesota was passed. The act was unpopular and was regarded as an arbitrary measure in the interest of old school doctors and was repealed within two years. Evidently the old territorial laws of 1851 continued in effect until 1883 when another Medical Practice Act and the first State Board of Medical Examiners were created.

The present medical laws were passed and have been modified from time to time. At the meeting of the Minnesota State Medical society in 1884, Dr. Millard stated that over 200 persons practicing medicine had left the state because of the requirements of the Medical Practice Act.

The Basic Science Law was passed in 1927 and materially raised the standards of all professions practicing the Art of Healing. In 1917 the Legislature passed a law making fee splitting, in any form, a serious offense.

Individual Physicians

The Minnesota State Medical Association holds an enviable position among the state medical societies of this country. This has been accomplished only through the untiring energy, the scientific achievements and the sincere and persistent efforts of its members, individually and by committees.

Among the great pioneers associated with medicine in Minnesota were Dr. Perry H. Millard of Stillwater, Dr. Charles N. Hewitt of Red Wing, and Dr. Martha G. Ripley of Minneapolis.

Dr. Perry H. Millard was a pioneer in medical education and the first dean of the University of Minnesota Medical School. He held this position until February 1, 1897, when he died of pernicious anemia.

Although the medical department was organized at the University of Minnesota in 1883, for several years the faculty was only an examining body which conferred diplomas on a very small number of candidates who presented themselves for examination.

In 1888 the College of Medicine and Surgery of the University of Minnesota was established, with Dr. Perry Millard as dean. The St. Paul Medical College and the Minnesota Hospital College voluntarily surrendered their charters, and men selected from their faculties formed the nucleus of the staff of the new school. First classes on the University campus were held in the original Millard Hall, a structure which is still in use on the old campus. Gradually, the other medical teaching institutions in the Twin Cities consolidated with the Medical School at the University, until the University of Minnesota became the only institution teaching medicine in Minnesota. Under the administration of President Vincent, the Medical School, as well as the whole University, became much stronger and more efficient.

The affiliation of the Medical School with the Mayo Foundation in 1915 and the development of the Continuation Center for postgraduate study at the University under Dr. W. A. O'Brien, in 1937, placed Minnesota among the best and most efficient postgraduate schools of medicine in this country.

Dr. Charles N. Hewitt was a pioneer in public health work and the first secretary and executive officer of the Minnesota State Board of Health,

which was organized by an act of the Legislature in 1872. Massachusetts had enacted public health legislation in 1869, and California in 1871. Thus Minnesota, in 1872, became the third among the states to make the health of its citizens a direct concern of the state government.

Dr. Hewitt had served with distinction as a major in the Medical Corps during the Civil War and was well qualified and trained as a health officer. He was instrumental in the passing of many important public health laws and inspired a large amount of public health education. For a short time he gave physical examinations to University students, the forerunner of our present excellent Student Health Service at the University. He urged universal vaccination, established a smallpox vaccine laboratory and advocated township nurses to care for patients during epidemics. In those activities and many others he was far ahead of his day. After twenty-five years of faithful service and leadership, Dr. Hewitt was not reappointed, and thus political considerations terminated his official service. Dr. H. M. Bracken succeeded him and was followed by Dr. C. E. Smith, Jr.

In 1921, Dr. A. J. Chesley, the incumbent, was appointed as secretary and executive officer of the Minnesota State Board of Health. During the last twenty-eight years, he has served with distinction, not only in the duties of his position but in his wholehearted co-operation with the Minnesota State Medical Association. He is nationally recognized in his chosen field, having been president of the American Public Health Association and president of the Conference of State and Provincial Health Authorities of North America.

Dr. Martha G. Ripley, pioneer woman physician, was born in Vermont in 1843. Soon afterward, she came to the Territory of Minnesota. She was the founder and, for many years, directing genius of the Maternity Hospital in Minneapolis, which was opened November 30, 1886. She devoted her many years of active practice to the special care of mothers and babies. The national reputation which Minnesota holds in its low maternal and infant mortality rate is in a measure due to her untiring efforts and scientific advancements.

Gillette Hospital

In the year 1896, Jessie Haskins, a slender, crippled girl read a paper before the Minnesota State Legislature on the need of a state institution for the care of indigent crippled and deformed children. The following year, she appeared again before the legislature, as did Dr. Arthur J. Gillette. Dr. Gillette offered to give free orthopedic treatment to all indigent crippled and deformed children, if such a state hospital were established. That same year a bill was introduced and passed which provided for the care of these unfortunate ones. The City and County Hospital of St. Paul assigned a ward exclusively for the care of these children, and during the first two years eighty crippled children were treated. In 1907, a group of citizens and business organizations of St. Paul gave twenty-three acres of land adjoining Phalen Park for the location of the present Gillette State Hospital for Indigent Crippled and Deformed Children. In 1909, the amount of $55,000 was appropriated for the building of this hospital and, in 1913, $60,000 more was appropriated for an addition.

Thus through the efforts of Dr. Arthur Gil-

lette, president of this Association in 1918, Minnesota became the *first state* in this country to appropriate funds and erect a hospital for the care of its indigent crippled and deformed children.

W. W. Will L. L. Sogge

From October 24, 1897, to January 1, 1949, 21,110 patients have been treated at this state institution.

Dr. Arthur Gillette was the first chief-of-staff and served as such from 1897 to the time of his death, March 21, 1921. Since that time, Dr. C. C. Chatterton has held this position. These men, along with twenty-five other prominent physicians and surgeons, representing various specialties, are members of the staff and give their time willingly and without compensation.

Miss Elizabeth McGregor has been superintendent since 1914 and, with her pleasing and understanding personality, has added much to the care and happiness of these children.

On September 24, 1886, Dr. Justus Ohage performed the *first* successful cholecystectomy in America at St. Joseph's Hospital in St. Paul. The patient lived for thirty-four years following her operation. Dr. Ohage was graduated from the University of Missouri in 1880. He served as commissioner of health in St. Paul from 1899 to 1918. During his term of office, in 1904 at the St. Louis Exposition, St. Paul was awarded a medal for being the healthiest city in the world. Dr. Ohage was president of our Association in 1895.

The General Practitioner

During the early territorial days, specialization in medicine was infrequent, and most physicians could be classified as general practitioners. After World War I there was an indication that the medical pendulum was swinging further and further toward specialization. This has become increasingly more pronounced since World War II. One of the main reasons for this was the preference and greater rank and pay given to medical officers during their period of military service. Naturally, many medical veterans, aided by their GI Bill of Rights, after their discharge selected postgraduate training in some special field rather than entering or returning to general practice. Unfortunately, many hospitals also began to demand a board certificate for membership on the staff. The U. S. Veterans Administration has been offering much higher pay to certified members. Medical students and interns were encouraged by the medical schools consciously or otherwise, to take postgraduate work leading to certification by one of the American specialty boards.

For a while it appeared as though the general practitioner were to become the forgotten man, instead of the indispensable one in our profession. He is the generalized specialist who handles skillfully and efficiently, at a minimum expense to the patient, over 85 per cent of all illnesses. He delivers the patient, treats his childhood diseases, guides him through his period of puberty, advises him about his marital problems, knows every detail of his heredity, his emotional conflicts and his personality reactions. He has been the guiding light, not for one, but for several generations of his patients' families. He is not only the general practitioner, but the real family doctor.

Among the outstanding general practitioners in the late eighties were Dr. H. M. Workman of Tracy, Dr. W. L. Beebe of St. Paul, Dr. L. H. Boyer of Duluth, and many others.

During the last three years the general practitioner has again been receiving well-deserved recognition as the first and last line of defense against disease. In 1946, the American Medical Association convention included, for the first time, a section on general practice. Several medical schools are devoting special courses to the training of general practitioners. Since 1947 the American Medical Association has elected, annually, the most outstanding general practitioner in the United States. He is chosen from a list of outstanding physicians submitted by the various state medical societies.

Being selected as the outstanding general prac-

titioner or family doctor in his state is the highest honor that can be bestowed on any physician by his own state medical society.

In 1947 this great honor was given to Dr. W. W. Will of Bertha, president of our Association in 1936, and, in 1948, it was given to Dr. L. L. Sogge, of Windom, president in 1931.

In 1938 the State Committee on Tuberculosis was organized under the chairmanship of Dr. J. A. Myers of Minneapolis. Within five years a sub-committee was established in each county of Minnesota. I have been informed that the Minnesota State Medical Association was *the first one* in this country to develop such an extensive anti-tuberculosis campaign. As a result, the tuberculosis mortality rate which was 30.6 per 100,000 population in 1938 was reduced to 17.7 per 100,000 in 1948.

In 1940 the State Committee for the Control of Medical Testimony was organized. The purpose of the committee was to maintain the highest level of ethical medical testimony in all the courts of our state and also to educate and censure and, when necessary, to refer to the State Board of Medical Examiners for disciplinary action any physician who seemed consciously to deviate from the truth. The Minnesota State Medical Association was the *first state* in the Union to discipline its own members who rendered questionable medical testimony in our courts, either due to ignorance, over-enthusiasm or prejudice. The work of this committee has received a national reputation and other state societies are developing similar plans. Its members have been invited to discuss this program, known as the Minnesota Plan, at medical meetings held in our own state, at Chicago, Atlantic City, Omaha and in Massachusetts. Articles on this subject have been published in Minnesota Medicine, the *AMA Journal,* the *Journal of the Omaha Midwest Clinical Society,* the *National Journal of the Association of Railway Claim Agents* and the *National Journal of American Insurance.* As a result, expert medical testimony in the courts of Minnesota has attained a very high standard of efficiency. Although there are thirty-six committees of the Minnesota State Medical Association, the above two were singled out because of the original contributions made in their special fields.

On April 8, 1949, through the efforts of Mr. R. R. Rosell, our executive secretary, and his staff, the Minnesota State Medical Association held a joint meeting of newspaper men and women and physicians at Minneapolis. At this conference, the various problems and opinions relating to medical ethics, medical news publication

Father Galtier's Chapel

and socialized medicine were discussed. One hundred and sixty-one editors attended. The meeting was a very instructive and educational one.

This was the *first* joint meeting of journalists and physicians on a state-wide basis ever held in this country, and I believe similar meetings will be conducted in other states in the near future.

The Woman's Auxiliary to the Minnesota State Medical Association was founded in Minneapolis October 13, 1922. The first meeting was held in Millard Hall, at the University of Minnesota, and Mrs. Horatio B. Sweetser, Sr., of Minneapolis, was elected as the first president. At this time there were already three existing county medical auxiliaries: Duluth, St. Paul and Minneapolis. The Hennepin County Medical Auxiliary, founded October 10, 1910, lays claim to the record of "*first* Auxiliary in the United States." There were forty members present at the first meeting, and Mrs. William J. Byrnes was first president. At present the State Auxiliary has 2,048 members. They have been a great asset in promoting and improving public relations, in increasing general interest in health problems and in educating the public in the national emergency that American medicine is facing today.

The Sisters of St. Joseph built the first hospital in Minnesota. It was a four-story stone building, erected in 1853 on the site of the present St. Joseph's Hospital in St. Paul. While the hospital

was still under construction, a cholera epidemic developed in St. Paul. Father Galtier's chapel, located on Bench Street, was opened as an emergency hospital, and the St. Joseph's Sisters nursed the sick. Thus the old log cabin became the first private institution for the care of the sick in this territory. After the Civil War hospitals were erected in increasing numbers and today Minnesota has excellent hospital facilities.

In 1870, the terminal of the Northern Pacific railroad entered Brainerd. Emigrants were taken by rail from St. Paul to Brainerd, then transported west by covered wagons. At Brainerd the railroad company erected a colonization home where emigrants remained till the covered wagons began their westward journey. If emigrants became ill, the colonization home was used as a temporary hospital. Similarly, when railroad employes in this neighborhood required hospitalization, the same facilities were utilized, thus the colonization home became the *first industrial hospital* in this country and the forerunner of the first NPBA hospital, erected in Brainerd in 1882.

Although the Blue Cross Hospital Insurance plan is considered of recent origin, as long ago as 1882 the lumberjacks of Northern Minnesota had a prepayment contract with two Duluth hospitals where hospitalization was furnished for $12 per year.

There are many other interesting episodes in the medical history of the Minnesota Centennial, such as the ultimate control of the widespread epidemics of smallpox, diphtheria, cholera and typhoid fever among the Indians and early settlers, the heroic deeds of the early medical missionaries, the military accomplishments of our Medical Corps, but time will not permit of their discussion.

The record of our pioneer medical men is an honorable one. We can also look ahead with a great deal of confidence. Minnesota is fortunate, indeed, to have a large number of young medical men located throughout the state, conscientious, capable and scientifically trained. They are willing to render the outstanding medical service that our public has been accustomed to for years. However, there are two definite dangers. There is a small group of medical graduates, ultra-scientifically trained, who employ all known laboratory methods, but neglect careful medical examinations, to arrive at a diagnosis. I like to refer to them as swivel-chair diagnosticians. They sit in their offices waiting for the laboratory reports instead of utilizing their five special senses in the study of these cases. They not only incur, sometimes unnecessarily, a large laboratory expense for the patient, but deprive themselves of the keen satisfaction of having solved a difficult diagnostic problem through their own efforts. Do not misunderstand me. I fully realize the importance of modern laboratory diagnostic methods, judiciously applied when indicated, but I also stress the value of meticulous case reports and detailed and repeated physical examinations.

The second grave danger, and this is quite universal, is the absolute indifference towards the medico-legal problems in our own Legislature and the national compulsory health insurance program being considered in Washington. Unless the young medical men of today awaken to these great problems and take definite action, they may discover tomorrow that they are deprived of their great heritage, to practice medicine the American way, as a free enterprise and without interference from a bureaucracy in Washington, a tragedy not only for the medical profession, but especially for the American public.

In closing, I quote from the first formal presidential address of the Minnesota State Medical Association, delivered by Dr. Samuel Willey, February 1, 1870, almost eighty years ago:

"Thus far, our meetings have been characterized by the utmost harmony—our number is rapidly increasing by the enrollment of good men from all sections of the state—and we may safely assert that the organization is already one of which not only ourselves, but the citizens of Minnesota, may justly feel proud. Our profession is not only governed by the code of laws of the AMA, but it has a natural code of laws, springing from a reciprocal system of feelings and sympathy pervading its members. May this sympathy and fraternal spirit ever animate us—and may our profession ever be our study, our pride and our enthusiasm."[3]

Fortunately, this still applies today.

ENDOMETRIOSIS

CLAUDE J. EHRENBERG, M.D.
Minneapolis, Minnesota

THE HISTORY of endometriosis, contrary to that of many other conditions within the sphere of gynecology, is relatively a short one. As with most new subjects in medicine there was at first the inevitable confusion of terms, and it is only recently that the name itself has become generally accepted. There is still much to be learned before the problems relating to endometriosis are solved, a situation which will become increasingly apparent as this symposium proceeds. Much, however, of what has been accomplished is the product of American gynecologic effort. Two names in particular, which stand out in connection with the American contribution to whatever knowledge we now possess, should be mentioned. They are those of Cullen and Sampson.

According to Graves, Chiari, a German, was the first to mention endometroid growths in the literature. In 1887 he described small tumor-like knots in the tubal angles which he named "salphingitis isthmica nodosum." Soon after, similar growths containing both smooth muscle and glandular tissue were discovered in the wall of the uterus and were named "adenomyomata." From this time on, there appeared numerous reports, especially in the German literature, of the same and like conditions, with a variety of names. In 1896, Von Recklinghausen, through the publication of his studies, established the condition as a pathological entity with the designation of adenomyoma and cystadenoma of the uterus and the tubes. It is of interest to note, because of the controversy that was to develop, that he considered the growths to have their origin in Wolffian body rests.

In 1897, Cullen made the first American contribution to the literature. Nine years later this same author published a monograph on adenomyoma of the uterus, a work that was classic and one which is still considered monumental in the extensive literature which has accumulated around this subject. Cullen rejected Von Recklinghausen's idea of origin in Wolffian body rests, maintaining that his studies showed that the glandular elements in these lesions were of Mullerian origin, a concept which was later entirely supported by the meticulous work of Frankl and Robert Meyer, and others. The controversy in itself, while of profound academic interest, seems to have a greater importance because of the effect that the studies leading to its settlement had on the terminology applying to the condition.

Although a number of authors had previously suggested that these endometroid growths were of Mullerian origin, the impact of Von Recklinghausen's work was decisive, and his views were quickly and widely accepted. Following the contemporary custom of attaching a proper name to a disease, the growths became known in the literature as Von Recklinghausen tumors, a name which disappeared when Cullen reeestablished the Mullerian theory and adhered to the designation of the condition as adenomyoma.

When the latter studies such as those of Frankl and Meyer led to a more detailed knowledge of the cytology of the condition, the name adenomyoma was questioned as it connoted true neoplasm formation, especially after Robert Myer demonstrated the invasive nature of the basilar endometrium and further described a rare mixed tumor of the uterine wall which he proved was a true adenomyoma. Consequently, led by Frankl, the German school replaced the "oma" suffix with that of "osis" and the terms adenomyosis and adenosis were introduced, depending on whether muscle tissue or glandular tissue alone was present. The designation of adenomyosis interna and externa are still in favor in German, although the late Dr. Graves rejected the term adenomyosis externa because of the implication of the constant presence of muscular elements in growths outside of the uterus.

On the other hand, the German writers feel that Sampson's comprehensive title of endometriosis implies the acceptance of what they believe is an unproved hypothesis of endometrial transplantation. Sampson's work in this country from 1921 on resulted in the name, endometriosis, a condition which he described as the "presence of ectopic tissue which possesses the histological structure and function of the uterine mucosa. It also includes the abnormal conditions which may result not only from the invasion of organs and other

PATHOLOGIC ASPECTS OF ENDOMETRIOSIS

MALCOLM B. DOCKERTY, M.D.
Rochester, Minnesota

IN PATHOLOGIC terms, endometriosis means the occurrence of endometrial-like tissue beyond the confines of the uterine mucosal lining. Acceptance of this definition commits me to a description of two basic forms of the disease, namely, internal and external (or ordinary) endometriosis. In perhaps 12 per cent of cases both forms coexist. By internal endometriosis, or adenomyosis, or adenomyoma I refer to a condition in which normal endometrium invades, in nodular or diffuse fashion, the underlying myometrium. Invasion rarely proceeds as far as the peritoneal surface of the uterus but on occasions there may be extension into the regions of the broad ligaments. The uterus may be diffusely thickened by the process, or again, single or multiple nodules of variable size may be featured.

Internal endometriosis, in contradistinction to the ordinary or external form, is rarely associated with infertility. The tumors rarely pedunculate like fibromyomas and they rarely bleed. Malignancy originating in them is extremely rare, but because of their infiltrative tendencies, removal by the operation of "myomectomy" or, rather, "adenomyomectomy" is most difficult. When, as is usual, they develop decidual reaction during pregnancy they reputedly weaken the uterine wall and predispose to rupture of the uterus.

Microscopically in about 99 per cent the invasion is effected by both endometrial glands and stromal components. In 1 per cent, according to Goodall and a few others, stromal elements alone are present, and to this rare condition the term "stromal endometriosis" or "interstitial endometriosis" has been applied. The invading nodules exhibit a peculiar tendency to grow, wormlike, into veins and lymphatics. Metastasis has been observed. Many, in fact, doubt the existence of the condition as an entity, feeling that the few cases described are examples of low-grade leiomyosarcomas. We have seen no undoubted examples, and Dr. Meigs has stated that the records of the Massachusetts General Hospital reveal only one possible case.

This, in brief, is all I shall have to say about internal endometriosis, since the heterotopic tissues with which this discussion is concerned are those present on the outer surface of the colon, the ileum, the umbilicus, the bladder and other locations. To these the terms "external" or "ordinary endometriosis" have been applied.

The pathologic fundamental to keep in mind is that each focus of endometriosis is in itself a miniature uterus with functioning glands and stroma. Acted upon by the ovarian hormones, the tissue responds by going through all the phases of the menstrual cycle, forming decidua during pregnancy and atrophying with the menopause. Most importantly it *menstruates*. However, this ectopic tissue differs from its uterine counterpart, the normal endometrium, in two important regards, namely, (1) the underlying soil is poor, and (2) effective drainage is lacking. The poor-soil effect is seen in the tendency for the implants to burrow underneath the peritoneum, along tissue planes, and even to invade lymphatic spaces. Endometrium lacks a basement membrane, and invasion always proceeds beyond the lines which seem to limit the lesions grossly. Lack of drainage accentuates the factor of poor soil, for with the accumulation of menstrual blood, cysts of varying sizes form. Enlargement takes place as a consequence of repeated menstruation, and increasing intracystic pressure results in either a deeper burrowing of the endometrium or rupture of the cyst, with spillage of its contents and secondary implantation. This spillage produces adhesions which firmly glue together such structures as adjacent loops of bowel, and in endometriosis the adhesions are always stronger than the structures they unite. The utmost care must be exercised in dissecting free these adherent structures, for this reason.

In addition to these general features of endometriosis there are special considerations which pertain to involvement of certain structures. An account of some of these is worthy of a brief discussion.

Ovarian involvement is frequent, and it is bilateral in 70 per cent. Minor lesions consisting of small, puckered, reddish dimples on the cortical surfaces may be present, or again, large, perfor-

Presented before the Minnesota State Medical Association, Saint Paul, Minnesota, May 11, 1949.

ating, tarry cysts may excavate the entire substance of the ovaries. These may produce sterility from simple ovarian failure. Unfortunately the terms "chocolate cyst," "tarry cyst," and "hemorrhagic cyst" have been loosely employed to designate ovarian endometriomas. Hemorrhage into a cystadenoma can produce "tar," and bleeding into a follicular cyst, a corpus luteum cyst or even into a tubo-ovarian inflammatory cyst may impart to the contents of such a cyst a chocolate appearance. Yet none of these is an endometrioma. The best guide in the gross pathologic diagnosis is the existence, on the surface of an endometrial cyst, of brownish black puckered areas which, whether adherent or free, exude, on compression, a dark thick fluid. This phenomenon results from imperfect attempts at sealing over chronic recurrent perforations.

Although it is impossible to study microscopically the fate of these endometriomas over periods of years, there is circumstantial evidence that certain changes occur. Occasionally the cysts slough away their epithelial lining and contract down into small ovarian hematomas. A similar fate befalls many at the time of the menopause but in these, islands of atrophic endometrium may be found. In a certain number sizable cavities persist, and in these the glandular epithelium may remain as epithelia caps surmounting fibrous papillary cores—the so-called ovarian papillary cystadenofibromas. In an undetermined but, I am convinced, sizable number, the endometrial lining becomes malignant, being activated by the same hormones which produce carcinoma of the fundus uteri. The transition has been difficult to demonstrate convincingly, but the literature contains about a dozen undoubted examples. I have encountered one case which illustrates this most serious sequel of ovarian endometriosis.

In the fallopian tubes two forms of endometriosis exist. The first is an interstitial type which is comparable to uterine adenomyosis. This type distorts the lumen and is one of the common causes of ectopic gestation. Infertility results when obstruction is complete. In the second type the serosal surfaces of the tubes share in the seeding of pelvic external endometrial tissue. In this type the lumen of the tube is patent but, as a result of fibrous contraction the fimbriated end, is separated from the surface of the ovary by a distance exceeding the normal. This separation is reputedly responsible at times for the infertility observed in endometriosis.

The uterine lesions of external endometriosis are very common indeed, and they are encountered most frequently on the posterior surface. Ordinarily quite superficial, they may at times extend deeply, running down into the rectovaginal septum and occasionally ulcerating into the vagina or the rectum. Perhaps 10 or 15 per cent of these deep-seated lesions will be associated with uterine adenomyosis. However, it is felt that the rectovaginal endometriomas arise from the peritoneal component of the condition.

The gastrointestinal lesions of endometriosis center, for the most part, on the sigmoid and the rectovaginal septum. However, the terminal portion of the ileum, the cecum and the appendix are sometimes the seat of rather serious involvement.

Sigmoidal and rectal endometriomas represent extensions of cul-de-sac implants. They may ulcerate the rectum, the sigmoid or the vagina and may imitate carcinoma or diverticulitis. In thirteen clinic patients with lesions of this type, resection of involved bowel became necessary because of signs and symptoms of intestinal obstruction secondary to scirrhous napkin-ring constriction, obturation by a polypoid endometrioma, or acute angulation of the rectosigmoid. Three had experienced melena along with their recurrent comenstrual bouts of constipation. In a number of additional examples mild chronic intestinal obstruction was almost immediately relieved by bilateral oophorectomy.

In about 5 per cent of cases of endometriosis involving the terminal portion of the ileum the invasion is deep and extensive enough to produce chronic small intestinal obstruction. My colleagues and I have encountered three such cases and have reviewed the reports of thirteen additional ones in the literature. The condition is confused clinically with appendicitis and, at operation, with carcinoma of the small bowel. In the cases we studied, involvement of the wall did not proceed to the stage of mucosal ulceration. Thickening from infiltration and acute kinking from dense peritoneal adhesions were characteristic features. In half of the cases from the literature the ileal lesions were almost the sole evidence of endometriosis.

The peritoneum over the bladder is invaded in perhaps 10 per cent of cases of pelvic endome-

triosis, and in a small number of these there may be no other evidence of the disease apparent. Approximately 10 per cent of the cases are associated with deep penetration of the vesical wall and the production of cyclic dysuria. Mucosal involvement in 33 per cent of these cases of deep penetration produces periodic hematuria. In the fifty-odd cases in the literature reviewed in 1943 by Moore and his co-workers, approximately 60 per cent of the patients had had previous pelvic operations. Involvement when extensive is liable to produce puckering of the ureters and secondary hydronephrosis may result.

A much more frequent ureteral lesion, however, is that of kinking which is produced by the contracting fibrous tissue in an overlying endometrioma of the pelvic peritoneum. This results in drawing the ureters dangerously close to the cervix and making the operation of total hysterectomy hazardous from the standpoint of producing urinary fistulas.

These, then, are the principal lesions of endometriosis. Others exist as tumors of the umbilicus, abdominal scars, vulva, vagina, thigh and so forth. The basic pathologic condition is similar to that outlined in the foregoing. It is necessary in treating them to remember that each lesion has "roots" like a cancer and that excision must be wide if recurrence is to be avoided.

To summarize these pathologic features, it may be said that endometriosis is unique in that it represents invasion of normal tissues by equally normal and benign tissues of a different type. Its fires are fanned by the draft of the ovarian hormones, and its effects are produced mechanically as a result of periodic hemorrhage. Though the process is usually quiescent during pregnancy, an associated decidual reaction may weaken and cause rupture of the adenomyomatous pregnant uterus. The ravages of the disease, while ordinarily terminated by the menopause, may at times progress with the production of adenofibromas and adenocarcinomas of the ovary.

COUNTY HEALTH DEPARTMENT

Minnesota's first full-time county health department to be set up under the new law passed by the 1949 legislature, which permits establishment of county, multi-county, and city-county health departments, is being organized in Hennepin County.

One of the key organizations behind the drive for a county health department has been the Hennepin County Health Council. Chairman of the group is Edwin J. Cooper, superintendent of schools at Robbinsdale. Members of the council include representatives of official and non-official health agencies, schools, professional persons, and interested county citizens. Also supporting the new department is the Hennepin County Public Health Nursing Committee.

At a meeting held in Minneapolis on June 8, representatives from all over the county unanimously passed a resolution to be presented to the county commissioners endorsing the rural Hennepin County health department plan. A similar resolution was passed a week later in Excelsior when representatives of eleven communities met to discuss the pollution problem of Lake Minnetonka.

Formally authorized by the county commissioners on June 28, 1949, a five-member county board of health, which includes a physician and a dentist, will select a health officer, subject to the approval of the State Department of Health. All small-city, village, and township health officers will be relieved of their tasks when the full-time health officer begins his duties. This will insure a single and unified administration of health laws for rural Hennepin County. Minneapolis, which has its own health department, will not be included in the county health department jurisdiction.

The new health officer will pick his staff members, with approval of the board of health as prescribed by law. Total budget for the department will be financed by a one-mill levy on rural Hennepin County residents. This will yield a tax return of 27 cents per capita from some 140,000 persons.

In the beginning, the department will spend about 85 cents per capita on the health program, which includes health department costs, public health nursing services, and local school boards' expenditures for school nurses. This is below the $1.50 per capita standard advocated by the American Public Health Association. All necessary services of a health department will not be available at first, but will be added when additional funds, probably from federal sources, will become available.—*Minnesota's Health*, July, 1949.

TUMORS OF THE OPTIC DISC

Report of Case

E. R. BRAY, M.D.
Saint Paul, Minnesota

TUMORS of the optic nerve are very rare. Clinically they may be divided into intraocular, intraorbital and intracranial. Of these the intraocular tumors, or those of the optic disc, which are the subject of this paper, are found least of all. In their early stages they may produce no subjective symptoms and may be found only by accident in a routine eye examination. Later they may cause loss of vision through encroachment on the macular region or through retinal detachment or glaucoma.

Tumors of the optic disc may be primary or secondary.

Duke Elder divides primary tumors of the optic disc into three types: (1) pigmented tumors, (2) tumors belonging to the group of phakomatoses, and (3) nerve tumors.

1. Pigmented tumors may be benign or malignant melanomata. A benign melanoma lies beneath the retinal vessels which pass over it, usually without change of direction or size. It is not always possible to be sure of its benign nature in one examination. If the growth increases in height as well as width, it is probably malignant, and the eye with as much of the optic nerve as possible should be removed.

2. The second type of primary tumors includes the group that are brought together under the heading of phakomatoses, which means mother cells. They are supposed to be misplaced embryonic cells which later develop into new growths and include angiomatosis of Lindau, fibromatosis of Recklinghausen and tuberous sclerosis of Bourneville. Closely associated with tuberous sclerosis and often found in the same patient are drüsen of the optic disc. Dr. A. B. Reese of New York has written a very comprehensive paper[4] describing this association. Drüsen, or hyaline bodies of the optic disc, have been described as resembling a mass of frog eggs or grains of tapioca or having a papular surface like a mulberry. When the bodies lie just below the surface of the disc, they may give an appearance of optic neuritis or papilledema. They are congenital and usually bilateral, and if small they may give no symptoms.

Dr. Reese states that during the last seven years at the New York Institute of Ophthalmology, nine cases with hyaline bodies in the disc were found in routine microscopic examination of 893 eyes that had been removed for other reasons. That would indicate that about 1 per cent of enucliated eyes show hyaline bodies in the optic disc. In the majority of cases drüsen of the optic disc are harmless, but they may become cystic and break into the vitreous. They are made up of calcium and a hyalin-like material. As they are often associated with optic atrophy, some think they may be the result of optic neuritis. Parsons considered them degenerate changes of an exudate. About 33 per cent of the patients with drüsen of the optic disc show disorders of the nervous system. The most common would include convulsions, psychoses, disturbances of gait and speech and hydrocephalus.

Tuberous sclerosis gets its name from its many cerebral areas of sclerosis resembling a tuber or potato. It is congenital and is usually associated with mental deficiency, epilepsy and tumors of one or more organs. Death often occurs in the second decade from status epilepticus. The skin lesion usually associated with it is a reddish brown papular rash that extends over the face, including the nose, in a butterfly like appearance. This skin eruption also occurs occasionally in patients with simple drüsen of the optic disc, and mulberry-like tumors of the optic disc have on a number of occasions been reported in cases of tuberous sclerosis. Renal disorders are often found in both groups. Dr. Ferdinand Koch considers the effect on the patient of drüsen of the optic disc, compared with that of tuberous sclerosis, as one of degree. "The former may never be noticed while the latter is progressive and ultimately fatal."

Presented before the Minnesota Academy of Ophthalmology and Otolaryngology, March 11, 1949.

3. The third type of primary tumors consists of the nerve tumors, mostly gliomatous in nature and mostly malignant.

Secondary tumors spread from adjacent tissue and take on the characteristics of the tissue involved. The ones usually met with are melanomata from the choroid and neuroblastomata from the retina. Neoplasms may also extend forward from the optic nerve and nerve sheath, such as gliomata and endotheliomata.

Fig. 1. Mulberry-like appearance of the tumor at the optic disc.

Metastatic tumors may be found but occur only in terminal cases. The treatment then is directed only to the relief of pain, for the patient has only a short time to live.

In the differential diagnosis one must consider massive blood clots in this region and also inflammatory masses due to syphilis or tuberculosis.

The patient I wish to report is a boy, twelve years old, who came to my office four years ago on account of poor vision in his left eye.

He was well developed, slightly over weight, with normal pupilary reactions. The external appearance of the eyes was normal. His vision in the right eye was 30/20 and in his left 20/200. Under a mydriatic, I found his retinoscopy results to be about +.50 sph. in each eye. The right fundus was normal, but in his left I found a light grey tumor nearly covering the optic disc. It extended into the vitreous several diopters, and the blood vessels on either side of it were normal in size. The tumor had the mulberry-like appearance of drüsen of the optic disc. The remainder of the fundus appeared normal, and the tension and fields of each eye were normal. He had a rash on his face (known as adenoma sebaceum) that consisted of a macular eruption of reddish brown spots appearing on a slightly pale skin. It appeared in the nasolabial folds, over the entire nose, and in the intraorbital region, giving it the butterfly-like appearance.

Fig. 2. Butterfly-like distribution of the reddish brown macular eruption on the face of the patient.

I have seen this boy several times since his first visit and find that his vision remains about the same. His deportment seems quite normal, and he works and plays like other boys of his age. He likes school and is in the seventh grade. There is no history of eye trouble or nervous disturbance among his three brothers or one sister or his parents or grandparents.

Summary

Tumors of the optic disc are rare. Primary tumors of optic disc are usually benign but should be kept under observation for any change in their appearance. Secondary tumors are usually malignant and require enucleation as soon as the diagnosis is established. When metastatic involvement is present, the only treatment is to make the patient comfortable for the short time he has to live.

The case reported was one of simple drüsen at the optic disc, benign in character but having the macular eruption on the face that is often associated with tumors of a more serious nature.

IMPRESSIONS FROM EUROPEAN NEUROSURGICAL CLINICS

LEONARD A. TITRUD. M.D.
Minneapolis, Minnesota

THE PROBLEMS of a tourist are greatly simplified in this era by efficient travel agencies that arrange hotel accommodations and schedule transportation. During the past summer of 1948, European travel would have been almost impossible without this aid because of the large number of people throughout the world who journeyed to see the London Olympic Games in August. It was estimated that approximately 100,000 Americans were in England at this time. Norway and Sweden, which were visited during this trip, were congested with welcome visitors also. This entire journey was expedited by air travel. The nonstop Minneapolis to New York flying time was five and one-half hours. From New York City northward to Gandar, Newfoundland, the travel time was four and one-half hours. Gandar is the closest North American airport to the European continent and approximately forty transatlantic flights daily leave from or arrive at this international airbase. The flying time from Gandar to London occupied twelve hours of smooth passage. The trip from London to Stockholm was five hours; and from Stockholm to Oslo occupied two and one-half hours. Therefore, the entire trip each way of about 6,000 miles was traveled comfortably in about thirty hours.

The first visit to a medical clinic in Stockholm was at the Serafimerlasarettet, or the University's teaching hospital, where Professor Herbert Olivecrona directs the neurosurgical department. The neurosurgery service occupies eighty beds in a modern wing of the hospital devoted exclusively to its use. As in other European clinics visited, neurosurgery is associated intimately with the neurology service and has its own operating rooms and x-ray facilities. In this center there were two new and excellently equipped air-conditioned surgical rooms which were used daily.

Although this particular clinic serves Sweden principally, patients come from all parts of northwestern Europe. Because of the department's prominent reputation, a great deal of work has been accomplished here. More than 3,000 patients with verified brain tumors have now been treated. During this visit there were neurosurgical residents on duty from England, India, Italy, Latvia, Sweden, and the United States. Approximately twenty-five patients who had been operated upon recently for brain tumors were seen on rounds with Dr. Gustav Norlén, who was in charge of the clinic at this time. The patients were in good postoperative condition. The ideas expressed by the attending staff concerning methods of treatment and prognosis of various histological types of tumors of the nervous system seemed quite in accord with that of American clinics. X-ray therapy is used to a limited extent except in some of the rapidly growing neoplasms of childhood and in pineal and pituitary growths. The surgical technique witnessed was excellent and the operating was done very quickly. Here, as in Norway, an electrically driven trephine was used safely and satisfactorily, decreasing the time and work in reflecting the osteoplastic flap for cerebral exposure. Most of the procedures are done with local anesthesia. Penicillin is not employed routinely postoperatively in Scandinavia or England, but only in the presence of definite infectious processes.

The technique of cerebral arteriography has been well perfected in this clinic, and about 500 studies are made each year. Cerebral vascular displacement or various peculiarities in structure of the arteries and veins has proved important as an aid for identifying the intracranial disease. The contrast medium employed is much the same as our 35 per cent diodrast, and it is usually introduced by means of a needle passed through the skin into the carotid artery without surgically exposing the vessel. Many outpatients are studied in this manner. This is the best method for identifying intracranial angiomas, and at this clinic a series of over sixty has now been found. A large number of their some 200 annual verified brain tumors is studied by angiography.

Medullary tractotomy, or the Sjöquist procedure, is employed for most of the trigeminal cases. Only poor operative risks and individuals more than sixty-five years old are treated by the Frazier transtemporal method of rhizotomy. Alcohol injection of the trigeminal branches is very seldom done here. Occasional transitory ataxia

from disturbance of the restiform body occurs after medullary tractotomy but there have been very few complications. This operation has the advantage of desensitizing the face to pain and leaving touch sensibility intact. Much less keratitis has occurred than with the transtemporal operation in surgery for those having ophthalmic division involvement. Several patients were seen on rounds who had medullary tractotomy, and the results seemed excellent.

The supradiaphragmatic sympathectomy of Peet was the only operative method for essential hypertension here. They believed that the results were as good as those obtained using Smithwick's thoraco-lumbar operation; but, of course, this is not in agreement with the opinion of most American centers.

While in Stockholm, there was also an opportunity to visit the Südsjukhus which is the new modernistic 1,500 bed city hospital. The thirty-five-bed neurosurgical service here is directed by Professor Olaf Sjöquist. This is a busy clinic and at the time was conducted by Dr. Bjorksteen.

Professors Torbjoern Caspersson and Holger Hyden direct the Biological Laboratory at the Karlinska Nobel Institute which is on the outskirts of Stockholm. This University of Stockholm research laboratory is new and excellently equipped. One of the neurosurgical fellows was engaged there in studying histology of brain tumors using the new R.C.A. electromicroscope. Dr. Hyden has been responsible for developing malononitrile, a drug that improves nucleoprotein metabolism in cerebral cells. This has been used successfully in this clinic to improve the mental status of psychotic patients. He discussed this work and stated that 150 patients had been treated since 1945 with the best results having been secured in mental depression.

The visit to the neurosurgical clinic at Oslo's Rikshospitalet was most cordial also. Professor Arne Torkilden is in charge here. He had just returned from a four month's visit to Candada and the United States. Approximately 200 patients suffering from brain tumor are operated upon each year at this neurosurgical clinic, which is the only one in Norway. Here, too, this service has its own operating and x-ray facilities. About twenty-five brain tumor patients were seen during rounds. As in Professor Olivecrona's clinic, localization of brain lesions was dependent more on air studies and arteriograms than on neurological examination.

Professor Torkildsen carries out the pertemporal operation in cases of trigeminal neuralgia, but he prefers the medullary tractotomy for those who suffer ophthalmic division pain. He admitted no complications with the use of the Sjöquist procedure and had observed no particular keratitis in these cases. It was interesting to learn that he had been able to relieve the headaches in some typical cases of migraine with trigeminal rhizotomy. Prior to carrying out this operation, it was made certain that novocaine injection of the ganglion would provide relief of the unilateral cephalgia.

The employment of cortical area six excision for athetosis had not proved satisfactory at this hospital. Pyramidal tractotomy had provided good results in treatment for the tremors of paralysis agitans.

In cases of hydrocephalus, Professor Torkildsen very seldom practiced coagulation of the choroid plexus. He employed ventriculocisternostomy, together with x-ray therapy, in cases of malignant tumors of the third ventricle that obstructed the aqueduct. In case of benign aqueduct obstruction, as after meningitis in children, he preferred third ventriculostomy and carried out the Torkildsen procedure only if the third ventriculostomy became obstructed.

This clinic has been particularly responsible for the development of cerebral arteriography due to the great interest of Dr. Arne Engeset, who is in charge of x-ray, and Professor Torkildsen. Since 1938 over 3,000 arteriograms have been done here and only three transitory convulsions were witnessed as serious reactions among these. Per-Abradil, which is much the same as our 35 per cent diodrast, is used for the contrast medium, and as much as 80 cubic centimeters have been injected during the examination of one patient without ill effects. These clinicians were as serious as those in Stockholm in advising against the use of thorotrast as the contrast medium because they were certain that there were instances of malignancies of the liver and bone marrow due to thorotrast. Except in 1 or 2 per cent of all cases, the percutaneous injection into the carotid artery was successful without the need of exposing the vessel. Only a few subcutaneous hematomas had occurred, and these

were not serious. Sensitivity to the iodine-containing contrast medium was rarely encountered. Professor Torkildsen emphasized the desirability of employing cerebral arteriography for localization of brain tumors, especially in the presence of increased intracranial tension, because the patients were much less disturbed by this study than by ventriculography. Craniotomy and tumor removal were always carried out on the same day as ventriculography when the intracranial pressure was increased for the safety of the patient. However, the use of angiography permitted postponement of craniotomy until the following day without endangering the patient. Ventricular air study was frequently unnecessary because intra-arterial contrast medium not only indicated the tumor's location, but also its characteristic vascular pattern and source of the blood supply.

Professor Torkildsen had not carried out prefrontal lobotomy in large numbers for mental illness. He was impressed with the use of this procedure in the treatment of intractable pain. He believed that the various types of frontal lobe operations for mental illness must soon be comparatively evaluated so as to establish a uniform operation.

The London Hospital, with about 1,000 beds, is one of the largest voluntary hospitals in the city. It was rebuilt in the east end in 1800. Mr. D. W. C. Northfield, the chief neurosurgeon here, was on a holiday and Mr. Crawford was in charge. Their service occupies forty beds and they have their own operating theater. The neurosurgical service also maintains additional beds at Brentwood, an annex hospital.

One of the most progressive and stimulating centers visited was the National Hospital at Queen's Square, London, an institution devoted solely to the treatment of nervous system diseases. Mr. Wylie McKissock is in charge of neurosurgery in this center. He is an extremely energetic person and enjoys having visitors about. He is particularly well known because of his vast experience with prefrontal lobotomy for mental disease. He has carried out this operation in over 1,200 cases, and four to six year follow-up studies have been made on several hundreds of cases. There has been over an 80 per cent satisfactory result, particularly in patients exhibiting depression and obsession. The frontal leukotomies have been done mainly at outlying psychiatric hospitals where he has done as many as six or eight a day. Mr. McKissock employs low lateral frontotemporal trephine openings with small dural incisions and a brain needle is used as the dissecting instrument to decrease cortical scarring and obviate epilepsy. There has been 2 to 3 per cent mortality, mostly from hemorrhage. Aside from mental illness, he has employed frontal leukotomy for spastic torticollis with lasting cures in two cases and without a followup in the third.

It was interesting to learn that Mr. McKissock did not definitely favor either the transtemporal rhizotomy or medullary tractotomy in the surgical treatment for trigeminal neuralgia. His preference is for the posterior cranial procedure of Dandy with a small bone opening through which he divides the sensory roots.

Professor J. Paterson Ross is the director of surgery at the St. Bartholomew Hospital. For many years he has maintained a great interest in surgery of the sympathetic nervous system. Mr. J. E. A. O'Connell directs the neurosurgical service which has remained at an outlying hospital since the war.

Guy's Hospital is also located on the east side in London. It suffered considerable bomb damage and has not been entirely repaired. A neurosurgical department is being initiated there under the direction of Mr. Faulkner of Australia, who worked with Professor Hugh Cairns during the war years. Guy's Hospital also has a medical school on the grounds and a particularly interesting anatomy and pathology laboratory. The specimens are excellently prepared and mounted and are valuable in teaching. As in the other historic hospitals of London, the works of many famous investigators are preserved. The original kidneys employed by Bright in the description of his disease are still in this museum.

The Royal College of Surgeon's building in London has been quite completely repaired following the bombing which damaged Hunter's Biological Museum chiefly. The Hunterian Library in the upper part of the building remains unchanged.

One of the great centers of neurosurgery is contained in Oxford's Radcliffe Infirmary of the Nuffeld Institute. With Professor Hugh Cairns traveling in South Africa, and Mr. J. Pennybacker in Ireland, Dr. Schiller was in charge of the service. Dr. Ritchie-Russell directs the neurology service there. The twenty-two neurosurgical beds were filled principally with brain tumor

patients. Because of the scarcity of beds, almost no sympathetic surgery was done. The spinal and peripheral nerve surgery cases are done mainly at the Wingfield-Morris and Churchill Hospitals in Oxford. Cerebral angiography was considered favorably at this clinic, but the technique of exposing the carotid arteries for the injection proved the most successful.

A unique experience was enjoyed at the Radcliffe Infirmary in the treatment of tuberculous meningitis. The prevalence of tuberculosis in Great Britain has caused numerous children to become ill with meningeal infection. The frequency may be appreciated when it was estimated at a recent meeting in Dublin, Ireland, that 5 per cent of the intracranial lesions operated upon are tuberculous. In the cases of tuberculous meningitis, streptomycin was given intramuscularly daily. In addition, this drug was injected into the ventricles through cranial trephine openings in doses of 50,000 units daily for periods of one to two weeks. Intrathecal administration was found undesirable because of the obstructed circulation from arachnoidal adhesions. The therapeutic results were good, and it is wondered if they are not dealing with a different type of tubercle bacillus than is encountered ordinarily in the United States.

One of the most enlightening and interesting experiences of all was to visit the New York Neurological Institute and hear Dr. Lawrence Poole's elaboration of his frontal topectomy for mental illness, and to learn of the postoperative results from Dr. Robert Heath. Dr. Poole stated that his observations of personality changes following brain wounds in the war prompted him to investigate which frontal lobe cortical areas are dominant in perpetuating emotional stress, fears, and anxieties in mental illness. After considerable investigation it was discovered that surgical excision of Brodman areas nine and ten bilaterally was sufficient to produce the desired result without disturbing intellect or judgment. They were particularly happy with the effect because the unusual personality change of childish euphoria or apathy, associated at times with prefrontal lobotomy, was absent in their cases.

The operation, which is not particularly shocking, has been done safely in elderly and mentally deteriorated patients and occupies about two and one-half hours. Intratracheal anesthesia is used. A free piece of bone is removed from the forehead to expose the anterior poles of both frontal lobes. The cortex of Brodman areas nine and ten is excised on each side in a length of 5 centimeters, width of 3 centimeters, and depth of 1.9 centimeters. An average 30 grams weight of tissue is usually removed from each side. Subpial excision has not been found necessary. No convulsive seizures had occurred to date in the sixty-four patients who had been operated upon.

The operations had been done at the Neurological Institute and also at the Greystone Hospital in New Jersey. One month of psychiatric rehabilitation is carried on with each patient. These individuals have exhibited no particular electroencephalogram changes after topectomy. Dr. Poole has also carried out this operation in the treatment of pain with good results, but he stressed that the white matter association fibers on the inferior and medial parts of the frontal lobes must be divided also.

* * *

During the visits to these clinics it was gratifying to observe that almost equivalent progress was being achieved everywhere. There was much evidence of independent thought and research resulting in positive achievement at every center. Each staff had great interest in the activities at other hospitals, and also had wide knowledge of the accomplishments of others. This universal advance of neurosurgery is only an example of that in every other medical field.

ENDOMETRIOSIS

(Continued from Page 805)

structures by this tissue, but also from its relation to menstruation." Such a definition, possibly qualified by the adjectives interna and externa to denote the presence either within or without the body of the uterus, would seem to make the term, endometriosis, sufficiently comprehensive and yet definitive enough to encompass all of the extremely varied manifestations of the disease. One may then conclude, that the designation, endometriosis, is sufficient until other etiological relationships are established which can disprove or change the name.

DELAYED PRIMARY CLOSURE OF WOUNDS

FRANK S. BABB, M.D.
Saint Paul, Minnesota

DELAYED primary closure of wounds, which proved so useful in war surgery, can frequently be used to advantage in private practice if we but remember there is such a thing.

Originally a delayed closure was referred to as a secondary closure and performed some time after the first two weeks or longer. It was found, however, that the skin edges only remained mobile for about ten days, and the undercutting necessary to approximate these edges frequently counteracted the advantages of waiting. Attempts were then made to accomplish closure while the tissues were still mobile and before edematous granulation filled the wound. The optimum time was found to be the fourth or fifth day.

Why resort to delayed closure in the first place? Winnett Orr and Trueta proved the efficacy of *not* closing certain wounds. This proved most effective in grossly infected wounds but resulted in foul-smelling plasters over long periods of time and extensive fibrosis of tissues. Reconstructive procedures such as bone grafts and nerve sutures were unduly delayed. The routine use of primary suture, however, will result in suppuration and disruption in certain wounds. Hence the necessity for a third alternative arises.

Indications for Delayed Primary Closure:

1. Grossly contaminated crushing wounds.
2. Wounds in debilitated persons or ischemic limbs.
3. Infected wounds, including compound fractures not treated early.
4. Chronic infections, including osteomyelitis and diabetic ulcerations.

What Does Delayed Closure Accomplish?

1. It permits reactionary swelling to subside and so avoids tension with subsequent breaking-down of the wound.
2. It permits separation of non-viable tissue.
3. It provides intact skin coverage at the earliest opportunity.

Delivered at a special section meeting on orthopedic and fracture surgery in connection with the ninety-sixth annual meeting of the Minnesota State Medical Association, May 9, 1949, Saint Paul, Minnesota.

Technique:

1. Through surgical debridement at the earliest opportunity.
2. Light dusting with an antibiotic.
3. Light packing with dry gauze.
4. Immobilization.
5. Supportive therapy including blood, antibiotics and vitamin C.
6. Delayed primary closure on fourth or fifth day.
7. Immobilization.

Surgical debridement does not render a wound bacteriologically clean, but it deprives the organisms of food on which to thrive, namely, dead tissue. It provides the wound with walls of normal healthy tissue with an intact blood supply, the best barrier to bacterial invasion. The would-be invaders remain only contaminants.

Light packing with dry gauze keeps the skin edges apart. Firm even pressure should be maintained throughout the wound. This packing must *not* act like a tight "cork" and so defeat its very purpose.

The delayed primary closure should be obtained with widely spaced and deeply placed interrupted sutures. An occasional vertical mattress suture everts the skin edge and affords better approximation. Releasing incisions which can themselves be skin-grafted, are sometimes necessary to avoid tension. If tension cannot be avoided, it is better to accept a partial closure and complete the skin coverage later by whatever skin grafting procedure seems indicated.

If on the fourth day the wound still appears dirty and further debridement is necessary, this should be done, followed by a day or two of continuous wet dressings before completing the closure.

In conclusion, I would like to draw attention to the use of such a technique in dealing with some of the smaller diabetic ulcers and sinuses in the lower extremities. Thorough surgical debridement, including dead bone, is again a most important preliminary. Delayed primary closure will frequently succeed in closing such lesions, so notoriously resistant to convervative management.

DIFFERENTIAL DIAGNOSIS IN PULMONARY SHADOWS OBSERVED ON X-RAY FILMS

HILBERT MARK, M.D., M.P.H.
Director, Division of Tuberculosis, Minnesota Department of Health
Minneapolis, Minnesota

AS MASS chest x-ray examinations involve more people, certain statistical observations become established as expected findings. Minnesota Department of Health experience in over 500,000 film examinations in rural Minnesota shows that we may expect 1.5 per cent of the general population six years of age and over to have some pulmonary shadow which the roentgenologist considers abnormal.

The observed shadows may be minimal or extensive, localized or disseminated, fibrotic, nodular, pneumonic or ulcerative. The findings vary from patient to patient, but most commonly one observes a combination of densities. At times the shadows will follow a pattern which will enable the roentgenologist to give his impression of the underlying cause. Since a number of diseases may produce, at some stage of their development, similar patterns, the roentgenologist, therefore, does not intend thereby to make a firm diagnosis but rather to offer a clue for immediate clinical evaluation. As stated by Overholt and Wilson,[2] surveys discover but do not diagnose disease, and they emphasize the fact that time is a traitor to pulmonary diseases. Wangensteen has given four cardinal points setting forth what a clinician desires from an x-ray film examination.

"1. Information to confirm the diagnosis tentatively made on the basis of history and physical examination.

"2. Information to exclude certain diagnostic possibilities.

"3. Information which may lead to a diagnosis not previously thought of.

"4. Information as to the details of the pathological anatomy present."

Medical literature continuously reveals reports, which are becoming increasingly significant, wherein the simulation of one disease by another makes it mandatory that an adequate clinical evaluation follow the abnormal film findings. All of the authors decry the danger of waiting for time to establish the seriousness of the lesion.

Today we are confronted with the necessity of developing a new approach in our differential diagnosis of pulmonary shadows. Patients are seeking medical advice on the basis of x-ray findings and not because some symptom or sign has disturbed them. Even careful histories may fail to elicit any lead as to the nature of the existing abnormality. Since mass surveys cover an entire community within a given time, the findings are a cross section and reveal the diseases present in various stages. Thus we see incipient, latent or advanced; acute, subacute or chronic; primary or secondary phases of one or more diseases in one or more patients. Obviously some persons with characteristic symptoms or signs will also be x-rayed, but they as a group do not present any great diagnostic problem. By the time such signs or symptoms present themselves, the x-ray shadows, too, will in the majority of cases fall into a classical pattern.

In order to point out some of the aids to be considered in differential diagnosis, a series of cases will be presented. Figure 1 illustrates the diagnostic aids recommended. This does not mean that a clinician will require every aid listed before a diagnosis can be made, as obviously, in many cases, a diagnosis will be made without any extensive search.

With Figure 1 in mind, the following illustrative cases are presented:

The first series of two cases includes those persons with rounded densities in the subclavicular area. In both of these cases thoracotomy was required before a definitive diagnosis could be made. However, tissue studies revealed entirely different situations.

Case 1.—A woman, aged thirty-eight.

History: Tuberculosis exposure to roommate twenty years ago. In 1935, Mantoux test was positive. From 1935 to 1939 repeated chest x-rays were all negative.

Past Illness: In April, 1944, there were complaints of stomach distress, cramps and diarrhea, and weakness.

Present Illness: Weakness was noted in April, 1944, which continued. In August, 1945, pulmonary shadow was found on x-ray. Patient was admitted to sanatorium with diagnosis of minimal A tuberculosis.

Physical examination was negative.

Presented at a special session of chest physicians at the ninety-sixth annual meeting, Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

X-Ray Findings: Localized infiltration in left apex, probably tuberculous. Repeated x-ray examinations during residence showed no change.

Sputum: Patient did not raise sputum. Four gastric washing specimens were cultured and no tubercle bacilli found.

Blood: Hemoglobin, 15.3, white cells 7400, polymorphonuclear cells 69.5 per cent, lymphocytes, 25.5 per cent, monocytes, 3.5 per cent. Sedimentation rate, 11 to 9.

On November 3, 1945, the patient was discharged with a diagnosis of minimal tuberculosis, unimproved.

Follow-up: Chest x-ray examinations were repeated every one to three months. Patient developed severe chest colds during 1947-48. In March, 1947, x-ray film showed increase in infiltration, and on basis of findings thoracotomy was done. Diagnosis at time of thoracotomy, and confirmed by tissue section was inoperable carcinoma.

Case 2.—A woman, aged thirty-seven.

History: In July, 1947, survey film revealed a nodular density in the left first interspace, and case was referred to private physician. On April, 1948, follow-up film revealed the rounded nodule definitely enlarged with a hazy border.

Present Illness: In May, 1948, there was no change on x-ray film. Mantoux test was positive. Patient was admitted to sanatorium as tuberculous. She had no symptoms.

Physical examination was negative.

Tuberculin test was positive to 0.00002 mg. PPD.

X-Ray Findings: In July, 1948, a dense, discreet infiltration was seen in left first interspace, giving impression of tuberculosis or tumor. On August 23, and September 7, 1948, follow-up x-ray examinations revealed no change.

Sputum: No cough or expectoration was present. Three gastric washing specimens were cultured and no tubercle bacilli found. One gastric washing specimen was inoculated into guinea pig; no tubercle bacilli were obtained.

Blood: Hemoglobin 14.4, white cells 6500, polymorphonuclear cells 52.5 per cent, lymphocytes 35.5 per cent, monocytes 9 per cent. Sedimentation rate, 17 to 22.5.

Bronchoscopy: Secretion was obtained from trachea and left main bronchus. Questionable submucous tubercle was seen. No carcinoma cells were found. Bronchial and tracheal aspiration material was cultured and inoculated in guinea pigs; no tubercle bacilli were present. At this time the diagnosis was deferred but thought to be nontuberculous.

Thoractomy: Segmental resection was done. Tissue study revealed tuberculosis.

The next series of two cases are those with shadows in the lower lobe. These two were chosen because of similar appearances on x-ray examination and in both cases "time" was disregarded. Fortunately, in one case delay was unimportant.

Case 3.—A woman, aged thirty-eight.

History: Survey film on October 10, 1946, revealed a rounded area of increased density in the right base. Case was referred to private physician. On October 24, 1946, the history and physical examination were negative. Patient was advised to disregard x-ray findings.

After patient had severe flu, x-ray follow-up examination on January 27, 1947, showed a density 5 cm. by

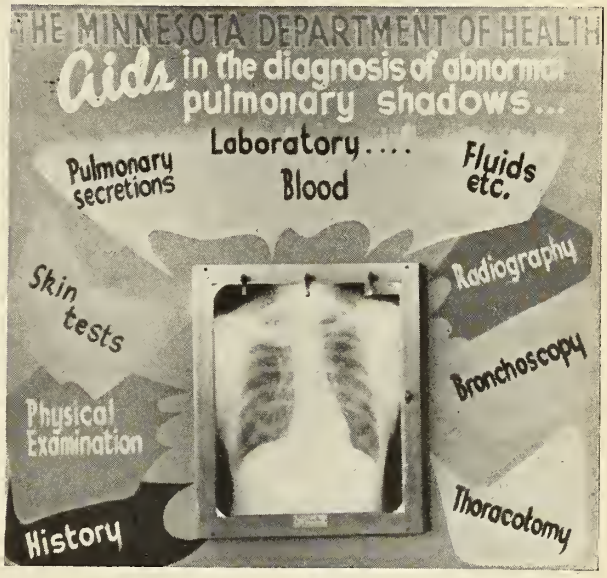

Fig. 1. Diagnostic aids in the clinical evaluation of abnormal pulmonary shadows.

6 cm., nature undetermined. Lateral film was taken. Possible biopsy was considered.

Mantoux test was positive in January, 1948. X-ray follow-up examination showed no change. Lateral was taken. Roentgenological diagnosis was pleural plaque.

In January, 1949, x-ray follow-up examination showed no change. Lateral film examination confirmed diagnosis of pleural plaque.

Case 4.—A woman, aged forty-nine.

History: Survey film in March, 1947, revealed findings of pericardial adhesions, increased density right lower lung.

Bronchoscopy in January, 1948: Pulmonary secretions were negative for cancer cells. There was a depression in right middle lobe bronchus. Sputum: Three gastric washing specimens were cultured and no tubercle bacilli found.

In March, 1949, x-ray examination showed increase in mottled infiltrations bilaterally. Symptoms: Loss of weight, considerable coughing. Diagnosis: Extensive carcinoma with localized metastasis.

The next series of two cases are those with upper lobe infiltrations with suspected cavitation. The first case poses many problems in differential diagnosis while the second case was quickly diagnosed.

Case 5.—A woman, aged twenty.

History: Weight loss (25 pounds) since March, 1938.

In September, 1938; Cough and expectoration, hemoptysis 1 dram. In October, 1938: Mantoux was positive; x-ray findings revealed tuberculosis, and patient was admitted to sanatorium.

Physical Examination: Left, dullness and fine post-cough râles from the second to fifth rib anteriorly.

Sputum: Seventy sputum examinations were negative; specimen was inoculated in guinea pig, and no tubercle bacilli were present.

Blood: Hemoglobin 75, white cells 20,750, with 89.5 per cent polymorphonuclear cells. With white cells at 30,100, there were 91 per cent polymorphonuclear cells, 6 per cent lymphocytes, 3 per cent monocytes. Sputum study showed numerous eosinophiles and neutrophiles but no tumor cells.

Bronchoscopy was negative on two occasions.

X-ray Findings: Lung abscess or atypical tuberculosis.

April 12, 1939: Discharged.

October, 1942: Admitted to General Hospital; pneumonectomy attempted.

October 30, 1942: Died.

Autopsy Findings: Bronchiogenic carcinoma.

Case 6.—A man, aged eighty-eight.

History: X-ray examination in 1944 showed possible tuberculosis, probably inactive. No follow-up by patient's physician. On May 4, 1948, a survey film revealed infiltration at both uppers suggestive of reinfection tuberculosis, with a suggestion of a cavity. Patient had loss of weight (25 pounds), an urge to cough, pain in the left chest, and a sensation of a full chest.

In July, 1948, Sputum was positive for tubercle bacilli.

On August 5, 1948, Patient was admitted to sanatorium.

The next five cases are an assortment to illustrate the diagnostic aid or aids (italics) which helped the clinician to determine the definitive diagnosis.

Case 7.—A man, male, aged sixty-one.

History: On April 26, 1948, a *survey film* revealed a homogeneous density over entire right side, obliterating entire lung field.

Physical Examination: On July 20, 1948, showed dullness over lower one-half right chest; otherwise it was negative.

Blood was normal.

On September 20, 1948: Patient admitted to University Hospital. Asymptomatic except for some exertional dyspnea for about one year. Blood pressure was 140/90; pulse 80; respiration 20; temperature 99°. There was a massive pleural effusion on the right.

Laboratory: Urine was negative; white cells 7,200; differential normal; sedimentation rate 89 mm. in one hour.

X-Ray Findings: Pleural effusion on right and soft infiltrative lesion in left upper.

Bronchogram: Partial atelectasis of the entire right lung.

Study of Fluid: Early examination failed to reveal tubercle bacilli. Ultimately many acid fast bacilli were found.

October 26, 1948: Discharged from University Hospital with diagnosis of moderately advanced tuberculosis.

November 4, 1948: Admitted to sanatorium.

Case 8.—A man, aged thirty.

History: On February 2, 1949, he reported to physician because of severe cough and cold.

X-Ray Findings: February 4, 1949: Infiltration in left middle and lower lung field, probably representing a pneumonia. March 7, 1949: Some clearing of pneumonic process. Examination showed hemoptysis for twenty-four hours, temperature 98°, questionable râles in right apex. White cells were 10,600, sedimentation rate 3 mm.

Sputum: March 11, 1949—negative. March 31, 1949—positive. April 4, 1949—positive.

Diagnosis: Acute primary tuberculosis.

April, 1949: Admitted to Veterans Hospital.

Case 9.—A woman, aged twenty-eight.

History: December, 1937—dry cough during pregnancy. April, 1938—cough dry but severe, treated as bronchitis. May, 1938—tuberculin negative. June, 1938—x-ray examination revealed exudative pulmonary tuberculosis. June 29, 1938—admitted to sanatorium.

Additional History: Frequent attacks of coughing and wheezing as often as two times a week.

Physical Examination: Temperature up to 102°, pulse 120.

Tuberculin Test: PPD and MA 100 were negative.

Sputum: Fifteen smears were negative; stool and gastric washing specimens were inoculated in guinea pig, but no tubercle bacilli found.

Blood: Hemoglobin 78 per cent, white cells 12,400, with 17.5 per cent eosinophiles. *Repeated test for eosinophilia*—7.5 to 16 per cent.

November 5, 1938: Discharged.

Diagnosis: Loefflers syndrome.

Case 10.—A woman, aged sixty-one.

History: *Had pneumonia thirty-five years ago* with cough and expectoration. Raised *30 to 50 c.c. of sputum* daily since. General health was good to December, 1942. In February, 1943, had fatigue, severe cough, later dyspnea, anasarca, and ascites.

Admitted to sanatorium on March 16, 1943. X-ray examination revealed cavities with fibrosis. *Repeated sputum examination* failed to reveal tubercle bacilli.

Diagnosis: Chronic interstitial pneumonitis—nonspecific.

Case 11.—A man, aged thirty-four.

History: Sandblaster from 1929 to 1937. March, 1939—pneumonia with pleurisy left; fever 104°, no x-ray. September, 1939—fever 103°, dyspnea, chills, et cetera, but back to work in four days.

October, 1939—dysnea and loss of weight (10 pounds) three weeks prior to admittance; slight expectoration with bleeding ten days prior to admittance.

Tuberculin Test: Negative O.T. 0.01 and 0.1 mg.

X-Ray Findings: Atypical for silicosis but possible.

Sputum: Ten examinations were negative; stool and gastric washing specimens was inoculated in guinea pig, but no tubercle bacilli found.

Vital Capacity: 1800 to 1900 c.c.

Blood was normal, sedimentation rate 109 mm. in one hour.

Autopsy: Silicotic nodules; no tuberculosis; right heart failure. Pure silicosis.

Summary

In this short period I have attempted to emphasize the following facts:

1. X-ray film examinations do not in themselves necessarily make a diagnosis in any given case even though the pattern might be suggestive of a specific disease entity.

2. In reaching a definite diagnosis it is well to bear in mind certain diagnostic aids or steps to be followed.

3. Patients who are found to have some pulmonary lesion on surveys report to the physician as a result of x-ray findings rather than because of some sign or symptom.

4. Procrastination may lead to an irreversible situation if the more serious diseases are not diagnosed within a short period of time.

The author wishes to express his appreciation to Dr. Sumner Cohen, assistant medical director, Glen Lake Sanatorium, for his assistance in procuring the clinical studies of some of the cases illustrated above.

Discussion

Sumner S. Cohen, M.D.: The primary purpose of the mass x-ray type of examination is to aid in the diagnosis of early pulmonary tuberculosis. Minimal x-ray shadows should not be disregarded just because they are small, since early active tuberculosis usually begins as a minimal infiltration. Active minimal tuberculosis generally is asymptomatic, so the absence of local or constitutional symptoms need not eliminate the possibility of active tuberculosis. The final diagnosis of etiology and activity of obscure x-ray shadows is the responsibility of the clinician and should not be based exclusively on x-ray appearance. When tuberculosis is suspected, complete clinical study is indicated and should include history, physical examination, tuberculin tests and sputum or gastric studies for tubercle bacilli. In doubtful cases, additional studies such as special x-rays, bronchoscopy and bronchograms, may be necessary. The initial x-ray examination often indicates the need for long-term follow-up even though the x-ray shadows are interpreted as inactive tuberculosis at the first examination. The final success of the mass x-ray program will depend upon accurate diagnosis and the institution of indicated treatment as soon as possible.

TUMORS OF THE OPTIC DISC

(Continued from Page 810)

5. Walsh, Frank B.: Clinical Neuro-ophthalmology. Baltimore: Williams and Wilkins, 1947.

Discussion

Dr. H. L. Bair: The case which Dr. Bray has presented is very interesting. According to the literature, drüsen of the optic disc occur in about 1 per cent of eyes removed and examined histologically. As Dr. Bray mentioned, a possible relationship has been established between drüsen of the optic nerve head and tuberous sclerosis. The retinal lesions that have been described as associated with tuberous sclerosis are not exactly the same type as the usual drüsen of the optic nerve. Those which I have seen were smoother and did not have the well-defined mulberry formation of typical drüsen of the optic nerve. From the appearance of the lesions in the fundus of this patient, I would classify the disease as tuberous sclerosis. This diagnosis, of course, generally implies a poor prognosis. Only observation over a long period of time will determine this.

Dr. Bray: I wish to thank Dr. Bair for his discussion of this subject. There are no doubt many cases of drüsen of the optic disc that are not found in the ordinary routine fundus eye examinations. The patient presented has made a good adjustment both in school and in outside activities. This and the mulberry appearance of the optic disc lead me to believe that he will never have any serious complications.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from July issue.)

Practitioners of Medicine in Olmsted County

Not until 1854 did the still undefined Olmsted County receive a resident physician of the regular school of medicine. From that year forward there came practitioners of all types, from graduates of the best medical schools† to bonesetters, herbalists and so-called magnetic healers, and in time a horde of itinerant practitioners of every known variety.

The first resident physician of the regular school in the county, Dr. Hector Galloway, arrived in Oronoco in 1854 with the little group of men who founded that village; although it is said that Dr. Galloway did not remain at the time of his first arrival, his association with the county began then. In the spring of 1855 Dr. Martin T. Perrine came to Rochester, Dr. Jesse N. McLane soon followed, and Dr. Reuben N. Sackett settled in Quincy Mills. In 1856, Dr. Ira C. Bardwell and Dr. Cornelius S. Younglove came to Rochester, Dr. J. C. Cole to Marion, and Dr. G. W. Green to Pleasant Grove. In 1857 Dr. Lewis H. Kelley, who built the first brick block in Rochester, settled in the city, and in 1858 came Dr. Edwin C. Cross and Dr. Joseph A. Leonard, the latter then beginning his distinguished career as editor and statesman. In 1859, Dr. Alexander Grant was a cultured newcomer in High Forest, and in 1860, Dr. E. W. Cross was outstanding among the several physicians who entered practice in Rochester. Dr. Staunton B. Kendall in 1862 settled on a farm in Kalmar Township, from which he moved three years later to near-by Byron. In 1863 there came to Rochester Dr. W. W. Mayo, who was to be for many decades a prominent citizen of the city.

The following chronological roster, as far as information has been available, includes all the recognized members of the medical profession who practiced in Olmsted County in the nineteenth century. In addition it gives, because they were typical of many and played a definite part in early medical practice, a few "magnetic healers," an herbalist or two, and a few practitioners of short residence who perhaps were better classed as itinerant. Of the total list, twelve were women, resident in the county between 1860 and 1900. Of the regularly qualified practitioners, some twenty-five were members of the staff of the Second Minnesota Hospital for Insane* (opened in 1879; since early 1893 named the Rochester State Hospital) in the period from 1879 to 1899, inclusive.

It will be noted that among the practitioners of medicine in Olmsted County, during the decades under consideration here, were numerous representatives of eclecticism and homeopathy. Some of them, like certain exponents of the regular

†Because in a recent article, *Notes on the History of Medicine in Fillmore County Prior to 1900* (Guthrey), much information was given as to the types of regular physicians who came into southeastern Minnesota in the early years, their professional training and the medical schools from which they came, such discussion is omitted here.

*In a brief sketch of the Second Minnesota Hospital for Insane, in this paper, is included a condensed chronological record of the service of these men. In the present roster their status as members of the staff of the state hospital is indicated. Biographical notes on these physicians are included in the alphabetical series of sketches that completes this history.

school of medicine, moved on after a few years. Many of them remained a lifetime in the county or in the region and, among the most highly respected and most frequently consulted of the county's physicians, were leaders in citizenship and in the care of the sick. Of these, all kept abreast of their profession, studying at intervals at universities and hospitals in Chicago and in the East. Many of them in due course became active members of the regular county, regional and state medical societies.

The roster indicates as nearly as possible the time of arrival of the physicians in the county and gives the first known village and township of the residence of each. Many physicians came from the East; some of these remained a short time, others spent decades in one locality, and others moved from place to place in the county. It has been interesting to note that the marriage of physicians to daughters of pioneer citizens of the county often determined the place of residence of the physicians. Dakota Territory in the early eighties became a goal of immigration to many citizens of Olmsted County, among them numerous physicians.

Some of the physicians listed here were born in Olmsted County and spent their lives there. Others came as children of pioneer parents, received their early education in the county, their medical schooling elsewhere, and returned to the county to practice. Of some physicians the exact date of arrival is known; of others it can be stated only that they arrived in the sixties, before 1866, for example, or that they were long in southern Minnesota but not actually in the county until late in the century. In the biographical sketches which are to come these facts are made clear whenever possible.

Chronological Roster of Physicians of Olmsted County Prior to 1900

Name	School[1]	Year of Arrival	First Place of Residence	Township
Alexander, Joseph	Herb	1854	Rochester[2]	
Galloway, Hector	R	1854	Oronoco	Oronoco

[3]The Rev. Levi Hall, a Methodist minister, in 1879 an undergraduate medical student, was then listed as a physician in a business and professional directory; he took his medical degree in 1882.

[4]William Alonzo Vincent, an undergraduate medical student, was employed at the State Hospital in 1880; on graduation in March, 1881, he became assistant physician.

[5]In 1892 Dr. Linton was married to Dr. Robert McEwen Phelps, of Rochester.

[6]In 1900 Dr. Booker was married to Mr. George W. Granger, of Rochester.

[7]Henry S. Plummer spent vacations from medical school studying at St. Mary's Hospital, Rochester; after graduation as a physician, in 1898, although resident in Mower County, he practiced widely in Olmsted County. He settled in Rochester in January, 1901.

Certain groups of practitioners, other than those listed in the roster, merit comment.

Arrivals at the Turn of the Century.—There commonly have been linked erroneously with the period considered in this paper the names of certain physicians who entered practice in Olmsted County soon after the turn of the century. A few are named here who became well known in the region. In 1900 Dr. Isabella C. Herb joined the staff of the Drs. Mayo as a pathologist and anesthetist; she remained in Rochester about five years. In 1901 Dr. Hugo Speier, an experienced physician, began his practice of several years in Rochester. In that year also, newly graduated Dr. Axcel C. Baker and Dr. Walter V. Gulick, both residents of the county, began their initial practice in Oronoco; Dr. Baker succeeded Dr. E. M. Clay and, on moving soon to Chicago, was succeeded by Dr. Gulick, who later was in Rochester. In 1901 Dr. Henry S. Plummer, of Racine, Mower County, as already noted, joined the Drs. Mayo in Rochester. In 1902 Dr. E. Starr Judd, of Rochester, returned home with his degree of doctor of medicine to begin his notable career as an associate of the Mayos by serving as an intern at St. Mary's Hospital. In the same year Dr. John E. Crewe (1872-1947) came from Zumbrota, Goodhue County, to enter partnership with Dr. J. G. Cross in Rochester. For many years an internist in private practice, Dr. Crewe also long served Olmsted County as coroner; he resigned in 1946, after nearly thirty-five years in the office.

Physicians of Neighboring Counties Well Known in Olmsted County.—In the course of widespread intercounty practice in southeastern Minnesota and in the development of regional organization of medicine, many practitioners of Olmsted County and of the neighboring counties became well known to one another, so that there were calls back and forth among them for professional consultation. Occasionally, when a physician was away on a clinical trip, one of his confreres

from his own community or elsewhere would carry on his practice for him; for example, in 1891, when Drs. W. J. Mayo and C. H. Mayo were attending a medical meeting together at Saint Paul, one of the rare times when they were both absent from home, Dr. S. H. Van Cleve, of Mantorville, and Dr. W. A. Chamberlain, of St. Charles, served at Rochester for them.

Some of the first physicians to attend settlers of Olmsted County were R. W. Twitchell and A. H. Trow, who settled in Chatfield, Fillmore County, in 1854 and 1856, respectively, and who were summoned into Elmira and Orion Townships of Olmsted County and as far west as Pleasant Grove. Since Chatfield lies partly in Olmsted County, all the physicians of that village practiced widely in the northern county; some of them had their homes within its border. A roughly chronological list of the physicians of Chatfield from 1854 to 1900 includes the names of R. W. Twitchell, Nelson A. Allen, A. H. Trow, Isaac S. Cole, D. N. Morse, Morrison, W. F. Coleman, Masse, William Haslam, H. Thomas, E. H. Grannis, John C. Dickson, Jesse C. Fate, Isaac W. Timmons, Aaron M. Stephens, Milton A. Trow, Florence J. Halloran, Charles McH. Cooper, George E. Jackson and Alexander MacDonald.

From near-by counties other than Fillmore come well-known names, of which a few are given here: In the earliest years there were Dr. F. C. Gibbs, of Plainview, who died in 1864, and Dr. J. R. Dartt, of Mantorville, who died in 1874. Of the early period also, but of long life, were others: Dr. W. T. Adams, of Elgin, son-in-law of Dr. Gibbs, for many years was the chief physician in Viola Township, Olmsted County, and for some time kept regular office hours at the general store in Viola; in 1876 young Dr. Eugene C. Davis, of Viola, a native of the county, joined Dr. Adams in practice at Elgin. There were Dr. Charles Hill, of Pine Island, and, of a later period, Dr. W. L. Craddock of that place; Dr. F. H. Milligan, of Wabasha; Dr. Nathaniel S. Tefft and Dr. J. P. Waste, of Plainview; Dr. H. H. Guthrie, of St. Charles, and the later Dr. W. A. Chamberlain, of that place; Dr. Franklin Staples and Dr. J. B. McGaughey, of Winona, and Dr. S. B. Sheardown, of Stockton, and his son, Dr. T. W. Sheardown, of Winona. Some of these men and others from outside the county became members of the Olmsted County Medical Society and in 1892 were among the founders of the Southern Minnesota Medical Association.

Olmsted County Boys Who Became Physicians Elsewhere.—There was a large group made up of men who were natives of Olmsted County or who came to the county as boys, who qualified as practitioners of medicine prior to 1900 but who either did not follow their profession in their home county or did not do so until after 1900. All had ability, it is said, and some became well known. From a long list the following names are taken: George B. Ayres, S. H. Baker, Sylvester L. Bedal, George E. Campbell, Sheridan G. Cobb, Paul B. Cook, Francis Feeney, Joseph A. Gates, Royal A. Gove, Milan J. Hart, J. A. Heilscher, Seth E. Howard, L. F. Hoyt, Fred. Hyslop, E. E. McPeek, James McPeek, P. H. Manion and John S. Manion, Henry Miner, Alton Moulton, Joseph F. Percy, Eustis Singleton, G. A. Stevenson, R. R. Stevenson and T. Y. Stevenson, John T. Smith, Job J. Thompson and Francis R. Woodard. Other names that perhaps might be included have been omitted because of uncertainty as to residence or training of the practitioners; in the eighties and nineties the regional newspapers had the habit, which has been a source of confusion in research in the nineteen forties, of referring to undergraduate medical students as "doctors."

General histories of the development of communities usually discuss physicians in their civic capacities rather than in their professional roles. As a rule physi-

cians were better educated than their fellow citizens, and in addition to their professional work they consequently were called on to accept civic responsibility, which in the growth of settlements overshadowed their work as physicians. When a practitioner gained the confidence of the people as a physician, however, he became a minor oracle and his decisions usually were unchallenged. Although some young men became physicians because their physical health was not equal to the strenuous pursuits of farming, milling, carpentering, and the like, more of them entered upon the study of medicine because of the honored position physicians held in their localities and especially because of the personal esteem the students had felt since boyhood for certain physicians.

Many of the men named here, as well as others who are mentioned elsewhere in this article as physicians of Olmsted County, received their first medical instruction from able local physicians and surgeons. It was expected, in the day of study under preceptors, that when a young man had acquired sufficient experience to warrant his practicing independently, he would move on to another community; as conditions of medical education changed, the student would leave his preceptor, after a period of from one year to three years, to take a degree at a medical school. It is remembered to the credit of most of the preceptors that they were kind and wise instructors to students and that they were generous colleagues to young physicians just entering practice.

Druggists.—In the early years there were certain druggists of the county to whom the public gave the title of doctor. It should be said that many qualified practicing physicians of Rochester of that period operated drugstores, usually in partnership with druggists, and compounded their own medicines, and that nearly every physician in the outlying villages of the county either operated a drugstore or kept on hand a supply of medicaments so comprehensive as almost to constitute a drugstore.

The professional druggists of Olmsted County, from the time of J. S. Woodard, the pioneer druggist of Rochester in 1858 or earlier, form a long list. Among the best known personal or firm names are those of Franklin Van Dooser, J. D. Ameigh, John Clark (who in 1861 offered from six cents to ten cents a bushel for ashes, to make soap), H. B. Upman, J. Charles, O. W. Anderson, A. F. Childs, E. C. Richards, J. E. Ells, Gustavus Hargesheimer and Brothers (later the sons of G. Hargesheimer were druggists), F. A. Pool, J. D. Blood, Pierce Brothers, Samuel Geisinger, Angelo Newton, George Weber and P. G. Heintz. Many of the druggists served as preceptors to local youths who were interested in learning pharmacy. Among these druggists, most of whom were in Rochester, there were partnerships of varying terms, of which a few were: Woodard and Ells, Anderson and Childs, Ells and Hargesheimer, Pool and Harrington, Pool and Geisinger, Geisinger and Newton, and Weber and Heintz. In Rochester, in 1947, the names of Weber and Hargesheimer still were associated with the drug business.

On August 16, 1871, the editor of the *Central Record* of Rochester said: "We suggest that arrangements be made whereby some of the drugstores be open on Sunday so that people can get medicines on the Sabbath." In the next issue of the paper it was announced that each of the following stores, in the order named, would be open one Sunday a month: Upman, Hargesheimer, Pool and Geisinger, and Anderson.

Dentists.—Although most physicians and surgeons in the early decades of medical practice in the county were necessarily dentists on occasion, Olmsted County, even in that era of traveling dentists, had a resident dentist, Dr. J. M.

Williams, who came to Rochester in 1856 and who in the forty-two years of his practice there accepted advances in his profession and served the community well. One of his announcements, in 1865, illustrated by a picture of teeth, was: "Persons from a distance desiring false teeth will not be detained more than one or two days, and when so detained will be allowed $1 a day for board. My prices will always be as low as any dental physician in southern Minnesota." In 1868 Dr. Williams was using nitrogen monoxide ("laughing gas"), in which practice he was endorsed by the leading physicians and surgeons of the city, Drs. R. M. Reynolds, W. W. Mayo, Hector Galloway, E. C. Cross and E. W. Cross. An able preceptor, he was the first professional instructor of Archibald Bamber, who had come to the community as a child. Dr. Bamber from 1867 for many years was a leading dentist of Rochester and was also a preceptor in dentistry. There is included here, to illustrate a custom of the times, a notice that was published by Dr. Bamber in 1871. This little statement has been taken from among many notices of the sort that appeared in that period, from physicians, dentists, lawyers, editors and others. Dr. Bamber said: "I am now in want of a couple of good cows and will at any time take in payment for dentistry, farm produce. I will at the present time take wheat at $1 a bushel." Another student under Dr. Williams was Dr. J. H. Spaulding, son-in-law of Dr. Galloway, who ultimately had a distinguished career in dentistry in Paris, France.

In 1864 a Dr. Welch, of Rochester, wrote a series of short articles, "Points on Dentistry," which were published in the city papers. In the seventies Oronoco received Dr. Chamberlain, who died there in 1879. In that decade Rochester received Dr. F. L. Beecher, who practiced in the city until his death in 1906, Dr. B. F. Allen, brother of Dr. W. A. Allen, Dr. E. D. Allison, and Dr. E. Pentecost. In 1889 Dr. W. S. Aldrich settled in Rochester, and in 1895 Dr. Erwin Sinclair, a graduate dentist of that year, whose boyhood home had been Byron, joined him in partnership. In the nineties also Dr. T. P. Haggerty, sometime of Eyota, was in Stewartville, and Dr. A. B. Clark was in Eyota. Dr. C. A. Couplin came to Rochester in 1898 and Dr. H. J. Smith in 1899. Dr. Smith in the previous year had done dental work among the patients at the state hospital at Rochester.

Information has come regarding a lay citizen who served his community as a dentist and as an aid to physicians in the practice of medicine, John H. P. Fawcett, father of the late C. E. Fawcett, M.D., (*q.v.*), of Stewartville, and A. C. Fawcett, D.D.S., of Rochester. Mr. Fawcett came to Olmsted County in 1858 as a farmer and to the village of Marion in 1866 as a merchant. At the back of his general store he had a small room in which on certain days of each week, at one period, Dr. Kelly of Rochester, it has been said, kept office hours. There one day when the doctor had difficulty in removing a tooth for a patient, he called on Mr. Fawcett for help. The merchant made the extraction with dexterity and complete success. From that time he studied dentistry and, with the approval of physicians, acted as dentist for his neighborhood. At first he had only a dental forceps (still in use, in 1947, by his son and his grandson, dentists in Rochester) that a local man had brought from service, perhaps from a military hospital, during the Civil War, but he soon acquired a full professional set of instruments. He was also a student of Gunn's book on medicine, and at the request of certain physicians of Rochester, among them the Drs. Cross and Dr. Mosse, the story runs, who often were called to the community, Mr. Fawcett acted as a sort of auxiliary practitioner. In each case, between visits of the physician, he performed indicated offices, such as administering medicines, taking temperatures, and changing bandages, and reported progress of the patient to the physician. On at least one occasion he gave first aid. Happening to be at hand

when a local woman received a broken wrist in falling from a cart during a runaway, Mr. Fawcett improvised a splint with strips of wood that he pried from a fence post near the road and with strips of cloth that he tore from the apron of a woman who lived near the scene of the accident, and took the patient to Rochester for more expert attention.

Opticians.—For many years in the period under consideration there were only two licensed opticians resident in Olmsted County, it is believed. Both were highly respected citizens. John B. Blickle, a native of Germany, who was born in 1850, received training as a watchmaker and jeweler in his native country and in Switzerland. In 1879 he settled in Rochester, Minnesota. For a time he worked with Eleazer Damon, pioneer jeweler in the city, before opening his own business; from 1886 until 1909, the year of his death, he was an able optician as well as a jeweler. One of his sons, Henry Blickle, of Rochester, followed his father in business as jeweler and optician. Dr. Joseph W. Grainger was a native of England, born in 1838, who before coming to Rochester in 1883 had been a watchmaker and jeweler as well as an optician. In Rochester he was a practicing optician. A skilled member of his profession, he was president of the Southern Minnesota Optical Association for two terms, and of the Northwestern Optical Association for four terms. In 1901 he was appointed by Governor Van Sant, of Minnesota, as a member of the board of examiners in optometry and in due time was reappointed for a second term of three years.

Osteopaths.—Osteopathy did not come to Olmsted County until the late nineties, when Dr. Anna B. Collins arrived in Rochester in the autumn of 1897. She moved to Milwaukee early in 1898. Dr. and Mrs. W. A. Fletcher and Dr. John A. Waddell, all practitioners of osteopathy, arrived in Rochester in the spring of 1898; after a few weeks they removed to Cantril, Iowa. Dr. and Mrs. S. A. Thompson came to Rochester from Minneapolis in August, 1898, but did not stay long.

Miscellaneous "Doctors."—There were sundry persons resident in Olmsted County at various times from the early years of settlement into the nineties who called themselves "doctor"; three of them, included in the foregoing roster, in due time received exemption certificates to practice in the state. The record is meager. Some of the number, it has been learned, were veterinarians. Others were herbalists whose practice was limited to their own neighborhoods; some of these herbalists were women who were also midwives. A few practitioners, so-called, were local peddlers who carried a stock of patent medicines in addition to other merchandise. One of this group bought and sold rags as his chief undertaking. There were certain others who compounded cure-all salves from mysterious prescriptions and peddled them.

(To be continued in the September issue.)

President's Letter

DOCTOR'S ORDERS—FOR DOCTORS, TOO!

The patient is tired—his fatigue manifesting itself in an almost tangible weariness of spirit. He admits to an uncertain schedule of eating and sleeping, a job that requires his attention at odd hours of the day and night and for unpredictable stretches of time. His nerves are taut with the strain of split-second decisions, the exacting and instantaneous discipline the brain exercises over his hands and eyes.

The doctor knows that what this patient needs is a long vacation, away from any reminder of his profession, and minus a schedule that is all the more strenuous because it is a varying one. He knows, too, that this patient, when he returns, should develop some hobbies, get interested in sports that will take him out of doors.

But will the doctor follow doctor's orders?

He will if he takes the long look, past the momentary appearance of selfishness in his absenting himself from patients who need him, and realizes that if he is to maintain optimum efficiency and skill over the longest span of years, he must follow the health rules that he prescribes for others. He must keep in mind that his value to his patients is cumulative; with every passing year, as he prescribes the medicines and performs the operations that save life and health, his patients come to depend on him more and more.

With this dependence comes faith in the doctor—as a friend and healer, and, often, as family counsellor. Through long years of association the doctor-patient relationship, an almost sacred tradition, since it deals with the basic principles of human well-being, is built up.

The medical profession has no right to deprive patients of this rewarding tradition. Doctors owe it to their patients, as well as to themselves, to conserve their health and lengthen their life expectancy.

That doctors do not care for themselves properly is evidenced by the fact that doctors do not live as long as their fellow citizens. Heart disease is the greatest death-cause among physicians. States Frank G. Dickinson, Ph.D., director of the AMA Bureau of Medical Economic Research: "Heart disease is in reality an occupational hazard of the medical profession."

THE HOOVER COMMISSION REPORT

THE EFFORTS of recent Presidents of our country to effect reorganizations in the Federal Government have come to naught due to congressional terpitude. The establishment of the Hoover Commission, however, was initiated by and unanimously approved by Congress.

A twelve-man Commission was set up in 1947 and the services of some 300 outstanding citizens were obtained gratuitously to serve on the so-called task forces to study and report their recommendations for reorganization.

The Task Force on Federal Medical Services was composed for the most part of outstanding physicians under the chairmanship of Tracy S. Voorhees. Its report, which appeared in January, 1949, brings out the lack of co-ordination and gross extravagance of Federal medical activities and the need for radical reorganization.

Four large and forty smaller federal agencies spent $1,250,000,000 for health and medical services in 1948. This amount was five times that spent in 1940 and 20 per cent more than in 1947. The Veterans Administration alone plans to spend in 1949 as much as all forty-six agencies spent in 1948—half of it for new hospitals. The United States now gives some medical care to 24,000,000 beneficiaries, 18,500,000 of whom are veterans.

The Veterans Administration has adopted a building program to increase the existing hospital bed capacity by a third and eventually to 300,000 by 1980. While it is estimated on good authority that by 1975 some 250,000 will be required for service-connected cases and chronic non-service cases—the latter being almost all medically indigent—the fact is that the Veterans Administration is at present unable to staff the beds now available. The question is brought up whether this enormous building program will not interfere seriously with the operation of the new hospitals being built all over the country as a result of the Hill-Burton Bill. Will these latter hospitals and private hospitals be able to obtain the needed personnel?

The hospital building program of the Veterans Administration envisions $1,100,000,000, and the Armed Forces desire an additional $200,000,000 for constructions. The large veterans hospitals cost taxpayers $20,000 per bed, the smaller ones $30,000 and some even $51,000 per bed. Why?

The report brings out specific examples of needless construction of hospitals by the Veterans Administration and the Army costing millions of dollars where existing Navy hospitals could well care for the needs.

The report also states that half of the eighty-nine new veterans hospitals are being built or planned in areas where they will be difficult to staff.

Some 900,000 dependents of the Army and Air Force are at present receiving complete medical care virtually free. This free care has been given on the basis of a sixty-year-old law entitling dependents to hospital care "whenever practicable." A similar situation exists in the matter of hospital care of veterans for non-service-connected disabilities. Veterans may be cared for in veterans hospitals if they declare themselves medically indigent and if beds are available. The Veterans Administration is evidently going to see that beds will be available. There is said to be little check on the statement that the veteran is medically indigent. We recently heard of a veteran who deposited $40,000 in government bonds on entering a veterans hospital and declared himself unable to afford hospital care. The status of these two groups should be clarified in the interest of overall planning.

The report recommends, in brief, the integration of the numerous governmental health activities into two major systems, military and non-military. The non-military federal health activities would constitute a Department of Health headed by a Cabinet member. The Task-Force was originally instructed to make its report on the basis that health activities would constitute a bureau in a department including Bureaus of Health, Education and Social Security. The Task

Force's original report in January, 1949, was made on that basis, but a supplemental report made in March, 1949, strongly recommended the establishment of a separate Department of Health with a Cabinet member who shall be a trained medical administrator. This change in their report would not alter materially their recommendations.

The Department of Health, then, would be made up of three main divisions: (1) Medical Care; (2) Public Health, and (3) Research and Training.

Under Medical Care would be included the Veterans Administration, Public Health Service, St. Elizabeth's Hospital and, rather paradoxically, the general hospitals of the Army. It is felt that most patients in the Army general hospitals are of little further military value and in the interest of better medical care and economy these hospitals should be operated with the non-military group. Recommendation is further made that those entitled to Federal medical services be cared for as often as possible in non-Federal hospitals on a reimbursible basis so that the veteran can remain near home and voluntary hospitals may receive much needed patronage.

Under the division of Public Health most of the Federal public health functions would be gathered with certain exceptions, such as preventative medicine functions of the armed forces, the Children's Bureau, the Office of Vocational Rehabilitation, meat inspection or other actvities of the Department of Agriculture. This division would administer grants-in-aid in public health to the states, conduct a clearing house of information on public health activities and would establish interstate standards for foods, drugs and sanitation. These grants-in-aid, instead of being made as now in twelve different categories by three Federal agencies, would be administered by the Public Health Division. They believe the Children's Bureau should operate as a staff unit directly responsible to the secretary of the department, and at a later date, within three years, the administration of the grants for maternal and child health aid for crippled children should be transferred to a special Grant Unit in the Public Health Division.

Research and training are included in one division. Research in military problems and in atomic energy are not included. Arrangement is made for an Interagency Committee to supervise contracts, grants-in-aid and institutional grants to non-Federal institutions. The Division of Research and Training would be responsible for planning the research program and allocating funds for research projects. It would operate the experimental work of the National Institute of Health and the authorized Clinical Research Center for the combined clinical and laboratory investigation of cancer, mental disease and cardiovascular disease. The research grants-in-aid program of the Public Health Service and of the Medical Research and Education Service of the Veterans Administration would also be transferred to this division. A fellowship program along the lines of that presently conducted by the Public Health Service, whatever aid to medical schools Congress might decide to give, administration of the Army Medical Library would all be functions of this division.

In regard to the question of aid to medical education, the report states there are seventy medical schools in the country, forty-three supported by private funds. A large number of the latter are in financial distress. Formerly, 70 per cent of the expense of operating a medical school was furnished by tuition fees. Now these fees supply only 25 per cent of this cost. The American Medical Association has estimated that an additional $700,000,000 is needed at once to supplant the endowment of private medical schols or $16,000,000 a year. Fellowships, too, are needed to stimulate the training of research personnel, public health officers and psychiatrists.

While the AMA has been opposed to Federal assistance to the medical schools, it would seem that of necessity the private medical schools will need assistance from a source outside private philanthropy in order to continue. Federal grants, if found necessary, should not interfere with autonomy of the schools.

The more one looks into the Task Force Report on Federal Medical Services, the more one realizes what a shake-up in the whole structure of our Federal government is proposed. The need for complete reorganization in the interest of efficiency and economy is evident. It is estimated that somewhere from three to five million dollars would be saved in the cost of the federal government yearly, and the number of Federal employes could be cut 10 per cent.

That there will be strong opposition from selfish interests is a foregone conclusion, and changes will have to be made piecemeal and over a period of time.

An aroused public opinion can do much to put the plan over. A unique organization composed of leading citizens and nonpartisan in character, including former Vice Presidents Dawes and Garner and five former members of Democratic and Republican Cabinets, has been formed to support the Commissions' recommendations.

The medical profession for years has advocated a U. S. Department of Health to be headed by a physician trained in medical administration to have Cabinet rank. We stand for the adoption of the recommendations of the Hoover Commission as far as the health activities of the government are concerned. We do not want these activities merely to constitute a Bureau in a Department including Education and Social Security but to be a Department in its own right.

CLINICS IN COLOR TELEVISION

RADIO may be compared—radio, television, color television. To the uninitiated all three inventions are beyond comprehension, but color television is the superlative.

The first use of color television on May 31, 1949, for surgical and medical clinics at the Hospital of the University of Pennsylvania sets a milestone which deserves some comment. Similar clinics were given in color television at the American Medical Association meeting in Atlantic City through closed circuit from the Atlantic City Hospital by staff members of the Medical School of the University of Pennsylvania and the Atlantic City Hospital and visiting surgeons. The advantage of this new method of presenting clinical material was convincingly demonstrated. Close-ups of surgical operations and skin lesions lend themselves particularly well to this new medium.

The demonstrations were sponsored by Smith, Kline and French Laboratories who own the equipment, and they plan to repeat them at future medical meetings. Co-operating with the laboratory firm and the University of Pennsylvania was the Engineering and Research Laboratories of the Columbia Broadcasting System under the direction of Dr. Peter Goldmark who designed and produced the color TV equipment for medical institutional use.

The camera can be so focused that the image on the receiving screen is several times larger than what the surgeon himself sees. While the camera is in use, the lens is approximately four and a half feet from the operating field. Thus, all viewers have the advantage of a close-up view of the operative field or the patient.

It is probable that before long color television will be standard teaching equipment in the larger medical schools. The day will then have arrived when television spectators will be able to see the operative site just as well or better than the one at the operator's side.

COMMUNITY CHESTS

IN THE FALL of each year the Community Chests of the country conduct local campaigns for funds for the various humanitarian activities which they support. There are now 1,250 Community Chests in the country—an increase of 200 during the past year. These include approximately 14,000 separate agencies.

Community Chests were originally established as an economy method in the support of worthwhile community eleemosynary activities. Voluntary solicitors make one visit on prospective donors instead of each agency making its own campaign. The citizen is approached by one instead of twenty or more solicitors. Only worthwhile agencies are included in the Chests, and duplication is avoided.

One may be inclined to wonder why the need for funds for benevolent organizations has not diminished. A consideration of the character of the activities of the member organizations, however, will indicate that there is as much need now as ever before and the need will be greater rather than less in the future for all the agencies in most Community Chests. The character of the activities of most of the agencies is that of prevention rather than relief, and the need for the various youth activities—the Boy and Girl Scouts, the community centers, the USO, the YMCA and YWCA, Child Guidance Centers and Day Nurseries—in view of the great amount of present-day juvenile delinquency is greater than ever.

Voluntary support of local activities which make for better communities is one of the hearten-

ing evidences of the existence of a feeling of responsibility for their fellow men in the hearts of the American people. May Community Chests continue to grow in number and breadth of activity!

COURSE IN PRACTICAL NURSING

The University of Minnesota is initiating a course in Home Management and Practical Nursing to be offered jointly by the School of Agriculture and the School of Nursing at the University. The first course will begin October 3, 1949 and will consist of six terms or eighteen months in all.

Students will register in the School of Agriculture on the Saint Paul campus this fall. Training will be obtained on the campus in Saint Paul and also in Minneapolis. Work will be assigned also in the University Hospitals and during next summer in rural hospitals. Students will be able during their course to take advantage of extra-curricular activities in the form of music, dramatics and athletics. Living cost will be approximately $150 a term.

Upon completion of the course, graduates will receive a diploma and will be eligible to take the State Board Examination for Practical Nurses.

There is a great demand for practical nurses at present, both in cities and rural communities, to care for the sick at home and in the hospitals, to assist registered nurses in hospitals and to work in rural community organizations. The training given these young women in home management, including cooking and sewing as well as caring for the sick, provides a valuable background for general living.

Application blanks may be obtained from the office of J. O. Christianson, Superintendent, School of Agriculture, University Farm, Saint Paul 1, Minnesota.

DOCTORS AND PUBLICITY

Employment by the American Medical Association of a public relations firm to present the doctors' opinions on the state medicine issue to the country is drawing criticisms from quarters which favor President Truman's proposal for compulsory Federal health insurance.

One self-righteous expression which comes to our attention says that if "so vital an issue of health insurance can be decided by the special, ingenious and concealed pressures of a firm of professional publicists, then democracy has been perverted."

For our part, we can't get excited about the alleged perversion of democracy by a professional group which is doing no more than using the government's own methods to oppose attempts to force it into a socialistic strait-jacket and to foist an expensive, inefficient and unnecessary system of bureaucratic medicine on the country.

The Federal government has more publicists on its payroll than all the private public relations firms in the country combined. Every department, agency, bureau, branch and other subdivision, whatever its name, has its staff of publicity workers zealously seeking to protect its interests and put the best possible construction on its activities. It is safe to say that hundreds—perhaps more—of the Federal press agents are currently devoting their time to belittling and disparaging the American medical profession and trying to sell the public the idea that for a few dollars a year in additional payroll taxes, all medical and dental care, surgery, hospitalization, eyeglasses, teeth, hearing aids, wigs, etc., will be "free" just as they are in Great Britain under the beneficient aegis of socialized medicine. They don't mention that England's payroll taxes only finance one-tenth of the program and that the income tax rate is 40 per cent up.

What's wrong about the doctors hiring publicity experts to tell the public their side of the story?

As for "ingenious" and "concealed" pressures, nothing could be more specious or devious than some of the pro-state medicine propaganda constantly being poured out on the public. Figures are twisted and juggled. Misleading statistics, such as those relating to armed forces rejections for physical reasons are cited as "proof." American public health, demonstrably at the highest level to be found anywhere in the world, is pictured as appallingly bad because it isn't better than some reformer's idealistic slide rule says it ought to be.

Isn't that "perverting democracy," too? Or are government press agents in a sacrosanct class by themselves?

We don't blame the doctors for fighting back. They are not publicity experts. They are, predominantly, professional men, trained to heal and relieve human suffering, not to engage in a duel of wits with the Federal government's double-talking propagandists.

They have a case and a convincing one for continuance of private medicine in the United States. It is to be hoped that they may use every legitimate means to present it to the public in the ablest possible manner. —From Jackson (Mississippi) *Daily News.*

A GOOD INSECTICIDE, NOT POISON

A statement was recently issued by the Department of Agriculture and the Federal Security Agency calling attention to the proved value of DDT as an insecticide. Some public alarm has been caused by misleading comments concerning possible hazards connected with the use of this chemical. It is pointed out that DDT has contributed materially to the welfare of the world, and should not be brought into disrepute through overemphasis of the well recognized fact that it has toxic properties, especially if improperly used. The ingestion of a tube of toothpaste, or a cake of soap or a bottle of cleaning fluid might be injurious or fatal, and yet they are harmless and useful substances if properly employed.

The fact that DDT, like other insecticides, is a poison, has been given full consideration in the formulation of recommendations for its use: "There is no evidence that the use of DDT in accordance with the recommendations of the various Federal agencies has ever caused human

BYRNES SCORES DRIFT TO STATISM

One of the most incisive analyses of the current, ominous trend of the American people toward complete dependence on the government was given by James F. Byrnes at Washington and Lee University, June 18.

Mr. Byrnes, former member of the House of Representatives from South Carolina, has served as U. S. senator, war mobilizer, justice of the U. S. supreme court and secretary of state. In presenting the speech for insertion in the Congressional Record, Senator Robertson described Mr. Byrnes as ". . . drawing upon a background of experience in public affairs equaled by few and surpassed by none of our day and generation and speaking with a frankness and candor permitted to one who is now a detached observer of political trends."

Said Mr. Byrnes:

"We do well to give thought to the men and women who settled this country. They came here to avoid the tyrannies of monarchies and enjoy the blessings of liberty. They were practical idealists. They kept their eyes on the stars but kept their feet on the ground. For a century and a half their sterling qualities were emulated by the American people. But today their philosophy of life and their views of government seem forgotten or ignored.

Toward Economic Slavery

"Every segment of society is demanding special privileges—the farmer wants higher prices, the wage-earner wants increased wages, pensions, and hospitalization. Too many people want more pay for less work. We are going down the road to stateism. Where we will wind up, no one can tell, but if some of the new programs seriously proposed should be adopted, there is danger that the individual—whether farmer, worker, manufacturer, lawyer, or *doctor—will soon be an economic slave pulling an oar in the galley of the state.*

"Unfortunately each political party tries to outpromise the other. Some people even go so far as to say that it is unsocial to save. They want to lean upon the state, yet the state has to lean upon each one of us.

"Too many people are trying to transfer power to government. That is justified in war but not in peace. In time of peace the state must exist for the individual and not the individual for the state. Power once transferred to government is difficult to recover. Power intoxicates men. When a man is intoxicated by alcohol he can recover, but when intoxicated by power he seldom recovers.

"We are not only transferring too much power from the individual to government but we are transferring too many powers of State governments to the Federal Government.

"We should not have the Federal Government regimenting our lives from the cradle to the grave.

Alias Public Welfare

"Some of the proposals now suggested which would curtail the liberties of the people are offered in the name of public welfare and are to be made possible by Federal aid. That phrase is an opiate. It is deceptive. It leads people to believe that Federal funds come from a Christmas tree. The truth is there are no Federal aid funds except those taken from your pockets. If the people generally will ever come to understand this, there will be less demand for Federal aid.

"Beware of the Greeks bearing gifts. Beware of those who promise you something which does not belong to them and which can be given to you only at your own expense or the expense of another who may not produce to make the promise good.

"Give States a Chance"

"The States may have failed to make adequate expenditures in some fields. That does not justify the transfer to the Federal Government of powers it was never intended to exercise. In every State there has been increased expenditures for welfare purposes. Give the States a chance.

"If the Congress, instead of seeking new ways to spend the money which is being collected from the people, would repeal some of the excise taxes, the States could then levy additional taxes in that field. They could provide for many worthy causes and still leave the people with more money and more liberty.

"In the days ahead of us, there will be a struggle between those who believe in individual freedom and those who would subordinate the individual to the dictates of the government. There will be a struggle, too, between those who would transfer even greater powers to the Federal Government and those who would stand by the Constitution in its reservation of powers to the States."

GOVERNMENT GETS THIRD DAY'S PAY

Every third day the people of this country work for the government—that is, federal, state and local governments combined take one-third of everything Americans produce.

Pointing out how government control engenders more government control, Ralph W. Gwinn, New York Representative, told the House of Representatives:

"Many enlightened scholars have expressed doubt as to whether any government can take more than two days in ten from the people, or 20 per cent of the nation's income, and still leave a people able to take care of themselves. Above that level, Socialist management becomes inevitable. We must remember that as recently as 1930, London and Paris managed only 21 per cent of their national economy; Berlin managed 22 per cent and brought on national socialism three years later, Moscow, after thirteen years of socialism, managed only 29 per cent of the Russian economy. Can we be excused, if we fail to take to heart these facts and govern ourselves accordingly?"

Mr. Gwinn, in strengthening his contention that the government has become over-powerful and unwieldy, said:

"With a forty-hour work-week, we have less than twenty-seven hours, or about three and one-third days per week to produce our food, clothing, and shelter, and to maintain our health and education. It cannot be done. So, as a consequence, the people cry out in increasing millions for the Government to do for them what they are incapable of doing for themselves in three and one-third days per work week. The only cure that Government proposes is that of extending Government management, increasing taxes, and thus reducing even further the number of days in which the people can work for themselves in the management of themselves, their property and their happiness. Such methods can only lead to scarcity and general poverty, as in Russia."

Socialized Medicine a Bribe

Asserting that U. S. Government is well on the way toward socialism, Representative Gwinn called attention to another signpost on the road:

"Our socialists propose to continue . . . to Marxist serfdom by bribing our doctors to socialize health and medicine from Washington just as the British Marxist Government has done. The procedures are almost identical. Seven hundred and fifty thousand doctors, nurses, and hospital personnel would enter our Government employment and cease the free practice of medicine. Washington would guide and control it all, drying up the voluntary source of skill, mercy, health, and hospitalization. Multiply 750,000 by four and you get another group who will vote according to the promises of appropriations for their particular benefit. The less fit will grab $8,000 a year in Government salary just as they grabbed 2,000 pounds a year in England.

"There will be no more need to excel in skill and devotion to patients; there will be no more competitive effort for public favor. Payments by Government will be for quantity, not quality, of service. . . . Government medicine is sterile. It never invents or discovers new cures. It can but appropriate and try to take by force what the individual alone can give as a voluntary free servant of the people. He alone can have the heart of sacrifice and devotion and love of service. Without freedom in medicine, the art of healing itself disappears."

CHRONIC ILLS PART OF HOSPITAL PLAN

Care of the chronically ill comes in for serious consideration in the 1949 revision of the *Minnesota Plan for Hospitals and Public Health Centers,* just released by the State Department of Health.

The publication, which outlines an over-all hospital construction plan for the state on the basis of the hospital Survey and Construction Law, calls for two chronic disease hospital beds per thousand of population—a total of 5,776 for Minnesota.

The Department is considering chronic disease patients apart from tuberculosis patients, mental patients and individuals requiring only nursing or domiciliary care. A chronic disease hospital is defined as having "the primary purpose of providing medical treatment for the cure or rehabilitation of chronic conditions including the degenerative diseases."

According to the plan, the hospitals are to be located as near to the patients as possible without overlooking the "urgent desirability" of constructing the units in conjunction with general hospitals where diagnostic and treatment facilities are available. The formula being used would allocate chronic disease beds to sixty-seven hospitals in thirty-seven locations, which were selected with regard to population density and distance patients would have to travel to medical centers.

CIO EXECUTIVE LAUDS BLUE CROSS PLAN

Harry Becker, director of the International UAW-CIO's social security department, has been quoted as saying:

"Blue Cross can offer Labor a more favorable program than is otherwise available in America today for the following reasons: Blue Cross can contract with all hospitals in a given geographical area on an actual cost of care basis; Blue Cross has a tax advantage which reduces premium costs; Blue Cross has non-profit status; Blue Cross can keep operating expenses within 10 per cent or less of income; and Blue Cross, as a community agency, is tending in the direction of effective, non-professional public representation on governing boards of trustees."

MINNESOTA STATE MEDICAL ASSOCIATION

House of Delegates

Summary of Proceedings*

Saint Paul Session—May 9-11, 1949

First Meeting, Sunday, May 8, 1949

The Terrace, Hotel Lowry
Saint Paul, Minnesota

The Ninety-sixth Annual Session of the House of Delegates of the Minnesota State Medical Association was held in the Terrace, Hotel Lowry, Saint Paul, Minnesota, beginning at 2:15 p.m., Dr. C. G. Sheppard, Hutchinson, Speaker, presiding.

Dr. Sheppard called the meeting to order and asked for the report of the Credentials Committee. Dr. Rolf Hovde, Winthrop, reported that a quorum was present. After approval of the minutes of the 1948 session of the House, Dr. Sheppard introduced two guests, Mr. C. H. Crownhart, executive secretary of the Wisconsin State Medical Association, and one of his staff members, Earl Thayer, executive director of public relations. Mr. Crownhart spoke briefly, opining that "physicians, as citizens, have interests in any type of legislation that affect the public welfare" adding that "these are momentous times, and I hope your statesmanship in your sessions today and tomorrow will be guided by the best judgment that you men can exercise in the interest of the health of the people of Minnesota and of the nation as a whole."

Dr. Sheppard next called for the report of Dr. F. J. Elias, chairman of the Council.

Report of the Council

Dr. Elias: The first meeting of the Council in connection with the Ninety-sixth Annual Meeting of the Minnesota State Medical Association was held on Saturday, May 7, 1949, at 2 p.m. in the Hotel Saint Paul, for transacting routine business. Minutes of the previous meetings were approved and financial reports were submitted and accepted. Supplementing the report of the Finance Committee . . . your Council chairman desires to call your attention briefly at this time to the sound financial position of your State Association. Shannon and Byers, auditors, reported on April 7, 1949, after examining the records of the accounts of the Association, that they were accurate, and that the increase in the total net worth in 1948 amounted to $1,165.37 over the previous year.

. . . the Council approved a resolution to contribute $100 for 1949 toward the extensive education program carried on by the National Society for Medical Research to eliminate impediments to research.

Discussion (of nurse recruitment) centered around the following facts:

1. The Minnesota State Medical Association has, by authorization of the Council and the House of Delegates, lent its full support to nurse recruitment efforts in the past.

2. Physicians who have worked closely with organizations . . . who have been engaged in nurse recruitment activities in recent months, are not satisfied that the needs of the rural communities are being properly considered; specifically that the representatives of the Minnesota Nurses Association . . . lay too much stress on the five-year course, and very little, if any, on the three-year course or the one-year course for training practical nurses.

3. The Minnesota Nurses Association and the Minnesota Hospital Association are not aware of the substantial contribution that has been made by the Minnesota State Medical Association in this respect.

. . . the following applications for Temporary Affiliate Membership were approved: Paul Giere Larson, Montevideo; Hyman Katzovitz, Saint Paul.

The following applications for Affiliate Membership were approved: John W. Helland, Spring Grove; William Howard Hollands, Fisher; H. E. Nelson, Crookston.

Applications for Life Membership were approved as follows: Alphonse E. J. Sohmer, Mankato; Oscar Daignault, Benson; Edward H. Frost, Willmar; J. C. Jacobs, Willmar; J. B. Clement, Lester Prairie; Edwin Elmer Shrader, Winsted; W. E. Wray, Campbell; George P. Kirk, East Grand Forks; Charles B. Lenont, Virginia.

A resolution was approved to authorize the Council of the Minnesota State Medical Association to assume the leadership for establishing a State Health Council in order that the medical profession in this state might maintain supervision over the medical aspects of such a program.

With the completion of routine business, your Council adjourned at 11 p.m. to reconvene at 9 a.m. Sunday morning, May 8.

The morning was devoted largely to a lengthy and spirited discussion . . . on the best approach toward fostering a broad prepayment medical and hospital coverage program for the state.

Three . . . resolutions were adopted by the Council for referral to the Resolutions Committee of the House:

1. A resolution to bend every effort to prevent enactment of laws providing compulsory health insurance or any similar plan which would jeopardize the health of the citizens of the United States.

2. The second resolution expressed opposition to the extension of the Social Security Act to include self-employed individuals.

3. The final resolution expressed appreciation to the local medical society, its committees and its Auxiliary, and to other groups and individuals for their splendid cooperation in assisting with the planning of the Ninety-sixth Annual Meeting of the Minnesota State Medical Association now in progress.

* * *

The House of Delegates approved the report and Speaker Sheppard called for the report of the Finance Committee from Dr. R. L. J. Kennedy, Rochester, Chairman.

Report of the Finance Committee

Dr. Kennedy: Attention is called to the fact that it was predicted last year that at the rate of income that existed then, and with mounting costs of operations, a

*In accordance with action by the Council of the Minnesota State Medical Association in 1944, publication of the proceedings of the House of Delegates is limited to summary. Any MSMA member who wishes to obtain a complete report may do so by contacting his delegate.

deficit would be unavoidable. For this reason the Council recommended an annual assessment of $10 per member to be levied in 1949 and to be replaced in 1950 and thereafter by a $10 increase in annual dues.

The program of the Committees on Public Health Education and Radio was greatly expanded at the direction of the House of Delegates at the meeting in June, 1948.

The return of the membership of the Association to the prewar level tapered off very sharply by December, 1948, due to the fact that most of those who had been inactive because of military service had returned to their practice.

The investment list of the Association underwent little change during the year 1948. According to the financial advisors for the Association, the investment position of the Association is conservative.

* * *

When the contract between the Veterans Administration and the Association comes up for re-negotiation on July 1, 1949, the Association will operate on a strictly month-to-month administrative cost basis so that there will be no uncertainty in the future as to what the income to the Association for services to the Veterans Administration will amount to.

The Finance Committee wishes to acknowledge with thanks the advice and help rendered to it by the Executive Secretary, Mr. R. R. Rosell, throughtout the year and for his aid in preparing this report.

The members of the Finance Committee, in addition to the chairman, are: O. J. Campbell, M.D., Frank Elias, M.D., and Ernest Hammes, M.D.

* * *

In accepting the Finance Committee's report, the House moved to continue the $10 assessment for 1950. In line with the committee's recommendation, thereafter the assessment would be made permanent by amending the Constitution to raise the dues to $30 per capita.

Reports of Reference Committees

The next order of business was the reports of the various reference committees. The Speaker called first upon Dr. R. F. Hedin, Red Wing, Chairman of the Reference Committee on Medical Education Reports.

Medical Education Reports

Dr. Hedin: Your Reference Committee on Medical Education Reports met at 10 a.m., May 8, 1949. The following Medical Education reports were considered:

Committee on Cancer—A. H. Wells, M.D., Duluth, Chairman.

Committee on Conservation of Hearing—L. R. Boies, M.D., Minneapolis, Chairman.

Committee on First Aid and Red Cross—John S. Lundy, M.D., Rochester, Chairman.

Heart committee—F. J. Hirschboeck, M.D., Duluth, Chairman.

Committee on Public Health Nursing—Mario Fischer, M.D., Duluth, Chairman.

Committee on Syphilis and Social Diseases—P. A. O'Leary, M.D., Rochester, Chairman.

Committee on Vaccination and Immunization—Robert N. Barr, M.D., Saint, Paul, Chairman.

Committee on Tuberculosis—J. A. Myers, M.D., Minneapolis, Chairman.

Committee on Hospitals and Medical Education—H. S. Diehl, M.D., Minneapolis, Chairman.

These reports were accepted, together with these Committee recommendations and comments: endorsement of an investigation of the desirability of a state-wide Red Cross Blood Bank distribution; commendation of the excellent work performed by the division of venereal diseases under the direction of Dr. Harry Irvine; suggestion that the Veterans Administration be urged to provide additional facilities to the extent necessary to care adequately for veteran patients suffering from tuberculosis; appreciation for the work of Dr. George Aagaard as director of the postgraduate program for physicians; emphasis on the need for expanding the programs for training of practical nurses and nurse anesthetists.

* * *

Dr. Sheppard next called for the report of the Reference Committee on Miscellaneous Scientific Reports, Dr. E. C. Bayley, Lake City, Chairman.

Miscellaneous Scientific Report

Dr. Bayley: Your committee has carefully considered the following reports:

Committee on Anesthesiology—R. C. Adams, M.D., Rochester, Chairman.

Committee on Child Health—G. B. Logan, M.D., Rochester, chairman.

Committee on Diabetes—J. R. Meade, M.D., Saint Paul, Chairman.

Committee on Fractures—E. T. Evans, M.D., Minneapolis, Chairman.

Committee on General Practice—R. H. Creighton, M.D., Minneapolis, Chairman.

Historical committee—M. C. Piper, M.D., Rochester, Chairman.

Committee on Industrial Health—Leonard Arling, M.D., Minneapolis, Chairman.

Committee on Maternal Health—J. J. Swendson, M.D., Saint Paul, Chairman.

Committee on Medical Testimony—E. M. Hammes, M.D., Saint Paul, Chairman.

Committee on Military Affairs—J. H. Tillisch, M.D., Rochester, Chairman.

Committee on Nervous and Mental Diseases—W. P. Gardner, M.D., Saint Paul, Chairman.

Committee on Ophthalmology—T. R. Fritsche, M.D., New Ulm, Chairman.

Committee on Public Health Education—A. E. Cardle, M.D., Minneapolis, Chairman.

Committee on Radio—R. M. Burns, M.D., Saint Paul, Chairman.

Speakers' Bureau—F. J. Heck, M.D., Rochester, Chairman.

Editorial committee—C. M. Gambill, M.D., Rochester, Chairman.

Your committee approved the above reports . . . with the following qualifications:

This committee wishes to thank Dr. Piper for his years of faithful and loyal service and fine work in establishing full and accurate historical records, and heartily accepts the committee's appointment of Dr. Harry Weber as co-chairman.

With regard to the approach of solving the problem for more physicians in the Armed Forces, the committee feels that if moral suasion does not obtain the required number, there would be no objection to drafting them by law.

Your committee wishes to commend Dr. Walter P. Gardner and his Committee on Nervous and Mental Diseases for the time and effort they have spent and their accomplishments.

Special consideration was given to the report of the Committee on Health Education, which acts in a public relations capacity. Attention was called to the many splendid projects which this committee initiated this year, i.e., the state-wide medical press conference, employment of a field secretary, sponsorship of health councils, preparation and distribution of a special health publication *Health News and Views*.

The report was accepted, with the amendment that forthcoming issues of *Health News and Views* have a card inserted which would read, "Kindly send this to some friends in a neighboring state."

Dr. Sheppard then called for Medical Economics reports, Dr. Paul Leck, Austin, Chairman.

Medical Economics Report

Dr. Leck: The Reference Committee on Medical Economics Reports . . . has considered the annual reports of the following committees:

Editing and Publishing Committee—E. M. Hammes, M.D., Saint Paul, Chairman.
Committee on Interprofessional Relations—W. P. Gardner, M.D., Saint Paul, Chairman.
Medical Advisory Committee—W. H. Hengstler, M.D., Saint Paul, Chairman.
Committee on Medical Economics—George Earl, M.D., Saint Paul, Chairman.
Committee on Medical Ethics—R. D. Mussey, M.D., Rochester, Chairman.
Committee on Public Policy—R. F. Erickson, M.D., Minneapolis, Chairman.
Committee on University Relations—A. E. Cardle, M.D., Minneapolis, Chairman.

The committee approved the reports; passed two motions: (1) that it would recommend to the House of Delegates that Dr. R. F. Erickson be asked to address the House, (2) that an expression of appreciation be extended to Dr. Erickson, Manley Brist, Dr. L. L. Sogge, the Council, R. R. Rosell and his staff for their untiring efforts during the legislative session; and made these recommendations and comments:

. . . that the Editing and Publishing Committee be commended for the maintenance of high standards of Minnesota Medicine, despite the small deficit for the year 1948; that delegates be urged to emphasize to members of each county society the need for continued study and action on medical economic problems.

* * *

Dr. Erickson, Mr. Brist, Dr. Sogge and Dr. Hammes were asked to address the House and each spoke briefly on legislative matters. The men were given a rising vote of thanks and the committee report was accepted.

Dr. Sheppard then called on Dr. B. O. Mork, Jr., Worthington, to discuss health councils. Dr. Mork urged medical men to take the leadership in setting up health units and health councils, pointed out that the movement is endorsed by the AMA, and described the operation of the Nobles county health council which has been in existence for more than a year.

Dr. Sheppard next called for Miscellaneous Medical Economic Reports, Dr. F. W. Behmler, Morris, Chairman.

Miscellaneous Medical Economics Reports

Dr. Behmler: The Reference Committee on Miscellaneous Medical Economics reports considered the following reports:

Insurance Liaison committee—A. W. Adson, M.D., Rochester, Chairman.
Committee on Medical Service—A. W. Adson, M.D., Rochester, Chairman.
Committee on Rural Medical Service—P. C. Leck, M.D., Austin, Chairman.
Committee on State Health Relations—C. E. Proshek, M.D., Minneapolis, Chairman.
Committee on Veterans Medical Service—R. H. Creighton, M.D., Minneapolis, Chairman.

The reports were approved, with these recommendations and comments: that an information office be set up in each county where the public could receive information regarding the voluntary prepayment medical and hospital plan; that special approval be given the report on resolutions that were presented by the Council on Medical Service of the AMA; that the formation of health councils in each county be speeded up, if at all possible; that the study of the coroner situation be continued.

* * *

After House approval of the report, Dr. Sheppard asked for the report of the Reference Committee on Officers and Councilors Reports, Dr. Nelson W. Barker, Rochester, Chairman.

Officers' and Councilors' Reports

Dr. Barker: The Reference Committee wishes to express high commendation of the work of the secretary and the executive secretary. . . . Particular commendation is made of various procedures initiated during the year in the dissemination of information regarding compulsory health insurance, as well as various other new activities which have been carried out by the Central Office during the year. (Medical Press Conference, meeting of County Officers and House of Delegates, appointment of Lyle A. Limond, field secretary, noted.)

Among committee comments and recommendations were: suggested increase in public relations personnel; increased efforts to enlarge membership of State Association; request for more detailed information on financial report; commendation of work of Chairman and Council; approval of re-districting of third and fourth Councilor districts, as proposed by Dr. L. G. Smith; special notice of activities of Nicollet-Le Sueur Medical Auxiliary; commendation of Seventh District plan for channeling publicity and literature; suggestion that Dr. Will explain this plan to House of Delegates and that Dr. W. L. Burnap address the House on the nursing problem.

* * *

Dr. R. L. J. Kennedy was called upon to discuss the financial report at greater length. He cited again that increased and extended activities in virtually all fields had necessitated greater financial appropriations this year.

Dr. A. E. Cardle, chairman of the Public Health Education Committee, was asked to comment on the expanded health education program of the Association. He delineated the differences between the state and national program and pointed out how the two were correlated while still in the planning stage. He called attention to the Medical Press Conference, the tabloid *Health News and Views,* and the supplement being planned for Sunday editions of the Minneapolis, Saint Paul and Duluth newspapers. He also explained the organization of statewide public relations work, mentioning the state office personnel and the part-time public relations consultant employed by the MSMA, all working under the direction of the Health Education committee.

R. R. Rosell, Executive Secretary, was asked to comment on the number of physicians who are members of the State Association.

Mr. Rosell: At the present time I think we do not have over 10 per cent of practicing physicians in the state who are not members of the State Association.

* * *

The report of the Reference Committee on Officers and Councilors Reports was accepted, and the House of Delegates turned to new business.

At this point Dr. J. F. DuBois, Sauk Centre, and Dr. T. E. Bratrud, Thief River Falls, suggested the possi-

bility of increasing the dues to provide more money for health education work. Dr. Cardle indicated the willingness of his committee to accept suggestions for improvement. Dr. F. J. Lexa, Lonsdale, expressed doubt that doctors would react favorably to an increase in dues; while Dr. Gordon MacRae, Duluth, explained the value of assessing extra money on a local level and spending it locally. He detailed the excellent public relations program of the St. Louis county society which is financed by the doctors there and operates within those community boundaries. His sentiment was echoed by two other delegates and by Mr. Rosell.

The order of business was interrupted briefly for an introduction of Mrs. H. F. Wahlquist, State Auxiliary President. Mrs. Wahlquist outlined the Auxiliary's work during the year and concluded with the hope: may we always work together for better health in Minnesota.

After a moment of silence in honor of Mother's Day, the House adjourned at 5:10 p.m.

Second Meeting, Sunday, May 8, 1949

The Terrace, Hotel Lowry
Saint Paul, Minnesota

The House of Delegates reconvened at 8:15 p.m. with the Credentials committee reporting a quorum present. Dr. W. F. Braasch, Rochester, was the first person to address the House. He spoke on behalf of the World Medical Association, which he described as a powerful force for the improvement of health, the progress of medicine, and the promotion of international good will. Reminding doctors that there is a current campaign to have every member of the AMA become a contributing member of the WMA, he urged every doctor present to study the program and take part in it.

The next item of business was a report from Jarle Leirfallom on the activities of the Division of Social Welfare. Mr. Leirfallom remarked on the welfare legislation passed by the 49th legislature, believing it to exceed in amount, and perhaps in quality, welfare legislation passed by any previous session. Mr. Leirfallom reviewed those laws he thought to be of particular signifiance to the medical profession: provision of facilities for the treatment of emotionally disturbed children; change in the adoption law which will cut red tape in getting children out of institutions and into homes; creation of a commission to study divorce, juvenile and desertion laws; requirement that every person placing a child for permanent foster care, or assisting in that placement, report to the Director of Social Welfare; removal of the maximum in aid to dependent children; changes in the tuberculosis control and treatment laws which: raised the amount of state aid for indigent tuberculosis patients, made the control of tuberculosis patients, as public health menaces, easier, and permits the closing of sanitoria when they are no longer of use; appointment of the Director of Social Welfare as co-ordinator of the displaced persons program; setting up of a formula for state financing of relief and welfare services.

Mr. Leirfallom expressed appreciation for the cooperation of the physicians of the state, adding his gratitude for the benefits of a splendid committee which has advised him from time to time.

Dr. F. F. Callahan, chief of the medical unit, Division of Social Welfare, discussed briefly the increase in medical costs, particularly in the old age group.

Dr. Sheppard then called on Dr. O. I. Sohlberg, Saint Paul, who reported on Minnesota Medical Service, now sixteen months old. He emphasized that the more persons enrolled in this program, the less demand for socialization. Of importance, he feels, is the need for every physician to become associated with the program.

Following Dr. Sohlberg's report, Dr. Sheppard asked for reports on the Minnesota State Board of Examiners. Dr. J. S. McCartney, Minneapolis, discoursed on the basic science examinations and Dr. DuBois, on the State Board of Examiners in general.

Outpatient medical care for veterans was discussed before the House by Dr. Richard B. Hullsiek of the Veterans Administration who asked for the continued co-operation of the State association and the profession in general.

Dr. Sheppard next called on Dr. A. J. Chesley to report on the State Department of Health. Following Dr. Chesley was Dr. H. S. Diehl, who, as dean, reported on the University of Minnesota's Medical School. His report was supplemented by the Assistant Dean, Dr. M. M. Weaver. Following Dr. Weaver's remarks, Dr. Hammes and Dr. Sheppard expressed the association's regret that Dr. Weaver is leaving Minnesota and wished him well in his new position as dean of the Medical School of British Columbia.

The House adjourned at 10:40 p.m.

Third Meeting, Monday, May 9, 1949

The Terrace, Hotel Lowry
St. Paul, Minnesota

The House of Delegates reconvened at 1:30 p.m., with a quorum present. The first item of business was a supplemental report of the Council by Dr. Elias. Subject of the report was Minnesota Medical Service. Dr. Elias quoted the anticipation of the Council—that Blue Shield will enroll at least twice as many subscribers in 1949 as it did in 1948. He cited the importance of keeping pace with the trend of the times, in this case, notably, broader coverage for low income groups.

Also included in the final report of the Council were these recommendations: Dr. Cardle, as member of the AMA House of Delegates, to succeed Dr. Hansen; Dr. George Earl, as member of the AMA House of Delegates to succeed Dr. F. J. Savage of Saint Paul; Dr. W. W. Will to succeed himself as alternate delegate, and Dr. E. M. Hammes to succeed Dr. George Earl, Saint Paul, as another alternate delegate to the American Medical Association.

Drs. Theodore Catlin, Buffalo, and F. L. Schade, Worthington, were appointed to continue as members of the Advisory Board to the State Department of Health under the Hospital Licensing Law, and Dr. Thomas E. Broadie, St. Paul, was reappointed to the Advisory Board of the State Department of Health under the Hospital Administrators Registration Law.

The Council did not recommend any additional assessment, feeling that funds presently available are sufficient

for the Public Health Education program on a state level. Component medical societies were urged to take whatever steps were necessary, financially and otherwise, to implement and expand their present public health education programs and initiate such new activities as the local society may endorse. Material developed by the State Office, under the Public Health Education committee's direction, and material from Whitaker & Baxter should be used.

Dr. Elias also read a letter from the Office of the Secretary of Defense, calling attention to the quota of volunteers for the Armed Forces, established for Minnesota on the basis of availability and distribution of physicians.

After the House approved Dr. Elias' report, he read a resolution from the Woman's Auxiliary, opposing compulsory health insurance. The resolution was endorsed by the House.

Next was the report of the Resolutions Committee, Dr. F. J. Hirschboeck, Duluth, chairman.

Resolutions Committee Report

WHEREAS, under the system of private practice of medicine, the health of the people of the United States is better than that of any other people; and

WHEREAS, voluntary, democratic ways have been found most satisfactory in meeting the need for medical care of persons in all income groups, now therefore,

BE IT RESOLVED, that the Minnesota State Medical Association do everything in its power to prevent enactment of laws intended to provide compulsory health insurance or any similar plan which would jeopardize the health of the citizens of the United States.

That a copy of this resolution be forwarded to the President of the United States, to each Senator and Representative from the State of Minnesota, and that said Senators and Representatives be and are hereby respectfully requested to use every effort at their command to prevent the enactment of such legislation.

* * *

WHEREAS, legislation is now under consideration in committees of the Congress of the United States which proposes extension of the Social Security Act to include self-employed individuals, and

WHEREAS, such a measure is destructive of self-reliance in this group of individuals, and

WHEREAS, such individuals would be found to pay amounts greatly in excess of possible benefits to be derived, and

WHEREAS, such legislation would constitute another step toward a completely socialistic state, now, therefore,

BE IT RESOLVED that the Minnesota State Medical Association hereby expresses unalterable opposition to such legislation; That a copy of this resolution be forwarded to the President of the United States, to each Senator and Representative from the State of Minnesota, and that said Senators and Representatives be and are hereby respectfully requested to use every effort at their command to prevent the enactment of such legislation.

* * *

BE IT RESOLVED, that in the interests of good public relations and the furtherance of public confidence in the high standards maintained by the medical profession as a whole, that members of the Minnesota State Medical Association are urged to use prescription blanks which are not identified with drug firms.

* * *

The House of Delegates recognizes and appreciates the contributions of many groups and individuals to the success of the 96th Annual Meeting of the Minnesota State Medical Association.

Specifically the House of Delegates wishes to pay tribute:

To the officers and members of the Ramsey County Medical Society, the Ramsey County Medical Auxiliary, and the Committee on Local Arrangements for their untiring efforts in planning many of the events on the program and in extending the hospitality of the convention city;

To the management of the Hotel St. Paul and the Hotel Lowry for courteous service to convention guests and delegates;

To Radio Stations WCCO, KSTP, WTCN and WMIN for making possible the fine schedule of broadcasts in connection with the meeting; and

To the *Minneapolis Star-Journal,* the *Minneapolis Tribune,* the *St. Paul Dispatch,* the *St. Paul Pioneer-Press,* the United Press and the Associated Press for their excellent advance notices and coverage of the convention.

* * *

BE IT RESOLVED, that the Minnesota State Medical association officially commend Doctor (M. M.) Weaver for his exceptional service to the medical profession of this state.

* * *

WHEREAS, a bill has been passed at the 1949 Legislative session for the improvement in the care of the mentally ill in the State of Minnesota, and

WHEREAS, it may not fulfill all the desired objectives of the Minnesota State Medical association in dealing with this problem, however,

BE IT RESOLVED, that the Minnesota State Medical association commend the members of the 1949 Legislature for the worthy motives in this bill and for its passage; and

BE IT FURTHER RESOLVED, that we urge the entire medical profession of Minnesota to co-operate in every way in the successful carrying out of this program, and that efforts be made in the future to implement existing legislation to further the care of mentally ill patients in our institutions; and

BE IT FURTHER RESOLVED, that a copy of this resolution be sent to each member of the Legislature of Minnesota and the Governor of the State of Minnesota.

* * *

Your committee on Health Education proposes to sponsor, at no expense to the Minnesota State Medical association or its component societies, a special tabloid section on medicine to be issued in connection with the Sunday newspapers of Minneapolis, Saint Paul and Duluth.

The section would tell, by means of pictures, news and feature stories, the progress of medicine in Minnesota. Advertising to finance the tabloid would be paid for by hospitals, optical firms, drug manufacturers, insurance companies and any other ethical groups and individuals allied with medicine.

* * *

WHEREAS, your Committee on Public Health Education believes that there is an increasing need to secure closer understanding with the press of this state and,

WHEREAS, one criticism frequently heard from the press is that the medical profession expects the press to maintain the entire burden of indirect publicity from the doctor to the public without any remuneration and,

WHEREAS, as long as this opinion exists, your committee believes that, with county medical society approval, doctors may place a professional card, stating only the name, address, telephone number and office hours of the doctor, in the local newspaper, provided, however, if a physician is so recognized in his community, he may, with local medical society approval, insert his specialty; the said card not to exceed one column in width and two inches in depth; and, likewise, a component medical society may sponsor special greetings, messages, or announcements in the name of the component society or the

(Continued on Page 846)

In Memoriam

E. W. BENHAM

Dr. E. W. Benham for many years a prominent physician in Mankato died June 19, 1949 in Compton, California.

Dr. Benham was born in Cleveland, Ohio, in 1867 and came to Minnesota in his childhood. He was graduated from the Northfield High School and worked for a while as secretary to the chief engineer of the Great Northern Railway.

He graduated from the University of Minnesota Medical School in 1896, practiced for ten years at Madison Lake and Amboy, and spent three years in postgraduate study in the East. He was first associated with Dr. J. H. James in practice at Mankato and later became a member of the Mankato Clinic. Since his retirement five years ago, after forty-seven years of practice, he and Mrs. Benham have spent much of their time in California.

Dr. Benham was a member of the Blue Earth County Medical Society, the Minnesota State and American Medical Associations. He was a member of the Masonic Lodge. St. John's Episcopal Church, the Kiwanis Club and the original Social Science Club.

He is survived by his wife, Louise Oleson Benham, and two daughters, Mrs. Bert Bosteter of Compton, California, and Helen Benham of Monrovia, California.

JAMES H. BENTSON

Dr. James H. Bentson, a native of Saint Paul, died June 28, 1949 of carcinoma of the lung. He was thirty-one years of age.

Born in Saint Paul May 15, 1918, the son of Mr. and Mrs. Mort Bentson and a nephew of the late Dr. Max Hoffman of Saint Paul, he attended the Saint Paul Academy and graduated from the University of Minnesota Medical School in 1942 with M.B. and M.D. degrees.

Since graduation he has been associated with the Mayo Clinic. Two years ago he developed carcinoma of the lung. Keeping his affliction a secret from his parents so as not to cause them to worry, he sought medical advice in eastern clinics to no avail. He died in New York City while on a trip with another member of the Mayo Clinic.

Dr. Bentson, his medical career so tragically terminated at its very beginning, is survived by his parents, a brother, Lawrence of Los Angeles and his grandmothers, Mrs. Esther Hoffman and Mrs. Anna Bentson, both of Saint Paul.

HERBERT A. BURNS

Dr. Herbert A. Burns, recently of Ten Mile Lake, Hackensack, and Minneapolis, died July 8, 1949, following a cerebral hemorrhage. He was sixty-six years of age.

Dr. Burns was born January 12, 1883, at Found du Lac, Wisconsin. A graduate of the University of Minnesota Medical School in 1908, he served seven years as epidemiologist with the State Board of Health, was in the Army for a year and a half and with the United States Public Health Service for three years. Specializing in diseases of the chest he was associated with the Veterans Bureau for five years. He was also at one time superintendent of the tuberculosis sanatorium at Ah Gwah Ching and for thirteen years ran the state sanatorium at Walker. In 1942 he was appointed head of the tuberculosis control unit in state mental hospitals.

Dr. Burns is survived by his wife, four daughters, Mrs. Oscar Kosberg, Little Rock, Ark., Mrs. Richard T. Roberts, Cedar Hills, Tenn., Mrs. Philip Cloutier, Waterloo, Ark., and Mrs. Robert Bagley, Duluth; one son, Dr. Hugh T. Burns of the Panama Canal Zone; one sister, Maud Burns of Hutchinson, Minnesota, and a brother, Dr. Jay H. Burns of Hutchinson.

LLOYD G. DACK

Dr. Lloyd G. Dack, associated for a number of years with the Earl Clinic, Saint Paul, died suddenly of a heart attack while playing golf July 9, 1949. He was fifty-nine years of age.

Dr. Dack was born in Stanton, Minnesota, June 8, 1890. After two years at Carleton College, he attended the University of Minnesota where he graduated with B.S. and M.D. degrees in 1916. He took postgraduate work in eye, ear, nose and throat diseases at New York Postgraduate School and had practiced his specialty in Saint Paul for twenty-one years following a brief period of general practice in Brooten, Minnesota.

Dr. Dack was a member of the Ramsey County Medical Society, the Minnesota State and American Medical Associations, the American College of Surgeons, a fellow in the American Ophthalmological Society, the Medical Assembly and Phi Beta Pi, medical fraternity. He was also a Shriner and a member of the Kiwanis Club.

He is survived by his wife, two daughters, Mrs. Raymond McMahon and Mrs. Jere Dalldorf, and two stepsons, Dr. John C. Poore of Palo Alto, California, and Dr. Thomas N. Poore of Rochester, Minnesota.

JAMES S. GILFILLAN

Dr. James S. Gilfillan, for many years an outstanding internist of Saint Paul, died June 13, 1949. A fractured hip sustained April 16, 1949, doubtless contributed to his death at the age of eighty-one.

Dr. Gilfillan was born in Saint Paul, April 15, 1869, the son of Judge and Mrs. James Gilfillan. He attended public schools in Saint Paul and Shattuck Military Academy in Faribault. His desire to study medicine being disapproved by his father, he obtained employment with the Northern Pacific railway. During this period he began reading medicine and upon the death of his father entered the University of Minnesota Medical School. After graduating in 1897 he transferred to the Univer-

sity of Pennsylvania where he received his medical degree in 1898. His internship was served in Kings County Hospital, Brooklyn, after which he began practice in Saint Paul. In 1907 he took postgraduate work in Vienna.

From 1903 until 1936, Dr. Gilfillan held various appointments on the faculty of the University of Minnesota Medical School, having been Associate Clinical Professor of Medicine from 1915 until 1936.

He was a member of the Miller Clinic during its existance from 1921 to 1933 and had offices in the Hamm Building with Dr. George E. Senkler and Dr. A. R. Hall from 1932 until his retirement in 1938.

Dr. Gilfillan was a member of the Minnesota Academy of Medicine, of which he was president in 1931; Minnesota Society of Internal Medicine; the Ramsey County Medical Society and its president in 1911, and a member of the Minnesota State and American Medical Associations.

Dr. Gilfillan had a wide knowledge of medical literature, a remarkably retentive memory and an unusual ability in judging essentials in making a diagnosis. On the occasion of the testimonial dinner given retiring members of the Medical School faculty on June 10, 1936, the following tribute was paid him:

"A characteristic widely known and acclaimed is his uncompromising honesty, both in opinion and in expression. He has never been known to allow any consideration of circumstance or of personal profit to cause him to waver in this regard. Dr. Gilfillan's teaching and conversation have been salted and peppered, but withal delicately flavored by a sense of humor that make his leadership delightful and never to be forgotten."

Dr. Gilfillan married Hilda Benson in 1906. He is survived by his widow, a son, James, and three grandsons, James, Sterling and Duncan; a brother, Col. Perry Gilfillan, and four sisters, Mrs. Webster Wheelock, Mrs. Samuel Gilbert, Mrs. James Byrd Hewitt, and Mrs. Benjamin C. Bradford, all of Saint Paul.

George E. Senkler
Carl B. Drake

WALTER C. POPP

Dr. Walter C. Popp, consultant in therapeutic radiology at the Mayo Clinic, Rochester, Minnesota, died June 4, 1949 of coronary occlusion. He was forty-seven years of age.

Dr. Popp was born in Pittsburgh, October 24, 1901. He attended St. Vincent College at Latrobe, Pennsylvania, before studying medicine at the University of Pittsburgh, where he graduated in 1929. After interning at St. Francis Hospital in Pittsburgh, he entered the Mayo Foundation as a fellow in dermatology and syphilology on July 1, 1930 and received the degree of M.S. in 1933.

He served successively as associate in roentgen therapy, instructor in radiology and at the time of his death was consultant in therapeutic radiology, the Mayo Clinic, and assistant professor of radiology, the Mayo Foundation.

Dr. Popp was very active in community affairs. He was at one time president of the Rochester Automobile Club, the City-County Safety Council and the Lourdes Parent-Teacher Association. He also served on several committees of the Chamber of Commerce. He was a member of the local county medical society, the Minnesota State and American Medical Associations.

He is survived by his wife and three daughters, Madeline, Jeanne and Barbara, and one sister, Mrs. Peter Sobers of Washington, D. C.

WILLIAM HENRY RUMPF

Dr. William H. Rumpf of Faribault died June 26, 1949 at the age of eighty-two.

Dr. Rumpf was born in Dubuque, Iowa, on January 2, 1867. He attended Brooklyn Polytechnic High School and graduated from Yale College in 1886. His medical education was obtained at the University in Berlin, Freiburg, and Kiel where he obtained his medical degree in 1891. He interned at the Royal Berlin Obstetric Hospital and took postgraduate work in Vienna in 1891.

He came to Faribault in 1902 after having been connected with Northwestern University Medical School for ten years.

Dr. Rumpf is survived by two sons, Dr. C. Walter Rumpf of Faribault and Dr. William Rumpf, Jr., of Dallas, Texas.

THE DOCTOR AND THE PATIENT

The responsibility of the doctor in enabling the patient to gain psychological acceptance of the diagnosis cannot be too strongly emphasized. There is much that auxiliary medical personnel can do, but all that they do cannot equal what the doctor himself can accomplish in helping the patient to develop a constructive attitude toward his illness. The patient "can take it" from the doctor to a degree that no one else can match. The understanding and assurance the patient receives from the doctor have far more effect in creating a frame of mind conducive to successful hospitalization than any help the patient receives from others.—William B. Tollen, Ph.D., VA Pamphlet 10-27, October, 1948.

A GOOD INSECTICIDE, NOT POISON

(Continued from Page 833)

sickness due to the DDT itself . . . despite the fact that thousands of tons have been used annually for the past four or five years, in the home and for crop and animal protection." As a precautionary measure modifications of recommendation have recently been made by the Department of Agriculture for the use of DDT on dairy cattle. There is, however, no justification for any public alarm about the safety of the milk supply from the standpoint of possible DDT contamination. This has been agreed upon by the Department of Agriculture, the Army and the Navy, the Pan-American Sanitary Bureau and the Federal Security Agency.—*New England J. Med.*, June 30, 1949.

✦ Reports and Announcements ✦

AMERICAN COLLEGE OF SURGEONS INTER-AMERICAN CONGRESS OF SURGERY

The sixth Inter-American Congress of Surgery will meet as part of the thirty-fifth Clinical Congress of the American College of Surgeons at the Stevens Hotel, Chicago, October 17 to 23. Dr. Frederick A. Collier of Ann Arbor, Michigan, is president and Dr. Arnold Caviglia of Buenos Aires is secretary general.

This will be the first time the Inter-American Congress has been held in the United States. The first Congress was held in 1942 in Santiago, Chile; the second in 1943 in Buenos Aires; the third in 1946 in Montevideo, Uruguay; the fourth in 1947 in Rio de Janeiro; and the fifth in La Paz, Bolivia. Surgical societies of South and Central America are members. Between 200 and 300 Latin-American surgeons are expected to attend, and sessions will be open to Fellows from the United States and Canada.

AMERICAN ACADEMY OF NEUROLOGY

The first national scientific meeting of the American Academy of Neurology was held at French Lick Springs, Indiana, on June 1, 2 and 3. Thirty-eight scientific papers were presented at the meeting, which was attended by almost 300 persons.

The American Academy of Neurology was founded two years ago to foster the progress of clinical neurology. It now has over 700 members. President of the organization is Dr. A. B. Baker of the University of Minnesota.

INTERNATIONAL COLLEGE OF SURGEONS

The United States Chapter of the International College of Surgeons will hold its fourteenth annual assembly in Atlantic City, November 8 through 11. Special surgical clinics will be conducted in Philadelphia hospitals on November 7.

At Atlantic City, scientific sessions will be held in the various surgical specialties. An extensive technical and scientific exhibit will be presented by manufacturers of surgical instruments, x-ray apparatus, operating room and hospital equipment and pharmaceuticals.

Approximately 500 surgeons will be received as Associates and Fellows of the College at the convocation on November 10.

All doctors of medicine interested in surgery are invited to attend the assembly. A program may be obtained from Dr. Arnold S. Jackson, Secretary, Jackson Clinic, Madison 5, Wisconsin.

NATIONAL GASTROENTEROLOGICAL ASSOCIATION

The National Gastroenterological Association will hold its fourteenth scientific session at the Somerset in Boston on October 24 to 26. Among the speakers to present papers at the convention are Dr. Owen H. Wangensteen, University of Minnesota Medical School; Dr. Frank Lahey, Boston; Dr. William B. Castle, Boston; Dr. George Crile, Jr., Cleveland; Dr. Maxwell Finland, Boston; Dr. J. M. T. Finney, Jr., Baltimore, and Lord Alfred Webb-Johnson, president of the Royal College of Surgeons, London, England, who will be a guest of honor at the banquet to be held on Tuesday evening, October 25, 1949.

At the annual banquet to be held at the Somerset, the winner of the National Gastroenterological Association's 1949 Prize Award Contest for the best unpublished contribution on gastroenterology or an allied subject will receive the prize of $100 and a certificate of merit.

Immediately following the convention, on October 27, 28 and 29, the Association is sponsoring a course in Gastrointestinal surgery at the Boston City Hospital.

Further information concerning the program and details of the course may be obtained by writing to the Secretary, National Gastroenterological Association, 1819 Broadway, New York 23, N. Y.

MISSISSIPPI VALLEY MEDICAL SOCIETY

The fourteenth annual meeting of the Mississippi Valley Medical Society will be held at the Jefferson Hotel, St. Louis, September 28, 29 and 30. Over thirty clinical teachers from the leading medical schools will conduct the assembly, the entire program of which is planned to appeal to general practitioners. There will be about sixty scientific and technical exhibits, round-table luncheons, et cetera. No registration fee will be charged, and every ethical physician is invited to attend.

The American Medical Writers Association will also hold its annual meeting at the Jefferson Hotel on September 28.

Programs of both meetings may be obtained from Harold Swanberg, M.D., secretary of both organizations, 209-224 W.C.U. Building, Quincy, Illinois.

CONTINUATION COURSES

Diseases of the Chest

The University of Minnesota announces a continuation course in Diseases of the Chest to be presented on October 20, 21, and 22, 1949. The course is sponsored by the Minnesota Chapter of the American College of Chest Physicians and is intended for general physicians. The course will be held at the Center for Continuation Study on the Minneapolis campus of the University.

Among the subjects to be presented will be "The Work-up of a Patient with an Abnormal Chest X-Ray Shadow," "The Differential Diagnosis of Cardiac and Pulmonary Dyspnea," "The Psychosomatic Aspects of Chest Diseases," and "Acute Respiratory Diseases." Symposia will be held on pulmonary tuberculosis and carcinoma of the lung. A clinical x-ray conference and medical clinic will be held on chest diseases.

Dr. O. A. Sander, Milwaukee, Wisconsin, will discuss

"The Pneumoconioses," as a visiting faculty member for the course. Clinical and full-time members of the staff of the University Medical School and the Mayo Foundation will complete the faculty for the course.

Pediatric Roentgenology

The University of Minnesota announces a continuation course in Pediatric Roentgenology on October 31 to November 5, 1949. The course, which will be presented at the Center for Continuation Study, is intended for radiologists and pediatricians. The material to be presented will include the basic medical sciences, clinical medicine, and diagnostic roentgenology, as it pertains to general and special problems in the field of childhood diseases. Presentation will be by means of lectures, clinics, conferences, and round-table discussions.

Distinguished visiting physicians who will participate as members of the faculty for the course will include Dr. John Caffey, Babies Hospital, Columbia University Medical Center; Dr. Edward B. D. Neuhauser, Children's Hospital, Boston; Dr. Edith Potter, University of Chicago; and Dr. Frederic N. Silverman, Children's Hospital, Cincinnati. The remainder of the faculty for the course will be made up of clinical and full-time members of the staff of the University of Minnesota Medical School and the Mayo Foundation.

Infectious Diseases

The University of Minnesota announces a continuation course in Infectious Diseases on October 3, 4, and 5, 1949. The course will be presented at the Center for Continuation Study and is intended for general physicians.

Among the subjects to be presented will be "Laboratory Facilities Needed by and Available to the Practicing Physician for the Diagnosis of Infectious Diseases," "Immunization Procedures," "Chemotherapy and the Antibiotics." Symposia will be held on rheumatic fever, virus diseases, and poliomyelitis.

Dr. Louis Weinstein, Chief of the Department of Infectious Diseases at Massachusetts Memorial Hospital, Boston, will be a visiting member of the faculty for the course. Dr. Weinstein will present the subjects, "The Pneumonias," and "The Current Concepts of the Common Cold and Influenza." The remainder of the faculty for the course will be made up of clinical and full-time staff members of the University of Minnesota Medical School and the Mayo Foundation.

✦ Woman's Auxiliary ✦

WA PRESIDENT REVIEWS NATIONAL CONCLAVE

Mrs. H. E. Bakkila

Auxiliary members throughout the country can take credit, in large measure, for postponement of the issue of compulsory health insurance, according to Leone Baxter, of Whitaker & Baxter, directors of the AMA's National Education Campaign.

Miss Baxter, addressing the national Auxiliary convention in Atlantic City, praised the Auxiliary for helping to get the story of American medicine and the voluntary health insurance plan before the people of the United States. She said the enlistment of friends' and neighbors' help in writing congressmen and stating objections to any form of compulsory health insurance had helped immeasurably in delaying action on the bill.

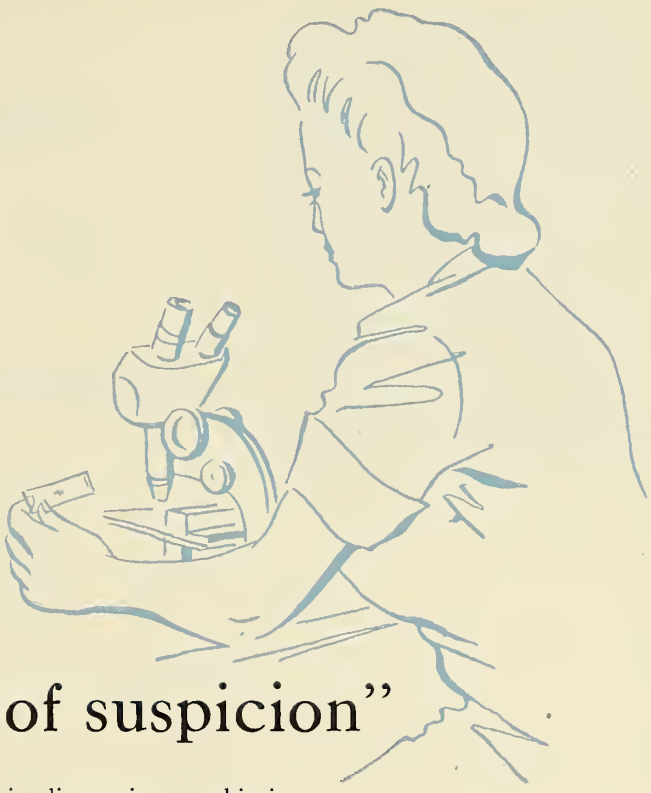
Specifically, the action of the General Federation of Women's Clubs at the recent convention can be attributed to doctors' wives working together for one purpose, she stated. The Women's Club members passed a resounding and unequivocal resolution against the socialized medicine proposal, thereby chalking up another important organization name on the list of national, state and local groups which have recorded their convictions to be in accord with the principles of democracy and free enterprise.

After commending the activities of the past year and urging their continuance, Miss Baxter sought the cooperation of the Auxiliary in the latest Education Campaign project: equipping every doctor's office with a copy of Sir Luke Fildes' painting of "The Doctor."

Miss Baxter's approbation was echoed by other convention speakers, among them: Miss Mary McGinn, director of the Women's Division, Whitaker & Baxter; Dr. R. L. Sensenich, president of the AMA and Dr. Ernest E. Irons, president-elect; Dr. Elmer Henderson, chairman, Board of Trustees; Dr. J. J. Moore, treasurer; Dr. George F. Lull, secretary and general manager.

To re-emphasize its own position in the controversy of health insurance, the Auxiliary resolved:

WHEREAS, the people of the United States are provided with medical care of the highest quality of any nation in the world developed under our free system of private initiative; and



WHEREAS, there is documentary proof that compulsory health insurance in other countries has resulted in lowering the standard of medical service, invaded family privacy, destroyed the patient-physician relationship, and eliminated the free choice of family physician demanded by liberty loving people; and

WHEREAS, government controlled medical care programs have caused constant increase in taxation with continued *decrease* in "take-home pay," thus lowering family standards of living; and

WHEREAS, government interference in the practice of medicine as now proposed in bills before congress would destroy the growth and expansion of the voluntary prepaid medical plans as approved by the American Medical association and this body, would threaten national bankruptcy, and endanger the health and welfare of our children; therefore be it

RESOLVED, that the Woman's Auxiliary to the American Medical association, in convention assembled this eighth day of June, 1949, does hereby go on record against any

(Continued on Page 846)

"A high index of suspicion"

The difficulties and pitfalls in diagnosing amebiasis are stressed frequently in medical literature.

". . . despite the absence of a history of dysentery, amebiasis must be considered in the differential diagnosis of many bizarre clinical syndromes. . . . A high index of suspicion is the keynote of early diagnosis."[1]

In acute or latent forms of amebiasis, Diodoquin may be employed over prolonged periods. This high-iodine-containing amebacide "is well tolerated. . . . The great advantage of this simple treatment is that in the vast majority, it destroys the cysts of *E. histolytica* and is, therefore, especially valuable in sterilizing 'cyst-carriers.' It can readily be taken by ambulant patients and, therefore, eliminates the necessity of hospitalization."[2]

form of compulsory health insurance or any system of political medicine designed under the guise of public welfare; and be it further

RESOLVED, that the Woman's Auxiliary to the American Medical association herein reaffirms its belief in the American Medical association policy of expansion of voluntary prepayment medical insurance plans which can most economically provide maximum, high-standard medical care to the American people; and be it further

RESOLVED, that a copy of this resolution be forwarded to the President of the United States, to members of congress, and to each Woman's Auxiliary to respective State Medical societies.

* * *

Minnesota's past president, Mrs. Harold Wahlquist, was elected first vice president of the national organization, and another Minnesota member, Mrs. Charles W. Waas, was elected to membership on the Nominating Committee for the 1950 convention in San Francisco. Other new officers are:

President: Mrs. David B. Allman, Atlantic City, New Jersey.

President-elect: Mrs. Arthur A. Herold, Shreveport, Louisiana.

Second Vice President: Mrs. Henry Garnjobst, Corvallis, Oregon.

Third Vice President: Mrs. W. E. Hoffman, Charleston, West Virginia.

Fourth Vice President: Mrs. Mason G. Lawson, Little Rock, Arkansas.

Treasurer: Mrs. George Turner, El Paso, Texas.

Constitutional Secretary: Mrs. Harry M. Gilkey, Kansas City, Missouri.

Historian: Mrs. Jesse D. Hamer, Phoenix, Arizona.

Parliamentarian: Mrs. William E. Dodd, Beach Haven, New Jersey.

SECOND PR WORKSHOP SET FOR SEPTEMBER 22

Mrs. Reuben Erickson

Recognizing again this year the importance of public relations techniques in mobilizing opinion against compulsory health insurance, the Auxiliary has scheduled its second annual Workshop for September 22, at the Hotel Radisson, Minneapolis.

The tentative program schedule calls for registration at 9 a.m. The morning will be devoted largely to a delineation of the issues at stake and the plans which are being followed by the State Medical association and the National Education Campaign, being conducted for the American Medical association by Whitaker & Baxter.

J. S. Jones of the Minnesota Farm Bureau will discuss the general threat of socialism, while Dr. A. E. Cardle, chairman of the MSMA Committee on Public Health Education, will describe the Minnesota program, and Miss Mary McGinn, director of the Woman's Division of Whitaker & Baxter, the national campaign.

Technical information will be divulged during the afternoon session by experts in newspaper, radio, visual education, and other public relations fields.

The Auxiliary is particularly anxious to have officers of county Auxiliaries, publicity, public relations and legislative chairmen and members-at-large attend. Any Auxiliary member who is interested in being present may check with the program chairman or the State Medical association office.

The Radisson is keeping a number of rooms in reserve for the night of September 22, thus facilitating the schedule of those who will be attending the Workshop and also the fall board meeting which is slated for the morning of September 23, in the Italian room of the Radisson.

SUMMARY OF PROCEEDINGS
HOUSE OF DELEGATES

(Continued from Page 840)

members thereof, including announcements, messages and other material sponsored by the component society in co-operation with other groups, therefore,

BE IT HEREBY RESOLVED, that the Minnesota State Medical association go on record as approving such cards, announcements, messages and other material, provided the same meets the approval of the component medical society.

* * *

The House of Delegates approved all of the resolutions, thus completing the report of the Resolutions Committee.

Election of Officers

The next order of business was the election of officers. The following were unanimously elected by the Delegates:

President-Elect—F. J. Elias, M.D., Duluth.

First Vice President—W. F. Hartfiel, M.D., Saint Paul.

Second Vice President—C. W. Moberg, M.D., Detroit Lakes.

Secretary—B. B. Souster, M.D., Saint Paul.

Treasurer—W. H. Condit, M.D., Minneapolis.

Speaker, House of Delegates—C. G. Sheppard, M.D., Hutchinson.

Vice Speaker—H. M. Carryer, M.D., Rochester.

Councilor, Third District—L. G. Smith, M.D., Montevideo.

Councilor, Fifth District—Justus Ohage, M.D., Saint Paul.

Councilor, Seventh District—W. W. Will, M.D., Bertha.

Councilor, Ninth District—A. O. Swenson, M.D., Duluth.

Delegates to the American Medical Association—A. E. Cardle, M.D., Minneapolis; George Earl, M.D., Saint Paul.

Alternates—W. W. Will, M.D., Bertha; E. M. Hammes, M.D., Saint Paul.

Meeting Place 1950 Convention

The final order of business was the selection of the meeting place for the 1950 Convention. The House of Delegates voted to accept the invitation from the St. Louis County Medical Society to hold the meeting in Duluth.

At 3:20 p.m. the Ninety-sixth Annual Meeting of the House of Delegates was adjourned.

FROM SECRETARY OF DEFENSE LOUIS JOHNSON—

AN URGENT APPEAL TO YOUNG DOCTORS!

Your personal help is needed to avert a serious threat to our national security!

By the end of July of this year we will have lost almost one-third of the physicians and dentists now serving with our Armed Forces. Without an increased inflow of such personnel, the shortage will assume even more dangerous proportions by December of this year.

These losses are due to normal expiration of terms of service. The professional men who are leaving the Armed Forces during this critical period are doing so because they have fulfilled their duty-obligations and have earned the right to return to civilian practice.

Without sufficient replacements for these losses, we cannot continue to provide adequate medical and dental care for the almost 1,700,000 service men and women who are the backbone of our nation's defense.

Normal procurement channels will not provide sufficient replacements!

To alleviate this critical, impending shortage of professional manpower in the three services, I am urging all physicians and dentists who were trained under wartime A. S. T. P. and V-12 programs under government auspices or who were deferred in order to complete their training at personal expense, *and who saw no active service*, to volunteer for a two-year tour of active duty, at once!

We have written personally to more than 10,000 of you in the past weeks urging such action. The response to this appeal has not been encouraging, and our Armed Forces move rapidly toward a professional manpower crisis!

Many responses have been negative, but worse—a great number of doctors have not replied. It is urgent that we hear from you immediately!

We feel certain that you recognize an obligation to your fellow men as well as to your profession in this matter. We are confident that you will fulfill that obligation in the spirit of public service that is a tradition with the physician and dentist.

There is much to be said for a tour of duty with any of the Armed Forces. You will work and train with leading men of your professions. You will have access to abundant clinical material; have the best medical and dental facilities in which to practice. You will expand your whole concept of life through travel and practice in foreign lands. In many ways, a tour of service will be invaluable to you in later professional life!

Volunteer now for active duty. You are urged to contact the Office of Secretary of Defense by collect wire immediately, signifying your acceptance and date of availability. Your services are badly needed. Will you offer them?

Louis Johnson

Of General Interest

The American Red Cross Saint Paul Regional Blood Center has been supplied with serum albumin in 100 c.c. containers complete with recipient sets for treatment of shock, hypoproteinemia, nephrosis, burns, et cetera. Immune serum globulin in 2 c.c. ampoules for prophylaxis and treatment of measles has also been received for distribution. These products are supplied by the American National Red Cross and may be obtained without cost by application to Dr. E. V. Goltz, Technical Director, Saint Paul Regional Blood Center, 91 E. Kellogg Boulevard, Saint Paul 1, Minnesota. Telephone: GArfield 4981.

Since the supply of these products is limited, they can not be supplied for storage or general distribution. Dr. Goltz has been instructed to send units out only upon the request of a physician who gives the patient's name, diagnosis, and number of units he proposes to administer.

* * *

Dr. William C. Bernstein, Saint Paul, was recently promoted from instructor to clinical assistant professor of proctology at the University of Minnesota.

* * *

"Sarcoidosis of the Orbit" was the title of a paper presented by Dr. Frank N. Knapp and Dr. William V. Knoll, Duluth, at the annual meeting of the American Ophthalmological Society at Hot Springs, Virginia, June 3.

* * *

Examinations for appointments to the grade of Lieutenant (jg) will be conducted in all U. S. Navy hospitals from September 12 to 16. Graduates of approved medical schools who have completed intern training or who will complete such training within four months of the date of examination, and who are physically fit and less than thirty-two years of age, may take the examination. Compensation for those accepted for naval service, including rental and subsistance allowances, is $5,011 for those with dependent and $4,575 for those without.

Detailed information may be obtained from the offices of Naval Officer procurement or from the Bureau of Medicine and Surgery, Navy Department, Washington 25, D. C.

* * *

Among physicians attending a continuation course in the treatment of tumors, held at the University of Minnesota early in June, was Dr. Ernest O. Hanson of Cloquet.

* * *

Dr. Howard M. Wikoff, after completing a three-year fellowship in internal medicine at the University of Minnesota, became associated with the Bemidji Clinic in June. A graduate of the University of Minnesota Medical School in 1940, Dr. Wikoff interned at Minneapolis General Hospital and then spent three and a half years in military service. He will limit his practive in Bemidji to the field of internal medicine.

Dr. John J. Hochfilzer, Saint Paul, left for England on July 15 to attend the Fourth International Congress of Otolaryngology in London.

* * *

At the fifteenth annual meeting of the American College of Chest Physicians, held in Atlantic City, June 2 through 5, Dr. John R. McDonald, Rochester, presented a paper entitled "Carcinoma of the Lung: Its Diagnosis by Cytologic Examination of Sputum and Bronchial Secretions."

* * *

During the last school year the activities of the Department of Postgraduate Medical Education at the University of Minnesota returned to the level reached before the war. In his annual report, Dr. George N. Aagaard, director of the department, stated that a total of 4,163 persons were enrolled in twenty-six continuation courses for physicians and twenty-five courses for workers in fields related to medicine.

Among new courses offered during the year were a course in child psychiatry for pediatricians and general practitioners and a two-week course in psychosomatic medicine. Both were enthusiastically received.

Another innovation was the presentation of a course in electrocardiography, one evening a week for twelve weeks, for physicians in the Twin Cities area. The course was oversubscribed, and two sections had to be organized. A similar ten-week course was later conducted in St. Cloud by Dr. Aagaard, and upon its completion the physicians who had attended it formed a study club to continue their work in the subject.

Other than the courses for physicians, special courses were offered for non-physician workers in such related medical fields as nursing, pharmacy, public health, child care and education.

* * *

Dr. E. W. Arnold of Adrian participated in a radio broadcast over a local station on June 12. He discussed the Blue Cross and Blue Shield health plans.

* * *

Principal speaker at a meeting of the Blue Earth Community Hospital staff, held at the Riverside Town and Country Club on June 2, was Dr. Bernard J. Spencer of Blue Earth. Dr. Spencer, who recently spent a year at the Children's Hospital in Boston, discussed the diagnostic signs that indicate which "blue babies" might be helped by an operation.

* * *

In Anoka, Dr. Joseph E. Twidwell became associated in practice with Dr. Frank E. Mork and Dr. A. Harold Mork on July 1. A graduate of Creighton University School of Medicine, Dr. Twidwell served his internship at the Lutheran Hospital in Omaha, Nebraska, and took further training at St. Mary's Hospital, Minneapolis.

* * *

New officers of the Minnesota Surgical Society, elected at a recent meeting in Duluth, are Dr. Gordon MacRae,

Duluth, president; Dr. L. W. Johnsrud, Hibbing, vice president, and Dr. M. G. Gillespie, Duluth, secretary-treasurer.

* * *

A new program of scholarships, to start in the fall, is being offered to undergraduate students in the University of Minnesota Medical School by the Minnesota Medical Foundation, it was announced on July 11 by Dr. Owen H. Wangensteen, president of the Foundation.

The scholarships will be awarded annually in amounts totalling $2,500, with individual grants ranging between $500 and $1,000. Students who will be members of the sophomore, junior and senior classes in the fall are eligible to apply for scholarships. Scholastic standing and financial need will be important factors in the awarding of the scholarships.

The program was drawn up by a committee headed by Dr. Wesley W. Spink, professor of medicine at the University. Other members of the committee were Dr. Howard Horns, assistant dean of the medical school, and Dr. George N. Aagaard, director of postgraduate medical education at the University.

* * *

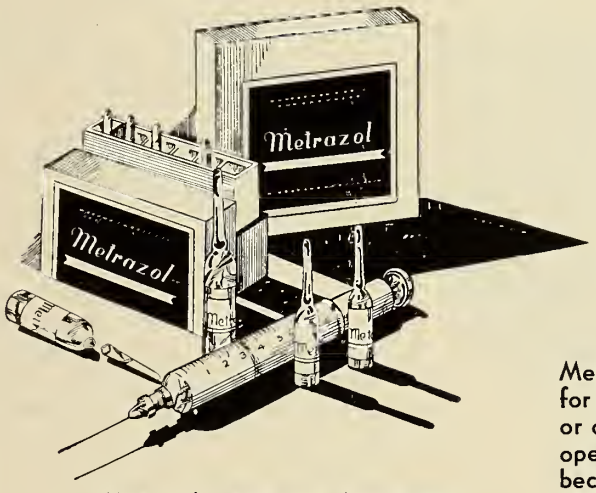
Dr. J. J. Yaeger resigned from the Cairns Clinic in Redwood Falls on June 23 to accept a post as assistant resident physician in pediatrics at the Children's Hospital, Denver, Colorado. Dr. Yaeger is being replaced, Dr. R. J. Cairns has announced, by Dr. James B. Flinn, who was associated with the clinic in 1947 and 1948. Dr. Flinn has been practicing for the last year at the General Hospital in Louisville, Kentucky.

"Neurologic Lesions in the Newborn: Effect of Prolonged Labor and Asphyxia" was the title of a paper presented by Dr. H. M. Keith, Rochester, at a meeting of the Canadian Society for the Study of Diseases of Children which was held at Alexandria Bay, New York, during the middle of June.

* * *

It was announced early in June that Dr. Henry Hutchinson had been appointed full superintendent of the Moose Lake State Hospital. Dr. Hutchinson has served as acting superintendent for the past several years. Except for a period of three years during the war, he has been affiliated with the hospital since 1938.

* * *



Dr. Raymond B. Allen, president of the University of Washington and a former fellow in the Mayo Foundation, was appointed early in June to direct unification of the army, navy and air force medical services. Dr. Allen entered the Mayo Foundation on July 1, 1930, and received a Ph.D. degree in urology from the University of Minnesota in 1934.

* * *

Dr. Austin V. Denman, Mankato, attended the June graduation exercises at the University of Louisville, Kentucky, where he participated in a reunion of the Class of 1909. One of Dr. Denman's former classmates was Dr. E. L. Henderson, Louisville, newly elected president of the AMA.

* * *

At a meeting of the Zenith City Post No. 487 in Duluth on June 15, Dr. Roy C. Pederson of Duluth

Metrazol, pentamethylentetrazol
Ampules, 1 cc. and 3 cc.
Sterile Solution, 30 cc. vials
Tablets and Powder

Metrazol

COUNCIL ACCEPTED

A DEPENDABLE, QUICK-ACTING CEREBRAL AND MEDULLARY STIMULANT

Metrazol is indicated for narcotic depression, for instance, in poisoning with barbiturates or opiates, in acute alcoholism and during the operation and postoperatively when respiration becomes inadequate because of medullary depression due to the anesthetic.

Inject 3 cc. Metrazol intravenously, repeat if necessary, and continue with 1 or 2 cc. intramuscularly as required.

ANNOUNCES CONTINUOUS COURSES

SURGERY—Intensive course in Surgical Technique, two weeks, starting August 22, September 26, October 24.
Surgical Technique, Surgical Anatomy, Clinical Surgery, four weeks, starting September 12, October 10.
Surgical Anatomy and Clinical Surgery, two weeks, starting September 26, October 24.
Surgery of Colon and Rectum, one week, starting September 12, October 10.
Esophageal Surgery, one week, starting October 10.
Thoracic Surgery, one week, starting October 3.
Breast and Thyroid Surgery, one week, starting October 10.
Fractures and Traumatic Surgery, two weeks, starting October 3.
GYNECOLOGY—Intensive Course, two weeks, starting September 26, October 24.
Vaginal Approach to Pelvic Surgery, one week, starting September 19, November 7.
OBSTETRICS—Intensive Course, two weeks, starting September 12, November 7.
MEDICINE—Intensive General Course, two weeks, starting October 3.
Gastroenterology, two weeks, starting October 24.
Gastroscopy, two weeks, starting September 26, October 24.
Electrocardiography and Heart Disease, four weeks, starting September 7.
DERMATOLOGY—Formal Course, two weeks, starting October 24.
Informal clinical course every two weeks.
ROENTGENOLOGY—Diagnostic and Lecture Course first Monday of every month.
Clinical Course third Monday of every month.
X-ray therapy every two weeks.
UROLOGY—Intensive Course, two weeks, starting September 26.
Ten-day Practical Course in Cystoscopy every two weeks.

General, Intensive and Special Courses in all Branches of Medicine, Surgery and the Specialties.

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL

Address: REGISTRAR, 427 South Honore Street
Chicago 12, Illinois

spoke on "Government Trend Toward Control of the Practice of Medicine." A question-and-answer period followed Dr. Pederson's talk.

* * *

A paper entitled "Recognition and Treatment of Congenital Dislocation of the Hip During the First Six Months of Life" was presented by Dr. Vernon L. Hart, Minneapolis, at the Harvard Medical School on June 4. Dr. Hart also presented a paper on the same subject at the AMA meeting in Atlantic City. A motion picture by Dr. Hart and his associate, Dr. Wesley H. Burnham, was shown in the scientific exhibit each day of the AMA meeting.

* * *

Dr. E. Mendelssohn Jones, Saint Paul, has been reappointed as a member of the state board of medical examiners. His new term will end on May 1, 1956.

* * *

The resignation of Dr. Philip C. Welton, Wabasha, as superintendent and medical director of the Buena Vista Sanatorium was announced on June 8. Dr. Welton said that he resigned "because of a conflict of policies in the sanatorium commission." It was stated that Dr. Welton, following his resignation, planned to establish a private practice in Winona.

* * *

The purchase of valuable historical medical books for the medical library at the University of Minnesota was made possible in July, when $3,735 was presented to the Friends of the University of Minnesota Library through the Greater University Fund. The money was a gift of the University's medical school classes of 1922-1923 and was raised by a committee headed by Dr. Owen H. Wangensteen, chairman of the department of surgery, during the 1948 and 1949 campaigns of the Greater University Fund. The gift was designated for the purchase of medical books and papers for which no other funds were available.

* * *

Among the new officers of the Minnesota Heart Association, elected at the organization's annual meeting in Minneapolis on July 12, are Dr. John F. Briggs, Saint Paul, president; Dr. Grace Roth, Rochester, first vice president, and Dr. H. B. Sweetser, Minneapolis, second vice president.

* * *

Dr. Sidney A. Slater, superintendent of the Southwestern Minnesota Sanatorium, was the principal speaker at a meeting of the Worthington Civic Co-operative Club in Worthington on July 18.

* * *

It was announced on July 15 that Colonel Samuel F. Seeley, formerly of Minneapolis, had become chief of the surgical service at Walter Reed General Hospital in Washington, D. C. A graduate of the University of Minnesota Medical School in 1927, Dr. Seeley studied surgery at the Mayo Clinic during 1934 and 1935.

* * *

Dr. Richard J. Salk, a former resident of Sauk Rapids, became associated in practice with Dr. F. H. Baumgartner in Albany on July 1. Dr. Salk, a graduate of

the University of Minnesota Medical School, served his internship at Ancker Hospital, Saint Paul.

* * *

Certificates and insignia were presented by Dr. Russell M. Wilder, Rochester, to twenty-four dietetic interns at exercises at St. Mary's Hospital in Rochester on June 21.

* * *

After twenty-five years of practice in Albert Lea, Dr. Donald S. Branham left during the middle of July to become a staff member of the St. Peter State Hospital. When Dr. Branham first located in Albert Lea he was associated with the late Dr. H. D. Burns. Later he became a co-founder of the Medical Arts Clinic with Dr. S. A. Whitson. During the recent war he served in the Aleutians and on the Pacific Coast.

* * *

Dr. Robert N. Barr was appointed deputy executive officer of the Minnesota Health Department at a meeting of the State Board of Health at the University of Minnesota on July 14. His new position is the first such post in the organization's history.

A graduate of the University of Minnesota Medical School in 1930, Dr. Barr conducted a general practice for three years, then joined the Minnesota Health Department as an epidemiologist. In 1937 he received a master's degree in public health at Johns Hopkins University. He served in the Pacific Theater during World War II, then returned to Minneapolis to become chief of the section of departmental administration in the Health Department. In May, 1948, he became chief of the special services section, and he will continue to hold that position in addition to his new appointment.

It was predicted at the time of Dr. Barr's appointment as deputy executive officer that he will succeed Dr. A. J. Chesley, secretary and executive officer, when Dr. Chesley, now seventy-two, retires. No retirement plans have been announced, however, by Dr. Chesley.

* * *

Dr. Russell R. Hendrickson, Lake Park, resigned his post at the Sand Beach Sanatorium as of August 1. It was announced that Dr. Hendrickson planned to move to Crookston.

* * *

Having completed his internship at Minneapolis General Hospital, Dr. James H. Walston has become associated in practice with Dr. M. I. Hauge in Clarkfield. Dr. Walston is a graduate of the medical school at Northwestern University.

* * *

Dr. John Bellamo, who recently completed his internship at Ancker Hospital, Saint Paul, has opened offices for the practice of medicine in Grand Meadow.

* * *

In Slayton, Dr. Philip W. Hursh became associated in practice with Dr. Hugh D. Patterson on July 1. A graduate of the University of Minnesota Medical School in 1943, Dr. Hursh interned at Queen's Hospital in Hon-

olulu, then served in the army in the Pacific area. Following his discharge, he was a resident physician at Asbury Hospital, Minneapolis, for a year and at the Students' Health Service, University of Minnesota, for another year.

* * *

It was announced on July 9 that a new physician, Dr. Richard Hartzell, who recently served in the U. S. Navy, had arrived in Grantsburg.

* * *

Dr. Joseph P. Healy, until recently a surgical resident at St. Luke's Hospital, Saint Paul, opened offices for the practice of medicine in New Richmond on July 11. Dr. Healy, a graduate of Creighton University, interned at St. Joseph's Hospital, Saint Paul.

* * *

During the latter part of June, Dr. O. H. Hegge of Austin attended the annual meeting of the American Railway Surgeons in Chicago.

* * *

The annual report of the Minneapolis Public Schools Health Service, released on July 16 by Dr. Hermina Hartig, chief school physician, showed that 15,934 Minneapolis school children were examined in 1948-1949—an increase of 5,000 over the previous year. The eight physicians who gave part-time service to the schools detected numerous ailments. Eye and ear defects were found in about 12 per cent of the children. The physicians discovered 560 cases of malnutrition and 230 cases of athlete's foot. The more common communicable diseases were found in the same incidence as in previous years, but the number of poliomyelitis cases went from five in 1947-1948 to sixty-six in 1948-1949. The report revealed that only 15 per cent of Minneapolis public school pupils have not been immunized against smallpox and that 6 per cent have not been immunized against diphtheria.

* * *

Dr. James E. Murphy, who practiced in Sauk Rapids for several years, moved to Staples in June and opened offices for the practice of medicine. A graduate of the University of Minnesota Medical School in 1938, Dr. Murphy served his internship at Miller Hospital, Saint Paul. He was in military service for five and one-half years.

* * *

Red Wing acquired a new physician near the end of June when Dr. George M. Hawley, formerly of Dallas, Texas, opened offices for the practice of medicine at the Medical Block Clinic. A graduate of Johns Hopkins School of Medicine, Dr. Hawley interned at Johns Hopkins Hospital and the University of Rochester. During the recent war he served for three and one-half years in the navy. For the past three years he has been associated with the Southwestern Medical Foundation in Dallas.

The name of Dr. Hawley is not new in Red Wing. The present Dr. Hawley's grandfather, Dr. A. B. Hawley, was prominent in early Red Wing history. He arrived in the community in 1857 to become one of its first physicians.

Dr. M. B. Hesdorffer, medical consultant for the Veterans Administration insurance service program in the Minneapolis area, was named director of the health and medical care division of the Hennepin County Community Chest and Council, effective July 15. Dr. Hesdorffer, a graduate of the University of Minnesota Medical School, replaces Dr. D. A. Dukelow, who left on March 1 to become medical consultant on health and fitness for the AMA in Chicago. Dr. Hesdorffer was with the United States Public Health Service for three years and was in private practice in Minneapolis for one and one-half years.

* * *

Dr. James H. Reinhardt, a former resident of Detroit Lakes, and Miss Frances Kraemer, of Glen Lake, were married in Hopkins on June 22. Dr. Reinhardt, a graduate of Temple University Medical School, is beginning his medical practice in Red Lake Falls.

* * *

A one-week trip to Glacier National Park highlighted the last week of June for Dr. and Mrs. A. C. Baker of Fergus Falls. On the trip Dr. Baker attended the Great Northern Surgeons' convention which was held at the Glacier Park Hotel.

* * *

On July 1, Dr. Doreen A. Martin began her medical practice at the Community Clinic in her home town of Wabasha. A graduate of the University of Minnesota Medical School, Dr. Martin served her internship at Grace Hospital, Detroit, and at Swedish Hospital, Minneapolis.

In Rochester, Dr. H. A. Wente, formerly of Moose Lake, opened offices on July 15 for the general practice of medicine. Dr. Wente is a graduate of the University of Minnesota, and he served his internship at St. Joseph's Hospital, Milwaukee. He recently completed a term of service in the army, being stationed in the Orient.

* * *

Dr. B. J. Branton, mayor of Willmar, was chairman of a Kandiyohi County pageant, "Sweet Land of Liberty," which was presented at Willmar on June 21 and 22.

* * *

A discussion of the emotional problems of tuberculosis patients was presented by Dr. Harry A. Wilmer at a meeting in Minneapolis in mid-June sponsored by the Hennepin County Tuberculosis Association. Dr. Willmar, a Fellow of the Mayo Foundation in Rochester, is the creator of "Huber the Tuber," a cartoon character in Dr. Wilmer's book on tuberculosis.

* * *

After eighteen years of working in inadequate office quarters, Dr. Ralph B. Johnson of Lanesboro is moving into his own building—designed and constructed according to his own carefully planned specifications. Construction of the one-story brick building began in May and was expected to be completed in August. Plans called for the new structure to contain a reception room, a business office, two examining rooms, an x-ray room, a room for minor operations, and a laboratory.

Dr. William O. McLane, formerly of Wadena, became a member of the staff of the Bratrud Clinic in Thief River Falls on July 1. He is specializing in diseases of the eye, ear, nose and throat. He replaces Dr. John Lehman, who recently moved from the city. Dr. McLane was graduated from the Rush Medical College, Chicago, in 1928. He conducted a general practice until 1944, when he was awarded a postgraduate teaching fellowship in otology and otolaryngology at the University of Illinois and the Illinois Eye and Ear Infirmary in Chicago. Following this, he practiced for a time in Duluth and in Wadena.

* * *

A painting by Dr. H. B. Clark of St. Cloud was one of the winning entries in the annual American Physicians Art Association exhibit at the AMA convention in Atlantic City in June. For Dr. Clark it was the second award of merit to be won by him in the association contests. Another painting of his placed as a winner in the 1948 exhibit.

* * *

On July 24, the residents of Morton and the surrounding country gathered in the Morton community hall to honor the eighty-seventh birthday of Dr. Fletcher Penhall, who practiced medicine in the community for fifty-three years. Dr. Penhall came to Morton in 1891 and practiced there until 1944, when he joined the staff of the Willmar State Hospital.

* * *

Dr. David W. Feigal, recently of Graceville, began practice in the Lake Minnetonka area early in July when he became associated with Dr. W. W. Rieke of Wayzata. The two physicians have opened an additional office at Long Lake where Dr. Feigal maintains office hours several afternoons each week.

A graduate of the University of Minnesota Medical School in 1947, Dr. Feigal served his internship at Ancker Hospital, Saint Paul. He practiced at Graceville for one year before joining Dr. Rieke.

* * *

Dr. and Mrs. Charles G. Forrest of Clearbrook were named Minnesota's "happiest married couple" in a contest sponsored by the Minneapolis Aquatennial and the Bride and Groom radio show in June. They were nominated for the award by their daughter. As the "happist couple" they were special Aquatennial guests and were later flown to California for a vacation. Dr. Forrest has practiced medicine in Clearbrook for forty years.

* * *

Two papers were presented by Dr. John J. Pemberton, Rochester, at a meeting of the Rocky Mountain Cancer Conference in Denver on July 14 and 15. They were entitled "Malignant Tumors of the Thyroid Gland" and "Maligant Lesions of the Lower Lip."

* * *

Dr. Wallace L. Fritz of Saint Paul lost a race with the stork on July 20. He was taking his expectant wife to Bethesda Hospital when a flat tire—his first in thirteen years—stalled his car. Before help arrived, Dr. Fritz delivered the baby himself—a 7-pound 2-ounce girl.

DEALERS IN DEPENDABLE MERCHANDISE

It was announced on July 8 that Dr. Donald E. Pohl, formerly of Council Bluffs, Iowa, had become a member of the staff of the Crookston Clinic. A graduate of the University of Iowa in 1944, Dr. Pohl has been a resident in internal medicine at the University of Nebraska for the past two years.

* * *

Dr. J. S. Lewis began his practice at the Itasca Clinic in Nashwauk on July 1, replacing Dr. O. C. Braun, who had practiced there since 1941. Dr. Braun moved to Grand Rapids to be associated with the Itasca Clinic there. Dr. Lewis, a graduate of the University of Minnesota Medical School in 1948, served his internship at the University Hospitals.

* * *

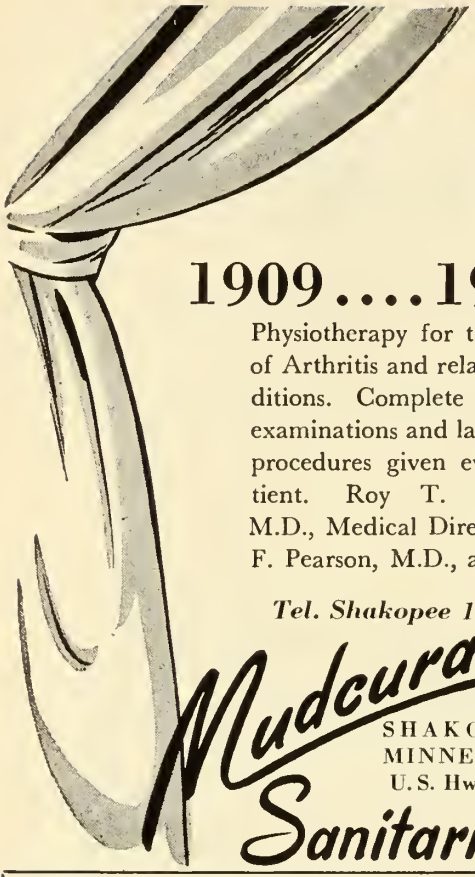
Dr. Joseph N. Gehlen, Saint Paul, received his Fellowship certificate at the convocation of the American College of Chest Physicians in Atlantic City, June 2 to 5.

* * *

Dr. Robert A. Weyhrauch, a former resident of Wadena, joined the staff of the Alexandria Clinic on July 1. A graduate of the University of Minnesota Medical School in 1947, Dr. Weyhrauch recently completed a two-year internship at Swedish Hospital and General Hospital in Minneapolis.

HOSPITAL NEWS

Dr. Benjamin W. Mandelstam, Boston, has been appointed administrator of the new Mount Sinai Hospital in Minneapolis. Although the 200-bed, $3,500,000 hospital will not be ready to receive patients until the summer of 1950, Dr. Mandelstam will assume his new position this September. Between the time of his arrival and the opening of the hospital, he will oversee the final details of construction and direct the purchasing of equipment.



The new administrator for Mount Sinai Hospital has had extensive experience in hospital construction problems, as well as intensive training and experience in every phase of hospital administration. Dr. Mandelstam, a graduate of Tufts College Medical School, practiced medicine for six years and then became medical advisor of the Massachusetts Department of Public Welfare in 1940. Since then he has been assistant director of the Jewish Hospital of Brooklyn and assistant director of Beth Israel Hospital in Boston. Before being appointed to head Mount Sinai Hospital he was executive director of the Nathan Littauer Hospital in Gloversville, N. Y.

BLUE SHIELD NEWS

Up to June 30, 1949 Blue Shield has made payment on 11,423 cases in the total amount of $444,596.00. Payment was made for 2,322 cases during June, amounting to $89,648.59.

On August 1, 1949, the second change in the Minnesota Blue Shield contract was put into effect. This change was explained to the participating doctors of medicine by a letter in July. The change referred to is the increase of payments for emergency medical services in the hospital as distinguished from surgical care.

The Board of Directors approved the report of the Medical Advisory Committee to increase the payment

to participating doctors of medicine for emergency medical cases in the hospital, as distinguished from surgical cases, to the amount of $8.00 for the first day, $5.00 for the second day, $4.00 for the third day, and $3.00 per day thereafter up to and including twenty-one days, and that for all other medical cases in the hospital which are not emergency medical cases they be continued at the present schedule of payments which is $5.00 for the first day and $3.00 per day thereafter up to and including twenty-one days. The Board of Directors further approved that such change in the payment to doctors schedule become effective August 1, 1949.

The Board of Directors realizes that there are certain hospitalized medical cases that in fairness to the patient and the medical profession, require a payment larger than that previously provided for in the schedule of payments. This improvement is intended to be applicable only to those cases of an emergency nature where the serious or critical condition of the patient is an increased responsibility and requires more time than the ordinary hospitalized medical case. The continuance of this improved schedule of payments will depend in part upon the fairness with which the medical profession bills these cases. Blue Shield, therefore, asks for the co-operation of physicians in making the charge only in those cases where there can be no question about the emergency nature of the case.

The question arises as to the distinction between an emergent and a non-emergent case. It will be necessary that the attending physician advise the Blue Shield office as to whether a hospitalized medical case should be classified as emergent or non-emergent, since the office personnel would not be able to make this determination.

As pointed out in the letter informing physicianss of the emergent medical service payments, the Blue Shield office wishes to ask continued co-operation in listing as emergent only those cases which correctly fall within that classification. Obviously, if routine cases were classified as emergency medical cases, payment would increase to such an extent that it might necessitate a return to the previous medical payment or an increase in premium on the Blue Shield contract. It is believed that all physicians will use caution and discretion in indicating hospitalized emergency cases when it is realized that this one phase of the change in the Blue Shield policy could be very costly and also very dangerous for the economic structure of the Plan. The Blue Shield Plan, of course, is in the hands of the physicians of Minnesota, and it is realized that they do not wish to see the Plan financially affected due to indiscriminate use of its various services.

The Medical Advisory Board is now giving further study to revisions of the whole schedule of payments to physicians where payments appear to be inequitable.

Minnesota Blue Shield is growing and is attempting to provide greater coverage and greater service to the people of Minnesota. With the continued co-operation of physicians, Blue Shield will constantly strive to improve the contract, not only from the standpoint of the public, but also from that of medical profession.

Blue Shield Begins Redeeming of Notes to Doctors

At a meeting of the Board of Directors on June 22,

1949, action was taken in regard to the redeeming of notes held by doctors of medicine who lent funds to the corporation for organizational purposes.

Action was taken to authorize the Treasurer to redeem up to an amount of $22,500 on a quarterly basis, subject to the financial condition of the corporation and with the approval of the Insurance Commissioner of Minnesota.

The first payments are being made in July in the amount of $22,500. The redemption of notes will be made by drawing of lots of such notes listed and unpaid on the records of Minnesota Medical Service, Inc.

The Insurance Commissioner has advised that the Board of Directors of Minnesota Medical Service, Inc., may redeem these notes at their wish, with the exception of $25,000 which in accordance with the Enabling Act is the amount required for working capital, and until the Insurance Department has had an opportunity to further examine the books and records of the corporation. Final redeeming of the $25,000 in notes will be made after approval of the Insurance Commissioner that such shall be repayable only out of surplus earnings of such corporation, after reserves for incurred claims, unearned subscribers' payments and a reasonable amount for contingencies have been provided.

Notes are being redeemed during the month of July in the amount of approximately $22,500 plus accrued interest at 4 per cent from July 1, 1948, to July 1, 1949, to those doctors who have lent funds to the corporation, on the basis of drawing by lot of such notes listed unpaid on the records of the corporation.

The Board of Directors of Minnesota Medical Service, Inc., is pleased to be able at this time to begin redeeming notes for these funds, and greatly appreciates the confidence and support the medical profession has given to the Blue Shield Plan. It is to be recalled that at the time Minnesota Medical Service Inc. sent out a request to the doctors to participate in lending funds for the working capital that the amount was oversubscribed, and never at any time was it necessary to use more than about $20,000 of the total $87,000 subscribed, and through a notice in MINNESOTA MEDICINE further contributions were terminated.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

THE VALUE OF HORMONES IN GENERAL PRACTICE. W. N. Kemp, M.D., Vancouver, British Columbia. 115 pages. Price $3.00, paper cover, spiral binding. Minneapolis: Burgess Publishing Co., 1949.

MANUAL OF MEDICAL EMERGENCIES. Stuart C. Cullen, M.D. Professor of Surgery, Chairman, Division of Anesthesiology, State University of Iowa College of Medicine, and E. G. Gross, M.D., Professor and Head of Department of Pharmacology, State University of Iowa College of Medicine. 267 pages. Illus. Price $3.75, cloth. Chicago: Year Book Publishers, Inc., 1949.

MANUAL OF HUMAN DISSECTION (Shearer's). Edited by Charles E. Tobin, Ph.D. Associate Professor of Anatomy, the University of Rochester School of Medicine and Dentistry. Second Edition. 286 pages. Illus. Price $4.50, cloth. Philadelphia: The Blakiston Co., 1949.

BLAKISTON'S NEW GOULD MEDICAL DICTIONARY. First edition. Edited by Harold Wellington Jones, M.D., Colonel, U. S. Army, Retired, Contributing Editor, *Encyclopedia Americana*, Former Director, Army Medical Library, Washington, D. C.; Normand L. Hoerr, M.D., Ph.D., Professor of Anatomy, School of Medicine, Western Reserve University; Arthur Osol, Ph.D., Professor of Chemistry, Director of Chemistry Departments, Philadelphia College of Pharmacy and Science, Editor-in-Chief, *United States Dispensatory*. With the assistance of an editorial board and over 80 contributors. 252 illus., 129 in color. 1294 pages. Price: Textbook edition, $8.50. Thin paper edition, $10.75. Deluxe edition, $13.50. Philadelphia: The Blakiston Co., 1949.

This completely new medical dictionary should be welcomed by every physician, dentist and medical student who can read the English language.

Described by the publishers as the first new medical dictionary in thirty-eight years, the volume bears no resemblance to the customary revised editions of dictionaries which have been offered on the market every few years in the past.

Gone are definitions of such non-scientific and non-descriptive terms as Bright's disease and Buerger's disease. Instead, under "Bright, Richard" and "Buerger, Leo" there are thumbnail biographies, with references to chronic nephritis ("which received the name *Bright's disease*") and thromboangiitis obliterans, respectively. The definitions of the diseases are found, properly, under their scientific names.

Hundreds of new words, carefully analyzed and defined, are included, making the volume as up to date as possible. A system of modern phonetic respelling is combined with syllabification to indicate correct pronunciation. An atlas, with color and black-and-white illustrations covering anatomy, dentition, malaria parasites, bandaging, fractures and numerous other subjects, is bound into the center of the book. Tables describing blood constituents, diets, anatomic systems, hormones, anomalies, phobias, veterinary doses and other subjects are grouped for easy reference in a special section. The extensive vocabulary covers all branches of medicine and allied sciences—medical physics and chemistry, dentistry, pharmacy, nursing, biology, botany, et cetera—including medicolegal terminology.

The book is nicely bound, and its contents are set in easily readable type, with all defined words standing out clearly in boldface letters.

The dictionary was compiled by three well-known scientists with the co-operation of an editorial board and more than eighty capable contributors. The book is a notable achievement, and it should be of great use to anyone associated in any way with the medical profession.

J. H. L.

TRANSACTIONS OF THE THIRD AMERICAN CONGRESS ON OBSTETRICS AND GYNECOLOGY, Septemher 8-12, 1947. 412 p. Illus. Price $9.00. Portland, Oregon: Western Journal of Surgery Publishing Co., 1948.

The Proceedings as published in this volume present an excellent refresher course for anyone who feels the need of one.

There is a symposium on sterility, round-table discussions on asphyxia in the newborn, prolonged labor, uterine myomas, early ambulation in obstetrics, etiology of abortions, and the data on the study of 2850 Rh determinations.

Other presentations were on the various types of anesthesia and analgesia used in obstetrics, cancer of the cervix and its treatment, pregnancy complicated by heart disease, tuberculosis and diabetes, different types of cesarean sections and their merits, thyroid therapy and nutrition in pregnancy.

All of these subjects were presented by recognized authorities. This volume serves as an excellent review of up-to-date methods and opinions.

Announcing . . .

. . . the start of construction on a new wing to be equipped with the most modern facilities for care and treatment. The new addition will be ready for use this year. Our bed capacity will be increased to 110.

"With the awakening of the civilian population to the importance of psychiatric medicine . . . where will be the facilities to treat patients?"

A. E. Bennett, M.D., Department
of Neuropsychiatry, University
of Nebraska, Medical College.

delayed diagnosis

is enemy number one of

DIABETICS

A million or more diabetics are undetected and untreated.† But only about 55,000 new cases are being discovered each year in the course of insurance examinations and routine checkups. Early diagnosis and prompt treatment give the physician his best opportunity to ameliorate the disease and to avert or delay its complications.

An urgent problem

How shall the unknown diabetic be detected and directed to the doctor's office for diagnosis and proper treatment?

An important answer

AMES *Selftester**

a quick home screening test that brings those with glycosuria to you for diagnosis

The Ames Selftester for detection of sugar in urine is approved by the Council of the American Diabetes Association. It is a simple, reliable screening test to establish the presence or absence of urine-sugar and "refer" those with glycosuria to you for diagnosis.

The directions state:

1. **The Selftester does not diagnose diabetes or any other disease.** Its sole function is the detection of sugar (glucose) or sugar-like substances.
2. **If reaction is positive, see your doctor at once.** Sugar in your urine does not necessarily mean you have diabetes (nor does a negative result definitely exclude the presence of disease). But only your doctor, by medical examination and by additional laboratory tests, can tell you why you show sugar.

† Wilkerson, H. L. C. and Krall, L. P.: Diabetes in a New England Town, Journal of the American Medical Association, *135*:209 (Sept. 27) 1947.

when Milk becomes a dietary dilemma

Problem: When casein or other animal protein sensitivity renders all natural or processed milks* contraindicated in the pediatric dietary, because of eczematous, gastro-intestinal or other reactions, how can allergy be avoided and proper infant nutrition still be maintained?

Solution: Replace milk with Mull-Soy, the liquid hypoallergenic soy food—completely free of offending animal proteins. Mull-Soy is a biologically complete vegetable source of all essential amino acids, and closely approximates whole cow's milk in fat, protein, carbohydrate, and mineral content when diluted 1:1 with water. It is quickly prepared, palatable, easily digested and well-tolerated—equally desirable for infants, children or adults.

**Goat's milk and processed cows' milk have unmodified casein factors.*

Unusual features for superior radiography . . . .

with

KELEKET W-3 100

DIAGNOSTIC COMBINATION

For any diagnostic requirement . . . in office, clinic or hospital . . . the Keleket W-3 100 Combination, using single or double tube, offers exceptional convenience and economy.

Among features not usually found in X-ray equipment of this capacity, the W-3 100 unit includes the famous Keleket Multicron 100 generator, double rail-mounted tube stand with telescopic carriage and choice of hand or motor driven tilt-table.

The table, for example, is easily moved from Trendelenburg to vertical position—regardless of patient's weight. Angulating scales make exact positioning and re-positioning quick and easy. A positive clutch stops the table at any point desired.

Permitting greatly simplified technics, these and other Keleket features recommend the W-3 100 Combination for your practice. Telephone or write for complete details.

Essential food factors

Several decades ago, vitamins, minerals, and other noncaloric but useful components of the diet were known as "accessory food factors." Today, it is recognized that these *accessory factors* are in fact *essential factors*.

Hypernutrition aids the recovery process and tends to hasten tissue repair. Vitamin A, vitamin D, thiamine (B_1), riboflavin (B_2), niacinamide, ascorbic acid (C) and folic acid have enjoyed wide usage for convalescent and reparative states.

Lederle has consistently advocated such use of the vitamins.

Lederle

LABORATORIES DIVISION

AMERICAN Cyanamid COMPANY

30 ROCKEFELLER PLAZA
NEW YORK 20, N.Y.

1. HIGH IN PROTEIN–19%–as a result, a single ounce of Cerevim provides 5½ grams of protein–plus:

2. THIAMINE–0.6 mg. per ounce of Cerevim "The cumulative effects throughout a lifetime... (of thiamine)...may spell the difference between alert, successful living and a marginal effectiveness."[1]–plus:

3. NIACINAMIDE–6.0 mg. per ounce of Cerevim in accord with The National Research Council's recommended allowance[2]–since "Nicotinic acid is found in natural foods only in limited amounts."[3]–plus:

4. RIBOFLAVIN–0.9 mg. per ounce of Cerevim for this factor is directly related to growth[4] and is "essential to the defense powers of the organism"[5]–plus:

5. CALCIUM–300 mg. per ounce of Cerevim thus supplying 8 times the calcium in a fluid ounce of milk–plus:

6. IRON–7.5 mg. per ounce of Cerevim since "a child's increasing need for iron cannot safely be left to chance."[6]–plus:

7. COPPER–0.3 mg. per ounce of Cerevim in the 1:25 ratio which Elvehjem, et al.[7] and Cason[8] found particularly effective in raising hemoglobin levels in infancy.

With such natural foods of high biologic value as:

8. WHOLE WHEAT MEAL 9. OATMEAL 10. CORN MEAL 11. NON-FAT MILK SOLIDS 12. BARLEY 13. WHEAT GERM 14. BREWERS' DRIED YEAST 15. MALT

Leading to such benefits as the literature[9] reports:

16. "increase in urinary output of riboflavin" 17. "improvement in pediatricians' scores" 18. "improvement in skeletal maturity" 19. "improvement in skeletal mineralization" 20. "retardation of increase in dental caries" 21. "recession of corneal vascularization" 22. "improvement in the condition of the gums"

23. Better Bowel Function[10]

24. PALATABILITY–Cerevim makes all the above acceptable as well as available to infants and children.

in all–24 good reasons why CEREVIM is a first among first foods

a pre-cooked cereal for professional specification now produced exclusively at the M & R Dietetic Laboratories

Your Patients...

And the Meat They Eat

The established relationship between sound dietary planning and a state of maintained good health emphasizes the nutritional importance of meat, man's favorite protein food.

Not only does meat taste good, but of greater significance, it provides a host of nutritional benefits. Developments in the field of nutrition* have proved that complete protein—the kind that meat supplies in abundance—aids in building and maintaining immunity, hastens recovery after acute infectious diseases and following injury and burns, promotes health during pregnancy, aids in the growth and development of husky children, and is needed to maintain everyone in top physical condition.

No matter from what walk of life your patients come, and whether their pocketbooks demand economy or permit satisfaction of that urge for the fanciest cuts, meat gives them full value for their money.

Having a wonderful vacation

Wherever your pollen-sensitive patient spends his vacation, TRIMETON* may add to his enjoyment and rest by alleviating his symptoms of pollinosis. TRIMETON is an unusual antihistaminic. Essentially different in chemical composition, it is so potent that only one 25 milligram tablet is usually required to attain the desired relief in fifteen to thirty minutes. Best of all, your patient isn't likely to sleep away his vacation because the small milligram dosage lessens side effects. Your patient will also appreciate that the high potency of TRIMETON also means lower cost of therapy.

Trimeton

Dosage: One 25 mg. tablet one to three times daily.

TRIMETON, brand of prophenpyridamine, 25 mg. tablets, scored, are available in bottles of 100 and 1000.

Mrs. Sipper is a Vitamin-Skipper

Mrs. Sipper's *restricted* diet is somewhat lacking in essential nutrients. Through no fault of her own, she becomes sibling to the food faddist and first cousin to the hurrier, the worrier, the excessive smoker and toper. Their faulty or inadequate diets are a telling cause behind today's widespread prevalence of subclinical vitamin deficiencies.

In all of these cases, can newly prescribed eating habits carry the full brunt of the therapy? Isn't it wise to make use of the aid and assurance which vitamin supplementation can provide?

For your prescribing convenience, there's an Abbott vitamin product to serve nearly every vitamin need—for supplementary or therapeutic levels of dosage, for oral or parenteral administration. Your pharmacist can supply Abbott vitamin products in a variety of forms and package sizes. Abbott Laboratories, North Chicago, Ill.

INTRODUCING...

THE KOROMEX JELLY REFILLABLE UNIT

Physicians acclaim the new Koromex all inclusive contraceptive unit. This fine container is ivory-colored plastic, permanent, dust-proof, attractive for home use and ideal for traveling. It contains two regular size tubes of Koromex Jelly which rest in individual compartments . . . a Koromex Diaphragm stored in the ingeniously constructed cover compartment . . . and a Koromex Measured Dose Plunger Applicator that rests securely on its own rack.

Where pregnancy is contra-indicated, recommend the complete Koromex Jelly Refillable Unit to your discriminating women patients.

For those of your patients who require a slightly less lubricating but equally effective spermicidal preparation, a similar companion package containing two tubes of Koromex Cream instead of Koromex Jelly is also available.

ACTIVE INGREDIENTS: BORIC ACID 2.0% OXYQUINOLIN BENZOATE 0.02% AND PHENYLMERCURIC ACETATE 0.02%, IN SUITABLE JELLY OR CREAM BASES.

Untreated menopause. Epithelial cells are relatively small, large nuclei predominate; bacteria, leukocytes, free-floating nuclei and other debris cloud the smear picture. **1**

2 & 3 Smears showing progressive improvement during estrogen treatment. The picture is beginning to clear. The cells are enlarging and becoming more discrete.

4 Smear showing effects of full estrogen replacement. The smear is clean and free of leukocytes indicating restoration of a normal vaginal epithelium.

CONESTRON®

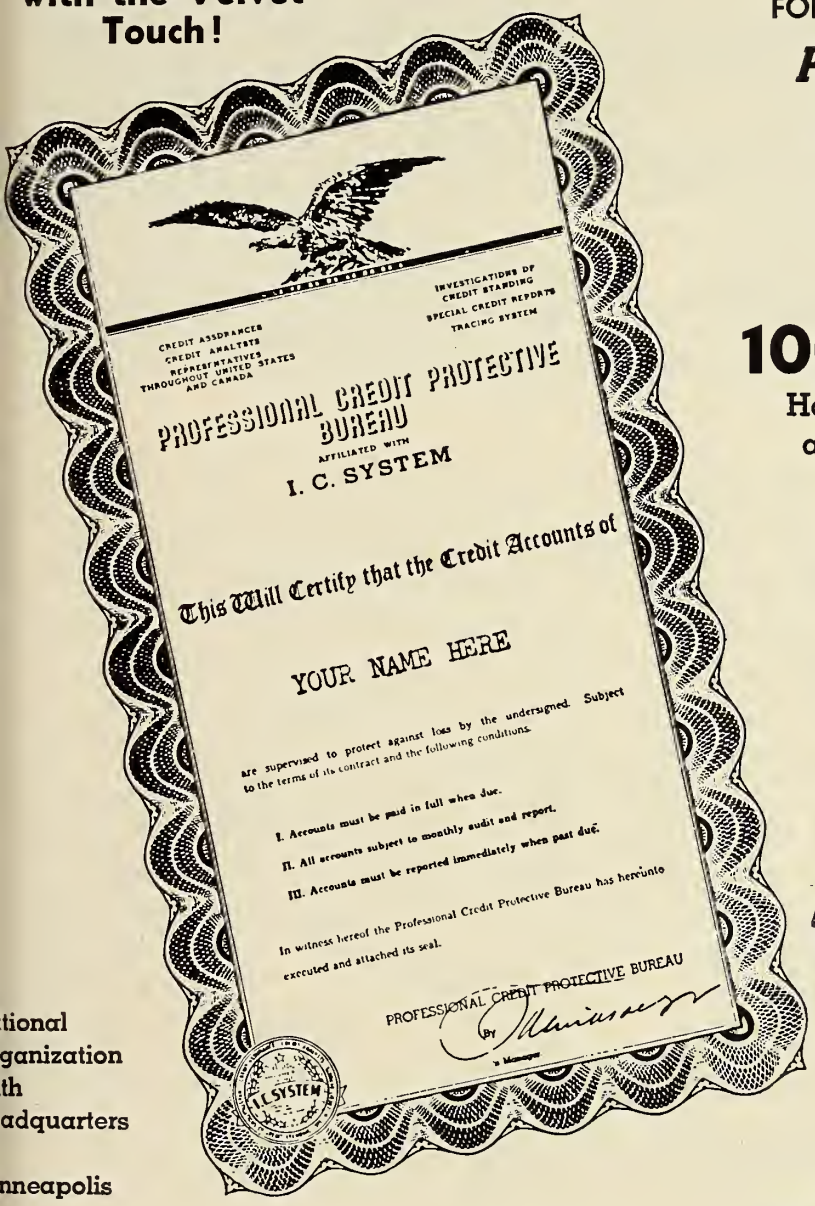
ESTROGENIC SUBSTANCES WATER-SOLUBLE

CONJUGATED ESTROGENS (EQUINE)

For action with little or no side action in control of menopause and certain other ovarian disorders.

CONESTRON, a complex of estrone, estradiol, equilin, equilenin and hippulin in the physiological conjugate obtained from the pregnant mare, supplies estrogens from natural sources, in the original, orally active form.

Conestron therapy produces a sense of well-being and is almost completely devoid of side reactions. Given in small, frequent, oral doses, Conestron permits a more uniform rate of absorption and maintains an effective level of blood estrogens.



Tablets of 0.625 and 1.25 mg., expressed as estrone sulfate. Bottles of 100 and 1000.

Long lines of black ants attracted to madhumeha, "honey urine," led the ancient Hindu wise men to observe and recognize diabetic urine, which they described as "astringent, sweet, white and sharp." Avid insects became an acknowledged means of diagnosis. Almost equally primitive methods of urine-sugar detection remained in effect for a score or more of centuries, until modern copper reduction tests were perfected, refined and simplified.

Simplest of all today is the reliable *Ames* tablet method, performed in a matter of seconds. Urine-sugar levels are determined by direct, easily-learned steps. The use of *Clinitest* (Brand) reagent tablets has eliminated the inconvenience of external heating. Interpretation of routine urine-sugar testing follows readily from color scale comparison.

RECENT ADVANCES IN PERNICIOUS ANEMIA, THE HYPOCHROMIC ANEMIAS AND THE HEMOLYTIC ANEMIAS

JOHN J. BOEHRER, M.D.
Minneapolis, Minnesota

IN THIS paper the recent advances in pernicious anemia, the hypochromic anemias and the hemolytic anemias will be discussed. Due to space limitations, the discussion will necessarily be brief.

Pernicious Anemia

In the twenty-three years which have elapsed since Minot and Murphy announced their discovery of the value of liver in the treatment of pernicious anemia, there has been an unremitting search for the substance in liver which makes it efficacious. Beginning with Cohn's successful preparation of a liver extract in 1927, repeated efforts were made to further purify and concentrate the effective material, with the result that for a number of years we have had available a number of relatively refined, stable, liver extracts. These extracts have been eminently satisfactory in the treatment of pernicious anemia. Administered properly, they have maintained normal blood levels, have prevented or improved the neurologic complications and, in general, have permitted the patient with pernicious anemia to live out a normal life expectancy.

However, there have been certain problems. For example, occasional patients have developed anaphylactic reactions to these materials. More important, however, was the disturbing fact that certain anemias which seemed morphologically identical with pernicious anemia were more or less refractory to these refined liver extracts. These entities, namely, sprue, pernicious anemia of pregnancy, pernicious anemia of infancy, tropical or nutritional macrocytic anemia, and so-called "achrestic" or "refractory" megaloblastic anemia, nearly always presented the megaloblastic bone marrow and the macrocytic anemia so characteristic of pernicious anemia. Yet the same liver extract which produced such rapid maturation of immature cells in the pernicious anemia marrow frequently failed in these similar conditions, whereas crude liver preparations, especially by mouth, often produced satisfactory results. The partial solution of this enigma has been an achievement of the past three years.

In 1945, following a series of apparently unrelated experiments in animals by other workers, Spies and Vilter and their associates announced that folic acid, a member of the Vitamin B complex, was highly effective in pernicious anemia. In rapid succession, this was followed by a number of equally electrifying reports. Sprue, both tropical and nontropical, was found to respond to folic acid in spectacular fashion, in nearly all instances. Pernicious anemia of pregnancy, the megaloblastic anemia of infancy, and the nutritional macrocytic anemias were likewise found to respond sharply to minute doses of this material. Folic acid appeared to be a discovery of the first magnitude, and an editorial in the journal *Blood* in 1946, called it "the wonder drug of the year."

It was puzzling, however, to learn that refined liver extract contained only traces of folic acid,

Presented in the Symposium on Hematology at the annual meeting of the Minnesota State Medical Association, May 10, 1949, Saint Paul, Minnesota.

quite insufficient to account for its potency in pernicious anemia. Similarly, it was disturbing to find that many cases of pernicious anemia treated with folic acid exhibited sub-optimal reticulocyte responses. But the crushing blow came late in 1947, when the first reports appeared concerning neurologic relapse in pernicious anemia patients treated with folic acid. It soon became obvious that folic acid, or pteroylglutamic acid, as it was then renamed, not only failed to prevent neurologic complications but seemed actually to encourage them, possibly because of interference with normal utilization of glutemic acid by nerve tissue. In any event, it was obvious that pteroylglutamic acid could not replace liver extract in the treatment of pernicious anemia, valuable though it was in the treatment of related states.

In spite of this disappointment the search went on, using various lactobacilli as experimental animals, and it was only a few months later that vitamin B_{12} was discovered by Short, isolated by Rickes, and proven by West to have almost unbelievable potency in the treatment of pernicious anemia. As Dameshek has said, "Here is a substance that, when given to a patient with pernicious anemia, results in a maximum reticulocyte response and a near maximal erythrocyte response following a *single* injection of 5 to 10 thousandths of a milligram. Has there ever been in the history of medicine a more potent material, microgram for microgram?" Nor is this all. Unlike pteroylglutamic acid, vitamin B_{12} has been shown to be equally potent in the relief not only of the neurologic complications, but of the mucous membrane lesions as well. In other words, at this time "vitamin B_{12} appears to be the long-awaited liver extract factor," normally formed by the interaction of extrinsic and intrinsic factors. Furthermore, these discoveries permit us, as Dameshek has pointed out, to make at least a tentative classification of the megaloblastic anemias, based on etiology. Thus it appears at the present time that Addisonian pernicious anemia and a few cases of sprue are exampled of "pure" vitamin B_{12} deficiency, whereas most cases of sprue, tropical macrocytic anemias, nutritional macrocytic anemias, so-called "refractory" megaloblastic anemias, pernicious anemia of pregnancy, and megaloblastic anemias of infancy represent deficiencies of folic acid.

It is obvious that there are still many gaps in our knowledge regarding the causes of the deficiencies themselves, but at least we now have a working basis for the treatment of what has previously been a most difficult group of diseases.

In addition to these fundamental discoveries, there is one further point regarding the management of the case of pernicious anemia which cannot be emphasized too strongly. It has been suspected for a long time that atrophic gastritis and achlorhydria may be precursors of two diseases with which they are notably associated, namely, pernicious anemia and carcinoma of the stomach. It has remained for recent statistical investigations, notably those of Rigler and his associates, to prove the melancholy fact that pernicious anemia is the blood-brother of gastric cancer. The incidence of stomach cancer in the pernicious anemia patient is at least four or five times as great as in other individuals in the same age group, and may well reach 15 per cent. The importance of this is clear. The treacherous silence of carcinoma of the stomach is well known, and one cannot wait for symptoms in the patient with pernicious anemia before advising x-ray examination. The patient with pernicious anemia must be *routinely* subjected to gastrointestinal x-ray examination, preferably every six months. There can be no compromise with this program, any more than one can compromise with the routine examination of the blood and the routine administration of specific therapy in these patients.

The Hypochromic Anemias

Recent studies in the field of the hypochromic anemias have been mainly concerned with fundamental observations regarding iron metabolism, rather than with clinical problems, but these investigations, often involving the use of radioactive iron, have been experimental proof of our general concepts of iron deficiency. Thus, the use of these tracer materials has proven conclusively that four to five times as much iron is absorbed in human beings when it is administered in the ferrous form as opposed to the ferric. The effect of achlorhydria in reducing absorption of iron from food, the depressing effect of alkalis on iron absorption, and the unimportance of such materials as copper and molybdenum in clinical iron deficiency have been re-emphasized.

There is still no evidence that iron ever needs to be administered parenterally, and there is likewise no evidence that any combination of iron with liver, with vitamins, or with folic acid is of

any advantage in the treatment of hypochromic anemia.

In this connection, it is well to remember that the great majority of anemias failing to respond to specific therapy fall into one of five categories: (1) unsuspected blood loss; (2) the anemias of chronic infection, particularly infections in the genito-urinary tract, the lung, the bones and joints, and in the blood stream; (3) the anemia of chronic renal insufficiency; (4) the myelophthisic anemias, due to throttling of the marrow by leukemia, by Hodgkin's disease, or by cancer; and (5) the hemolytic anemias. Failure of a normochromic or hypochromic anemia to respond to iron should immediately direct attention to these categories.

The Hemolytic Anemias

The hemolytic anemias, in spite of their comparative rarity, have received increasing attention in recent years from both diagnostic and therapeutic points of view. Thus, the introduction by Watson of quantitative methods for the determination of urobilinogen in feces has been of value not only in the differential diagnosis of jaundice but in proving beyond question the existence of a hemolytic process. Sharp increases in fecal urobilinogen may be, in fact, the only evidence that an obscure anemia is a hemolytic one. In most instances, however, the simultaneous presence of anemia, acholuric jaundice, and reticulocytosis, with or without splenomegaly, are the signs which lead to the proper diagnosis. Among other diagnostic aids one may mention the presence of spherocytes, particularly in familial hemolytic jaundice, target cells in Mediterranean anemia, and sickle cells in African hemolytic anemia.

With regard to specific hemolytic syndromes, there are several about which interest has centered in recent years. For example, paroxysmal cold hemoglobinuria was formerly thought to be almost exclusively a complication of syphilis. It is now known, however, that it may also appear simultaneously with the appearance of cold agglutinins. Since these antibodies occur with great regularity after viral pneumonia, it is evident that one must be on the lookout for the occasional appearance of the hemolytic syndrome. The first symptom is frequently the appearance of Raynaud's phenomenon in the extremities, and the literature records at least one instance where the extreme pallor of a foot in this connection was mistaken for an acute arterial thrombosis, following which the foot was packed in ice. Gangrene developed a few hours later, the syndrome was then recognized, and the foot fortunately saved.

The whole complex subject of erythroblastosis fetalis and Rh is likewise included under the heading of the hemolytic anemias. The immunohematologist is the only one who can discuss the ramifications of Rh, and the pediatrician is quite properly charged with the responsibility for the care of the erythroblastotic infant. I should like to point out, however, the potentialities of Rh haptene in the prevention of erythroblastosis. From the early reports, it would appear that the administration of this partial antigen to the Rh-negative mother during the latter part of pregnancy can be very effective in the prevention of erythroblastosis in the Rh-positive child.

From the internist's point of view, perhaps the most interesting and significant development in this field has been the extension of the concept of hypersplenism. The functions of the spleen are still mysterious, but it has become increasingly clear that its unexplained overactivity is the common denominator of a number of hematologic diseases. It has been known for a long time that splenectomy was of great value in congenital hemolytic jaundice, and for a shorter period its value in true thrombocytopenic purpura has been recognized. Similarly, primary splenic neutropenia has been found to respond to excision of the spleen. Of the so-called "idiopathic" acquired hemolytic anemias, some 60 per cent have been found to respond favorably to splenectomy. Most interesting is the concept of "symptomatic" hypersplenism. In this condition, which may be a feature of any disease in which splenomegaly is normally found, the enlarged spleen may be responsible for the abnormally low level of any blood element. Most commonly this is the red blood cell, and thus the syndrome of "symptomatic" hemolytic anemia may be found in such diverse diseases as leukemia, carcinomatosis, Hodgkin's disease, and cirrhosis of the liver. I have even observed thrombocytopenic purpura with such relatively benign lesions as sarcoidosis of the spleen. The importance of the recognition of this process is self-evident, since the removal of the spleen may permit even those individuals with serious underlying disease to extend their useful lives by several years. For example, a patient

LEUKEMIA, LYMPHOBLASTOMA AND POLYCYTHEMIA VERA

LOUIS R. LIMARZI, M.D.
Chicago, Illinois

LEUKEMIA has been known for over 100 years; still the nature and etiology of the disease are unknown. There is no cure for leukemia, and the therapeutic agents used in the disease are palliative in their effect. Patients with leukemia are made more comfortable by treatment despite the fact that it may not prolong life materially. In general, the indications for treatment in the chronic forms of myeloid and lymphatic leukemia are the appearance of signs and symptoms of anemia, hemorrhagic manifestations, pressure effects from an enlarged spleen or from enlarged lymph nodes or evidence of leukemic infiltrations in other organs.

Chemotherapy.—Arsenic in the form of potassium arsenite has been used in the treatment of chronic myeloid leukemia for many years. Arsenic administered by mouth over a long period of time has been followed by a gradual return of the leukocyte count to normal, associated with a rise in the hemoglobin and red blood cell count. The blood platelets are not depressed, and arsenic may be used in the leukopenic phase of the disease. The splenomegaly decreases, and the patient may appear clinically well. The initial dose is 3 to 5 minims of Fowler's solution in orange juice or milk, given three times daily after meals. After several days the dose is increased by 1 minim daily to the point of tolerance or the point at which the leukocyte count is normal. The serious objection to the use of Fowler's solution is development of toxic symptoms, namely, loss of appetite, nausea, vomiting, diarrhea, dermatitis, neuritis and renal irritation. The drug eventually has to be stopped in all cases, and this is usually because of its effect on the skin. Satisfactory remissions of from three to eighteen months have been maintained with Fowler's solution.

Urethane (ethyl carbamate) as a therapeutic agent in the treatment of leukemia was first reported by Paterson, Thomas and Haddow in 1946. In selected cases of chronic myeloid leukemia, urethane will produce a rapid fall in the white blood cell count and a nearly normal blood pattern. The dose is from 1.0 to 5.0 gm. daily administered by mouth (7½ grain tablets or 5 grain enteric-coated tablets). It may also be administered parenterally, although the intravenous route is not without danger. Remissions in chronic myeloid leukemia may be maintained with urethane as long as a proper dose is given. If the drug is stopped or if the dose is decreased, the leukocyte count steadily and rapidly rises, only to drop again with institution of adequate urethane therapy. The red blood cell count and hemoglobin values are improved during this treatment. The enlarged spleen decreases in size, but in our experience it never receded to its normal size. It is our impression, from a study of approximately 100 cases of leukemia, that some patients are made chronically sick while on urethane therapy in spite of the decrease in the leukocyte count and the recession in the size of the spleen and lymph nodes. Some patients experience anorexia, marked nausea and vomiting, or may show toxic symptoms in the form of anemia, agranulocytosis and thrombocytopenia. The drug may aggravate the gastrointestinal bleeding in cases of chronic myeloid leukemia. Urethane is generally more effective in chronic myeloid leukemia, although a reduction of the leukocytes to normal with a decrease in the size of the lymph nodes is frequently observed in chronic lymphatic leukemia. Acute leukemia is not benefited by the drug, although a temporary remission was induced in two of our cases. There is no evidence from our series of cases of leukemia that urethane prolongs the life expectancy of patients with the disease.

Nitrogen Mustards.—The application of these groups of compounds in the treatment of leukemia, Hodgkin's disease and other lymphomas has been evolved from their marked cytotoxic effects. The dose of nitrogen mustard is usually 0.1 mg. per kilogram of body weight given intravenously daily for four to six days. Because of the rapid hydrolysis, the solution is freshly made by dissolving 10 milligrams of the drug in 10 c.c. of sterile isotonic solution of sodium chloride. The calculated dose is then immediately injected into

Presented in the Symposium on Hematology at the annual meeting of the Minnesota State Medical Association, May 10, 1949, Saint Paul, Minnesota.

the rubber tubing during the course of an intravenous infusion of saline solution in order to avoid its contact with the patient's subcutaneous tissue or skin. Thrombophlebitis may also occur. Because of the toxic action of nitrogen mustard on the hemopoietic tissues, a complete blood count including a platelet count should be performed daily during the course of the treatment. Nausea and vomiting, often severe, are common in many cases one to three hours after the administration of the drug. Repeated remissions of six and twelve months have been obtained in several cases of chronic myeloid leukemia. Somewhat better results have been obtained in the treatment of chronic lymphatic leukemia. Practically all the patients treated have responded to the initial course of the drug with remissions which lasted from two to twenty-one months. Nitrogen mustards are of little or no value in acute leukemia. In general, nitrogen mustards are not superior to roentgen rays in the treatment of leukemia, although occasionally they are useful in radioresistant patients.

Folic Acid Antagonists.—These drugs were first used by Farber and his associates in February, 1947. The folic acid antagonists (aminopterin, a-methopterin and amino-an-fol) have produced temporary remissions in only about 50 per cent of acute leukemias in children. The dosage schedule usually employed in our cases of acute leukemia in children is 1 mg. of aminopterin intramuscularly daily for three to four days, followed by 0.5 mg. daily until there is conversion from a "blast" type of bone marrow to a normal pattern or nearly so. An attempt is then made to maintain a normal blood and bone marrow by the oral or intramuscular administration of 2 to 5 mg. of methopterin daily. In a series of ten cases of acute leukemias in children, five have died; the remainder have been maintained in a state of remission varying from four to eleven months. Aminopterin is a very potent and toxic folic acid inhibitor. Toxic effects noted in our patients include severe leukopenia, severe depression and aplasia of the bone marrow associated with a severe anemia, leukopenia and thrombocytopenia in the peripheral blood, rectal bleeding, hematemesis, ulceration of the mucous membranes of the oral cavity and anus, loss of hair and hemorrhagic infiltration of the skin. The bone marrow changes may be rapid, profound and irreversible. Fatalities have occurred for this reason. The margin of safety between a toxic reaction and death is at times very small. This is especially true in acute leukemia in adults. There is no evidence that folic acid antagonists cure leukemia. The use of the drug in chronic leukemia is limited by the early development of toxic phenomena.

Roentgen Ray Therapy.—For many years, since 1903, roentgen irradiation has been the most generally employed as well as the most successful treatment for chronic leukemia. The reduction in size of large glandular masses or an enlarged spleen improves the general physical condition of the patient. An elevated white cell count in itself is not an indication for irradiation. It is doubtful whether there is any advantage in treating those patients who are symptomless.

In spite of the fact that for many years roentgen therapy has been the method of choice, there is considerable controversy as to the type of treatment to be used. Some radiologists prefer local treatment to the spleen, enlarged lymph nodes and the long bones. Recently the use of small doses of x-rays to the whole body has proved successful in treatment of chronic leukemia. Reactions are less likely to occur with the "spray" technique. Total irradiation is not very effective in reducing a greatly enlarged spleen or marked adenopathy. In many instances the technique used will depend on the facilities available. During the first series of treatments it is wise to proceed cautiously, since there is considerable difference in the reactivity of patients to irradiation. Treatments can be given daily, two or three times weekly or less frequently. The white blood count and differential blood smear serve as a partial guide to the intensity and frequency of roentgen-ray exposure. It is generally agreed that the improvement is manifested by reduction in size of the spleen or lymph nodes and increased red blood cell count.

Symptoms of irradiation sickness include anorexia, nausea, vomiting and diarrhea. This reaction is more likely to occur when the upper abdomen has been treated. The intensity of the systemic reaction depends on the area of body surface treated, the portion of the body exposed and the dosage.

Radioactive Phosphorous.—In chronic myelogenous leukemia, P^{32} is effective in producing clinical and hematologic remission. Following

the use of P^{32} the leukocyte count decreases and the percentage of myeloblasts and myelocytes diminishes. The erythrocyte level increases in most cases. Clinically, asymptomatic improvement is noted with reduction in size of the spleen and lymph nodes. Because of the wide variation in the dosage of radioactive material required to restore the leukocyte count to near normal values, a rigid schedule of treatment is not feasible. However, it has been recommended that 1 to 2 millicuries be administered intravenously on the first day and 0.5 to 1 millicuries on the third, sixth, tenth and fourteenth days. In patients with a high leukocyte count, it may be necessary to administer from 0.5 to 1.0 millicuries at weekly intervals until the white cells number approximately 30,000 per cubic millimeter. The use of large and concentrated doses may result in depression of erythropoiesis and platelet formation. Treatment with P^{32} does not produce radiation sickness or other subjective disturbances. In a series of patients with myeloid leukemia treated with P^{32}, Hall and Watkins have noted that in six of fifteen cases the terminal blood picture was that of acute leukemia. The possibility of radioactive phosphorous as a precipitating cause of an acute phase must be considered.

It has been demonstrated that chronic lymphatic leukemia does not respond as favorably to therapy with P^{32} as the myeloid form of the disease. Smaller doses of P^{32} are required to reduce the total leukocyte count in lymphatic leukemia.

General measures employed in the treatment of chronic leukemia include rest and an adequate diet. Restriction of activity is not necessary if weakness is not pronounced and the temperature is not elevated. Many of these patients are able to lead active and useful lives for many years. A high caloric diet, adequate in protein, is recommended. If the diet is well balanced, the need for supplementary vitamins is not great.

Blood Transfusions.—Occasionally blood transfusions are required to correct the progressive anemia which develops during the course of the chronic leukemias. Since liver and iron are not effective in improving the anemia of leukemia, it is necessary to use whole blood when there is excessive weakness, restlessness, dyspnea and hemorrhagic tendencies. Symptomatic improvement may follow transfusions especially when the erythrocyte count is below 2,000,000 and the hemoglobin under 6 grams per 100 c.c. It may be necessary to give three or more transfusions (500 c.c.) to obtain the desired results.

Acute Leukemias

The treatment of acute leukemia with the folic acid antagonist has already been discussed. The course in most cases of acute leukemia is rapid, progressively downward, and usually fatal within three months. The treatment is essentially symptomatic with an attempt to make the patient comfortable. Because of the associated hemorrhagic tendencies, whole blood transfusions are of distinct value. Penicillin may be employed in controlling the secondary infection which is likely to accompany the ulcerative lesions in the oral cavity.

Lymphoblastoma

This group of diseases, the cause and nature of which are still unknown, include Hodgkin's disease, lymphosarcoma, reticulum cell sarcoma, lymphatic leukemia and mycosis fungoides. The treatment of lymphatic leukemia has been previously discussed. Satisfactory treatment for the lymphomas has not been found. For localized lesions in Hodgkin's disease, roentgen irradiation is the treatment of choice. There is general agreement that for patients with disseminated lesions the use of nitrogen mustard therapy with roentgen irradiation of selected specific areas appears to be the most effective method. According to some observers, when a patient is first seen presenting only one group of nodes involved, better results are secured if that group is resected and roentgen irradiation is given to the area postoperatively and also to other nodes in the adjacent regions.

The usual course of Hodgkin's disease, well managed by irradiation, is three to five years. In some instances it is shorter, while in the occasional case, palliation may be obtained for ten years or even longer. There comes a time when irradiation no longer causes regression of nodes and improvement in general condition. In the past general deterioration and eventually fatality ensued in these patients. Nitrogen mustard, which appears to act similarly to roentgen therapy, has proven of great value in some of these cases. An occasional patient with Hodgkin's disease may again become sensitive to roentgen ray treatment following nitrogen mustard therapy. Nitrogen mustard is also recommended for patients with Hodgkin's

disease in whom intensive roentgen ray therapy must be directed to the mediastinum, with consequent development of fibrosis of the lungs. This, of course, may be avoided by means of nitrogen mustard therapy. In general, the use of nitrogen mustard in Hodgkin's disease is indicated (1) when the lesions are generalized, (2) when the lesions, whether localized or generalized, are resistant to x-ray, and (3) in the presence of generalized symptoms such as fever, itching and neurological manifestations which are particularly amenable to chemotherapy.

Lymphosarcoma is best treated with roentgen rays. The response of giant follicular lymphoma to moderate doses of x-ray irradiation may be remarkable. All evidence of the disease may disappear and the patient may remain well for years. Craver believes that most of these cases, sooner or later, convert to reticulum cell sarcoma, becoming also less radiosensitive and more aggressive. The effect of nitrogen mustard in cases of generalized lymphosarcoma has been rather disappointing. Radioactive phosphorus, given intravenously in this disease as well as Hodgkin's disease, has produced disappointing results.

Mycosis fungoides has been treated with both roentgen rays and nitrogen mustard without any remarkable effect on the final course of the disease.

Polycythemia Vera

Radioactive phosphorous is perhaps the most effective means of treating polycythemia vera and producing prolonged remissions in this disease. This material has the advantage of never producing nausea or vomiting or any other ill effects when administered in therapeutic doses. Radioactive phosphorous emits a beta ray, has a half life of 14.3 days and localizes in a large measure in bone marrow and blood forming tissue. Radioactive phosphorous is usually administered as sodium acid phosphate and preferably intravenously since this eliminates the uncertainty of gastrointestinal absorption. From 3.5 to 7 millicuries is given initially. If at the end of from three to six months a hematologic and symptomatic remission has not been produced, a dose comparable to the initial dose or a fraction of it is given. When the symptoms are severe or the red blood cell count is so high that complications of thrombosis are feared, 500 c.c. of blood are removed every other day until the hematocrit value has been reduced to approximately 40 per cent. Complete symptomatic and hematologic remissions of from six months to more than five years may be produced by this form of treatment. The complications of P^{32} are largely confined to severe leukopenia, thrombocytopenia and anemia resulting from overdosage or unusual sensitivity of the patient. It is well known that chronic leukemia, especially the myeloid type, occurs in about 10 per cent of all cases of polycythemia even though no irradiation or P^{32} is given. On the other hand, following P^{32} treatment, several patients with polycythemia vera have been reported terminating with acute leukemia.

The nitrogen mustards produced hematologic and symptomatic remissions of from six months to two and a half years. A dose of 0.1 mg. per kilogram given on four consecutive days may produce symptomatic relief within three weeks after treatment. Hematologic values are within normal limits in some cases by two months after treatment. The toxic reactions that may result from the administration of the nitrogen mustards are nausea, vomiting, leukopenia and thrombocytopenia. The nitrogen mustards have the advantage of easy administration and do not require any elaborate set-up. On the other hand, the use of P^{32} is limited to certain medical and research centers, entails special equipment and precautionary measures which are too expensive or not feasible for most hospitals. Irradiation has been used in the treatment of this disease for many years. Spray irradiation, total irradiation or treatment of the entire body has been introduced in more recent years and is now regarded as effective and well tolerated. Remissions of from six months to five years have been reported by the method of total body irradiation.

The use of arsenic (Fowler's solution) is a safe and reliable method of treating polycythemia. The serious objection to the use of Fowler's solution in polycythemia vera is, namely, the loss of appetite, nausea, and vomiting which so commonly occurs. This is usually followed by loss of weight and disagreeable gastrointestinal symptoms which cause the patient to turn against the drug.

ANESTHESIA FOR THORACIC PROCEDURES

JOE W. BAIRD, M.D.
Minneapolis, Minnesota

THROUGHOUT the history of medicine, medical endeavor has often been retarded through the lack of progress along one line. This has been particularly true of thoracic surgery. Prior to the advent of modern anesthesiology, thoracic procedures were largely confined to extrapleural operations and those procedures which could be carried out rapidly.

Within the last fifteen years anesthesiology has come into its just place in the field of medicine. New agents have been discovered, new methods of administration have been devised, and new techniques have been perfected for the administration of some of our older and better known anesthetic agents.

It is generally recognized that endotracheal anesthesia[4] has done much to promote successful thoracic surgery. By using this technique the anesthesiologist has complete control at all times. The collapsed lung may be inflated at will. Secretions may be satisfactorily removed by suctioning through the endotracheal tube. The apneic technique may be carried on at will, and a patent airway is always assured.

Adequate preoperative and postoperative care of the patient, the proper mainteance of blood and fluid levels, the introduction of the antibiotics and improvements in diagnosis and surgical techniques have placed thoracic surgery on the high plane it now occupies.

The successful conduction of anesthesia for the patient who is undergoing a thoracic surgical procedure frequently challenges the skill and judgment of the anesthesiologist. Thoracic operations are usually performed upon anemic, poor-risk patients with altered vital capacities and upon those suffering from pulmonary neoplasms, congenital cardiac anomalies, intrapleural tumors, and debilitating diseases such as tuberculosis, bronchiectasis and abscess. These preoperative conditions predispose to anoxia, circulatory disturbances and shock.

In excisional surgery of the lung and intrapleural tumors, and also for operations upon the heart, mediastinum and esophagus, the patient is subjected to the dangers of an open pneumothorax, untoward vagal reflex stimuli, cardiac arrythmias, and the dangers of suffocation from bronchial secretions, blood, and pus expressed from the already diseased lung during operation. The anesthesiologist must be adequately equipped to combat these conditions to insure a satisfactory course for the patient.

Patients with an open pneumothorax will usually maintain adequate respiratory exchange through the one intact lung. However, if respiratory exchange is inadequate, the respiratory movements must be supplemented by intermittent pressure upon the breathing bag on the gas machine. It is not advisable to leave the exposed lung collapsed for long periods of time because the atelectatic condition of the lung may be difficult to correct unless the lung is expanded periodically. Positive pressure up to 10 mm. mercury applied every twenty or thirty minutes will effectively correct the atelectatic condition.

Reflex stimuli which are at times instituted during a thoracic procedure may be the cause of death during an operation. There are several precautionary measures that can be taken to prevent these reflexes. Adequate premdication with atropine will depress the vagal reflex. It has been shown[3] that procaine will reduce the irritibility of the myocardium and increases the threshold of stimuli necessary to produce fibrillation. The vagus nerve around the hilus of the lung may be injected with 1 per cent procaine. This effectively blocks vagal impulses and reduces the dangers of instituting a vago-vagal reflex which may lead to cardiac arrythmias and death. Procaine may be administered intravenously to correct these cardiac irregularities. Ten cubic centimeters of a 1 per cent solution will frequently correct untoward cardiac stimuli and restore a normal rhythm. Some authorities[2] administer procaine solution intravenously throughout the operation as a prophylactic measure. Sixty to 100 drops per minute of a 1 per cent solution will effectively control many of the dangerous reflex stimuli.

Execessive pulmonary secretion is frequently one of the most dangerous complications. This is especially true in patients suffering from tuberculosis, bronchiectasis, or lung abscess. Adequate

Read at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, June 10, 1949.

preoperative medication will lessen normal secretions. However, other measures must be instituted to control purulent secretions. Prolonged postural drainage preoperatively may be of advantage. Preoperative and postoperative suction bronchoscopy is one of the most effective means of controlling excessive secretions. During operation, secretions may be removed by passing the suction catheter through the endotracheal tube.

Selective endobronchial anesthesia has been used with some success. By employing this technique the infected lobes may be locked off, thus decreasing the danger of hypoxia.

There has been considerable controversy as to the best type of anesthesia for thoracic surgery. General anesthesia is favored by some surgeons, while others prefer spinal or local anesthesia. The advocates of the latter type of anesthesia feel that the conscious patient is better able to keep the bronchial tree free of secretions through an active cough reflex. However, there are disadvantages to this type of anesthesia. The patients will become restless and uncomfortable if forced to lie in one position for long periods of time unless heavily sedated. The heavy sedation will partially obliterate the cough reflex and thus defeat the purpose of regional anesthesia. Local anesthesia is most effective for thoracoplastics and extrapleural procedures.

A general anesthetic is usually the anesthetic of choice. Here the choice of anesthetic agent, and the technique of administration is relatively large. Ethylene, nitrous oxide, ether, pentothal and cyclopropane have been used and each with success. The agent used is apparently not as important as the skill with which it is administered.

Nitrous oxide and ethylene are relatively weak anesthetic agents. If these agents are chosen, the patient must be heavily sedated. Adequate sedation makes it possible to increase the oxygen concentration and reduce the dangers of anoxia. Ether and cyclopropane anesthesia for thoracic procedures have been enthusiastically accepted and condemned. Some authorities condemn ether anesthesia on the grounds that it is too irritating to infected pulmonary tissues. Others deny this accusation and are using it freely. Cyclopropane alone, or in combination with ether, is used extensively for thoracic surgery. Cyclopropane has been condemned on the grounds that it causes cardiac hyper-irritability and increases the danger of ventricular fibrillations. Some anesthesiologists add ether to the cyclopropane on the theory that it reduces the incidence of fibrillation. The gaseous and volatile anesthestic agents are administered with adequate oxygen, employing the closed carbon dioxide absorption technique.

It has been our experience[1] that a mixture of pentothal sodium and curare in combination with 50 per cent nitrous oxide and oxygen is the best anesthetic agent for all types of thoracic surgery. The pentothal-curare solution is administered intravenously. The nitrous oxide and oxygen are administered by inhalation through an endotracheal tube. The pentothal curare solution contains 25 mg. pentothal and 5 u. d-tubocurarine chloride per cubic centimeter. This concentration has proven satisfactory for all ages and for all types of surgery. The non-explosive properties of this agent make the use of the electrosurgical unit possible.

By combining d-tubocurarine with pentothal sodium we have found that the amount of penothal used in markedly reduced. The 50 per cent nitrous oxide provides a mild analgesia while the 50 per cent oxygen insures adequate oxygenation. The patient usually regains consciousness promptly following operation, thus decreasing the dangers of postoperative depression.

Since using this anesthetic agent we have encountered no fatal reflex stimuli or untoward cardiac irregularities, even though we have not used procaine routinely to reduce cardiac irritibility. We administer this anesthetic to small babies undergoing cardiac operations as well as to older patients undergoing extensive pulmonary procedures.

Proper closure of the pleura and expansion of the atelectatic lobes will help insure a smooth postoperative course. If catheter drainage is to be carried out, the lobes may be inflated after the chest has been tightly closed and before the catheters have been clamped. The lobes are expanded by exerting positive pressure until the atelectatic condition has been corrected. The catheters are then connected to a Steadman pump. This pump will remove intrapleural secretions and also maintain a slight negative pressure, which will further promote adequate expansion of the intact lobes.

If catheter drainage is not contemplated, a catheter may be left in the pleural cavity through

MANAGEMENT OF DISEASES OF THE THORAX

Surgical Aspects

GUSTAF E. LINDSKOG, M.D.
Professor of Surgery, Yale University School of Medicine
New Haven, Connecticut

IT IS the purpose of this brief and general presentation to consider the present status of pulmonary resection in its various forms, with respect to the therapy of the commonest pulmonary diseases now known to be at least in some degree amenable to surgical treatment.

To have a proper perspective on resectional therapy it is well to remember that this type of operation is of recent development. Sporadic attempts at partial lung removal had been made in the last part of the nineteenth century, and a very rare clinical success with partial lobectomy had been recorded, notably by Tuffier in the 1890's. The first groups of lobectomies with any significant attending success were reported by Brunn[5] in 1929, and Shenstone and Janes[18] in 1932. Brunn reported six cases with one death, and Shenstone fifteen cases with three deaths. These were principally cases of bronchiectasis and were done by a technique involving mass transfixion-ligature of the hilus and a resultant only partial amputation of the involved areas. The operation of total pneumonectomy remained an unsolved and uniformly lethal procedure until 1933 when Graham[9] reported a successful case for primary lung cancer. It is of interest to note that this first patient was a physician himself, and he has since led an active professional career. In the following year Cameron Haight[11] reported a total left lung removal for bronchiectasis with a living patient as the end result. These cases were a strong impetus to further efforts in many clinics, which eventuated in the fairly well standardized techniques of the present day.

Certain technical problems are common to all types of pulmonary resection which include total pneumonectomy, bilobectomy through the intermediate bronchus, total lobectomy, partial lobectomy and segmental resections. These common problems are concerned with (1) anesthesia, (2) the anatomy and dissection of the vascular structures in the hilus, (3) the method of closure and healing of the bronchial stump, (4) the prevention of empyema, (5) the prevention of bronchogenic infectious spreads (postoperative pneumonia), and (6) the prevention of surgical shock.

Anesthesia.—It is evident that the challenge of open-chest surgery has been the greatest impetus to the development of modern anesthesia and the anesthesiologist. The popularization of endotracheal anesthesia, as proposed and practiced experimentally by Meltzer, has been the principal factor in a safe open-chest technique. This permits an adequate airway in most positions, satisfactory aspiratory removal of blood and secretions, controlled reinflation of the lungs during and after resection, and adequate oxygenation in the pulmonary capillaries during operation. The choice of anesthetic agent is next in importance. It should preferably be an agent capable of inducing satisfactory anesthesia levels at a high oxygen concentration, and for this objective cyclopropane- and ether-oxygen are the most satisfactory. Of the two, ether provides the greater margin of safety, relatively less lability of anesthesia level, and a lesser disturbance in cardiac function. In our own clinic we carry out induction with cyclopropane or pentothal, followed by oxygen-ether, using a closed circuit rebreathing technique.

Anatomical Dissection.—As stated previously, the earliest resections were executed by a relatively crude mass-ligation technique which was relatively easy and immediately effective, but was associated with a high incidence of bronchial fistula and resultant empyema, as the strangulated tissues of the hilus usually sloughed out in the first week after operation. The classical contributions of Churchill,[6] Blades and Kent,[2] and Reinhoff,[17] among others, on the vascular anatomy of the pulmonary hilus permitted about 1940-42 a general shift to a precise anatomical dissection in the hilus with seriatim isolation and ligature of the arterial and venous branches as required. Churchill and Belsey,[7] Brock,[4] Boyden[3] and others pointed the way to conservative resection of pulmonary segments. The concept of the pulmonary segment rather than the entire lobe, as an anatomical and surgical pathological unit thus

From the Department of Surgery, Yale University School of Medicine, New Haven, Connecticut.
Presented at the annual meeting of the Minnesota State Medical Association, May 10, 1949, Saint Paul, Minnesota.

developed rapidly in the course of a half-dozen years.

Closure of the Bronchial Stump.—Whether in total pneumonectomy or lesser operations, this has evolved to a considerable but not entirely satisfactory degree. It is now generally considered that a clean sharp transection of the bronchus without proximal crushing or clamping and with an end closure using a single layer of simple nonabsorbable sutures (silk, cotton or wire) is the best. A further support of the closure by repleurization of the hilus, or a pedicle of pleura-lung to the stump, is an additional safeguard against failure due to tissue breakdown and fistula formation.

Prevention of Empyema.—Postoperative empyema is usually the result of a fistula in the bronchial stump, and not of direct contamination at the time of dissection. The incidence of fistula and empyema go hand in hand, as shown by Table I. The situation is quite comparable with the threat of peritonitis after intestinal resection, where a secure anastomosis usually means a clean peritoneum and steady recovery. Only rarely does a postoperative pleural effusion or hemothorax result in a clinical empyema requiring drainage, in the absence of a demonstrable bronchial fistula.

Prevention of Postoperative Pneumonia.—This is not usually a problem in tumor cases but is of great importance in bronchiectasis and chronic abscess, where highly infected purulent sputum may be retained in large amounts throughout the involved segments. In 130 consecutive resections of various types for bronchiectasis in our clinic (1938 to 1949) there were four hospital fatalities (3.1 per cent). Two of these deaths were due to contralateral bronchopneumonia, and were suffered before 1944 when penicillin became available for civilian hospital use. There are other factors than chemotherapy which promote safety by minimizing postoperative pneumonitic spreads. These are perfect anesthesia, meticulous pre-operative preparation including postural drainage and bronchoscopy, and pre-operative dental prophylaxis. The importance of the latter factor is not to be underestimated.

The other disease in which bronchial contamination during operation becomes all important is tuberculosis. Beyond the factors mentioned above, streptomycin therapy is proving to be of some protective value against immediate reactivation or spread of disease.

TABLE I

Technique	Operations	Bronchopleural Fistula	Empyema
Mass Ligation	22	12 (54.5%)	11 (50.0%)
Individual Dissection.....	63	10 (15.9%)	11 (17.4%)

Prevention of Surgical Shock Due to Blood Loss.—Accidental opening of a large pulmonary vessel in the course of dissection is not as frequent an accident as might be expected from the anatomical situation. A much more usual source of significant blood loss during operation is the exceedingly rich collateral circulation present in adhesions on the chest wall, diaphragm, and mediastinum as a result of chronic pulmonary disease and the attendant pleuritis. It has been shown by Wood and Miller,[19] and again by my colleagues, Liebow and Hales,[12] that vascular anastomoses exist between bronchial and pulmonary vessels to a significant degree in chronic pulmonary disease. Determinations of blood loss by colorometric or weighing techniques (of aspirated material in suction bottles and on gauze sponges or drapes) according to Baronofsky[1] have demonstrated that there may be a blood loss of 1400 c.c. in an average pneumonectomy or lobectomy. The importance of typed transfusable blood in reserve for these cases is thus made obvious. The use of hemostatic oxycel gauze and gelfoam for large denuded areas of dissection should also be mentioned as useful.

We shall now proceed to consider how attention to the various above-related factors has resulted in improvement of the results in the surgical treatment of bronchogenic carcinoma, bronchiectasis, pulmonary abscess, and tuberculosis, using as an example the case experience from the thoracic surgical service of the New Haven Hospital, where this work has been in progress since 1937-38.

Pulmonary Resection for Bronchiectasis

The development of resectional therapy for bronchiectasis is one of the brightest chapters in modern surgery. This procedure offers a chance for cure or great clinical improvement with social and economic rehabilitation to a majority of bronchiectactic sufferers.

Bronchiectasis is more often than not a disease

of multiple segments or lobes. From the standpoint of anatomical distribution our cases divide themselves roughly into thirds. In one-third the disease is confined to a single lobe or a lobular segment; in another third, the disease is multilobar but still unilateral; in the remaining third, both lungs are involved in a varying degree. In the last group, a bilateral program of surgery is feasible providing the upper lobes (excepting the left upper lobe lingula) are essentially uninvolved. The operations are spaced three months to one year apart when bilateral resections are required.

Before an operation is undertaken for the relief of bronchiectasis, an accurate and complete mapping of the bronchial disease by lipiodol bronchographic technique is required. Failure to recognize and remove all areas of disease invites an incomplete therapeutic result or failure. The lower lobes are most commonly involved, particularly the left lower. Two-thirds of the patients with left lower lobe disease have simultaneous bronchiectasis in the lingula of the left upper lobe, and about one-third to one-half of the patients with right lower lobe disease have associated involvement in the middle lobe.

In 1947 we reviewed our series of surgically treated bronchiectasis. There were then seventy-five patients, the ages of whom ranged up to forty-nine years. Ten of them had bilateral lobectomies, a total of eighty-five operations. The hospital postoperative mortalities were three (3.5 per cent). (Case mortality was 4 per cent.) Since 1947 there have been forty-five additional cases with one death; insufficient time has elapsed to classify the results in these cases.

The end results of the first seventy-five have been very encouraging. There have been no subsequent deaths in the series. Complete cure with absence of all symptoms resulted in thirty-five; a near cure with occasional mild cough and scanty, not measurable sputum resulted in seventeen cases. Altogether, fifty-two (70 per cent) were in these favorable categories. An additional fourteen (19 per cent) considered themselves greatly improved but had residual cough and sputum. Only one case was a complete therapeutic failure, in addition to the three deaths noted above. One of the deaths was due to avoidable respiratory obstruction at operation; two were due to spreading pneumonia in the opposite lung. There has been only one death since 1944 when penicillin became available for civilian use. The surviving patients are actively employed or working at home or studying. Several of the women have subsequently married and have had successful pregnancies. Symptoms of respiratory insufficiency have not been noted in unilateral cases, but several patients with bilateral involvement have dyspnea on exertion.

Resection for Chronic Lung Abscess

During our early experience with the treatment of lung abscess[15] (up to 1943) it became increasingly evident that acute and chronic abscess represented different therapeutic problems with respect to morbidity, mortality and late results. The conservative medical procedures and simple drainage operations which are so effective in the acute cases (that is, those with symptomatic duration of one to ten or twelve weeks) were found on systematic case analysis to be relatively ineffective and sometimes dangerous in the management of more chronic lesions (those of several months to years in duration).

Among twenty-two acute patients treated by bronchoscopy, postural drainage, sulfonamide chemotherapy (the only available at that time), and simple pneumonotomy, there was a single death, a mortality of 4.5 per cent. Twenty had excellent end results as indicated by relief of cough and sputum, with clearing of the x-ray findings. Among twenty-five patients with chronic lesions, the results were quite the reverse after simple drainage—a high mortality (seven deaths or 28 per cent) and eight patients with persistent cough, sputum, recurrent febrile attacks, bronchocutaneous fistula, and failure of x-ray clearing. Six of these patients required secondary lobar resections for cure. The reasons for this divergence in results between acute and chronic cases is to be found in the secondary pathologic changes which develop in the chronically abscessed lung lobe, and in a progressive deterioration of the chronic patient's general condition due to sepsis.

The local complications of chronic pulmonary abscess are: (1) bronchiectasis, (2) bronchostenosis, (3) organizing pneumonia and fibro-atelectasis, (4) multiple secondary abscess formation, (5) perforation and empyema, (6) hemorrhage. Simple drainage could not be expected to deal with these entirely, and it seemed wiser to substitute primary lobar or pulmonary resections in chronic cases as the situation required. After

preliminary bronchoscopy for diagnostic help in ruling out cancer, foreign body, et cetera, and after a lipiodol bronchogram to delineate the extent of secondary changes, twenty-four resections were carried out (fourteen primary, ten secondary). The early and late results have justified this departure toward radical treatment. The mortality was lower (three or 12.5 per cent) and the results improved (eighteen of the twenty-four patients well). Since the advent of penicillin in 1945 results have been even better. Expert anesthesia is a prerequisite, since the possibilities of bronchial contamination and obstructive anoxia are greater than in the usual cases of bronchiectasis and tumor. The literature of the past three years indicates that this apparently radical attitude is steadily gaining acceptance, although originally rejected by some thoracic surgeons as not sufficiently conservative.

The existence of a limited (encapsulated) interlobar or parietal empyema is not necessarily a contraindication to one-stage resection of the abscessed area. After evacuation of the local empyema at the time of thoracotomy, we have in six instances proceeded with removal of the original lobar disease quite successfully. These cases may require prolonged drainage of the residual pleural space, and it is quite obvious that only the protection afforded by penicillin and other chemotherapeutic agents makes this a feasible procedure.

It is well to emphasize here the not uncommon association of abscess with carcinoma in the age group forty-five and over. It may be occasionally difficult or impossible to entirely differentiate the two diseases by x-ray or bronchoscopy, which is another important reason for considering resection rather than drainage in the chronic cases.

Resection for Bronchogenic Carcinoma

After the first successful pneumonectomy for bronchogenic carcinoma was performed by Evarts Graham in 1933, intensive study by Rienhoff,[17] Churchill,[6] Crafoord[8] and others resulted in rapid technical advances. After 1938, reports of substantially large case series began to appear in the American and English literature. In 1947 Ochsner and DeBakey[16] were able to collect 2,034 cases from twelve different clinics, with an exploration rate of 29.2 per cent and a resection rate of 13.4 per cent.

It rapidly became evident to workers in this field that the limiting factors in the surgical treatment of pulmonary cancer were not technical but clinico-pathological. From one-half to two-thirds of patients are now appearing for treatment in an advanced inoperable state which precludes even an exploratory thoracotomy. The objective findings leading to this conclusion are usually as follows:

1. A positive biopsy from supraclavicular or axillary nodes.

2. Pleural effusion, especially when positive for cancer cells.

3. Skeletal or visceral metastases.

The bones usually involved in metastatic lung cancer are the thoraco-lumbar vertebrae, pelvic bones, upper femur, skull, ribs, and humerus.

This distribution is not dissimilar to that observed in breast cancer.

The viscera chiefly providing sites for metastases are the contralateral lung, liver, brain, kidneys, adrenals and skin.

4. Mediastinal extension, as evidenced by involvement of the recurrent nerve producing laryngeal cord paralysis and usually hoarseness, of the sympathetic chain producing a Horner's syndrome, or of the phrenic nerve causing paralysis of a hemi-diaphragm. Involvement of the superior vena cava may produce x-ray signs of mediastinal widening, as well as distended neck or arm veins with edema.

5. Bronchoscopic evidence of proximal extension to involve the trachea or carina. An important observation by Griess, McDonald and Claggett in 1945[10] showed that microscopic tumor invasion in the bronchial wall extended proximally on the average 2.5 cm. beyond the grossly visible lesion.

When a series of bronchogenic cancer patients has been screened by these criteria of inoperability, only 40 to 50 per cent will be left for serious surgical consideration. Of this group, a substantial fraction (about one-half) will be found at subsequent exploration to be incurable because of mediastinal invasion at the hilus, pleural and pericardial extension, remote lymph node involvement, and extension into the large veins. Yet it has been our practice to carry out palliative resection (i.e., without hope of cure) in as many of these as can be accomplished without transecting tumor in the bronchial stump. It appears that removal of a grossly infected, sometimes

bleeding and pain-producing lung as a palliative procedure has a great deal to recommend it. The surviving patients are usually symptomatically improved, and the average life span in this group is higher than in the untreated inoperable case.

Our first New Haven Hospital group of 100 cases began in 1938 and was complete in December, 1943.[13] The second hundred was on record by June, 1947,[14] and the third hundred by March, 1949. Comparing the three series, it is apparent that the exploration rate has risen from 32 to 47 per cent, and the resection rate from 12 to 30 per cent. This is in part due to a better case referral from medical and surgical colleagues in the State of Connecticut and in part to an increased willingness to attempt palliative resections where cure seems impossible. However, the line demarcating palliative and curative resections is sometimes hard to define. Our two longest post-resection survivors (now nine and seven years) were in a sense palliative resections. The first had a localized invasion of the chest wall which required extrapleural resection. The second had a complicating pneumococcal empyema at the time of admission, which fortunately was controlled with sulfathiazole, leading to a per primam healing of the postoperative chest and incision.

The operative mortalities in the three series were 25, 14, and 17 per cent, respectively; for the entire group of 300 cases, 17.4 per cent. It is probable that the increasing resection rate has led us to include poorer risks and technically more difficult cases. The usual causes of post-pneumonectomy death have been bronchial fistula and empyema, right heart failure and pulmonary edema; no patient has died of hemorrhage during or after operation.

Resection for Tuberculosis

From 1936 to date, our service has completed thirty resections for tuberculosis. These include seven lobectomies, two bilobectomies and twenty-one pneumonectomies. Fourteen patients were male, and sixteen female. They ranged in age up to seventy years, but the majority were in the fourth decade.

The therapeutic indications were as follows:

Thoracoplasty failures	9
Bronchostenosis of primary bronchus	7
Tuberculosis bronchiectasis	5
Tuberculoma and cancer suspects	4
Tension cavity	3
Miscellaneous	2

There have been no postoperative hospital deaths in this series. Two have subsequently died of complications, both due to tuberculosis spread, one with bronchial fistula and empyema.

There have been four instances of bronchopleural fistula (13.3 per cent). Of these patients, three developed empyema (10 per cent), one of whom, as already stated, died. There were four instances of contralateral spread of disease or reactivation (13.3 per cent). Three had wound complications which are now healed. Some of the above complications were multiple in the same patients.

As to end results, two patients previously mentioned are dead, and twenty-eight are living. Three are too recently operated upon to evaluate. Of the twenty-five sufficiently long-term survivors, twenty-two appear to be doing well (88 per cent). Seven of these are working; fifteen are at home or convalescing in a sanatorium with variable degrees of physical activity and negative sputum, but not all have had gastric concentrates and cultures.

These results are promising, perhaps due to case selection, and probably because streptomycin was used in the postoperative course of twenty-one patients. This drug was given for thirteen to nineteen days after operation, at levels of 1.0 to 2.0 grams daily. The most favorable group according to indications for operation has been that of post-thoracoplasty persistent cavity with positive sputum; the next most favorable, tuberculous bronchiectasis and the resections for tuberculoma. The poorest results were expected and obtained in the patients with tension cavity and unstable recent spreads with highly positive sputum. Our experience suggests strongly that resection is not sufficiently safe to be considered as a substitute for a well-conducted thoracoplasty when the usual indications for the latter operation exists.

POSTOPERATIVE MANAGEMENT FOLLOWING SURGERY OF MALIGNANCIES OF THE LARGE BOWEL

HARRY E. BACON, M.D., F.A.C.S., and LLOYD F. SHERMAN, M.D.
Philadelphia, Pennsylvania

A DECADE ago most large clinics reported mortality rates in the vicinity of 20 per cent following resection of the rectum and colon. Today, the same groups report an incidence of 5 per cent or less. Undoubtedly the employment of chemotherapeutic measures together with improvements in anesthesia and surgical techniques have contributed to this encouraging reduction in postoperative mortality rate. Reduction in postoperative morbidity also is an achievement that may be largely credited to the use of antibiotics, intestinal antiseptics and to refinements in postoperative care. According to Clute and Kenny,[5] it is becoming increasingly apparent that many factors other than chemotherapy are responsible for the progress in surgical management. It is obvious that improvement in all phases of preoperative and postoperative care have contributed in no small part to diminishing postoperative deaths and morbidity following the extirpation of malignancies involving the rectum and colon. This has made it possible to bring surgery to older age groups. At the present time, resection of malignant lesions in the seventh and later decades of life with subsequent satisfactory recoveries is not at all uncommon. In our department, during the past year, the average postoperative stay for patients submitted to resections for malignant lesions of the colon was ten days. This represents a marked reduction in morbidity as compared to similar resections performed five years prior to this report.

It is our purpose to discuss a few of the important adjuncts to postoperative care that have contributed materially to the decreased postoperative mortality and morbidity rates, and which consequently are a part of the regimen followed on our service.

Oxygen Therapy

It would be an error to imply that extirpation of malignant lesions of the colon and rectum, particularly the latter, whether by the Miles type of operation, abdominoperineal proctosigmoidectomy or low end-to-end anastomosis, does not fall within the category of surgically traumatic and often shock-producing procedures. Mindful of this fact, we are particularly staunch advocates of adequate supportive measures to prevent peripheral vascular collapse in the immediate postoperative period. The ability to administer practically 100 per cent oxygen in the inspired air via the BLB mask, economically, efficiently and without discomfort to the patient, has established this measure as a routine in our postoperative regimen.

Boothby, Mayo and Lovelace[3] have advocated the use of 100 per cent oxygen as a prophylactic measure against shock in the immediate postoperative period, and they stress the fact that oxygen therapy should not be instituted exclusively where shock has developed. They point out that the oxygen saturation of arterial blood can be increased from 10 to 15 per cent by the administration of 100 per cent oxygen, and although this increased oxygenation apparently is small, it is important in states of diminished blood pressure since it does produce increased partial pressure of oxygen in the capillaries.

The blood as it passes through the capillaries gives up only about 40 per cent of its load of oxygen to the tissues under normal circulatory conditions. The venous blood, therefore, is still 60 per cent saturated, and the partial presence of oxygen in the capillaries is equivalent to approximately 33 mm. Hg. If for any reason the rate of circulation is decreased, as occurs in states of shock; for example, the blood may liberate 80 per cent or more of its load of oxygen to the tissues. The capillary partial pressure of oxygen will fall from a normal of about 35 mm. to 14 mm. Hg. In such a case, on the basis of the characteristic dissociation of oxyhemoglobin, the inspiration of 100 per cent oxygen could be expected to increase the amount of oxygen available to tissues as much as 50 per cent.

Experimentally, Blalock and his associates[2] have confirmed the prevailing impression that the inhalation of high concentrations of oxygen exerts beneficial effects in the treatment of peripheral circulatory failure. They showed that a

Dr. Bacon is professor of proctology and head of the Department of Proctology, Temple University, Philadelphia.
Dr. Sherman is a resident in proctology, Temple University Medical School.
Read before the Salt Lake Surgical Society, Salt Lake City, Utah, February 14, 1949.

considerable increase in oxygen was available to the tissues, as evidenced by a rise in oxygen saturation of arterial blood throughout the body. They further concluded that oxygen availability was further enhanced by a concomitant increase in carbon dioxide tension.

Many investigators have reported the occurrence of irritation, congestion and even edema of the lungs in animals breathing high concentrations of oxygen for prolonged periods of time. In their studies, Comroe and his associates[9] noted substernal distress in 82 per cent of the normal males receiving 100 per cent oxygen for twenty-four hour periods. They also observed that signs of nose and throat irritations were common and concluded that the objectionable symptoms were due to a tracheobronchitis. They suggested that if oxygen therapy must be continued beyond a twelve-hour period, the concentration should be decreased 50 to 60 per cent, unless that concentration is insufficient to oxygenate the arterial blood, since arterial oxygen unsaturation represents more of a threat to the patient's life than does the possibility of a tracheobronchitis.

On the other hand, Boothby[3] and Evans,[14] respectively, report series of over 800 clinical patients who received 100 per cent oxygen for forty-eight-hour periods with no untoward effects. We have used 100 per cent oxygen postoperatively for twelve to sixteen hours in over 500 patients. No undesirable effects were observed, and we recommend its use most highly as an adjunct in the prophylaxis against shock in the immediate postoperative period following resections of the rectum and colon. We feel that blood pressure and pulse are stabilized much more rapidly with the prophylactic use of high concentrations of oxygen.

Our incidence of postoperative atelectasis has been small since we have been administering 100 per cent oxygen via the BLB mask. We also feel that our incidence of postoperative ileus has been reduced. However, it is impossible to state definitely whether or not the administration of 100 per cent oxygen together with the use of gastric suction in the immediate postoperative period has been the contributing factor. Fine[15] and his co-workers have shown conclusively that the administration of high concentrations of oxygen accelerates the decompression of bowel obstructions along with intestinal intubation since it facilitates the more rapid removal of nitrogen from the obstructed bowel. In the event of postoperative pulmonary complications, such as atelectasis, bronchopneumonia, lobar pneumonia or pulmonary edema, high-concentration oxygen therapy is instituted at once and continued for at least twenty-four to forty-eight hours as indicated.

Since there is still considerable disagreement among authorities[3,4,11,14] as to the best method by which high concentrations of oxygen may be administered most efficiently and with the least discomfort to the patient, the oxygen saturation of arterial blood was studied by one of us (L.F.S.) pre-operatively and postoperatively in a group of sixteen patients submitted to resection for malignant lesions of the rectum and colon. These patients were studied with a view to evaluating the oxygen saturation of the arterial blood in the immediate postoperative period under practical rather than ideal conditions. The pre-operative studies were made on samples of blood from the femoral artery after sedation, upon arrival of the patients in the operating room and just before administration of the spinal anesthetic. Blood samples were again taken postoperatively from the femoral artery following oxygen therapy for twelve to fourteen hours.

These patients were divided into two groups of eight each. One group received the oxygen by intranasal catheter and the other group via BLB mask at a constant rate of 7 liters per minute. In the group receiving oxygen by catheter, the catheters were replaced every four hours to rule out stoppage. The BLB masks were removed only momentarily during the twelve- to fourteen-hour periods to permit wiping of the patient's face, with the exception of the fourth patient in Table II, from whom the mask was removed for an hour because of our inability to replace an empty oxygen tank. All patients had Levin tubes emerging from beneath their BLB masks which gave a possible point of oxygen leakage.

These patients were under heavy sedation during the immediate postoperative period, and no particular complaints were registered concerning either method of administering oxygen. Oxygen has been administered postoperatively with the BLB mask to approximately 500 patients on the proctology service, and no appreciable discomfort has been noted as has been recorded with normal subjects in experimental trials.

Method.—The oxygen content and capacity of the arterial blood samples were determined by the

Van Slyke and Neill manometric method. All samples were subjected to dual tests to check the accuracy of the determinations.*

A significant effect of pre-operative medication is noted in the reduced oxygen saturation of arterial blood reported in the control series (Tables I and II). Oxygen saturation was determined in a number of these patients the day before operation when the patients were not subjected to the effects of hypnotics and analgesics. Oxygen levels at that time ranged within normal levels of 92 to 95 volumes per cent saturation. This would indicate that a considerable degree of oxygen unsaturation might also exist in the immediate postoperative period where hypnotics and analgesics are used, and at a time when increased or at least normal oxygen saturation is desired (Tables I and II).

TABLE I. OXYGEN SATURATION OF ARTERIAL BLOOD: INTRANASAL OXYGEN

	Control (Preoperative)			14-16 Hours Postoperative		
	Oxygen Content*	Oxygen Capacity*	Per Cent Saturation	Oxygen Content*	Oxygen Capacity*	Per Cent Saturation

8.	15.49	17.66	87.70	19.35	19.89	97.30

*Volumes per cent.

A relatively small number of patients have been studied thus far, but from the figures cited for Tables I and II, postoperative oxygen saturation, a definite trend is noted.

Obviously much higher oxygen saturation can be obtained in the immediate postoperative period by the use of the BLB mask than by administering oxygen via nasal catheter. Since it is during this period of a patient's convalesence that an increased oxygen saturation of arterial blood is most desirable, as has been previously pointed out, it would seem only plausible to administer oxygen by the most efficient route, namely, by use of the BLB mask.

Fluids and Electrolytes

During the past two decades much effort has been expended in attempts to place the diagnosis and treatment of dehydration on an arithmetical basis as Coller,[6] Moyer[20] and others have testified. All methods suggested have been based on the mistaken assumption that the various blood solutes (sodium chloride and plasma proteins) and the suspended particle (red blood cells) volumes were approximate constants. In spite of the increased emphasis placed on laboratory methods for controlling water balance, there are no universally applicable or dependable laboratory procedures or formulas available for the detection and treatment of fluid disequilibrium. Therefore, a clinical approach appears to be more generally applicable to the problem.

Since in the postoperative period our resection patients are subjected to continuous intestinal decompression for periods usually of two to three days, they receive, during this interval, fluids and nutrients by the parenteral route. Schedule I (next page) is a representative excerpt from our postoperative fluid regimen which is used as a guide by residents and interns.

Explanation of Schedule I.—

1. Oral intake is limited in an attempt to prevent excessive lavaging of gastric secretions while the

*Oxygen saturation measurements were made in the Department of Physiology, Temple University Medical School, by E. M. Greisheimer, Ph.D., M.D., and D. Ellis, B.A.

SCHEDULE I

Fluid intake 2500 to 4000 c.c. daily by parenteral route until these volumes can be taken orally. Requirement determined by skin turgor, perspiration, comparison preoperative and postoperative blood studies, urinary output, loss by vaporization, Wangensteen suction, Babcock sump drain.

Example

1. Oral intake limited to maximum of 1000 c.c. H_2O or Ringer's solution, preferred with gastric suction working twenty-four hours.

2. Five per cent glucose in normal saline administered to equal volume aspirated via Wangensteen suction and sump drain, plus estimated salt loss by perspiration.

3. Five per cent glucose in distilled water administered to equal volume urine output (800 to 1000 c.c. minimum desired, and anticipated on first postoperative day), plus estimated water loss by vaporization (1000 c.c. minimum).

4. Daily protein requirements fulfilled by supplementing fluids with (1 gm./kg. body weight) protein hydrolysates such as parenamine or amigen.

5. Whole blood in small transfusions (250 c.c.) if indicated by red blood cell count and hematocrit.

Wangensteen suction is functioning and to eliminate the tendency to alkalosis.

2. As Coller[7,8] has suggested, we limit, or refrain from using, parenteral salt solutions in the immediate (twenty-four hours) postoperative period. It has been found that by doing so the blood chloride levels suffer only moderately, and the daily urinary output is of more adequate volume. With this regimen, oliguria has been observed rarely. The volume for volume of gastric drainage plus the volume lost via the Babcock sump drains, when they are used, is replaced with normal saline solution. Additional saline is administered when perspiration is excessive.

3. A minimum of 1000 c.c. of 5 per cent glucose in distilled water is administered in the immediate postoperative period to promote an adequate urinary output. The daily urine volume is then replaced, volume for volume, with 5 per cent glucose in distilled water, plus the estimated water lost by evaporation, which is considered to be a minimum of 1000 c.c.

Wangensteen has suggested that a minimum excretion of 700 c.c. of urine is essential in the postoperative patient. Fluids are always administered with greatest care as to volume and rate of administration to patients in the older age groups and to those with possible myocardial damage.

Lockhart and Elman[19] recently demonstrated that the proper rate at which intravenous glucose solutions may be injected without producing glycosuria and unwanted diuresis is considerably slower than that which was previously suggested and supported by the work of Woodyatt. They showed that glucose solutions injected at rates less than 0.5 gm per kilogram of body weight per hour produced no glycosuria, while faster rates of injection produced glycosuria and diuresis. In other words, a liter of 5 per cent glucose solution should require one hour and twenty-five minutes if glycosuria and the associated diuretic effect is to be avoided. They also pointed out that amino acids injected in conjunction with glucose effectively reduced the degree of glycosuria as compared with glucose alone injected at the same rate. They believe that amino acids act by increasing the utilization of glucose in the tissues rather than by lowering the renal threshold for glucose excretion.

Protein Balance

Protein has a special significance in surgical patients because of the fact that injury and operation lead to tremendous protein loss. Even the phenomenon of surgical shock is concerned with the lack of sufficient circulating plasma protein to maintain normal fluid relationship. Jones and Eaton,[17] 1933, first reported that edema resulting from hypoproteinemia was not uncommon in patients before and after operations for gastrointestinal lesions, and emphasized that the administration of large amounts of sodium chloride intensified the edema. Since then the literature has become voluminous in descriptions of the effects of hypoproteinemia on the postoperative patient.

Ravdin,[22] as well as other workers, has shown experimentally and clinically that wound healing is delayed and inadequate where hypoproteinemia exists. Hartzell and his associates[16] found hypoproteinemia to be present more frequently than vitamin C deficiencies in patients with wound dehiscence. Mulholland[21] and co-workers demonstrated the amazing rate of healing of decubitus ulcers when the therapeutic regimen is unchanged except for an increased protein intake. Whipple[24] advocated the correction of existing anemias in protein-deficient surgical patients, to avoid further degrees of anemia.

Every operation, injury and infection is associated with a period of increased nitrogen catabo-

lism resulting in most instances in a negative nitrogen balance. Culbertson[10] found that approximately 25 gm. of nitrogen were lost per day following major surgical procedures. Under normal conditions, protein nutrition in the adult is maintained by the intake of an adequate, well-balanced diet containing among other things about 1 gm. of protein per kilogram of body weight per day.

Koop and associates[18] found that it was necessary to provide a nitrogen intake of 0.30 gm. per kilogram of body weight and a caloric intake of 30 calories per kilogram of body weight to maintain nitrogen balance in the immediate postoperative period following gastrectomies and cranial operations. Elman[13] states that some postoperative patients will have protein requirements as high as 300 to 400 gm. per day, but recommends the routine administration of 100 gm. of hydrolyzed protein and 100 gm. of carbohydrate parenterally in the immediate postoperative period to those patients who cannot take oral feedings.

Koop has also provided good evidence that forced feeding prior to operation is of real value because considerable nitrogen can be stored and drawn on in the immediate postoperative period. It is our policy to admit patients to our service five to seven days prior to operation. During this period they receive a high protein (120 gm.), high carbohydrate (400 gm.), and low residue diet with supplemental feedings of protein concentrate, or hydrolysate such as essenamine or delcos granules, so that on an average of 3 gm. of protein per kilogram of body weight are ingested daily.

Postoperatively we provide all resected patients with a minimum of 1 gm. of protein hydrolysate (parenamine or amigen) per kilogram of body weight daily by the intravenous route until proteins can be taken by mouth in adequate amounts. Some patients, particularly those subjected to the Miles resection, require a greater protein intake, apparently because of the large volume of serous drainage from their perineal wounds. In the immediate postoperative period daily serum protein studies are performed along with frequent hemoglobin and hematocrit determinations. These studies indicate that the regimen described above usually is adequate to maintain plasma protein levels within normal limits. Protein concentrates by mouth are started the day after oral feedings are begun. Anemias are corrected by frequent small transfusions.

Intestinal Antiseptics and Antibiotics

As has been mentioned above, candidates for resection of malignant lesions of the colon and rectum are admitted to the hospital five to seven days prior to operation at which time the oral administration of intestinal antiseptics is instituted. All patients receive sulfathalidine 0.1 gm. per kilogram of body weight during each twenty-four-hour period for a minimum of five days. The drug is administered in suspension to enhance its effectiveness. Forty-eight hours prior to intubation with the Levin tube (four hours before operation), oral streptomycin is started, 2 gm. being administered in each twenty-four hour period in divided doses every four hours.

The senior author and Rowe[23] have demonstrated with coliform counts that the combination of sulfathalidine and streptomycin produces the most efficient degree of intestinal antiseptis and have pointed out that the risk of producing resistant organisms is thereby minimized. The oral administration of sulfathalidine is again instituted postoperatively the day after oral feedings are resumed, according to the preoperative dosage schedule. The postoperative use of sulfathalidine is particularly recommended in those patients submitted to abdominoperineal proctosigmoidectomy with preservation of the sphincter muscles, or where open perineal wounds may exist in the presence of fecal contamination.

Postoperatively, penicillin is administered prophylactically for five to seven days. We subscribe to the infrequent dosage schedules for aqueous penicillin as have been recommended by Zubrod[26] and others.[25] These workers have demonstrated that the bacteriostatic effects of aqueous penicillin outlast the measurable blood levels by many hours, and recommend that doses of 300,000 units of aqueous penicillin intramuscularly every twelve hours offer a more rational method of controlling penicillin-susceptible infections than by maintaining blood levels with the frequent dosage schedule. This method of administering penicillin has the additional advantages of decreasing the work for the nursing staff and producing less discomfort to the patient.

Miscellaneous

It is not possible to discuss in detail all of the phases of postoperative care, but some of the important features of the regimen followed may be mentioned. Among these are early ambula-

tion, anticoagulant therapy and intestinal decompression.

We heartily subscribe to the initiation of early ambulation, and routinely, all patients in whom resection with end-to-end anastomosis has been performed, are out of bed and walking on their first or second postoperative day. Ambulation usually is delayed, however, until the third or fourth postoperative day where abdominoperineal proctosigmoidectomy has been performed because in this procedure the pelvic floor is not reperitonealized, and we feel that delayed ambulation prevents the small bowel from prolapsing about the recently "pulled through" colon.

We favor the conservative method of treating phlebothrombosis and thrombophlebitis, when they occur. Anticoagulant therapy is instituted in the form of oral dicumarol, as recommended by Allen and Barker.[1] Continuous intravenous heparin is used until dicumarol becomes effective, when a more rapid anticoagulant effect is indicated, as in instances of pulmonary embolism. Should the latter accident occur, we feel that blocking the stellate ganglia with procaine is of considerable benefit in improving the survival rate. Routinely, all patients over sixty years of age, particularly those with varicose veins or a history of thrombophlebitis or embolic phenomena, have their legs and thighs snugly wrapped with elastic bandages before going to the operating room. This procedure is continued for at least a week postoperatively.

As we previously mentioned, intestinal decompression by way of Levin tube with Wangensteen suction is maintained in the immediate postoperative period, following resection of all rectal and colon malignancies, until peristalsis becomes active. Decompression usually is carried out for a two- to three-day period, but longer if ileus occurs. If postoperative mechanical obstruction occurs, a Miller-Abbott or Cantor tube is introduced to the lowest attainable reaches of the small bowel, and conservative therapy by means of suction is attempted first. If this fails, early exploration and more definite treatment is recommended. We admit that each patient at all times must be treated according to his individual needs.

Summary

1. We feel that the administration of high concentrations of oxygen in the immediate postoperative period is of real value as a supportive measure against peripheral vascular collapse. It is during this period that a considerable degree of arterial oxygen unsaturation exists. Oxygen can be administered most efficiently via the BLB mask.

2. Some of the essentials of fluid balance and protein requirements in the immediate postoperative period are discussed.

3. In our hands the combined oral administration of sulfathalidine and streptomycin has proven to be the most satisfactory method of reducing the bacterial flora of the colon. Aqueous penicillin is used, prophylactically, on a schedule of large infrequent doses.

4. Other phases of our regimen of postoperative care have been mentioned, but in the final analysis each patient is treated according to his individual needs.

EMPLOYMENT OF RECTUS SHEATH AND SUPERIOR PUBIC LIGAMENT IN DIRECT INGUINAL HERNIA

HAMLIN MATTSON, M.D.
Minneapolis, Minnesota

RECURRENCE rates for direct inguinal hernia are at such levels that thorough clinical trial of the newer basic methods is justified. As late as 1934 Andrews and Bissell[1] suggested abandonment of the operation for direct inguinal hernia unless pain was present. Recently Ferguson[7] at the University of Minnesota analyzed 186 patients operated upon for hernia, and followed from three to seven and one half years after operation. Thirty-one per cent of the direct variety recurred. There were sixteen direct inguinal hernias and five recurrences. The more experienced surgeons, though dealing with mainly difficult cases, had the same recurrence rate as interns and residents. The series covered a period from January 1, 1940, to June 30, 1944.

Ever since Marcy[14] in 1881 advocated and Bassini[2,3,4] popularized suture of the inguinal strata to the inguinal ligament, nearly all popularly used procedures have been variants of such basic methods. In 1898, Lotheissen[8] used the superior pubic ligament which had been described by Cooper[6] in 1804. Narath[16] of Utracht was said to have used it before him. About a decade ago, after restudy of the inguinal anatomy, McVay[9,10,11,12] found that the natural attachment of the lower inguinal strata was the superior pubic and not the inguinal ligament. It was also found that the inferior layers of the inguinal strata were deficient in seven out of every 100 bodies. McVay revived and modified the Lotheissen operation and recently[13] has reported further surgical experience with the method and some changes in it. Rice has also modified the Lotheissen operation.[17]

While operating on a soldier in a desert hospital during World War II, I encountered not only absence of the inguinal ligament following previous operations but also absence of the lower transversus abdominis. To meet this situation I turned down a flap of rectus and pyramidalis sheath and sutured it to the superior pubic ligament. The procedure worked out so well that I operated on twenty-two patients with direct inguinal hernia using this method while in service with the armed forces.[15] Two of the patients in this series had recurrent direct inguinal hernias which had been operated on elsewhere. Since returning to civilian life and up to April 1, 1949, I have operated on fifty-eight direct inguinal hernias, making a total of eighty operated upon since 1943.

The rectus flap superior pubic ligament method was used in all but five. Others since have reported use of the method which I described in 1946.[5]

A five-year examination follow-up is planned, and so far only letter follow-up has been used. However, in order to encourage reporting of recurrences, the patients have had the situation explained to them and their co-operation has been solicited. To date, two recurrences have been found. One who had been operated upon by me showed a recurrent hernia at the internal ring. The rectus sheath flap was solid.

It now is becoming apparent more generally that superior pubic ligament operations for direct inguinal hernia are more anatomic and physiologic and give the lowest recurrence rates.

Method

Upon opening the cremaster muscle, an indirect hernia is looked for. If none is present, a tongue of peritoneum can be found nearly always and the finger inserted into the abdominal cavity. The extent of the direct inguinal hernia or redundancy of the floor of the inguinal canal can be tested. A large direct sac is opened, excised and its walls resutured. A redundancy can be tucked back into the areolar tissue medial to the superior pubic ligament. The transversus is incised over the superior pubic ligament and the exposure of the ligament completed by blunt dissection, using the finger to retract the femoral vessels. The fascia of the external oblique is dissected back as far as possible on the rectus sheath and a boomerang-shaped flap cut in the sheath of the pyramidalis and rectus muscles. The flap is sutured to the superior pubic ligament for a distance of about 4 centimeters from the pubic spine. Silk or cotton is used. Sutures in the rectus flap are of the mattress type at right angles to the direction of the

STUDIES IN EXPERIMENTAL GASTRIC CARCINOGENESIS

CLAUDE R. HITCHCOCK, M.D.
Senior Cancer Research Fellow, U. S. Public Health Service
Minneapolis, Minnesota

MAN STANDS uniquely alone in the animal world with respect to cancer of the stomach, for of all human types of malignancy, this cancer is the greatest killer, but the spontaneous appearance of adenocarcinoma of the stomach in lower animals is an extremely rare phenomenon. Up to 1936 only three cases of spontaneous gastric adenocarcinoma in mice had been reported in the literature. By 1938 two more had been added to the list. This survey covered a period of several decades with observation of many thousands of mice by several groups of investigators.

Today we are still concentrating our effort on inbred strains of mice. Several strains of more recent origin do develop spontaneous prepyloric glandular lesions as the animals grow old, but there is not general agreement as to the malignant quality of the lesions. The "I" strain started by Strong in 1925 has a high incidence of adenomatous hyperplastic lesions appearing spontaneously in the pyloric stomach.[18] A more recent strain produced in Strong's laboratories, the "NHO" strain, has prepyloric lesions that consist of branching glandular elements with small cysts and polypoid projections. This strain and a subline, the "BRS," are being extensively used today. Recently it was shown that whole body x-ray irradiation and subcutaneously implanted methylcholanthrene were both ineffective in changing the incidence or degree of malignancy of these lesions in these strains.[9] This observation is of very real interest and importance in this field.

The well established "C3H" and "A" strains are also widely used. The author is operating upon mice of these strains and implanting 20-methylcholanthrene into the glandular stomach wall. The animals are then bred and the offspring maintained as breeding families. The mice in the families are then treated in the same manner, and this procedure will be carried through successive generations. Ultimately the strains will be crossed, and genetic changes tending to a susceptibility for glandular cancer will be looked for.

Dogs are very refractory to the induction of cancer of the stomach with carcinogens, but lately there is some evidence that the problem of gastric polyposis may well be studied in old dogs since they do develop this lesion with age. Monkeys do not develop cancers with the present known carcinogens, as shown this past year by Pfeiffer and Allen when they reported an eleven-year study using fifty monkeys.[15] Rabbits have a glandular mucosa that regenerates from traumatically induced ulcers with a hyperplastic glandular overgrowth, but carcinogens given to these animals so far have failed to produce malignant lesions.[7] Laboratory rats will develop adenocarcinoma in the glandular or prepyloric stomach when carcinogens are implanted in the stomach mucosa, but the labile nature of the squamous forestomach of rats hinders sound evaluation of results. It can be appreciated from this brief summary that inbred strains of mice are still the animals of choice for this type of investigation.

Twenty methylochlanthrene and 1, 2, 5, 6 dibenzanthracene are the most effective carcinogens in use today for gastric carcinogenesis. Other hydrocarbons are used for cancers elsewhere in the body, but these two stimulate epithelial cancers in the gastrointestinal tract better than any others.

Methylcholanthrene fed to mice in prepared feeds is ineffective in the glandular portion of the mouse stomach. The squamous lined fore-stomach of mice will show squamous carcinomas, but these are not comparable to human adenocarcinomas. Consequently, much effort today is directed toward the prepyloric or glandular stomach. Methylcholanthrene can be implanted in the glandular stomach wall as crystals or injected in horse serum, and glandular cancers will result. To date, the dissolved carcinogen seems to be more effective than the plain crystals.

Lorenz of the National Cancer Institute has developed many emulsions of methylcholanthrene in olive oil or mineral oil as a base, utilizing various wetting agents to obtain close contact with the mucosa.[11] These emulsions, however, do not induce glandular cancers; only the squamous forestomach and the intestine develop cancers. The mineral oil emulsions have a higher viscosity than

From the Department of Surgery, University of Minnesota Medical School, Minneapolis, Minnesota.
Read at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 10, 1949.

the olive oil emulsions, and this factor seems to be important in getting more fore-stomach cancers with the former emulsions as against the olive oil emulsions.[12] In addition, precancerous esophageal lesions also appear with the mineral oil emulsions and not with the olive oil emulsions. The "I" strain mouse with the spontaneous glandular stomach hypertrophy so far has been refractory to this type of induction in the glandular stomach.[12] When mineral oil emulsions are used the first squamous lesions appear in ninety-four to 130 days. When methylochalanthrene is implanted in the gastric wall the adenocarcinomas develop as early as sixty days and as late as 330 days. The author uses mineral oil emulsions similar to those mentioned above and intubates the stomachs of mice daily giving a measured quantity. This will be considered in greater detail later.

There are still discrepancies as to what constitutes a malignancy in this type of animal work. Earlier investigators labeled any hyperplastic cystic lesion that had a tendency to downgrowth as malignant. Today the animal lesions must be anaplastic and infiltrate all layers of the stomach wall and grow on the serosal surface. Metastases, of course, constitute the best, most unequivocal evidence of malignant processes.

Many dietary substances peculiar to man have recently been investigated in mice. Tobacco tar was reported carcinogenic for rats' stomachs some years ago by Roffo, but the most recent studies using thick inhaled tobacco smoke and ingested tars have produced no gastric cancers. W. R. Peacock of Glasgow, Scotland, has three adenocarcinomas out of 148 genetically heterozygous mice fed for months on super-heated fats. The fats are those used in cooking for humans and are heated and reheated to 300° Centigrade.[14] These apparently are the first well-authenticated true malignancies produced in this manner, since much doubt is thrown upon Roffo's earlier work with hot fats in rats. Experiments are in progress in our laboratories testing the effects of mustard on mouse gastric mucosa along with methylcholanthrene. Heat is indicted as a physical carcinogen, still rather empirically, but meagre evidence is appearing to substantiate the idea of thermal internal carcinogenesis and thermal initiation of atrophic gastritis. Only a few experimental results in animals are available. The author is combining the effects of heat with the desquamating effect of eugenol and the carcinogenic effect of methylcholanthrene emulsions. The eugenol is given by tube to mice of various strains several times weekly, and then hot carcinogenic emulsion is instilled into the stomachs of one series and cold emulsion into another series on alternate days. This work was recently started, and no data are available as yet. A previous experiment by the author intubating a series of A-C3H and DBA mice with hot water alone at 65° Centigrade gave negative results in the esophagus and stomach, reflecting the results of others using the same technique.

The mucus of the stomach is considered to be a protective barrier for the delicate glandular cells. Ivy has recently shown that it has a thermal insulating effect with temperature around 62° Centigrade.[4] Mucus also exerts protective effects by acting to buffer and neutralize acid secretion. This complicated four-fold function of gastric and esophageal mucus provides an excellent basis for work. It is believed today that our carcinogenic agents would act on the glandular cells if we could produce mice that had long-standing atrophic gastritis and impaired mucous cell function. That there is a specific intracellular resistance of gastric glandular cells to carcinogens is doubted.

Bile is known to penetrate mucous layers and this fact has intrigued investigators for some time. To date, tauracholic acid alone has not proved to be carcinogenic.[2] On the other hand, the best gastric carcinogen, 20-methylcholanthrene, can be synthesized from bile acids and has a chemical structure similar to bile acids. No proof exists showing such a synthesis within the animal body as far as is known today. The author now has experiments under way testing the possible effects of bile as whole bile salts along with methylcholanthrene in the mouse stomach. The bile might penetrate the mucous barrier and over long periods of time allow sufficient direct action of the carcinogen to induce adenocarcinomas. Recently Hollander has demonstrated the tremendous desquamating effect of eugenol on the gastric mucosa in pouch dogs. He has studied the complete denuding and regeneration of the mucosa over three-month intervals. The author is using eugenol in the above-mentioned experiment with the hot and cold carcinogen emulsions. It is hoped a procedure of this kind will enable us to produce adenocarcinomas more readily and more abundantly. A good deal of basic work on mucous cells and their secretion is needed, and correlations with human gastric physiology is a must.

Other experiments in our laboratory deal with the effects of various deficiencies on the gastric mucosa. Mice are kept on iron deficient diets until they develop anemias in order to determine the influence of this anemic state on the development of adenocarcinomas due to methylcholanthrene implanted into the gastric glandular wall. Rats, infected with the spiroptera worm gongylonema neoplasticum, are being fed vitamin deficient diets in order to more thoroughly evaluate the much debated results of Johann Fibiger.[5,6] The generalized pronounced effects of vitamin deficiencies in epithelial cells seems too important to be ignored even though extensive work has been done in this field.[19] The metaplasia of glandular cells into squamous cells would seem to involve basic metabolic processes, and it is hoped some faint additional light might be shed upon this field in the near future.

This has been a brief summary of some of the basic animal research now under way in the University of Minnesota Medical School relative to stomach cancer. Many other projects, clinical, physiological, and chemical, are in progress in various departments, and round out the research program in this field.

DIRECT INGUINAL HERNIA

(Continued from Page 909)

fibers. A small, cervix cutting needle is used for deep sutures into the superior pubic ligament. If there is any evidence of weakness at the hinge, a row of sutures may be placed there. The cord is dropped into the concavity and the external oblique sutured anterior to it, allowing an aperture at the external ring sufficient to admit the tip of the fifth finger. The procedure occupies no more time than older methods, and difficulties with vessels are more hypothetical than real.

In addition to direct inguinal hernias, the method is applicable to indirect inguinal hernias with large internal rings and femoral hernias. It is especially applicable to direct recurrences because the work can be carried out in a virgin field.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from August issue)

Practitioners of Medicine in Olmsted County

Itinerant Practitioners, Quacks and Medicine Shows.—Olmsted County, and particularly Rochester, from the fifties into the nineties and especially in the late sixties and the seventies, was a happy hunting ground for all sorts of irregular practitioners of the healing art. Some of these gentry were frankly itinerant. Many of them, equally transient, made a point of expressing appreciation of the beauty and enterprise of Rochester and declaring intention of settling there permanently. Many came from Wisconsin and Illinois where, in the seventies, laws were enacted against irregular and unqualified practitioners. In that decade Rochester newspapers began to publish protests against the "tramp doctors" that were infesting the city and imposing on the credulous, of whom there were many. The abortive medical licensure legislation of 1869 (repealed in 1870) in Minnesota served only to exacerbate the nuisance of quacks and impostors. Designed to exclude the irregular and the unqualified, the act failed signally in its purpose. It rather gave the irregulars a chance, which they eagerly accepted, to organize medical societies and issue certificates to practice. After the protective legislation of 1883 the comments in the press chiefly concerned strangers in the city who had been arrested for practicing medicine without license.

From more than a hundred names of such exploiters of the public, a few are given here. As early as 1855 came Dr. William Hunter, who for a time lived in St. Peter, giving "medical inhalation and all else," especially for tuberculosis and other diseases of the lungs and the "air passages." Dr. McCall, of Wisconsin, in 1862 was representative of many who toured the county lecturing on anatomy, physiology and disease. A few years later the *Rochester Post* of April 3, 1869, commented on such a lecturer and his co-worker:

> We have been told of a sharp system of medical practice by a firm who were this week in Pleasant Grove and Stewartville, in this county, and are on their way further west. A Dr. Hamelin whose advertising has been published in this paper for a couple of weeks, made his appearance at Pleasant Grove, where he gave an interesting free lecture on anatomy and physiology, and announced the coming of Dr. Morse, who appeared within a few days in the neighborhood, giving diagnosis to large numbers of the afflicted for whom he prescribed at rates ranging from $50 upward, half cash and half notes.

The local career of Dr. Morse ended when an irate citizen of Pleasant Grove followed him to Stewartville and stood outside the doctor's stopping place shouting the practitioner's trickery to all listeners. The man from Pleasant Grove received back his cash and notes and the doctor departed.

In 1863 Dr. J. F. Underwood, "celebrated oculist and aurist" of Chicago, came

to the Stevens House, Rochester, to treat any disease of long standing, especially of eye and ear. There were countless "distinguished" opticians; Dr. A. Weinhold was one of the earliest, in 1864. In 1865 Dr. B. Phelps and Dr. F. H. Sime, oculists and aurists, came from St. Paul, and thereafter Dr. Sime returned at intervals, from Chicago and later from Winona, where he represented the State Eye and Ear Infirmary, offering "the best French and English artificial eyes," which he inserted without pain, he said, and which he guaranteed to fit. In the later sixties came Dr. Barth, "the most eminent surgeon now living," representative of the Milwaukee Medical and Surgical Institute, which was established in 1867. Dr. N. I. Lund was a homeopath from Norway who brought "renowned European Rheumatic Chains" which, he claimed, had been successfully applied for numberless diseases where all other remedies had failed. And in 1868 and 1869 came the notorious Dr. William P. Duvall, the Natural Healer and Practical Physician of the Western Healing Institute. A botanic physician, Dr. Duvall had the added advantage, he stated, of being the seventh son of a seventh son and of having possessed since the age of ten years peculiar and natural healing powers, whereby he healed all known diseases by laying on of hands: "The patient has only to sit calmly a few minutes, and all pains and ailments will gradually pass away." It presently came out that Dr. Duvall, who had started life as William D. Potts, had poisoned four of his wives, the last of them a girl whom he had married at Owatonna, Minnesota. He was checked in his career by imprisonment in the state penitentiary of Wisconsin at hard labor.

There were Dr. Ferrard, the "celebrated Spanish physician," who treated for deafness, sore eyes and asthma; Dr. J. J. S. McCabe, Indian Doctor; Schenastanaux, Indian Doctor; and Dr. Lyon, the "celebrated Brazilian doctor," whose vegetable treatment was advertised as a triumphant victory over sickness and premature death: "No indelicate examinations or exposures. By observation alone the doctor will explain and point out location of trouble without asking questions and without requiring any explanations." Dr. William Levingston, the Old Indian Doctor, for some time in 1878-1879 made Rochester his headquarters. Dr. S. C. Torpy in the seventies came from Green Bay, Wisconsin, practiced under the Indian botanical system of medicine and claimed to cure all kinds of chronic diseases, fever sores and phthisis, abscesses and asthma. He would announce that he was coming for one week and would advise his numerous patients and suffering humanity in general to take due notice and govern themselves accordingly. Dr. Spinney, proprietor of the Electro Medical Institute of Milwaukee, announced that he was very successful in the treatment of "diseases of the lungs and internal organs." Several of the surgeons of the Central Surgical Infirmary of Indianapolis, Indiana, came seeking to help those who were afflicted with any disease of the eye or ear, goiter, cross eyes, clubfoot, spinal curvature, fistula-in-ano, piles, epilepsy and chronic diseases. Dr. Hebern Claflin cured cancers without the knife, as did Dr. W. Wheeler, who added to his professional repertoire cures for sore eyes, female diseases, rheumatism and catarrh. There were other traveling practitioners, ad infinitum, including "foot doctors" and clairvoyants and magnetic healers. One of the last-named lectured on "human magnetism or the electric philosophy of life."

Worthy of mention also are certain practitioners, not frankly itinerant, of the early decades who advertised freely in local newspapers of many sections of country other than their own places of residence and who probably reaped a considerable harvest from the long-distance business that resulted. From the *Federal Union*, of Rochester, of April 27, 1872, comes the following excerpt from a detailed advertisement that perhaps had special appeal:

Dr. C. M. Mack, graduate of Guy's Hospital, London, England, and for over two years confidential physician to Her Majesty, the Queen; also late of the Medical University of New York, has now located at Indianapolis, and will give advice to the sick abroad as well as home. . . . The reasons are: 1st: That your local physicians are so much occupied in the treatment of acute diseases at the bedside of their patients that they have neither the time nor patience to give proper attention to a long standing and supposedly incurable disease. 2nd: The man of eminence who is called upon may have gained all his great reputation in surgery, instead of medicine, so that the invalid, not recognizing this fact, supposes he or she is trying the best skill that our country affords. Dr. Mack is successfully treating just such cases all over the country, by letter and express, whose faces have never been seen, as well as in his office at home. . .

Dr. Mack invited every reader of the announcement who had "any affection of the head, throat, lungs, heart, stomach, liver, kidneys, bladder, bowels, womb, genital organs, or rheumatism or neurologic difficulties, or eruptions of the skin, blood impurities, tumors, cancers, nervous affections, diseases of the eye or ear, etc . . . to send the symptoms they have and the price of a package of medicine ($5.00) on receipt of which they will receive one package free."

Still another type of impostor was a Dr. John Burns, who came from Iowa, it was said, and frequented Winona and Rochester. The *Winona Republican,* quoted by the *Rochester Post* of April 1, 1881, said:

It seems to be a successful game he is working, the details of which are as follows: In the morning his head is free from the debilitating effects of the previous night's libations and he sallies forth with business in his eye. If he meets a person on the street who seems to be sick, he is liable to stop the individual, talk a few minutes and then tell him what ails him. It makes no difference where he finds his invalid; he looks until one is discovered, seems to be wonderfully endowed with the power to read his disease and the man's character; inspires confidence by his adroit and honest behavior and finally prescribes for him. In this way he picks up two or three dollars during the forenoon and readily spends it in the afternoon and evening. Once before he was lodged in the station house in Winona, his second incarceration being chronicled last night. John should take a good long walk.

Not long afterward there was an account of his being in jail at Rochester; he died from delirium tremens at Brainerd in 1882, it was reported.

Certain of the visiting practitioners were accepted as of a respectable category. Dr. Clark A. Miner, of Chicago, who came to Rochester every three months, beginning in 1874, established on Broadway, in 1878, the Rochester Medical Institute, which was staffed by ten physicians and surgeons; evidence has not appeared that the institute was long lived. Dr. Lewis Pond came from Aurora, Illinois; there is mention of his having removed a cancer from a patient at Haverhill. Dr. L. P. Bunce, an eclectic practitioner of Lake City, primarily oculist and oral surgeon, stated that he gave treatment for all specific diseases of the blood. In the nineties Dr. A. H. Muedeking, who for some years lived in Owatonna, came annually with his "excellent white flint spectacles."

Up to the turn of the century and beyond, the numerous medicine shows, which had toured the country and all southern Minnesota as early as 1864, continued to thrive. The Wizard Oil Troupe, headed by "doctors," came at intervals over many years, giving concerts and selling Hamlin's Wizard Oil, which was said to cure everything from bunions to diphtheria. It was this company, in 1883, that caused Dr. W. J. Mayo, an earnest young physician just out of medical school, a moment of disillusion; no doubt other physicians in the region had similar experiences. Dr. Mayo had treated an old Irishman for lumbago, had received the patient's voluble thanks, and with some gratification had heard him tell Dr. W. W. Mayo that his son Will was a wonderful doctor. A little later Dr. W. J. Mayo saw his patient seated happily on the wagon of the Wizard Oil Troupe, proclaiming

that all doctors had failed and that he owed his complete relief from suffering to the magic of Wizard Oil. Later came Dr. T. J. Smith's traveling medicine show and that of a Dr. Laird. Among the many who came later were representatives of "Veno, from the land of the Rising Sun," and a group of two patent medicine vendors and two colored comedians who for a week gave daily and nightly entertainment at the corner of Zumbro Street and Broadway in Rochester. One of the last of the larger medical shows was that of the Kickapoo Medical Company that toured all parts of the country giving entertainments and selling medical wares that were guaranteed to cure all ills. This company laid stress on the removal of tapeworms: In the *Rochester Post* of May 24, 1895, was a statement that Dr. G. Peterson of the Kickapoo Company had removed a tapeworm sixty-four feet long from a local woman, one Mrs. Johnson.

Patent Medicines.—Patent medicines were at their zenith in the second half of the nineteenth century in Olmsted County as elsewhere. Although traveling vendors and medical shows dealt extensively in certain of these preparations, they handled a minimal portion of the concoctions that were available to the public. Scanning local newspapers of the period from 1856 to 1900 gives the impression that the manufacture and sale of patent medicines and of bitters was a leading business of the time, so numerous and so extensive were the advertisements. Some druggists, even though they solicited the prescription business of physicians, gave much space in their stores to patent medicines, which no doubt were highly profitable merchandise. These druggists became wholesale agents for the manufacturing companies, and if the agents did not advertise the medicines, the manufacturers did. After local railroads had quickened communication and shipping, the distribution of patent medicines increased greatly and the advertisements so burgeoned as to overshadow announcements of even such offerings as the new labor-saving farm implements, among which were seeders, cultivators, mowers and reapers. From almost any issue of any newspaper, especially during the sixties and seventies, the highly descrpitive names of hundreds of preparations could be taken. Often the advertisers ended the long lists with the line, "And a host of other patent medicines too numerous to mention." There were pills and "health restorers" for the relief of ailments of mankind; painkillers, cathartics, and diuretics, and preparations, whose uses were hinted with ponderous delicacy, for treatment for venereal diseases; remedies for catarrh and compounds for pulmonary and respiratory afflictions of all kinds; plasters, liniments, balms, balsams, ointments, soothing syrups, hair restorers and aids to beauty.

There were bitters without end. A few were Dandelion and Wild Cherry Bitters, which came from Iowa, Hostetter's Bitters, Swain's Bourbon Bitters, Roback's Bitters, Plantation Bitters, Hoofland's German Bitters, and Wright's Health Beverage or Tonic Bitters. Dr. Walker's California Vinegar Bitters were recommended by the maker "for everything from rheumatism to intermittent fever—all dyspepsias, skin diseases, pin, tape and other worms. In fact, Dr. Walker offers $100 reward for an incurable case, provided bones are not destroyed by mineral poison and vital organs not wasted beyond repair" (Rochester *Federal Union,* May 20, 1870). From Goodhue County, Minnesota, came A. J. Clark's Red Wing Stomach Bitters. Rochester, Olmsted County, was the home of the Gopher State Bitters, which were manufactured by Dr. W. A. Hyde, in 1868, and were marketed widely for a time by Daniels and Company of the city.

In immediately hampering legitimate medical practice, the itinerant practitioners, the quacks and impostors, and the patent medicine manufacturers and vendors ultimately advanced it. Words from the *Golden Bough,* on magic and

the black art, might be adapted to apply to quackery in medicine, to say that quackery paved the way for science, that if the irregular practitioners did much evil, they were the source of much good, and that if quackery was the child of error it yet became the mother of freedom and truth.

The Growth of Medical Practice in Olmsted County

Someone said, "Disease is from old; nothing about it changes. It is we who change, as we learn to recognize what was formerly imperceptible."

Some of the early practitioners of medicine in Olmsted County, as elsewhere, were of the type who said, in effect, with Dr. John Lettsom

> When patients to me do apply,
> I physics, bleeds and sweats 'em;
> If after that they choose to die,
> What's that to me, I let's 'em.

The best of the early physicians, however, dignified in manner, formal in dress, competent practitioners in their day, came with courage and the spirit of truth, and with a tolerant and generous attitude toward the people with whom they lived. Some of them apparently felt, as James T. Adams has said of pioneers, that the glory of the epic is lost without the dream. Some of them became projection points upon the level of their times.

Pioneer settlements of southern Minnesota were scattered and the early physicians few, so that the practitioners of each county traveled long distances, often into neighboring counties, to care for the sick. They made their rounds, in town and on their long rural "rides," on horseback or in horse-drawn vehicles. It is impossible to overemphasize the inconveniences they bore in lack of facilities and of communication between town and country, and the hazards of roads and weather that they overcame. Not until the autumn of 1898, when conditions of travel had improved somewhat, did an automobile enter Olmsted County. A banker of Spring Valley, Fillmore County, drove his car to Rochester, making the trip of thirty miles in two hours and fifteen minutes, including all stops, and stops were frequent, "to prevent teams on the road from becoming frightened." The automobile, which was made in Cleveland, had a gasoline engine of five and a half horse power, situated under the seat, and ran "easily fifteen miles an hour on any kind of road. It cost just $1,000 and is a luxury few will care to acquire" (*Record and Union,* August 28, 1898). The *Olmsted County Democrat,* however, was more optimistic and predicted that the machine might in time oust the horse: "Dr. C. H. Mayo was much interested in examining this means of locomotion and may conclude to purchase a horseless carriage for himself." As a matter of fact, Dr. C. H. Mayo, the first physician in Olmsted County, certainly in Rochester, to own an automobile, became the possessor of a steam-propelled machine in January, 1900.

The facts that intercounty practice became general and that physicians of different sections began to summon one another in consultation led ultimately to the regional organization of medicine. Although in the early period professional amity did not exist as it does today, it has become apparent that the best qualified physicians respected one another, that they were increasingly aware of the imperfection of medical education, and that they early began to work together for the good of the public and the honor of the profession.

Medical education, even in the best tradition of the early times, was faulty. The more conscientious and able of the regular profession tried to improve their knowledge by adding to their treasured libraries the best of medical textbooks and

medical journals. Accent was not placed publicly on study, however, because it was assumed by the laity of average communities that physicians were born, not made, and that if a practicing physician had to study his profession, he was not good at it. The lives of most of the early physicians were complicated by this attitude of the people, by rugged physical conditions of living, by insufficient means and by having a clientele in the same economic predicament as themselves. In the first decades of Minnesota it was an accepted thing that physicians should have more than one remunerative occupation in order to make a living for themselves and their families. In practicing their profession they were hampered by the limitations imposed on them by lack of scientific knowledge of medicine and by meagerness of equipment. The pharmacopeia was small, anesthetic agents were few and imperfectly understood, mechanical aids that a few decades later would be essential were unknown. One outstanding pioneer physician and surgeon (David S. Fairchild) said, long afterward, "The best we could do was make a diagnosis as to the nature of the disease and select a medicine which experience had shown to be the best suited to the case. We knew nothing about germs or antiseptic methods, so we had no worries on the score of blood poisoning . . ." The concept of disease and of medical treatment was one of gradual change.

For about twenty-five years in its early history, Minnesota, because of its bracing climate, was widely known and advertised as a natural sanatorium for persons suffering from consumption (tuberculosis), and there were consequently among the early settlers many sufferers from pulmonary disease and many who succumbed to it. In the *Rochester City Post* of March 24, 1866, there was quoted a communication from a Saint Paul correspondent to the *New York Herald* for the benefit of invalids coming west:

> Those who take the least medicine and are farthest from society and influence of other invalids, progress most rapidly. . . . Do not start from home before the middle of April because there is no certainty of the Mississippi being open for navigation before that period. A journey overland from La Crosse in the spring of the year is no trifling affair, even for persons in full enjoyment of health. Besides that, the March winds are no better than they might be, and it would be better for the patient to avoid them, perhaps, and wait patiently for the river to open, rather than run the risks incident to a long journey in stages.

By 1870 the rigors of winter were conceded to be a drawback for invalids, and there was an annual exodus of such persons to Colorado, California and other states of more equable climate. By 1874, although the healthful year-round climate still was stressed, the advantages of summer in Minnesota were being emphasized. In this year Andreas said of Olmsted County, ". . . . the uniformity of temperature makes the county an asylum for those who are afflicted with pulmonic diseases. It is also free from malarial influences, and is probably, with the rest of the state, one of the healthiest countries in the world. It is situated on the open prairie, it has in summer the full advantages of the refreshing breezes prevalent at this time, and year by year it is more and more becoming the summer resort of those who seek relief from the oppressive heat of a southern or less favored locality."

There were especially unfavorable seasons, however, and in Rochester the newspapers abounded in comments on adverse weather and the train of ailments that came with it. The winter of 1856, which has come down in history as one of the severest seasons ever known in the southern part of the state, brought loss of life to many who were not inured to such rigors. Most of the earliest homes furnished inadequate shelter. Even in the average winter, children who trudged to district schools, and all who were obliged to travel the roads—teachers, physi-

cians, preachers and farmers—suffered from exposure. The winter of 1863, however, was open, "not a day of sleighing all winter," and there were much typhoid fever and a variety of respiratory affections. An editor exclaimed, "Give us back old time Minnesota winter with its equable, dry, bracing and exhilarating climate, and typhoid and tendency to indisposition will vanish; this was a year of high mortality from diseases of various kinds." In the normal winter of 1865 there was little sickness; the general health, it was declared, had never been better. And so it went.

Smallpox was prevalent annually, as were other contagious diseases, and editors warned, "Let vaccination be thoroughly attended to." Certain local physicians, among them the Drs. Cross, advertised, as early as 1860, pure vaccine virus that they would "insert in individuals or whole families." In 1864 the death from smallpox of a soldier in Rochester, who had been quarantined in a none too suitable house on the outskirts of the city, led to acrimonious exchange between newspapers of Chatfield and Rochester, and to widespread publicity, because regional papers copied the items. A Chatfield editor declared that the patient had frozen to death and that burial had been made in a swamp by tapping the body down with a pile driver: "If one half of it is true, every heathen in that delectable village deserves an attack of varioloid at least." The Rochester editors denied the allegation with bitterness, and when smallpox broke out in Chatfield, made the most of their opportunity and offered to lend the alleged pile driver for disposal of possible victims.

Early Concept of Disease and Medical Treatment.—In the early decades in the county the popular concept of health and disease and of medical treatment was reflected by editorial comments, and inasmuch as there were few if any contrary expressions published by physicians, it is assumed that the concept expressed was theirs also. In the summer of 1865 there was much discussion of the enormous number of mosquitoes, and of prevailing cholera morbus, and there were cautions about diet, exposure and overexertion. Fear was expressed that as a consequence of the wet summer the autumn would be unduly sticky, but apparently no connection was suspected between the summer, the mosquitoes and sickness. It was said, a few years later, and the opinion was held by physicians, that malarial diseases originated in poisonous emanations from the earth, which embodied a subtle principle termed malaria, which was constantly rising, like an imperceptible gas, poisoning the air and generating disease, such as chills, fever, pneumonia, diarrhea and dysentery; and that the low temperature of the Minnesota winters effectually destroyed any malaria that might lurk in the soil ready to spring forth in warm weather. There were statements about the salubrious effect of perturbation of the air by wind, moisture being a powerful agent in generating diseases and the main vehicle of malaria and other atmospheric poisons, which clung to the moisture or were held in solution by it.

(To be continued in the October issue)

President's Letter

THE DEFENSE OF ETHICS

DEFINING medical ethics would be as difficult for most patients as reciting the Bill of Rights from memory; yet their very lives may depend on this volume of recorded traditions and ideals and the dictates of a group conscience. Perhaps it is our fault that medical ethics has not assumed a greater significance to the people we serve. Working 10 or 12 hours a day to cure sick minds and bodies, we have failed to think of the broader aspects of our relationship with the public.

While we have lived in this way, taking a pardonable satisfaction in the brilliant health records of our state, the symptoms of a great national illness have been developing and not until very recently has the doctor become aware of them. Our newspaper friends have criticized us—in their usual forthright and constructive way—accusing us of being "asleep at the switch" and "living in an ivory tower."

Now we have become militant. We must be. For we have the health and safety of millions to protect. We are trying, with every means at our command, to warn the public that government control of medicine would steal the American heritage of medical skill, medical discoveries and medical care. Government control would rob the patient of his right to choose a family doctor, would make public records of the confidential information that comes to a doctor by virtue of the trust and faith his patient has in him. Government control would increase an already gigantic tax burden and reduce the American standard of living, at the same time that it is lowering the quality of medical care, retarding medical research and building up a huge bureaucracy that will not belong to the people, as the ideal government does, but will enslave them.

In defense of the ethics of private practice, we have decided to purchase space in our community newspapers to inform the public what we believe would be the results of government control. We felt that we had as much right to be heard as, for instance, manufacturing plants and labor unions who buy space in newspapers to inform the public of their attitudes and policies.

For that decision, we have been attacked by certain groups who claim that we are "bribing" the press.

The idea that the newspapermen of our state could be bribed is ridiculous to anyone except editors of propaganda sheets not worthy of the name "newspaper" and power-hungry political job seekers, who hope, at any price, to cement their own futures in the vast superstructure of clerks, supervisors, investigators and tribunals that would mount with the passage of a compulsory health insurance bill.

The newspapermen and women of Minnesota, highly trained and educated, dedicated to the principles of freedom that the constitution guarantees the press, and imbued with a sense of community responsibility that is unequaled in any other profession, have placed Minnesota high in the ranks of journalistic excellence. Minnesotans have confidence in their newspapers because they know they are receiving, in the news columns, an objective recounting of the day's or the week's events. The editorials they know to be the editor's own carefully thought out opinion and interpretation of those events. What better media than newspapers like these could doctors of Minnesota select for conveying their own special message to the public?

It is true that personally and professionally most editors in Minnesota are opposed to any system of compulsory health insurance and they speak out against this threat in no uncertain terms. But editors have other causes to defend, other issues to consider. in their papers and no matter how deeply they feel about government domination of medicine we cannot expect that they will sit down and write an editorial on that subject every day or every week. Yet, as doctors, we regard this issue as one of our greatest responsibilities, and we want to bring the facts before the people as often as we can; hence, by direction of the House of Delegates of the Minnesota State Medical Association, our medical societies are now permitted to buy advertising space to tell their story.

In defending the spirit and letter of our ethical code in this way, it would be absurd to suppose that we were trying to destroy the ethical code of newspapers which, in its spirit of freedom and service to humanity, so closely parallels our own.

President, Minnesota State Medical Association

Editorial

HOSPITAL, SURGICAL AND MEDICAL INSURANCE

ON RECOMMENDATION of the Council on Medical Service of the American Medical Association, the House of Delegates in June, 1949, decided that the Associated Medical Care Plans, which is an organization made up of many medical care plans throughout the country, should be absolutely independent of the AMA, but that the AMA should continue to approve or disapprove medical insurance policies offered by the plans sponsored by the various State Medical Associations and those offered by the various insurance companies. The House of Delegates also stressed the importance of the AMA (and that means all of us) giving all the publicity possible to the desirability and, in fact, necessity for this type of insurance for everybody. This necessity applies to hospital insurance just as much as to medical care insurance.

This idea of the necessity to insure against the high cost of so-called catastrophic illness is not new. This instigated the formation of the Blue Cross some fifteen years ago and the Blue Shield just a few years ago. The Blue Cross now protects over 34,000,000 persons, and the Blue Shield over 11,000,000. That the public recognizes the need for such insurance is indicated by the fact that at present nearly 61,000,000 of the population are protected by voluntary hospital insurance of all types, over 34,000,000 by surgical, and nearly 13,000,000 by medical voluntary insurance.* The growth of medical insurance during its first years of existence has been even more rapid than was that of hospital insurance.

It is highly important that both these types of sickness insurance should be expanded to the limit. The overall cost of medical care so provided is much less than a tax-supported program would be and does not disturb the doctor-patient or hospital-patient relationship in the least. The Blue Cross and Blue Shield plans are conducted on a non-profit basis with a low overhead cost, and insurance of this type offered by many insurance companies is written on a basis where the cost is controlled by the actual experience of the class insured. Rates and benefits offered by the Blue Cross and Blue Shield are comparable with the indemnity policies offered by the many insurance companies in the field. However, Blue Cross offers full service benefits with the exception of room allowance and x-ray, and Blue Shield provides full service benefits to low income groups of people.

The field covered by the Blue Cross in the past has been limited to groups of employed individuals. Provision has been made for dependents of policyholders reaching the age of nineteen to apply for individual policies. By so limiting the policyholders to employed individuals the Blue Cross has been able to keep its rates low and at the same time insure against such hospital costs as operating room, anesthesia, laboratory service, surgical dressings, drugs, serums, intravenous solutions, liver extracts, glandular products, physiotherapy, oxygen, electrocardiography and basal metabolism—items which can easily mount up—in addition to the room cost. The need for increasing the former $5.00 provision for room cost in view of the marked rise in room rates in recent years has now been met by a slight increase in policy rates of five cents a month for individual policies and twenty-five cents a month for family policies for each additional dollar in excess of $5.00 up to $9.00. Thus a contract providing $9.00 a day for hospital room in addition to the other service benefits of the contract costs $1.45 a month instead of $1.25 for the $5.00 room allowance contract plus other service benefits for a single subscriber and $3.75 a month instead of $2.75 for the family subscriber. The Blue Cross is seriously considering issuing a non-group contract in the near future which will be offered to individuals whether they are employed or not, particularly to those who are not now able to enroll through a group. The cost of this contract will necessarily be somewhat higher than group rates.

The Blue Shield, for the remarkably low cost

*A Survey of Accident and Health Coverage in the United States. Prepared by The Survey Committee of the Health Insurance Council, August, 1949.

of $1.00 monthly for the individual and $2.25 for the family, provides surgical, obstetrical, and limited medical care which constitutes complete payment of the doctor's fee for individuals with an income of less than $2,000 a year or a family with less than $3.000 a year. To those with a greater income, insurance payments are applied to the doctor's bill. So far, the Blue Shield insures only groups but is seriously considering issuing individual policies in the near future.

There are probably thirty insurance companies licensed in Minnesota that write hospital, surgical and medical policies. They write not only group policies but individual policies on an indemnity basis. The rates offered are low and policies offered meet the present high cost of hospital beds —up to $9.00 a day. A prospectus issued by one insurance company offers a family policy covering $5.00 a day on a hospital bed, surgical and limited medical care for $84.00 a year. Policies vary in cost and benefits and should be read before they are purchased.

DIHYDROSTREPTOMYCIN

ALTHOUGH streptomycin is a valuable antibacterial agent its neurotoxicity has impaired its usefulness. This has been especially true when streptomycin has been used in the treatment of tuberculosis and other chronic diseases for which the drug has to be administered for several weeks or longer. The discovery of a new drug with the antibacterial potency of streptomycin but without its neurotoxicity, or even with a decreased neurotoxicity, would be a step forward.

Dihydrostreptomycin, a chemical derivative of streptomycin, which recently has been made generally available, seems to satisfy these requirements. *In vitro,* studies have shown that dihydrostreptomycin has about the same activity as streptomycin against most micro-organisms, especially Mycobacterium tuberculosis. Unfortunately, those tubercle bacilli which are resistant to streptomycin are equally resistant to dihydostreptomycin. Several groups of ingestivators have found streptomycin and dihydrostreptomycin to be equally effective in the treatment of experimental tuberculosis in various species of animals due to strains of M. tuberculosis that are sensitive to streptomycin. Likewise, it has been shown that dihydrostreptomycin has no demonstrable effect on experimental tuberculosis due to tubercle bacilli that are resistant to streptomycin. Up to now, too few patients with tuberculosis have been treated with dihydrostreptomycin to justify any final conclusions regarding the therapeutic efficacy of this drug as compared with that of streptomycin. However, most of the workers who have studied this problem are of the opinion that there is no essential difference.

It is the lesser neurotoxicity of dihydrostreptomycin that makes it an improvement over streptomycin. Gram for gram, dihydrostreptomycin less frequently causes damage to the vestibular apparatus than does streptomycin and, when vestibular damage does follow use of dihydrostreptomycin, it comes later in the course of treatment, is less severe, and is less likely to be permanent. However, it should be emphasized that dihydrostreptomycin can cause the same toxic effects as streptomycin and that dihydrostreptomycin should be used with caution. This is especially true if renal function is poor, as dihydrostreptomycin, like streptomycin, is excreted through the kidney. In the presence of poor renal function, an apparently safe dose of the drug may produce a dangerously high concentration of dihydrostreptomycin in the blood. Like streptomycin, dihydrostreptomycin may occasionally damage the auditory function and all patients who are being treated with this drug for prolonged periods should be carefully observed for evidence of such damage. Apparently the damage is usually in the higher frequencies and is of little clinical significance when it does occur.

Dihydrostreptomycin has proved to be of unique value in the treatment of patients who react to streptomycin with drug fever or skin rashes. Such patients have been treated with dihydrostreptomycin without recurrence of the allergic manifestations.

D.T.C.

DEFEAT OF REORGANIZATION PLAN NO. 1

IN AN EDITORIAL which appeared in our August issue, we gave a brief analysis of the report of the task force of the Hoover Commission on health activities of the federal government. We mentioned that in a supplemental report the task force strongly recommended that health activities of the government be made a seperate department of the government headed by an M.D., with training for such a position. This

step has been favored by the medical profession for years.

President Truman submitted to Congress what is known as Reorganization Plan No. 1, providing for a Welfare Department to be headed by Oscar Ewing to include Social Security, Education and Health activities of the federal government. This would include not only the Public Health Service but numerous additional health activities now conducted by other departments. The health activities of the government would thus be under the control of the Secretary of the Welfare Department.

The defeat of Reorganization Plan No. 1 by the Senate on August 16, is a demonstration of what a determined medical profession can accomplish when convinced of the justice of their cause and the need for action.

Senator McClellan, Democratic Senator from Arkansas, was chairman of the Senate Committee which conducted the hearings of the committee and deserves much credit for the conduct of the hearings. A group of physicians in a number of western states deserve the credit for instigating the campaign in opposition to the proposed legislation. Dr. Brookshire, Secretary of the Arkansas State Medical Association, in conjunction with the presidents of the Texas, Oklahoma and Arkansas State Medical Associations, called a meeting in Denver of representatives of some western states. The upshot of this meeting was that all the State Medical Associations were called upon to send representatives to Washington to do what they could to block Plan No. 1. Executive Secretary R. R. Rosell was Minnesota's representative. Representatives from Arkansas, Oregon, California, Louisiana, Texas, Oklahoma, Kansas, Virginia and Minnesota braved the summer heat of Washington to explain to Senators in person the undesirable provision of Plan No. 1, that it is not what the medical profession nor the Hoover Commission had been advocating and the danger of putting an out-and-out socialist at the head of a department in which federal medical activities would have no chance for independent action. As a result, Reorganization Plan No. 1 was defeated in the Senate by a vote of 60 to 32.

As soon as the physicians throughout the country were appraised of the situation, a flood of telegrams was sent the Senate Committee members. It is well recognized that communications to our representatives in Congress have their effect, and this expression of opinion doubtless also had some effect. The Senate committee took action in opposition to Plan No. 1, and this action was confirmed by the Senate. Thanks of the profession go especially to the representatives of the State Medical Associations who at some sacrifice went to Washington and were apparently successful in obtaining the defeat of a bill, whose passage in some quarters seemed a foregone conclusion.

Our appreciation should be extended not only to Senator McClellan of Arkansas, but also to Senator Fullbright of Arkansas, Senator Hunt of Wyoming, and Senator Taft of Ohio. Not a little thanks is due to that little fire-eater, Marjorie Shearon, editor of *American Medicine and the American Scene* which she publishes on her own in the interest of private enterprise and honesty in government. Regrettably, our Senator Humphrey felt himself pledged to vote for Plan No. 1, and led the fight for the bill not only before the Senate Committee but on the floor of the Senate.

The Hoover Commission, after prolonged study, has made its report and has recommended that a separate Medical Department be formed, to be headed by an M.D. This meets the hearty approval of the medical profession and should be done.

WELFARE AND PUBLIC HEALTH LEGISLATION

WELFARE LEGISLATION
1949 Session

Child Welfare

(1) *Chapter 39*—Amends Minnesota Statutes 1945, Section 260.01, to provide treatment facilities for a child "who because of erratic, unstable, or abnormal conduct appears to be emotionally disturbed and is, therefore, in need of psychiatric study, care, and treatment, and whose parents or guardian are unwilling or unable to provide him with such necessary care and treatment";

Section 2 of the amendment provides that these facilities shall be established at the Anoka State Hospital or the Hastings State Hospital.

(2) *Chapter 40*—Amends Minnesota Statutes 1945, Sections 256.01 and 393.07, authorizing the Director of Social Welfare to designate such county welfare boards as he may select to act as his agent in the placement of DSW wards in adoptive homes or for foster care.

(3) *Chapter 736*—Creates a commission to study the laws and court organization of Minnesota relating to juvenile courts, divorce, annulments, separate maintenance adoption, desertion, and non-support. The members of the Commission shall be appointed by the Governor and shall include leaders in the legal and social welfare professions, and members of the State Legislature.

(4) *Chapter 227*—Amends Minnesota Statutes 1945, Sections 257.03 and 257.04 to clarify the language requiring that any person placing, or who assists in placing a child in a permanent foster home must notify the Director of Social Welfare.

(5) *Chapter 400*—Amends Minnesota Statutes 1945, Section 259.03, as amended, to provide that in the case of the adoption of a minor who is illegitimate, consent must be had of his mother, and if she be under the age of 18 years, of her parents or guardian.

(6) *Chapter 466*—Amends Minnesota Statutes 1945, Section 144.176, regarding the adoption of a person born in a foreign country to permit the district court, upon evidence presented by the Division of Social Welfare from information secured at the port of entry, to make findings upon which the state registrar is to prepare a birth certificate.

(7) *Chapter 21*—Amends Minnesota Statutes 1945, Section 257.05 to permit the Director of Social Welfare, at his discretion, to authorize persons bringing children into the state for purposes of adoption to file a written guarantee of responsibility in lieu of the usual bond.

(8) *Chapter 32*—Amends Minnesota Statutes 1945, Section 256.93 by permitting the Director of Social Welfare to accept guardianship of all personal property of wards committed to his care, removing the previous limitation of $1,000.

Public Assistance

(1) *Chapter 606*—Amends Minnesota Statutes 1945, Section 256.74, Subdivision 1, as amended by Laws of 1947, Chapter 192, to provide that there shall be no maximum limit upon the amount of assistance in ADC cases, effective July 1, 1949. (The law now states only that the grant shall "provide such child with a reasonable subsistance compatible with decency and health.")

(2) *Chapter 677*—Amends Minnesota Statutes 1945, Section 256.15, Subdivision 2, as amended by Laws of 1947, Chapter 530, to increase the maximum Old Age Assistance grant to $55 per month effective July 1, 1949, and to $60 per month if and when the Federal government increases its financial participation in the Old Age Assistance program.

(3) *Chapter 420*—Amends Minnesota Statutes 1945, Sections 261.15, 262.01, 262.07, 262.13, 263.01 and 263.03, to make permissive the payment of poor relief in cash.

(4) *Chapter 341*—Amends Minnesota Statutes 1945, Section 256.36 by repealing provision that when an Old Age Assistance recipient moves to another county, the county of original grant may bill the county of present residence for one-sixth of the amount of any increase granted, and reinstates previous law so that county originally making the grant is responsible for full amount of the grant regardless of where recipient resides.

(5) *Chapter 534*—Amends Minnesota Statutes 1945, Section 256.51 as amended to remove the requirement that applicants for Aid to the Blind be more than eighteen years of age. (No limit as provision now stands.)

(6) *Chapter 711*—Amends Minnesota Statutes 1945, Sections 256.51 and 256.53 as amended by Laws 1947, Chapter 343, Sections 1 and 2. The personal property limitation for an applicant for Aid to the Blind is defined as ". . . not more than $500 for a single person or $750 for a married couple. Personal property shall include stocks and bonds, bank savings, farm machinery and livestock, land contracts, mortgages and cash value of life insurance policies. The first $500 for a single person, or $750 for a married couple, of sale value of clothing and household goods shall be disregarded in determining how much personal property is owned."

The maximum funeral allowance for deceased recipients of Aid to the Blind is increased to $150.

(7) *Chapter 22*—Repeals Minnesota Statutes 1945, Section 248.07, subdivision 6. This section placed the administration of vocational rehabilitation activities for the blind in the Children's Bureau, a state administrative unit which no longer exists. (Vocational rehabilitation for the blind is administered in the Public Assistance Unit of the Division of Social Welfare.)

(8) *Chapter 509*—Amends Minnesota Statutes 1945, Section 261.07 to provide that in determining the legal settlement of a poor person, any time during which that person was committed to a public institution or hospital in another state shall be excluded in computing the period of absence from this state.

Tuberculosis

(1) *Chapter 731*—Amends Minnesota Statutes 1945, Sections 376.31 and 376.33 to increase state aid for the care of non-paying patients in county tuberculosis sanatoria to a maximum of $7.50 per week.

Like benefits are provided for these counties not having

Prepared by Division of Social Welfare, April 28, 1949.

a tuberculosis sanatorium (using the facilities of the state sanatorium) through monies included in the Division of Social Welfare Appropriations Act, *Chapter 744* (H. F. 1835).

(2) *Chapter 96*—Provides that in tuberculosis sanatorium districts in which there is no longer a need for a sanatorium to care for persons living within the county or counties comprising the district, the sanatorium commission and the board or boards of county commissioners of the district may, with the approval of the Director of Social Welfare, discontinue the operation of the sanatorium, and sell or lease the property pertaining thereto.

(3) *Chapter 558*—Amends Laws of 1947, Chapter 616 for the purpose of clarifying the language regarding the responsibility of the state toward TB sanatorium employes who contract tuberculosis. (ex: amendment defines "contracts tuberculosis").

(4) *Chapter 116*—Amends Minnesota Statutes 1945, Section 376.19 to permit the construction, improvement and maintenance of roads terminating at a county tuberculosis sanatorium (Not to exceed 5 miles from the site).

Miscellaneous

(1) *Chapter 744*—The Division of Social Welfare Appropriations Act, provides in part that state aid for welfare financing shall be extended to those counties in which the real and personal property valuation is less than $7,000,000, and whose mill levy for welfare purposes exceeds the state average by 50 per cent or more but is insufficient to meet the county's welfare costs. Counties hereafter transferring monies out of their welfare funds are excluded from benefits. (Information as to the exact formula will be sent at a later date.)

(2) *Chapter 704*—Amends Minnesota Statutes 1945, Section 256.01 to empower the Director of Social Welfare to act as co-ordinator of activities relating to the Displaced Persons Program in Minnesota. This authority is to expire on June 30, 1951.

(3) *Chapter 681*—Amends Minnesota Statutes 1945, Section 350.11 to allow employes of the State and its political subdivisions a maximum of six cents per mile for the use of privately owned automobiles in the performance of official duties, effective July 1, 1949, and extending until July 1, 1951.

(4) *House Resolution Number 30*—Directs the Legislative Research Committee to undertake a study of the financial and social problems of needy Indians and the intergovernmental relationships between the various agencies working with them. The Committee's report is to be submitted at the next regular session of the Legislature.

In addition to the foregoing, a resolution was passed authorizing a committee of the Legislature to go to Washington to explain to responsible federal officials the problems particularly financial, of Minnesota Indians, and to urge the federal government to take steps to more adequately meet their needs. This Committee was appointed, and it completed its assignment in Washington early in the legislative session.

(5) *Chapter 618*—Amends Minnesota Statutes 1945, Chapters 261, as amended, 262, and 263; and amending Minnesota Statutes 1945, Section 256.01, Subdivision 2 to enable the Director of Social Welfare to participate in agreements with the federal government if and when the Congress makes available new grants-in-aid for public assistance or other welfare purposes. (The primary purpose of this act was to permit Minnesota to take advantage of federal funds in the event that the Congress extends federal aid for general relief to the states before our next legislative session. However, the county system relief bill failed to pass.)

(6) *Chapter 228*—Amends Minnesota Statutes 1945, Section 256.02 to transfer all powers and duties of the Director of Social Welfare regarding the inspection and investigation of prisons, jails, and lockups to the Director of Public Institutions.

(7) *Chapter 81*—Permits courts to appoint a psychologist to assist the two licensed doctors in the examination of allegedly mentally deficient persons.

(8) The Legislature also made enactments designed to improve mental hospital conditions and to develop a mental health program in the state. Details regarding these acts may be obtained from the Division of Institutions.

Youth Conservation activities were expanded. Specific information may be secured from the Youth Conservation Commission.

Resolutions

The Legislature also passed the following joint resolutions pertaining to welfare. These are merely legislative recommendations to the Congress, and are in no sense enforceable:

(1) *Resolution No. 7*—Memorializes the Congress of the United States to amend the Social Security Act to permit the federal government to share in grants paid to persons residing in public institutions.

(2) *Resolution No. 2*—Memorializes the President and the Congress of the United States to provide for the continued operation of the Indian school at Pipestone, Minnesota, and to reopen its hospital, which had already been closed.

(3) *Resolution No. 3*—Memorializes the Congress of the United States to amend the immigration laws to permit the adoption of European war orphans by American families.

PUBLIC HEALTH LEGISLATION
1949 Session

Animals, Use of—In promotion of scientific research and instructions in animal and public health. Live Stock Sanitary Board made the licensing agency. Chapter 195—S.F. 834, App. 3/26/49.

Boats, Safety of—Equipping with detachable anchor lines and elimination of annual issuance of metal boat tags using instead a tag to remain on boat until sold, taken out of service, or otherwise removed. Chapter 655—H.F. 1005, App. 4/25/49.

Cancer, Statistical Research—Authority given to Board to engage in; confidentiality of reports. Chapter 350—S.F. 1085, App. 4/9/49.

Prepared by the Minnesota Department of Health.

Civil Service—Allocations of positions in. Civil Service Director to make allocations where organizational structure changes in an agency, provides manner of appeals from allocations, et cetera. Chapter 646—S.F. 1081, App. 4/23/49.

Hospital Superintendents Registration Law—Moves up "grandfather clause" in 1947 law to October 1, 1949. Chapter 93—S.F. 121, App. 3/7/49.

Hospitals and Sanatoriums—Changes levy by boards of county commissioners for maintenance of county TB sanatoriums from three to five mills (Sec. 376.20). Chapter 29—S.F. 245, App. 2/18/49.

A Concurrent Resolution, No. 2—S.F. 286, memorializing President and Congress to continue operation of Pipestone Indian School and re-open Hospital at the school. App. 2/17/49.

With approval of Director of Social Welfare, sanatorium Commission and county board by resolution may cease operation of a sanatorium. Chapter 96—S.F. 319, App. 3/7/49.

Village with municipal liquor store may, with approval of voters, contribute "from village liquor dispensary fund toward the construction, maintenance and operation of a community hospital . . . for a period of four years thereafter . . . to any duly incorporated nonprofit hospital association not to exceed $4,000 . . . in any one year for construction and maintenance . . . and not to exceed $1,000 in any one year for the operation thereof; and the hospital shall be open to all residents of the community on equal terms." Not applicable where average net earnings of store are less than $8,000. Chapter 146—S.F. 194, App. 3/21/49.

Counties, cities and villages may accept gifts "to aid in building, acquiring, equipping and maintaining public hospitals. . . ." Chapter 152—S.F. 464, App. 3/21/49.

Hotels—Fire prevention and fire protection duties transferred from Hotel Inspector to Commissioner of Insurance. Chapter 469—H.F. 1606, App. 4/16/49.

Indians—Joint Resolution: H.F. 1641: LRC to study problems of Indians; passed House 4/13/49.

Local Health Units—Amended (1) to provide for less than full time health officer, (2) to impose a one-mill tax limitation, (3) to require unanimous vote of county commissioners of a county which contains a city of first class if majority of county commissioner districts lie within such city, and (4) health officer to have approval of State Board of Health. Chapter 405—S.F. 352, App. 4/14/49.

Mental Health—The "Mental Health Policy" Act, makes the Division of Public Institutions the Mental Health Agency. Chapter 512—H.F. 1397, App. 4/20/49.

Mosquitos—Five per cent of voters may authorize organization of mosquito abatement districts; one mill limitation; Conservation and Agriculture must approve. Chapter 404—S.F. 236, App. 4/14/49.

Narcotic Drugs—Amidone, is obemidone, and ketobemidone to be added to list of. Chapter 360—S.F. 706, App. 4/11/49.

Nuisances, Abatement of—In cases where a health officer abates a nuisance because the property owner failed to act, the previous law (Sec. 145.22) limited claim of the municipality against "any individual owner, or any one piece of property" to $25.00. This amount has been changed to $50.00. Chapter 80—S.F. 86, App. 3/4/49.

Pasteurization of Milk, Cream—No milk, or cream or *fluid* milk products to be sold unless pasteurized (casual sales on farms excepted). Chapter 403—S.F. 74, App. 4/14/49.

Retirement—State Employes—Amends Retirement Laws: (1) employes may retire at 58 after 20 years of service but retirement allowance shall be reduced ¼ of 1 per cent for each month that the employe is under age of 65. But allowance of any member entitled to 35 years' service credit is not subject to such reduction. (Sec. 12 (4)). Monthly allowance shall not exceed $150.00, (2) employe at retirement may elect to take lesser retirement allowance payable during lifetime with provision for surviving spouse to receive a reversionary annuity of not less than $120 per year "nor more than the amount of reduced retirement allowance to which the member may be entitled under his election." (Sec. 12 (5)), (3) on death of employe accumulated deductions are to be paid to beneficiary with interest 2% compounded annually. (Sec. 14 (1)), (4) tax levy for SERA fund to be increased from 4/10 to 8/10 of mill, (5) 60 per cent instead of 56 per cent of total deducted from salaries of employes paid from Federal grants is to be paid to fund (Sec. 8 (4)), (6) no deductions to be made from salaries on any amount thereof in excess of $4,800 in any fiscal year, (Not of $300 per month as at present) (Sec. 8 (2)), and (7) a state employe of five years or more who was a member of the Public Employes Retirement Association may obtain credit in SERA by paying to State fund sum equal to deductions at rate of 5 per cent on basis of salaries received from the political subdivision. Chapter 644—S.F. 853, App. 4/23/49.

Tuberculosis—To give health authorities means of isolating infectious TB patients who are recalcitrants; on Board of Health information that a person is in infectious stage county board may require law enforcement officer to visit and persuade person to enter a sanatorium. If persuasion fails, Board of Health can take matter to district court. A judge after hearing may direct the apprehension of person for confinement in a san. or hospital for examination to determine whether or not he is in infectious stage. Chapter 471—S.F. 14, App. 4/18/49.

Vital Statistics—Birth certificates for foreign born children adopted in Minnesota to be prepared where Court makes necessary findings; not to be evidence of citizenship. Chapter 466—H.F. 1560, App. 4/18/49.

We have learned that you cannot put a patient's mind in a cast. The great problem of the tuberculosis sanatorium is people leaving against medical advice. We have been foolish enough to expect patients to rest idly in bed and not to worry, but worries about families, jobs or money, go round and round in their heads until they decide to give up treatment and go home. Howard A. Rusk, M.D., National Foundation for Infantile Paralysis.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

DEFEAT OF PLAN NO. 1 IMPORTANT MEDICAL VICTORY

Rejection of President Truman's Reorganization Plan No. 1 by an informed and responsible Senate represents an important retracing step in the headlong flight toward socialism that has too long marked this country's course.

The Plan, which would have garnered control of health, education and welfare into the hands of Oscar Ewing, federal security administrator, was well on its way to passage before the American people were aware of its significance. Doctors from Arkansas, Oregon, California, Minnesota, Louisiana, Texas, Oklahoma, Kansas and Virginia rushed to the nation's capitol to warn the solons against casting a vote for this thinly veiled attempt to socialize medicine. Thousands of letters and telegrams from an aroused public weighted the scales of senatorial opinion.

In the Senate chambers the fight was led by McClellan and Fullbright, Democrats from Arkansas; Hunt of Wyoming, another Democrat; and Republican Senator Taft of Ohio.

Said Senator Taft, August 15:

"In view of his (Ewing's) public statements and actions, there can be no doubt that he would completely subordinate health and education to welfare. Doctor Parran resigned as surgeon general and Mr. Studebaker as head of the Office of Education, largely because no independence was left to them in their proper functions."

Despite Truman's unwavering championship of the Reorganization Plan, his assertion that it carbon-copied the Hoover recommendations (whereas the Hoover commission had recommended an independent United Medical Administration) and his last-minute summons to six Democratic Senators the day before the vote, nevertheless sixty Senators, twenty-three of them members of the Democratic party, voted against the plan.

A telegram from Dr. Elmer L. Henderson, president of the AMA, and Dr. George F. Lull, secretary and general manager, congratulated members of the "grass-roots lobby" for their part in the defeat of the plan:

"This victory was due to your magnificent support and intelligent efforts on behalf of the American people. The whole arsenal of bureaucracy and propaganda, including the White House itself, was unable to stop this triumph. It proves that the elected representatives of the people are responsive to enlightened opinion regardless of party politics or pressure. This is a significant test of medicine's strength in its fight to remain free."

HOOVER ADVOCATES "CRACKER BARREL" DEBATES

In the midst of the uproar, ex-President Hoover had a few incisive words to say on the occasion of his seventy-fifth birthday. "New government programs would require the spending of 75 to 85 per cent of people's savings," he pointed out, in an address broadcast from his alma mater, Leland Stanford University. "Sixty-one days of each year, we work for the government (in taxes)," he added, estimating an additional twenty days' pay a year from every individual if the government schemes go through.

Reminding his listeners that even now one out of every seven persons is a regular recipient of government money and that there is one government employe to every eight of the working population, Hoover warned that "We're on the last mile of collectivism."

He advised Americans to watch the manipulation of words and phrases to give them new meaning, citing as an example the deceptive phrase "deficit spending." In his opinion, debates like those traditionally held around the cracker barrels of the corner grocery stores would be wise. "In that atmosphere, phrases and slogans can be dissolved into common sense and intellectual integrity."

"BRIBERY" CHARGE TYPICAL OF SOCIALISM EXPONENTS

The exponents of socialized medicine are hard-pressed to find any grounds for their campaign

to put the health of the nation under government control. Just how desperate they are, as a rising tide of public opinion makes compulsory health insurance less and less likely, was evidenced by an August 9 publicity release from the Committee for the Nation's Health.

"The wording of the resolution (on advertising) made it clear that the sacrifice of medical ethics was being offered as an open bribe to the press of the state."

Thus was quoted Chet Paterson, executive director of the Committee for the Nation's Health, in speaking of the resolution on advertising passed by the Minnesota State Medical Association's House of Delegates, May 9.

The release was seized by Nathan Robertson of the *CIO News* who began his story:

"Minnesota doctors and newspaper editors have worked out a secret deal—under which the doctors have dropped their long standing ethical rule against advertising in return for a 'closer understanding with the press'—which amounts to bribing the press to fight President Truman's health insurance program."

Quoted as evidence of the "deal" was part of an editorial from the *St. Cloud Times* which advocated "a working arrangement between the medical profession and the press." The Committee for the Nation's Health pointed out that the editorial referred to the advertising arrangement; but the editorial actually went on to say:

"Moderate, well-timed and impersonal publication of news stories . . . would add to the reputation and professional stature of St. Cloud as a great medical center. This is more than medical advertising. It is an opportunity for public relations at its highest level."

This self-explanatory statement was omitted from the Committee's release, for obvious reasons.

Resolution a Guide

The much-maligned resolution actually was set up as a guide for activities that have been carried on for a period of more than ten years. As doctors know, most county medical societies permit the publication of small professional cards in local newspapers. Also doctors, as citizens of their communities, are expected to join in the promotion, by way of sponsoring advertisements which explain the campaign, of such drives as the Red Cross, Community Chest, et cetera. In recent years several medical societies have been buying space to explain the dangers of compulsory health insurance proposals.

A *Minneapolis Tribune* editorial phrased it:

"Action of the house of delegates clears the way for county medical societies to buy newspaper ads in order to present their side of the health insurance debate. This they have every right to do, as editors pointed out a state-wide medical-press conference April 8. Purchase of newspaper advertising space, however, in no sense constitutes a subsidy. Such space is available to all reputable advertisers, including doctors and medical societies or any other group wishing to support or oppose socialized medicine. Nor does purchase of advertising space include the right to dictate editorial policy of the newspaper."

"Deliberate Campaign"

The *Tribune* concludes its summation with:

"Just why the Committee for the Nation's Health . . . should want to hold up Minnesota doctors and editors as horrible examples to the nation is hard to understand. Its accusation has all the earmarks of a deliberate campaign to smear editors opposing Mr. Truman's health scheme."

The *St. Paul Dispatch* view parallels this, refers to the news release as "Based either on a deliberate effort to misrepresent or an inexcusable failure to understand. . . ."

Editorial wrath was boiling into print all over the state as the Committee's ridiculous charges became circulated. Among the more vehement was the *Maynard News* which stated:

"There seems to be no limit as to how far the CIO leadership will go to set one class against another in order to accomplish certain political and economic objectives.

"The same clique of rabble rousers that protest so loudly against race prejudice are energetically promoting class prejudice.

"The medical men and the editors of Minnesota's newspapers are the latest targets for their poison pen activities."

* * *

"Almost without exception, the editors of Minnesota are opposed to any legislation which will result in socialized medicine. They do not need bribes to prompt them to editorialize against compulsory health insurance or socialized medicine. They have received no bribes!

"The insinuation of the CIO *News* is an insult to the editorial and medical profession and will long be remembered."

AMA SCORES MISUSE OF ITS 1939 STATISTICS

One of the most frequently repeated assertions in the tottering defense of compulsory health insurance is a twisted version of 1939 American Medical association statistics on ability to pay for medical care. The misrepresentation appears this way in Ewing's *The Nation's Health:*

"As long ago as 1939, the American Medical association estimated that an income of $3,000 a year was not adequate to pay the costs of a major or chronic illness. Since then, the consumers price index has risen approximately 75 per cent. A family would need take-home pay of more than $5,000 to have the same spending power that $3,000 gave in 1939. Nearly 80 per cent of our

families earn less than $5,000 and consequently would have difficulty meeting the costs of a serious or prolonged illness."

With their reinforcements crumbling badly, the socializers are faced with another inroad of facts as the AMA scores this flagrant misuse of ten-year-old statistics.

States the AMA in a brief pamphlet reprinted from *The Journal:*

"With the coming of Blue Cross and Blue Shield insurance plans and those developed by the insurance companies, the test of inability to pay has been utterly and completely changed. The emphasis today in the purchase of medical care is on prepayment, as contrasted with the concept of postpayment of former times. The test of the ability to pay for the type of medical care covered by Blue Cross and Blue Shield policies, especially in the case of major illness . . . is the ability of a family to prepay the premium for a combined Blue Cross-Blue Shield hospital and medical insurance policy for the entire family. The cost of this family policy is the price of a package of cigarets, a bottle of beer or a gallon of gasoline a day. In other words, any family that cannot prepay about 20 cents a day . . . may be considered medically indigent in 1949 with respect to the medical care provided under these policies. Before the development of voluntary insurance plans, the test of the ability to pay medical care bills ran up to several hundred dollars—the cost of postpayment in a lump sum or in installments. As along as the American people continue to choose to pay half again as much for recreation as they do for all types of medical care and choose to spend as much for jewelry and watches, more for personal care and twice as much for tobacco as they pay for their physicians, the advocates of socialized medicine in 1949 will be hard pressed to use the setting of the 1930's, even using $5,000 instead of $3,000 as the income level, for measuring or computing the proportion of the population which cannot prepay the cost of medical care. The ability to 'prepay' and 'postpay' are simply two different ideas of two different decades."

OFFICIAL REPORT OF HEALTH ASSEMBLY PUBLISHED

The official report of the National Health Assembly is now available in book form. Oscar Ewing, who attempted to use the Assembly as a stepping stone to medical dictatorship, writes a verbose introduction to the book. Emphasizing the areas of agreement which the Assembly found, he had to admit that they did disagree on one small point: the matter of payment for medical care!

RADIO COMMENTATOR HITS TRUMAN SPENDING

Phelps Adams, replacing Fulton Lewis, Jr., during the latter's vacation, gave listeners to the program a new slant on government spending, July 25. He said:

"Compared to Harry Truman, Franklin D. Roosevelt was a nickel-nursing tightwad—incredible as it seems. During his three terms in office, Mr. Roosevelt had to pay virtually the entire combat cost of World War II . . . and he spent thirty-one billion dollars a year. That's billions with a capital B. But Harry Truman during his four, almost completely postwar peacetime years has spent one and a half times as much each year as Mr. Roosevelt did."

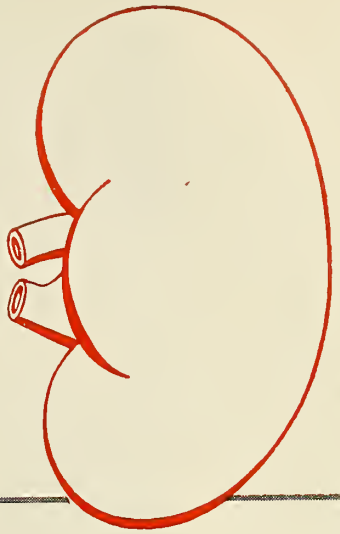
By way of comparison, Mr. Adams recounted the spending of George Washington's administration:

"He spent $4,000,000 a year. . . . Now the country, of course, has grown enormously since George Washington took office 160 years ago. It has grown in size, in population, and in wealth; but believe you me, nothing about this country has grown so fast and so much as the United States Treasury.

"Geographically the United States with all its possessions and territories is today about four times as big as it was in Washington's day. It has forty times as many people. And the combined income of all those people together—is 400 times what it was back there in 1789. But today the United States treasury under Mr. Truman, is spending nearly 11,000 times as much as Washington did. That's a lot of times."

Communication

To The Editor:



We noted in reading an editorial on chloromycetin which appeared in the July, 1949, issue of MINNESOTA MEDICINE, the statement is made that chloromycetin has been found to be of value in brucellosis but not in typhoid fever. Although we are not familiar with the clinical use of this drug in typhoid fever from personal experience, there have recently been reports of dramatic improvement following its use, and the hope has been held out that chloromycetin is a specific of great value in treating typhoid fever. These reports appeared in the *Annals of Internal Medicine,* 1948, Vol. 29, page 131, authors Woodward, Smadel, Ley, Green and Mankihar; and another report by Bradley which appeared in *The Lancet* for May 21, 1949.

Very truly yours,
D. S. FLEMING, M.D., Chief
Section of Preventable Diseases

Chronic senile phthisis is a condition which may drag on for years unsuspected, and the patient may come to be regarded as just another chronic bronchitic. The patients and their relatives are often so accustomed to their symptoms, and have had so little help from medicine, that they are averse to again visiting their doctor for a detailed overhaul, and the true state of affairs is only brought to light when some young member of the family develops acute tuberculosis, possibly meningitis, and all contacts are reviewed. Then the damage is done; for the sputum of the supposed chronic bronchitic is found to be loaded with tubercle bacilli.—W. A. LISTER, M.D., *The Lancet,* April 30, 1949.

In Memoriam

LYLE CHOLWELL BACON

Lyle Cholwell Bacon was born at Niles, Michigan, in 1866, descendant of a long line of early American settlers and pioneers. He was the son of Cyrus Bacon, Jr., a Major in the Medical Corps of the U.S. Army during the Civil War.

Due to the untimely death of his father he spent his early years in restricted circumstances. He was able to finish high school and come to Saint Paul about 1886, where he secured employment on the *St. Paul Pioneer Press*. After several years of steady work supplemented by summer employment, he was able to finish medical school, graduating from the University of Michigan at Ann Arbor in 1890. He was senior president of his medical class and all-time president of the class alumni. He served a short internship at the University Hospital and moved to Saint Paul where he was appointed professor of obstetrics and gynecology at Hamline University medical school. This office he retained until the school was merged with the University of Minnesota medical department some years later.

Dr. Bacon practiced in Saint Paul for fifty-eight years. He was a member of the Ramsey County Medical Society, Minnesota State Medical Association, American Medical Association, and the Minnesota Academy of Medicine.

Because of advanced years, he retired in February, 1948, and lived quietly until June 4, 1949. On this date he died peacefully from cerebral hemorrhage.

He is survived by his wife, Alice Kay Bacon, and four children: Mrs. Howard Y. Williams of Saint Paul, Dr. D. K. Bacon of Saint Paul, Dr. Lyle C. Bacon of Los Angeles, California, and Mrs. Frederick B. Hutt of Ithaca, N. Y.

JAMES H. BAKER

James H. Baker, Saint Paul, died at his home in Saint Paul July 31, 1949.

At the time of his retirement two years ago, Mr. Baker was executive secretary of the Hennepin County Medical Society. Previous to that, he was Sunday editor of the *Minneapolis Tribune* for many years.

Mr. Baker was born in Mankato, Minn., and graduated from University of Minnesota in 1913. He covered General Pershing's expedition into Mexico in pursuit of Pancho Villa for the *Minneapolis Tribune* in 1916.

During World War I he served with the Norton-Hardjes ambulance corps and later became a lieutenant in the French artillery. He was decorated by the French and Italian governments.

Mr. Baker is survived by his wife, a daughter, Mrs. Hamilton Ross, and a son, Bartlett, all of Saint Paul.

OSCAR L. BERTELSON

Dr. Oscar L. Bertelson of Crookston died suddenly July 14, 1949, at his home. He was a former resident of Fergus Falls.

Dr. Bertelson was born at Fayette, Iowa, October 2[illegible] 1878. He obtained his medical degree at the Universit[illegible] of Minnesota Medical School in 1900 and took eigh[illegible] months of postgraduate work at the New York Ophthal[illegible] mic College. He practiced for two years at Beltrami be[illegible] fore locating at Crookston.

Dr. Bertelson specialized in eye, ear, nose and throa[illegible] diseases. He was a Division Surgeon for the Grea[illegible] Northern Railway for many years. He was a member o[illegible] the Crookston Elks lodge and a member of the Re[illegible] River Valley Medical Society, the Minnesota State an[illegible] American Medical Associations.

Dr. Bertelson was married to Bertha Asseln, wh[illegible] preceded him in death in December, 1948. Because of il[illegible] health he had not been active in his profession for severa[illegible] years.

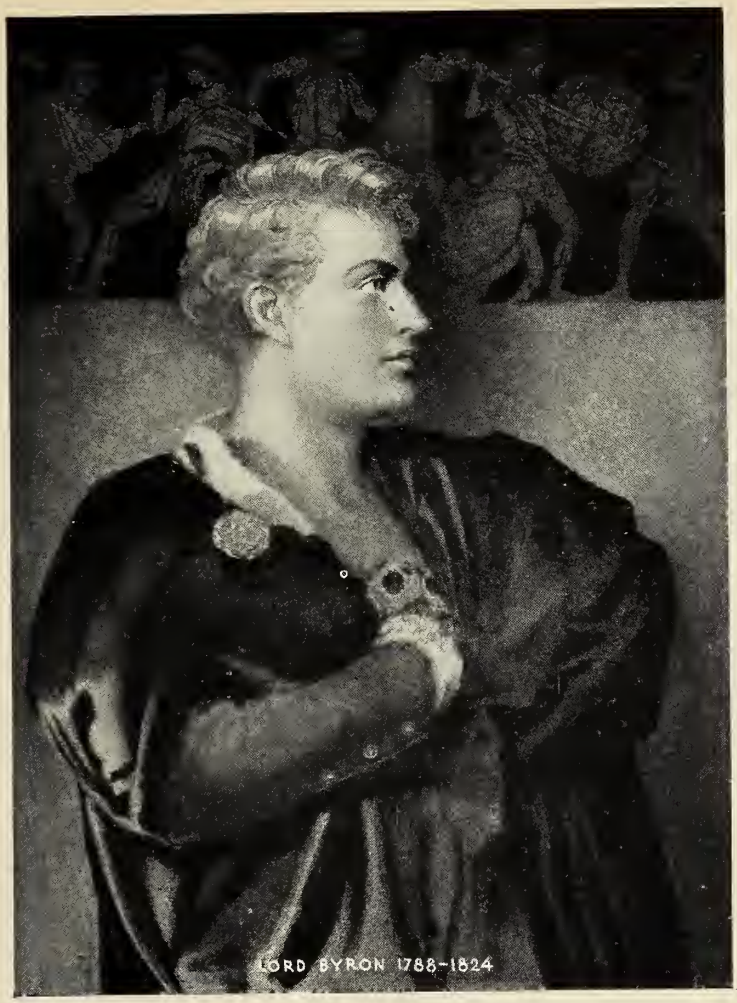
FAYETTE DWIGHT KENDRICK

Dr. F. D. Kendrick, St. Paul, died August 24, 1949 at the age of ninety-three.

Dr. Kendrick was born November 29, 1856, in Drey[illegible] den, Michigan. He graduated from the University o[illegible] Michigan Medical School, Ann Arbor, in the same clas[illegible] with Dr. William J. Mayo. He practiced homeopathy a[illegible] Bismarck, North Dakota, in the horse and buggy day[illegible] before coming to St. Paul in the early nineties.

On October 10, 1893, he married Sarah Kirk Stees o[illegible] St. Paul and moved into the Stees mansion, at 488 Gran[illegible] Avenue, built by Colonel Heather in the sixties. There[illegible] he has since lived but did not practice his profession, de[illegible] voting his time to hunting and fishing, to playing th[illegible] violin and piano, and to inventions, some of which he pat[illegible] ented. Mrs. Kendrick died in 1930.

Dr. Kendrick is survived by one daughter, Mrs. Isa[illegible] belle Kutili of Chicago, and two grandchildren, Ken[illegible] drick J. Kutill and Sally A. Kutill, also of Chicago.



VERNON JOHN TELFORD

Dr. Vernon John Telford of Litchfield, Minnesota died on July 18, 1949, in Eitel Hospital, Minneapolis. He was stricken with a heart attack while driving to Minneapolis.

Dr. Telford was born in Pipestone, Minnesota, July 15 1899. He obtained a B.S. degree from Hamline University and his M.D. degree from the University of Minnesota Medical School in 1929. After interning at St Mary's Hospital, Duluth, he practiced at Edgerton Minnesota, from 1930 to 1931, and had practiced eighteen years in Litchfield.

Dr. Telford was a member of the Meeker-Kandiyohi-Swift County Medical Society, the Minnesota State and American Medical Associations.

★ *Epileptic Men of Genius* ★

The brilliant English poet, Lord Byron, who had many mild convulsive attacks during his short life, is an outstanding example of the fact that epilepsy need not cloud a man's mentality.

Comparative studies have shown that in some cases better control of grand mal as well as petit mal seizures can be obtained with Mebaral than with corresponding doses of other antiepileptic drugs. Mebaral produces tranquillity with little or no drowsiness. It is particularly desirable not only in epilepsy but also in the management of anxiety states and other neuroses. The fact that Mebaral is almost tasteless simplifies its administration to children. Average dose for children ½ to 3 grains, adults 3 to 6 grains daily. Tablets ½, 1½ and 3 grains.

JACOB JOHN WESTRA

Dr. Jacob John Westra died July 17, 1949, in Champaign, Illinois.

Dr. Westra was born on March 2, 1908, at Grand Rapids, Michigan. He received the degree of A.B. in 1929 from Calvin College, the degree of Ph.D. from the University of Chicago in 1931 and the degree of M.D. from Rush Medical College, University of Chicago in 1936; he was intern for one year and resident for two years at Presbyterian Hospital in Chicago.

Dr. Westra entered the Mayo Foundation as a fellow in medicine on April 1, 1938, and remained until October 1, 1939, at which time he went to Owatonna, Minnesota, where he practiced until 1941. He then went to the Muncie Clinic, Muncie, Indiana. In 1944 he went to Champaign where he practiced until the time of his illness this summer.

He was a diplomate of the American Board of Internal Medicine, a Fellow of the American College of Physicians, and a member of the American Medical Association, the Illinois State Medical Society, Alpha Omega Alpha, Sigma Xi and the Champaign County Medical Society of which he was secretary in 1949.

Senator Taft said that the doctors have long wanted an independent Department of Health. He has believed that an Under Secretary such as is suggested by S.14 of the 80th Congress would be a fair compromise and would accomplish the desired results. However, the doctors' viewpoint has been upheld by the Hoover Commission which suggested the establishment of a United Medical Administration.

He stated, further, that Plan No. 1 does not follow the Hoover Commission, but instead places full power in the Secretary of Welfare. While some of its proponents suggest that this is only a temporary arrangement and that they will later look into the medical phase, this is certainly not the view being taken by the present Administrator. Senator Taft said, "If Plan No. 1 goes into effect, there will never be a United Medical Administration." He stated that he opposes Plan No. 1 because it completely subordinates health and education to welfare and because it fails to follow the Hoover Commission.

A.M.A. Bulletin No. 2

"If I am sick, I really want someone to look after me. If I am about to die, I want to make sure that I am given every chance the medical profession can offer me.

"I do not want someone, whose salary goes on whether I live or die, making a casual observation. I do not for a moment question the ethical attitudes of the medical profession either under socialized medicine or in private practice.

"But boy, oh boy, I sure do question human nature and am fearful of it. If you take the incentive of building a private practice or of sustaining a reputation away, I am afraid the socialized doctor is liable to relax and rest on his oars."—DANN O. TABER in *The Athens (Ohio) Messenger.*

AMERICAN ACADEMY OF PEDIATRICS MINNESOTA CHAPTER

Approximately twenty Minnesota pediatricians attended an organizational meeting of the Minnesota Chapter of the American Academy of Pediatrics in Duluth on August 6.

Dr. R. E. Nutting, Duluth, was elected president of the chapter. He had served as chairman of the state Academy membership prior to the formal organization.

Other officers elected at the meeting are Dr. L. F. Richdorf, Minneapolis, vice president; Dr. H. F. Flanagan, Saint Paul, secretary-treasurer; and Dr. R. L. J. Kennedy, Rochester, and Dr. E. D. Anderson, Minneapolis, fellows-at-large.

The Minnesota membership in the American Academy of Pediatrics totals forty-five.

AMERICAN COLLEGE OF CHEST PHYSICIANS POSTGRADUATE COURSE

The fourth annual postgraduate course sponsored by the American College of Chest Physicians will be held at the St. Clair Hotel, Chicago, September 19 through 23.

The course will consist of addresses by specialists in chest diseases and related fields. Round-table luncheon meetings will also be held. The principal speaker at a dinner on the evening of September 22 will be Dr. Andrew C. Ivy, vice president of the University of Illinois College of Medicine.

Those interested should apply to the American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois, remitting the registration fee of $50.

MILITARY MEDICAL CONVENTION

Under the auspices of the Twin City Medical Department Reserve Officers a Convention on Military Medicine will be held at the University of Minnesota, October 7 and 8, 1949. Attendance at this convention is urged for all Medical Reserve Officers as well as all other doctors interested in the subjects to be presented and in Military Reserve matters.

Program Outline
October 7

A.M.

11:30 Staff Meeting and Luncheon. Powell Hall.

P.M.

12:30 Registration. Museum of Natural History.

1:30 Movies: The Atomic Bomb. Museum of Natural History.

3:00 Lecture: Antibiotics, Wesley W. Spink, M.D., Museum of Natural History.

6:30 Dinner: Radisson Hotel. Speaker: From the Office of the Surgeon General: Hiroshima, 1945-1949.

October 8

A.M.

8:00 Clinical demonstrations at various hospitals to be announced; emphasis on various medical and surgical specialties.

P.M.

1:00 Minnesota-Northwestern football game.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

This year's 116th Meeting of the American Association for the Advancement of Science in the Pennsylvania Zone hotels of New York City, December 26-31, 1949, is expected to have the largest attendance in the Association's 101-year history. All seventeen sections and subsections of the AAAS and some fifty-three affiliated societies will have programs. Among these are included four sessions of papers on research in medicine, to be held in the Statler Hotel, Wednesday and Thursday, December 28 and 29. These sessions are under the sponsorship of AAAS Section N, of which Dr. Gordon K. Moe, University of Michigan, is secretary. One of the several speakers who will assure an outstanding program for these meetings is Dr. Alan Gregg, Chairman

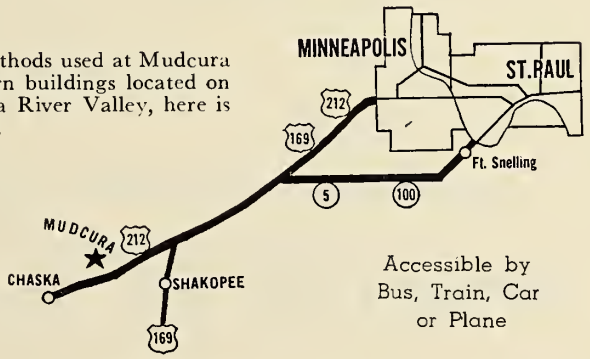
A WORD OF GRATITUDE ON OUR 40th ANNIVERSARY

MUDCURA SANITARIUM

Member of American Hospital Association

R. T. PEARSON, M.D. — B. F. PEARSON, M.D., Staff Physicians



SHAKOPEE, MINNESOTA

We wish to take this means of expressing our appreciation to hundreds of physicians for their splendid support and cooperation during the past forty years. Support and cooperation which has enabled Mudcura Sanitarium to grow into one of the leading accepted hospitals in the Northwest for the treatment of arthritis and related conditions. The hospital of today is a monument to the foresight and ability of the late H. P. Fischer, M.D. Today, Mudcura Sanitarium is a modern 100-bed hospital, with a complete physiotherapy department. Also equipped with modern laboratory and X-ray facilities. Roy T. Pearson, M.D., and B. F. Pearson, M.D., are staff physicians. The hospital employs about fifty people, including a technician and dietitian, masseurs, masseuses and nurses. Endorsed by the Carver-Scott County Medical Society and Licensed by the State Board of Health, Mudcura Sanitarium is also a member of the American Hospital Association and approved by the American Medical Association.

WRITE FOR FREE FOLDER . . .

A complete story with illustrations showing the methods used at Mudcura Sanitarium for treating the arthritic. With modern buildings located on landscaped grounds along the beautiful Minnesota River Valley, here is one of the Northwest's finest specialized hospitals.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

(Continued from Page 936)

of Section N and Director of Medical Science, Rockefeller Foundation.

Physicians interested in scientific research or in the broader aspects of science are invited to join the Association and attend the meeting. Those interested may obtain application cards by writing the American Association for the Advancement of Science, 1515 Massachusetts Avenue, N. W., Washington 5, D. C. Membership dues are $6.50, which entitles the member to the weekly, *Science*, or the monthly, *Scientific Monthly*. An additional $3.50 brings both journals.

WINONA COUNTY SOCIETY

A meeting of the Winona County Medical Society was held in St. Charles on July 18. The scientific portion of the meeting was preceded by a dinner attended by forty-four physicians and wives.

Two new physicians in the area, Dr. Norbert P. Blochowiak of Rushford and Dr. Roger F. Hartwich of Winona, who were applying for membership in the group, were introduced at the meeting. During the scientific session a motion picture on cancer was shown by Dr. Hilmar Schmidt, Winona. A discussion of staff problems and public health program was conducted, and a committee on public relations was appointed, consisting of Dr. R. H. Wilson, Dr. P. A. Mattison and Dr. Herbert Heise, all of Winona.

The society will hold its next meeting in Minnesota City on October 1.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

At the meeting of the Minnesota Society of Neurology and Psychiatry to be held Saturday, September 17, 1949, in Duluth, the program will be as follows:

Morning Session—10:00 a.m.
St. Mary's Hospital

The Szondi Test—L. E. Schneider, M.D.

Tumors In and About the Third Ventricle; An Analysis of Surgical Treatment—G. J. Strewler, M.D.

Prefrontal Lobectomy; A Follow-up Study of Thirty-five Cases—J. E. Haavik, M.D.

Neurological Problems; Three Cases Illustrating Difficulties Encountered Because of Misleading History—C. M. Jessico, M.D.

The Problem of Alcoholism—L. R. Gowan, M.D.

Luncheon—12:30 p.m.
Kitchi Gammi Club

Afternoon Session—2:00 p.m.
Deep sea fishing on the North Shore

LEO. G. RIGLER LECTURE

Dr. John Caffey, associate professor of pediatrics in the College of Physicians and Surgeons at Columbia University, New York, will present the annual Leo G. Rigler lecture at the University of Minnesota medical school Wednesday, November 2, at 8:15 p.m.

Dr. Caffey will speak on the subject "Some Normal Variations in the Growing Skeleton: Their Clinical Significance." He will speak in the auditorium of the Minnesota Museum of Natural History.

Associate pediatrician and roentgenologist at the Babies' Hospital and Vanderbilt Clinic, New York City, Dr. Caffey also is consulting pediatrician at the Grasslands Hospital, Westchester County, N. Y., and the Yonkers General Hospital, Yonkers, N. Y.

OCCUPATIONAL AND PHYSICAL THERAPY COURSE

Dr. H. D. Bouman, Professor of Physical Medicine, University of Wisconsin Medical School, Madison, Wisconsin, will participate as a visiting faculty member in a continuation course in Occupational and Physical Therapy to be presented at the University of Minnesota, October 13 and 14. The course is intended for occupational and physical therapists. Dr. Bouman will speak on the subjects, "Physical Medicine and Geriatrics" and "Rehabilitation of the Neurological Patient."

DEALERS IN DEPENDABLE MERCHANDISE

Woman's Auxiliary

AUXILIARY EDITOR CALLS FOR NEWS

Mrs. S. N. Litman

The editors of Minnesota Medicine are reserving this generous section of the magazine for Auxiliary news each issue—news which will be of great interest to all members.

Information about local meetings, programs and Health Days, as well as articles on newly organized Auxiliaries and plans for the coming year will be especially appreciated.

News of this type should be mailed before the tenth of the month to Mrs. S. N. Litman, 4806 West Seventh Street, Duluth 7; while the chatty notes concerning members may be sent to Mrs. Leonard Arling, 2310 East 43rd Street, Minneapolis.

PR WORKSHOP WILL FEATURE EDITOR'S TALK

Mrs. Reuben Erickson

Max F. Ninman, editor and publisher of the Reedsburg, Wisconsin, *Times,* will be the banquet speaker for the second annual Women's Auxiliary Public Relations Workshop at the Radisson Hotel, September 22. Mr. Ninman is past president of the Wisconsin Press Association and will discuss community responsibilities of the doctor and the doctor's wife.

The day-long program, which begins at 9 a.m. with registration will include the following:

J. S. Jones, Minnesota Farm Bureau, speaking on the general threat of socialism; A. E. Cardle, M.D., chairman of the MSMA Health Education Committee, the transition from planning to action in the Minnesota program; Miss Mary McGinn, director, Woman's Division of Whitaker & Baxter, the national campaign; Kenneth Wunsch, publicity director, Northwestern National Life Insurance Company, distribution of literature, press relations.

P. Kenneth Peterson, state representative, the public platform, speakers' bureau; Arleth Haeberle, Radio Station WTCN, radio; Edwin Lewis, Associate Professor of Economics and Marketing, University of Minnesota, contacting individuals and groups; Mrs. Harold Wahlquist, national Auxiliary vice president, Health Days.

Several other speakers have not yet confirmed their appearance on the program, but the program will be directed toward a complete presentation of public relations techniques and objectives.

During the afternoon session there will be health movies shown by Mrs. Netta W. Wilson, senior health information consultant at the Minnesota Department of Health. Mrs. Wilson will also distribute lists of films available to Auxiliaries for showing in local communities.

Following last year's Workshop pattern, there will be roundtable discussions of Auxiliary organizational activities. Three roundtables have been scheduled: county presidents, county treasurers, and legislative and public relations programs.

The fall board meeting will be held Friday morning, in the Italian room of the Radisson. A block of rooms has been set aside at the hotel for the convenience of those out-of-town members who wish to spend the night.

VACATIONS OVER, FALL PLANS WILL BEGIN

Mrs. L. Raymond Scherer

With summer vacations ending, Woman's Auxiliary plans will be gaining headway for next year. Despite the indications that compulsory health insurance is a dead issue, this ten-year-old menace will, according to most observers, be resurrected in the next congressional session.

The four-point program developed for Woman's Auxiliaries by Whitaker & Baxter includes: endorsement drive, participation in speakers' bureaus, distribution of literature and the placing of material in the women's sections of local newspapers. Miss Mary McGinn, director of Witaker & Baxter's Women's Division, points out that each area should select the phases of the program most appropriate and concentrate on them. A forthcoming plan of action will soon be available in printed form for Auxiliary use.

PERNICIOUS ANEMIA

(Continued from Page 891)

with chronic lymphatic leukemia desperately ill with symptomatic hemolytic anemia two years ago was subjected to splenectomy and is still vigorous and operating his farm.

There is great controversy at the present time regarding the exact manner in which the spleen exerts this destructive effect. One school believes that the spleen is of the origin of an antigen in these instances, and that the whole process is an example of an immune body mechanism, similar to mis-matched transfusions; another feels that the enlarged spleen has simply a greater area in which to perform its usual "grave-yard" functions. But, whatever the cause, it is obvious that its recognition is of considerable importance, since the relatively simple operation of splenectomy produces such spectacular improvement in them.

In closing, I think it is fair to say that hematology has kept abreast, at least, with other medical fields, in the scope and interest of its advances.

Of General Interest

A million-dollar damage suit has been filed in the United States District Court by Dr. N. R. Brewer, a lecturer in physiology and director of the animal quarters at the University of Chicago. The suit was filed against the Hearst Publishing Company, Inc., publisher of the *Chicago Herald American,* and William Randolph Hearst of San Simeon, California. Pictures published of Dr. Brewer holding dogs which were described as tortured and tormented, and references to Dr. Brewer as a torturer, a sadist and a cruel experimenter, formed the basis for his suit.

Another million-dollar libel suit was filed ten days earlier by Dr. Virgil H. Moon, of Wake Forest College School of Medicine in North Carolina against the same defendants for misrepresenting his views on animal experimentation in the May 24 and May 29 issues this year. A similar article had been published on August 27, 1944, which falsified statements Dr. Moon had made in an interview. Efforts on the part of Dr. Moon for the past five years to have the newspaper correct the misrepresentation have been in vain.

Dr. Anton J. Carlson, president of the National Society for Medical Research, in announcing the two suits, stated that no campaign in our century has continuously carried as much irresponsible lying, maliciousness and defamation as the one aimed at the doctor and medical science researcher by the so-called anti-vivisectionists. The researchers are now organized as the National Society for Medical Research to actively combat this unjustifiable misrepresentation.

* * *

Dr. Albert V. Stoesser and Dr. Lloyd S. Nelson are now associated in the practice of allergy and pediatrics at 1409 Willow Street, Loring Park, Minneapolis.

* * *

On August 8, Dr. J. Webster Raattama joined the staff of the Adams Clinic in Hibbing. Dr. Raattama, a graduate of the University of Minnesota Medical School who served his internship at Columbia Hospital in Milwaukee, will practice in Nashwauk and Keewatin offices.

Dr. M. F. Hayes, who previously practiced at Nashwauk and Keewatin, has retired from the organization.

* * *

After practicing at Wanamingo for the past two years, Dr. Clifford N. Rudie became a staff member of the St. Peter State Hospital on August 1. Dr. Rudie previously practiced medicine in Los Angeles for five years and in Kenyon, Minnesota, for ten years.

* * *

The Alvarenga Prize has been awarded to Dr. Owen H. Wangensteen, director of the department of surgery at the University of Minnesota, by the College of Physicians of Philadelphia for his contributions to the etiology and therapy of gastric and duodenal ulcers. The prize was established under the will of Pedro Francisco Da Costa Alvarenga of Lisbon, Portugal, an associate fellow of the College of Physicians of Philadelphia, and is awarded annually on the anniversary of his death, July 14, 1883. Dr. Wangensteen will deliver the Alvarenga Lecture before the College on November 2.

* * *

Dr. Bernard P. Strouth, who practiced in Dubuque, Iowa, during the past year, has moved to Council, Idaho, to be associated in practice with a physician there.

* * *

It was announced on July 24 that Dr. Charles L. Sherman of Luverne had been elected president of the Northwestern Minnesota Tuberculosis Sanatorium board for the thirty-fifth time. First elected to the position in 1914, Dr. Sherman has been head of the board continuously since then.

* * *

In July, Dr. James A. Cosgriff, Jr., became associated in practice with his father, Dr. J. A. Cosgriff, and Dr. J. J. McLeod, Jr., in the Olivia Clinic. A graduate of the University of Minnesota Medical School, the younger Dr. Cosgriff served his internship at St. Mary's Hospital in Duluth. He recently completed two years of naval service, being stationed part of the time at naval bases on Attu and Kodiak, Alaska.

* * *

A three-week vacation tour through the Northwest was taken by Dr. and Mrs. Roger G. Hassett of Mankato during late July and early August. A highlight of the trip was a 300-mile cruise north of Seattle to the Campbell River where the annual Tyee Salmon Derby was being held. Other features of the journey were stops at Lake Louise and Banff in Canada and at Glacier and Yellowstone National Parks. During Dr. Hassett's absence his practice was conducted by Dr. Joseph C. Von Drasek, who has been associated in practice at the Medical Center in Mankato for the past year.

* * *

Dr. James Reinhardt, formerly of Detroit Lakes, became associated in practice with Dr. Lester N. Dale of Red Lake Falls early in July. A graduate of Temple University Medical School, Dr. Reinhardt served his internship at Northwestern Hospital, Minneapolis.

* * *

The superintendent of the St. Peter State Hospital, Dr. Burton P. Grimes, was a speaker at a meeting of the Exchange Club in Mankato on August 10. The title of Dr. Grimes' talk was "Report on Your State Hospital."

* * *

An additional story will be added to the Mayo Memorial building at the University of Minnesota as a result of a new $200,000 Federal grant, it was announced on August 1. According to present plans, construction

of the building, which will now be at least eighteen stories high, will begin early in 1950.

Originally the plans for the memorial medical center called for a structure nineteen stories high. Later plans cut this to sixteen stories, and still later added a seventeenth. The foundations will be built to hold twenty-two stories, and the final size of the building will depend on costs.

* * *

The principal speaker at a meeting of the Winona Rotary Club on August 3 was Dr. F. J. Vollmer of Winona, who discussed the profession of medicine. He listed the qualifications which should be met by any youth who plans to enter the field of medicine, and he described the years of academic preparation and the various types of specialized training. Dr. Vollmer's talk was the first of a series by different speakers on the various professions.

* * *

Rushford acquired a new physician late in July when Dr. Norbert P. Blochowiak opened offices for the practice of medicine in the city. A graduate of the University of Minnesota Medical School, Dr. Blochowiak served his internship at Ancker Hospital, Saint Paul.

* * *

"Questions on Compulsory Health Insurance" was the title of a talk presented by Dr. Charles E. Rea, Saint Paul, at the University of Minnesota on July 20. Dr. Rea is a clinical assistant professor of surgery at the University.

The ten interns at St. Luke's Hospital, Duluth, spent August 9 fishing in Lake Superior, but their patients were not left unattended. While the St. Luke's group angled for lake trout, the interns at Duluth's St. Mary's Hospital carried out the duties of their colleagues as well as their own. The plan called for a later fishing trip by the St. Mary's interns, with the duty arrangement reversed.

* * *

It was announced on July 28 that a new clinic building would be constructed in Anoka. When completed, the twenty-four-room, air-conditioned structure will be occupied by Dr. Frank E. Mork, Dr. A. Harold Mork and Dr. Joseph Twidwell, Anoka practitioners. The building will also house two dentist suites.

* * *

Three physicians were among those named to the governor's advisory council of the Youth Conservation Commission on July 27. The physicians appointed by Governor Luther W. Youngdahl are Dr. Maurice N. Walsh, Rochester; Dr. Eric K. Clarke, Minneapolis, and Dr. H. S. Lippman, Saint Paul.

* * *

National Heart Institute grants of more than $1,200,000 to support heart disease research work in medical schools and hospitals in twenty-one states, the District of Columbia, and Canada were announced on July 15 by Oscar R. Ewing, Federal Security Administrator.

The grants were approved by Surgeon General Leonard A. Scheele of the Public Health Service following recommendation by the National Advisory Heart Coun-

cil. The council is a sixteen-member body composed of outstanding leaders in the medical sciences and public affairs.

According to Dr. C. J. Van Slyke, director of the National Heart Institute, the grants comprise only a portion of the Federal funds to be awarded for heart disease research during the current fiscal year. Additional grants for new heart research and for construction of heart research facilities and laboratories are expected to be announced shortly.

Established last August under authority of the National Heart Act, the National Heart Institute is one of the National Institutes of Health, the research arm of the Public Health Service, with headquarters in Bethesda, Maryland. In addition to conducting scientific research in its own laboratories, the Institute administers federal funds supporting research and training related to the cause, prevention and methods of diagnosis and treatment of heart disease in other institutions throughout the country.

* * *

Members of the Mankato Rotary Club, at a meeting on August 3, heard Dr. H. H. Russ, Blue Earth, give a talk on "The Prevalence and Treatment of Cerebral Palsy Handicapped Child en."

* * *

Dr. Lewis I. Younger, Mankato, announced on July 16 that Dr. Roger F. Hartwich, formerly of Minneapolis, had become associated with him in the practice of medicine. A graduate of the University of Minnesota Medical School, Dr. Hartwich interned at Milwaukee County General Hospital, then served in the army in Europe during World War II. Following his discharge in 1946, he took postgraduate work at the University of Minnesota and then served a three-year residency in general surgery at Swedish Hospital, Minneapolis.

* * *

Word has been received that Dr. Richard Fuchlow of El Paso, Texas, who formerly practiced in the Upper Midwest, died of a coronary occlusion early in August.

* * *

Dr. R. H. LaBree and Dr. J. J. Coll, of the Duluth Clinic, were speakers at a meeting at Grandview Hospital, Ironwood, Michigan, on August 9. Dr. LaBree discussed "Peripheral Vascular Diseases," and Dr. Coll spoke on "Liver Dysfunction."

* * *

Fifty-five grants totaling $138,726, in support of medical research, have been awarded during the first half of this year by Smith, Kline and French Laboratories, of Philadelphia. Mr. W. F. Thompson, vice president in charge of the company's research, announced that the funds were provided as scholarships and fellowships, as aids to preclinical research and for the support of studies in various fields of clinical medicine.

* * *

Lannin, Saint Paul, in charge of orthopedics at the University of Minnesota Health Service, have become associated with the medical staff of the Elizabeth Kenny Institute in Minneapolis.

* * *

A chest x-ray machine was given to Rochester and to Olmsted County in July by the Olmsted County Christmas Seal organization. The machine, which will be used for many purposes in the city and county, was purchased at a cost of more than $9,000.

* * *

Dr. and Mrs. Charles C. Merchant, medical missionaries of the Baptist General Conference, sailed from New York with their two children on August 30, bound for Tezpur, Assam, India, where Dr. Merchant will become chief of staff of Ahlquist Memorial Hospital. A graduate of the University of Minnesota Medical School, Dr. Merchant served his internship at Miller Hospital, Saint Paul, and then took graduate training in surgery at Deaconess Hospital, Minneapolis.

* * *

Announcement was made on July 31 that Dr. Evelyn Johnson had been appointed medical director of the Diagnostic Clinic for Rheumatic Fever in Saint Paul. The clinic is a public health service for children under eighteen, sponsored and financed by the Saint Paul section of the National Council of Jewish Women.

Dr. Johnson has been associated with the Minneapolis Children's Heart Clinic and Hospital for the past eight years, and she has also been affiliated with the University of Minnesota Children's Heart Clinic.

* * *

A service recognition certificate was presented to Dr. H. H. Young, Rochester, at the annual summer meeting of the Minnesota Safety Council in Duluth on August 19. Dr. Young is a member of the council's executive committee.

* * *

While Dr. Ralph H. Larson of Anoka took a week of vacation, in July, his practice was conducted by Dr. Myron J. Woltjen of the staff of Asbury Hospital, Minneapolis.

* * *

Dr. R. R. Hendrickson, formerly of Lake Park, became medical director of Sunnyrest Sanatorium in Crookston on September 1. Dr. Hendrickson, while at Lake Park, was superintendent and medical director of Sand Beach Sanatorium, medical director of Fair Oaks Lodge Sanatorium at Wadena and medical consultant at Ottertail County Sanatorium. Dr. Selmer Johnson, a former resident physician at the state sanatorium near Walker, has replaced Dr. Hendrickson as medical director of the Fair Oaks Lodge Sanatorium and as medical consultant at the Ottertail County Sanatorium.

* * *

On August 1, Dr. John L. Delmore, Sr., completed forty years of medical practice in Roseau. He now conducts his practice in the Delmore Clinic in association with two of his sons, Dr. John L. Delmore, Jr., and Dr. Robert J. Delmore.

* * *

Dr. Philip S. Hench, Rochester, has been appointed to head a national committee of medical scientists in a study of the new rheumatoid disease drugs, cortisone (Compound E) and adrenocorticotrophic hormone (ACTH). The group headed by Dr. Hench was appointed by Surgeon General Leonard A. Scheele of the Public Health Service.

* * *

Staff members of the Ada Clinic moved into their newly constructed office building on August 1. The modernistic one-story structure contains three physicians' offices, a treatment room, laboratory, recovery room, waiting room and a double dental office. The clinic staff is composed of Dr. Bruce Boynton, Dr. Byron Kinkade and L. A. Sanders, D.D.S.

* * *

Approximately 175 guests attended an open house held in the Barnesville city hall on July 31 to celebrate the forthcoming (August 3) golden wedding anniversary of Dr. and Mrs. Alphonse Cyr. A musical program, a buffet supper and the presentation of a purse of money to the couple were highlights of the occasion. Earlier in the day, Dr. and Mrs. Cyr were guests of honor at a baseball game.

Dr. Cyr has practiced medicine in Barnesville since 1906. Always active in civic affairs, he has served as city health officer for several years and has been a member of the school board for almost twenty years. He is a graduate of the medical school at Laval University in Montreal, Canada.

* * *

It was announced on August 3 that Minnesota had granted a medical license to the first foreign-educated

physician to qualify under the revised regulations of the State Board of Medical Examiners.

The license was issued to Dr. Robert C. Lam, a Chinese-born and Chinese-educated American citizen, who recently completed a residency in surgery at Asbury Hospital, Minneapolis. After obtaining a master's degree in bacteriology at the University of Illinois in 1940, Dr. Lam returned to China and began his medical studies at Peiping Union Medical College. He completed his medical school work at West China Union University in 1944 and interned at the Associated Universities United Hospital at Chengtu. On January 1, 1947, he began his surgical residency at Asbury Hospital, Minneapolis, and while there attended medical classes at the University of Minnesota.

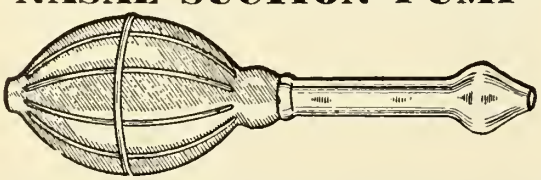
Upon acquiring his license, Dr. Lam accepted a position as resident surgeon at St. Mary's Hospital, Grand Rapids, Michigan. Minnesota and Michigan have a reciprocal arrangement on licenses.

* * *

Dr. J. J. Coll, Duluth, discussed some interesting aspects of myxedema before the Range Medical Society on August 23, 1949. The meeting was held at the Esquemoba Club at Virginia.

* * *

Dr. C. M. Jessico, Duluth, will speak on "Symptoms of Insecurity in Childhood" before the Association of Childhood Educators at the meeting held at the State Teachers' College, Superior, on September 21.



* * *

Dr. Robert V. Hodapp, son of Dr. R. J. Hodapp of Willmar, has joined the staff of the Lakeland Medical Clinic in Willmar. Dr. Robert Hodapp recently completed two years of military service.

* * *

In Norwood, Dr. Joseph D. Selmo and Dr. Grant L. Griebie recently completed the organization of the Norwood Clinic. Dr. Selmo has practiced in Norwood since 1940. Dr. Griebie, a graduate of Northwestern University Medical School in 1944, studied surgery in Chicago for two years and then served as an associate in surgery with a clinic in Great Falls, Montana, for three years. In organizing their clinic in Norwood, the two physicians added a considerable amount of new equipment to their facilities.

On August 4, Dr. Gaylord W. Anderson, head of the mayor's poliomyelitis committee in Minneapolis, announced that twenty-seven nurses and four physiotherapists were needed at the University Hospitals and the Elizabeth Kenny Institute. The appeal was not made because poliomyelitis had reached alarming proportions in the state. The reasons given for the appeal were the following: Poliomyelitis treatment has improved over the years, so that increased personnel is needed. Furthermore, since Minneapolis is a poliomyelitis treatment center, facilities in the city are overtaxed.

* * *

It was announced on August 1 that Dr. Kenneth J. Kelley had installed a new x-ray machine in his offices at Grove City.

* * *

Grants of $2,056,426 by the National Institutes of Health to provide continued support for medical and allied research projects at non-federal institutions, were announced on August 9 by Oscar R. Ewing, Federal Security Administrator. The grants were approved by Surgeon General Leonard A. Scheele of the Public Health Service following recommendations made by the National Advisory Health Council. A total of 217 projects will be supported at ninety-four institutions located in thirty-one states, the District of Columbia, Alaska and four foreign countries.

* * *

In Blue Earth, Dr. and Mrs. John A. Broberg, both eighty-eight years of age, celebrated their sixtieth wedding anniversary on August 20. Dr. Broberg retired from his medical practice seven years ago, after completing fifty years of service to residents of Faribault County. A graduate of the University of Michigan Medical School, Dr. Broberg first began practice in Delavan in 1892. After six years there, he moved to Blue Earth, where he has since remained.

* * *

Dr. and Mrs. M. O. Oppegaard returned to Crookston in August after a two-month trip through the countries of western Europe. While overseas, Dr. Oppegaard attended a medical meeting held in London early in July and visited clinics and hospitals in several European medical centers. A feature of the trip was a journey to the German city of Neustadt in northern Bavaria. Several citizens of Crookston have been sending aid to the needy in Neustadt, and Dr. Oppegaard, as mayor of Crookston, made the visit as a good-will gesture to the people of that German community.

* * *

Nearly $6,000,000 was contributed to the National Society for Crippled Children and Adults through the 1949 Easter Seal campaign. Practically all of this was contributed through a direct-mail campaign by member societies throughout the forty-eight states, the District of Columbia, Hawaii and Alaska. Funds are used for direct relief, education and research. More than 90 per cent of the funds raised annually remain in the state for local use.

* * *

According to the Public Health Service, the life expectancy of a white male at birth is now 65.2 years and

that of a white female is 70.6 years. The expectancy of a non-white male at birth is 57.9 years and that of a non-white female is 61.9 years.

* * *

Members of the Minneapolis Woman's Club presented a check for $5,600 to the Minnesota Mental Hygiene Society on August 24, to be used for the first mental hygiene clinic for children in Minneapolis. The amount was far more than double the $2,000 promised by the club earlier in the year. The mental hygiene clinic will be located at St. Barnabas Hospital and is expected to be open early next year.

HOSPITAL NEWS

On October 1, a hospital limited to convalescent and chronically ill patients will be opened in Aitkin. Dr. Erich F. Blaufuss, a veterinarian, is converting his eleven-room residence into a twenty-bed hospital, which he will manage. All physicians will be welcome to bring patients to the hospital. Among the facilities offered will be a contagion ward for the isolation of patients with communicable diseases. The hospital, which is located just outside the village limits of Aitkin, will be known as "The Gables."

* * *

The first public health center to be constructed under the Hospital Survey and Construction Program in Minnesota will be ready for occupancy early next year. Started March 21, 1949, the public health center is being constructed near the downtown section of Rochester, overlooking the Zumbro River. Two stories high and L-shaped, the building will house the offices, laboratory, and clinic facilities of the Rochester-Olmsted County Health Unit and District Number III of the Minnesota Department of Health, as well as city welfare offices.

Plans for a Rochester health center, where public health facilities could be grouped together under one roof, were first considered twenty-five years ago when Dr. C. H. Mayo was Rochester health officer. Because the Department of Health moved into the new city hall, hopes for a health center were temporarily abandoned. The second attempt is now about to become a reality, with construction proceeding satisfactorily and the likelihood that health and welfare personnel will move into the new building about February 1, 1950.

The total cost of the building is approximately $270,000. Of this amount, the Mayo Association gave $150,000 the City of Rochester appropriated $30,000, and the remaining one-third ($90,000) is available under the provisions of the Hill-Burton Act (the Hospital Survey and Construction Program).

MINNESOTA MEDICAL SERVICE

At the completion of the seventh month of 1949, Blue Shield payments to Doctors of Medicine in Minnesota for services rendered Blue Shield subscribers and their dependents passed the half million mark. This is evidence that the people of Minnesota are taking readily to Blue Shield and also that the doctors of Minnesota are beginning to feel the effects of their own plan.

A letter has been received in the Blue Shield office written by a Blue Shield subscriber in which the subscriber sets forth the thoughts of a general practitioner in southern Minnesota. The criticism is that in general Blue Shield does not pay enough on most cases, the general practitioner does not get a fair break. It is fortunate that this feeling is in a small minority. However, it would seem that such an imprssion should not exist at all. It would be wonderful if every doctor in Minnesota could feel that Blue Shield is his own plan, that it is to his advantage to promote it. Many groups of physicians have sponsored Blue Cross and Blue Shield campaigns both organizationally and financially. They have talked to groups in person and over the radio and have given money for paid advertising and considerable time to planning campaigns. When the people in a community hear "Doctor Joe's" voice on the radio they know Blue Shield is a good plan and the plan for them because "Doctor Joe" said so. When they see an advertisement in the paper signed by all the doctors in a community, they know they should sign up for Blue Cross and Blue Shield because the doctor's sponsorship indicates that the plan is legitimate and will benefit the patient when he most needs assistance.

Eventually, the good a group of doctors has done is heard in the Blue Shield office, but as soon as one doctor in Minnesota makes a statement like that above it is heard immediately If questions come up requiring information which is not readily available and this information is in the Saint Paul office, feel free to write or call to obtain it.

A new policy is being adopted to inform doctors regarding Blue Shield and Blue Cross. Bi-monthly a

bulletin will be sent to the president and secretary of each County Medical Society to be read at each County Medical Society meeting.

At the completion of the first six-month period, there were 29,327 Blue Shield single subscriber contracts in effect and 45,500 family contracts. These contracts represent a total of 190,853 persons in Minnesota covered by Blue Shield. A year ago there were 32,550 persons covered by Blue Shield. Also a year ago Blue Shield cases averaged 4.3 per day, but today the average has increased to 63.1 per day. This is an increase of nearly 1,500 per cent.

Over 8,498 more persons in Minnesota received care under the Blue Cross Plan during the first six months of 1949 as compared with the number receiving Blue Cross benefits during the first six months of last year.

Out of every 1,000 persons covered by Blue Cross, fifty-eight more persons received Blue Cross benefits during the first six months of this year as compared with those receiving benefits during the same period in 1948.

Respiratory diseases ranked first in frequency of occurrence, maternity benefits ranked second, injuries and poisoning third, and digestive diseases fourth.

Although maternity cases ranked second in frequency of occurrence, the number of cases per 1,000 contracts remained the same.

Maternity cases numbered 9,805 at the end of June, and Blue Cross maternity benefits totalled $773,679.

Between January 1 and June 30 of this year, Blue Cross subscribers received benefits totalling $4,671,456 in all, and received 414,962 days of hospital care.

Of the total Blue Cross benefits, during April, May and June of this year, as many as sixty-eight cases were over $1,000.

An unusually large hospital bill was received during the month of July. The total hospital bill for a sixty-one-day-stay pneumonia case was $2,783, on which the Blue Cross allowance was $2,445.

Current enrollment in Blue Cross totals 935,026, and Minnesotans have saved themselves over $35,000,000 in hospital bills during the past sixteen years because they were Blue Cross subscribers.

Nationally, there are now 33,745,826 Blue Cross subscribers representing over 21 per cent of the total population in the United States.

ANESTHESIA FOR THORACIC PROCEDURES

(Continued from Page 897)

the intercostal space until the chest is tightly closed. The lobes are then expanded and the catheter removed.

Upon returning to his room the patient is placed in an oxygen tent if any signs of hypoxia are present. Sedation should be kept to a minimum. Excessive sedation will depress respirations and also interfere with the removal of pulmonary secretions by depressing the cough reflex.

The postoperative pain may be lessened by blocking the affected intercostal nerves with one of the long acting anesthetic agents. Obliteration of this pain will promote earlier ambulation and increase respiratory exchange. Intravenous alcohol has also been used successfully postoperatively. This solution makes the patient more comfortable without undue respiratory depression.

Summary

Anesthetic problems created by thoracic surgical procedures have been discussed. The maintenance of a patent airway, prevention of anoxia, replacement of blood and fluid and the control of untoward cardiac stimuli should be the major considerations of the anesthesiologist during thoracic procedures.

Financial worry

We hope that you will never have to use what we have to offer for sale. Strange, isn't it? But to view it from a different angle we certainly have no desire to see you have a misfortune such as a fire—a robbery—an accident or some sickness. Yet the law of average is moving your way. The really strange thing is that few people do what they should to eliminate worries over financial loss. Just check yourself.

This misfortune might never happen to you. But isn't it wise to put away a little money each year into a plan of Accident and Health Insurance that has been critically investigated by your Association so that you won't have to worry about financial loss?

Delay offers no advantage!

For the public good

The health and well-being of at least 1,000,000 Americans depends upon their discovery and treatment as diabetics. The American Diabetes Association is directing the year-round Diabetes Detection Drive to find the "1,000,000 unknown diabetics" and guide them to their own physicians for treatment.

THE AMES Selftester (TRADEMARK) **AT ALL DRUGSTORES**

brings those with glycosuria to you for diagnosis.

A simple home screening test for urine-sugar, the Ames Selftester* is a new approach to this detection problem. Like the clinical thermometer, it is sold directly to the public through drugstores. Also like the thermometer, it does not give a diagnosis, but only a warning.

the directions state:

1. The Selftester does not diognose diobetes or any other disease. Its sole function is the detection of sugor (glucose) or sugar-like substances.

2. If reaction is positive, see your doctor ot once. Sugor in your urine does not necessorily meon you have diabetes (nor does o negotive result definitely exclude the presence of diseose). But only your doctor, by medical exomination ond by odditionol loborotory tests, can tell why you show sugor.

Good Nutrition..

A VITAL FACTOR IN THERAPY

The sound and wholesome nutritious diet is an integral part of modern day preventive and definitive therapy. A steady stream of adequate amounts of all the essential nutritional elements is vital for good growth, maintenance of tissue structure and functioning, healing after trauma, and resistance to infection. For maintaining this daily, steady stream of nutrients, however, conditions both in health and illness often make imperative the use of an efficient food supplement along with the diet.

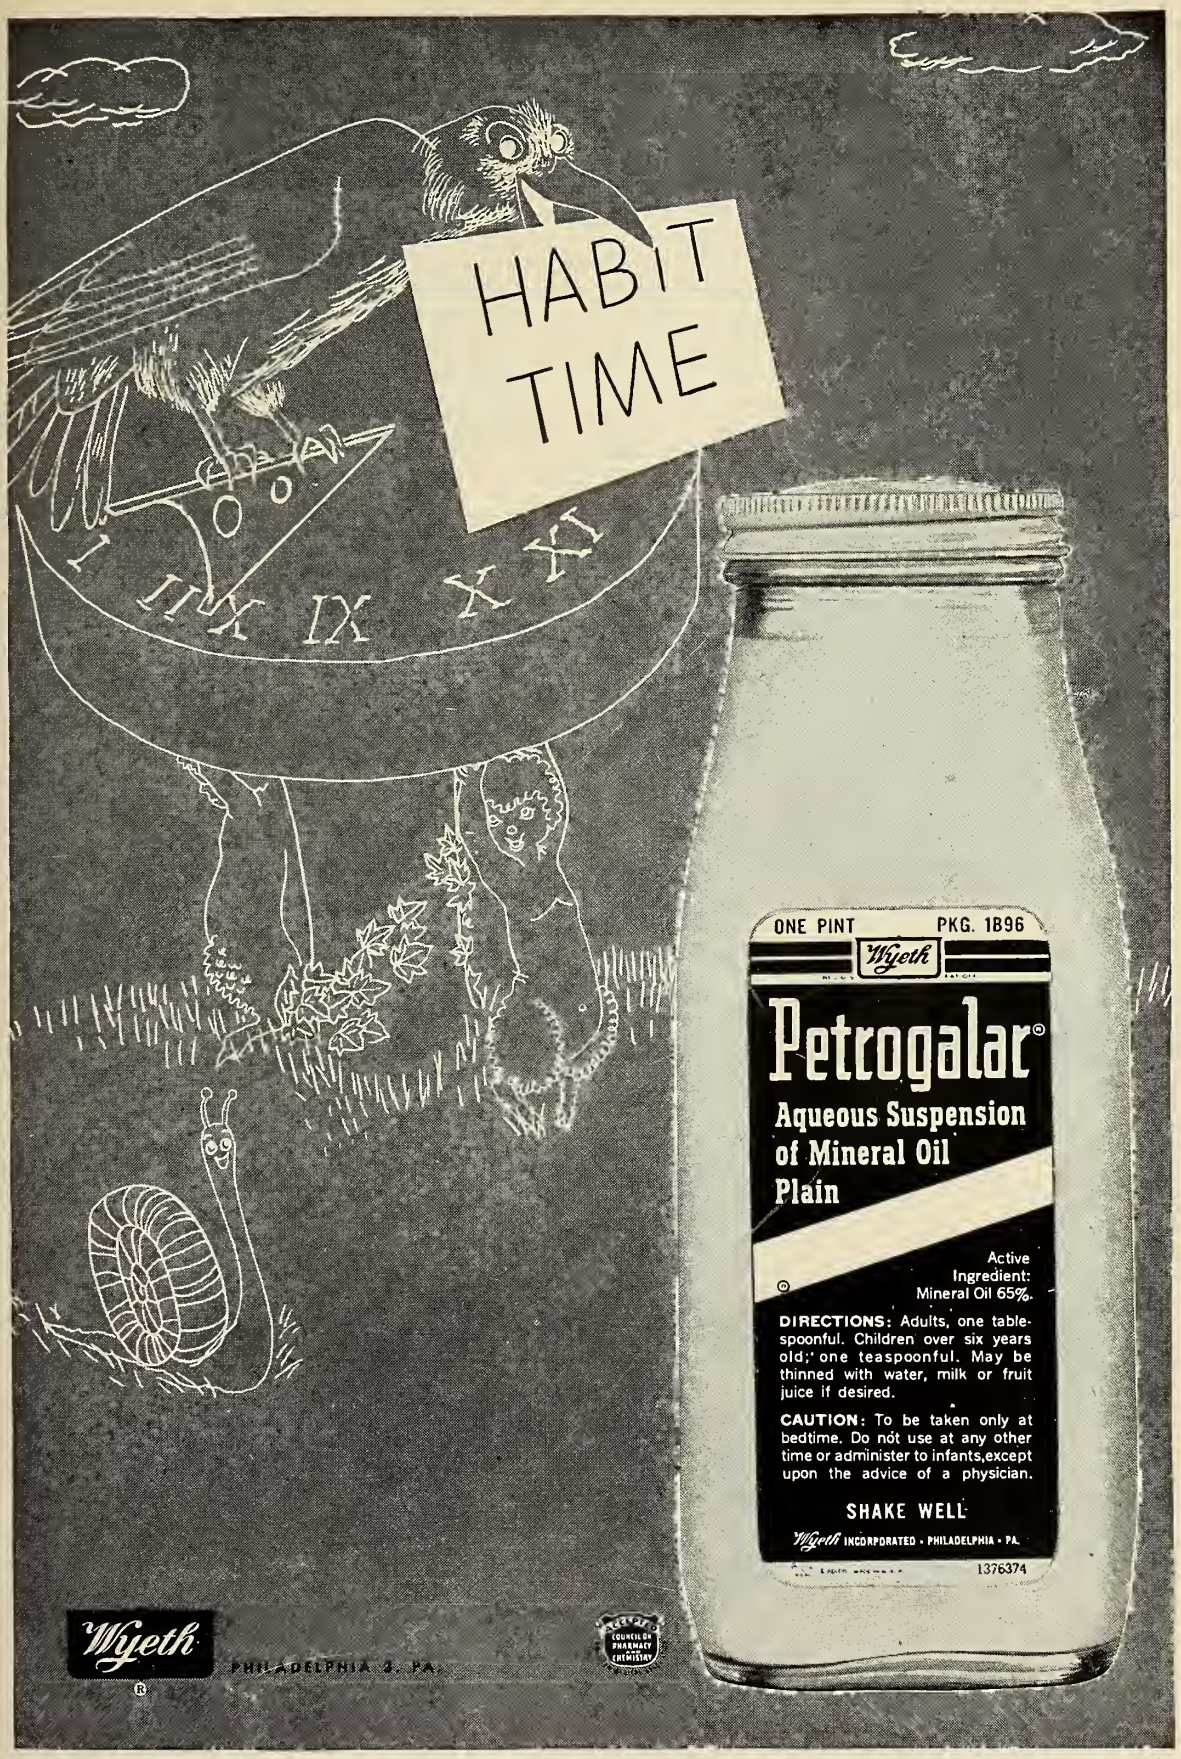
The *multiple dietary food supplement* Ovaltine in milk has wide usefulness for enhancing to full adequacy even nutritionally poor diets. Its rich store of vitamins and minerals includes vitamins A and D, ascorbic acid, thiamine, riboflavin and niacin, and calcium, iron and phosphorus. Its nutritionally complete protein has excellent biologic rating.

Since these vital nutritional values along with carbohydrate and easily emulsifiable milk fat are incorporated in liquid suspension or solution, Ovaltine in milk is also especially adapted to liquid diets. The highly satisfying flavor makes for its ready acceptability when foods are often distasteful.

The important overall nutrient contribution of three glassfuls of Ovaltine mixed with milk is presented in the accompanying table.

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

Ovaltine



Three servings of Ovoltine, each made of ½ oz. of Ovoltine ond 8 oz. of whole milk,* provide:

Nu-Trend

• A BEAUTIFUL NEW SUITE . . . BY HAMILTON

The latest addition to the Hamilton line, this new and beautiful suite of matched woods is designed to create new warmth and beauty for your examination room. Patients appreciate its modern distinctive appearance. It is economically priced and designed to help make your work more pleasant.

Available in a choice of two woods and four finishes, each designed to create a different effect. Selections may be made from red mahogany with tan upholstery, blonde mahogany with tan upholstery, regular walnut with brown upholstery, or silver gray walnut with burgundy upholstery. Features consist of a large examining chair-table with counter balanced top, adjustable stirrups, Hide-A-Roll attachment, steel-wood drawers, concealed treatment feature and generous storage space. The roomy instrument cabinet is available with either solid or glass doors.

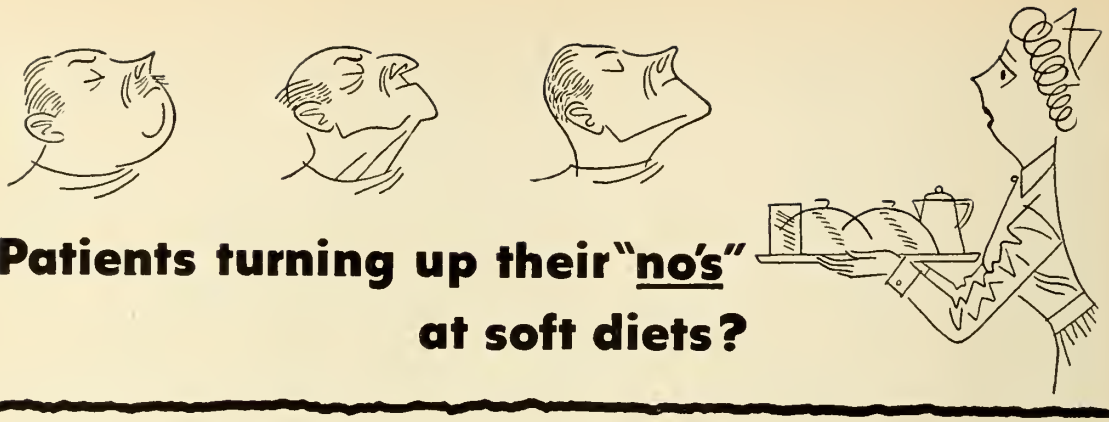
AUREO-MYCIN



The Newest and Most Broadly Useful of the Antibiotics

AUREOMYCIN HYDROCHLORIDE LEDERLE

Aureomycin is now generally accepted as one of the most versatile antibiotics yet isolated. In addition to attacking the Gram-positive cocci with great effectiveness, it is useful against many Gram-negative organisms, particularly those of the coli-aerogenes group. It is also effective against rickettsial infections and certain diseases of unknown etiologies, such as primary atypical pneumonia. Aureomycin in solution with sodium borate has been found highly effective in the eye in a concentration of one-half per cent. Among others it is active against the diplobacillus of Morax-Axenfeld, Friedländer's bacillus, staphylococcus, pneumococcus, and *Hemophilus influenzae*.

Patients turning up their "no's" at soft diets?

Try tasty, protein-rich Swift's Strained Meats!

A palatable, natural source of complete, high-quality proteins

It's not surprising that soft-diet patients develop appetite-apathy. The things they have to eat!

To help overcome this anorexia many doctors now recommend Swift's Strained Meats. Delicious, *real* meat that patients on soft, smooth diets can eat and *enjoy*. Swift's Strained Meats provide an excellent base for high-protein, low-residue diet. Rich in iron, they're chemically and physically non-irritating. They make available *simultaneously all* essential amino acids for optimum protein synthesis.

Swift's Strained Meats are tasty enough to tempt tired appetites. They supply goodly amounts of B vitamin to help stimulate patients' natural appetite for other foods. Swift's Strained Meats are 100% meat—a variety of six kinds: beef, lamb, pork, veal, liver, heart. Originally prepared for infant feeding, they're exceptionally fine in texture—may easily be used in tube feeding. Convenient—ready to heat and serve.

6 varieties:
Beef, lamb, pork, veal, liver, heart

For patients who can take foods of less fine consistency—Swift's Diced Meats offer tender morsels of nutritious meats with tempting flavors patients appreciate.

The makers of Swift's Strained Meats invite you to send for your copy of "The Importance of Protein Foods in Health and Disease"—a physicians' handbook of protein feeding, written by a doctor. Send to:

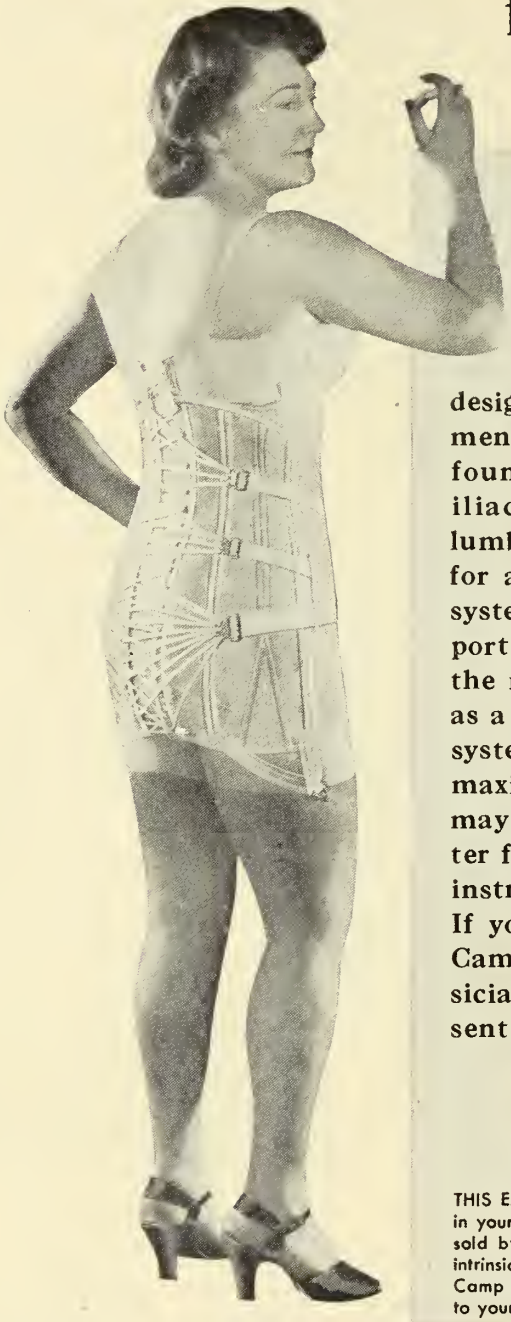
30-DAY TEST REVEALED

"Not one single case of throat irritation due to smoking Camels!"

Yes, that's what throat specialists reported after making weekly examinations of the throats of hundreds of men and women from coast to coast who smoked Camels, and only Camels, for 30 consecutive days.

R. J. Reynolds Tobacco Co., Winston-Salem, N. C.



According to a Nationwide survey:

More Doctors smoke Camels than any other cigarette

When three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel!

CAMP ANATOMICAL SUPPORTS for ORTHOPEDIC CONDITIONS

Whether it be relief from lesser degrees of postural or occupational strain, or as an aid in treatment following injury or operation, the Camp group of scientifically designed orthopedic supports for men, women and children will be found "comprehensive." Sacroiliac, Lumbosacral and Dorsolumbar supports may be prescribed for all types of build. The Camp system of construction fits the support accurately and firmly about the major part of the bony pelvis as a base for support. The unique system of adjustment permits the maximum in comfort. Physicians may rely on the Camp-trained fitter for the precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

Authorized Service CAMP Scientific Supports

THIS EMBLEM is displayed only by reliable merchants in your community. Comp Scientific Supports are never sold by door-to-door canvassers. Prices are bosed on intrinsic value. Regular technical and ethicol training of Camp fitters insures precise ond conscientious attention to your recommendotions.

AN APPROACH TO THE DISTINCTION OF MEDICAL AND SURGICAL JAUNDICE

C. J. WATSON, M.D.
Minneapolis, Minnesota

IN PLANNING this presentation, I purposely selected a rather cautious title, because of the many dangers which are inherent in this problem and of which I am sure most physicians are quite well aware. Despite a long interest in the subject of jaundice and the advantage of having had considerable and varied clinical material at the University hospitals, I would be the first to admit that the differential diagnosis of jaundice is by no means a closed chapter. In fact, it is being continually rewritten, and I have no doubt that important additions will be made in the not distant future.

As any physician must, I shall commence at the bedside with the history and physical examination. I shall not consider either of these areas exhaustively but only certain points that I believe need special emphasis. The history of pain, even of typical biliary colic, should not induce one to conclude too readily that there is a common duct stone. As have others, we have repeatedly encountered such attacks in cases of cirrhosis, less often in hepatitis, and still less frequently in patients with primary carcinoma of the common duct or ampulla. Distinct chills point rather clearly toward common duct stones, especially if accompanied by spiking fever. They may be met with, however, in cases of carcinoma of the ampulla or common duct with associated cholangitis, and they are observed at times in infectious hepatitis, but here they are largely limited to the pre-icteric or prodromal period, disappearing with the onset of jaundice.

One must, of course, give strict heed to any history of chemical exposure, especially to such substances as cinchophen or carbon tetrachloride, but in recent years a great deal of evidence has accumulated that the accidental transmission of the virus of homologous serum hepatitis, by means of parenteral therapy or even simple needle puncture, is a matter of no little moment to the whole problem of jaundice. The incubation period most often is between two to four months, although there are well-recognized exceptions on either side of this range. The possibility of homologous serum hepatitis must be seriously entertained in any individual who became jaundiced approximately three months after a procedure has been carried out which involved needle puncture. There is sufficient reason to believe that the virus may be transmitted by such simple means as needle puncture for blood cell counting or micro blood-sugar determinations, so that it behooves all of us to pay more attention to sterilization of our equipment.

I shall consider only a few points in the physical examination that I believe need additional emphasis. The first of these is the so-called foetor hepaticus, liver breath, or amine odor. The exact nature of this curious odor is still unknown. Its presence strongly suggests a diffuse parenchymal liver disease or medical jaundice, especially when it is outspoken and pervading the patient's

Presented before the Minneapolis Surgical Society, April 7, 1949.

room. Even milder degrees, noticeable only during the close examination of the patient, are usually related to parenchymal jaundice rather than extrahepatic biliary obstruction. No one has been

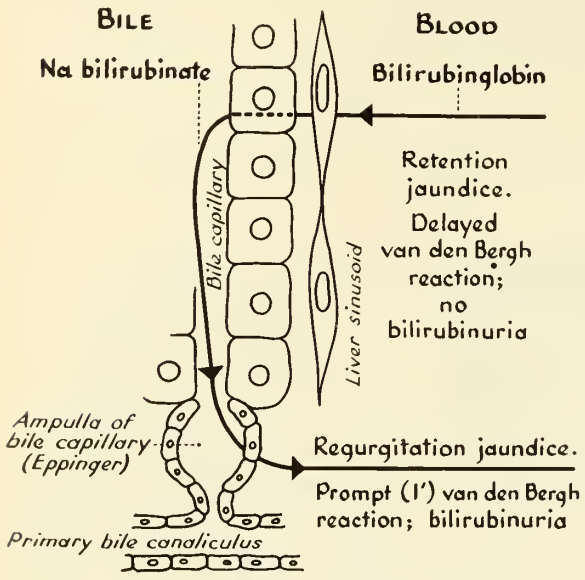

Fig. 1. Schematic drawing of pathological physiology of jaundice.

able to describe the odor with any precision, and some recognize it much more easily than others. It is ominous but not necessarily fatal in its significance.

The presence of multiple and especially of large spider nevi over the neck, shoulders, arms, hands, and upper thorax constitutes a physical finding which points clearly toward medical rather than surgical jaundice. These may appear with an acute hepatic injury and disappear with healing.

Most physicians are well aware, I am sure, that if the liver is demonstrably small or not significantly enlarged in the presence of marked jaundice, especially if the latter has been present for several weeks or longer, the cause is more likely to be a diffuse parenchymal disorder. It is perhaps less often appreciated that a markedly enlarged liver is not too uncommon in both hepatitis and cirrhosis as well as certain types of injury associated with fatty metamorphosis, so that increased size or even tenderness is of relatively little help in the differential diagnosis of jaundice. The most important physical sign of all is one that is too frequently overlooked, namely, that of the palpable, smooth, non-tender, distended gall bladder, a sign which is almost pathognomonic of carcinoma of the pancreas or main bile ducts. This is often referred to as Courvoisier's sign, but wrongly so, since Courvoisier was a pathologist and his statements[2] in this direction related only to the incidence of atrophic or shrunken gall bladders in cases of common duct stone, and of distended gall bladder in cases of cancer of the pancreas or bile duct. He called attention to the relative frequency of these two phenomena but did not offer his observations as a law nor describe a clinical sign. In this connection it should be emphasized that a markedly distended gall bladder may not be palpated at times, as in some instances it is well hidden below the right lobe of the liver and does not present against the abdominal wall. Thus the sign is of importance only when positive, but then it is of the greatest importance and should not be neglected. The distended gall bladder of this type is often visible as well as palpable, sometimes, in fact, being better seen than felt.

Splenic enlargement in a case of jaundice greatly favors a medical rather than a surgical type, but there are some exceptions, notably strictures of the common duct or common duct stones of long standing with secondary biliary obstructive cirrhosis.

The presence of melanosis of the skin in addition to jaundice is always suggestive of cirrhosis. This is frequently associated with a loss of axillary hair, and it is of some importance that cirrhosis of the liver is distinctly more common in relatively hairless individuals.

We may turn now to a brief consideration of the pathological physiology of jaundice with particular relation to laboratory diagnosis. This has been considered in more detail elsewhere.[10,14] The schematic drawing shown in Figure 1* is a somewhat oversimplified plan, embodying concepts for which the majority of available evidence speaks, and based in part upon the fundamental classification of jaundice provided some years ago by Rich.[8] In Figure 1 it is seen that a bilirubin protein complex is brought to the liver in the blood stream. As indicated in the figure, the protein to which this bilirubin is attached is probably the original globin of the hemoglobin molecule. This bilirubin complex has come directly from destroyed hemoglobin, either from old red

*Permission to publish this figure granted by Grune and Stratton, Inc., New York. C. J. Watson: Some newer concepts of the natural derivatives of hemoglobin. Blood, The Journal of Hematology, 1:99, 1946.

blood cells which are undergoing destruction every day in the reticuloendothelial system generally, or under pathological circumstances, from such areas as extravasations of blood or pulmonary infarcts. The formation of bilirubin is also increased, of course, whenever there is an increase in the rate of blood destruction, as in hemolytic anemias. In such instances the heightened bilirubin production is often mainly in the spleen.

Retention jaundice may be defined as an abnormal accumulation of the bilirubin protein complex in the blood—in other words, an hepatocellular inability to clear the blood of this substance. This type of bilirubin is characterized by a delayed or indirect van den Bergh reaction and by a failure of bilirubin to appear in the urine. Under normal circumstances bilirubin is excreted almost completely into the bile, the normal concentration in the plasma probably not exceeding 1.0 mg. per 100 c.c. In the process of excretion into the bile the combination with protein is broken. Bilirubin in the bile is in all likelihood a sodium salt. The majority of evidence indicates that bile containing this sodium bilirubinate may gain access to the blood either because of increased intrabiliary pressure or because of injury of the finer intrahepatic biliary radicals or cholangioles. This abnormal transit of bile into the blood is synonymous with regurgitation jaundice. The sodium bilirubinate in the blood is characterized by a prompt van den Bergh reaction. This substance readily passes into the urine. The prompt van den Bergh reaction is best defined as that which occurs within the first minute.[10] Thus, regurgitation jaundice is characterized by a prompt van den Bergh reaction and bilirubinuria. There is considerable evidence that the weakest point in the intrahepatic biliary tract—that from which the regurgitation under the circumstances mentioned is most likely to occur—is the ampulla of the bile capillary. Interestingly enough, Aschoff[1] spoke of this as the "Achilles heel" of the biliary tract. Studies by Eppinger[3] and by Ohno[7] and his associates bear out this concept. There is considerable evidence that the regurgitated bile first gains access to the lymph spaces and thence via the thoracic duct, or in part directly, to the blood.

While Rich's fundamental subdivision of jaundice into the two main forms, retention and regurgitation, is of considerable value as a primary method, it is insufficient from the practical standpoint of distinguishing medical and surgical jaundice, as may be seen in Table I. This has been discussed elsewhere.[11]

TABLE I. THE MAIN FORMS OF JAUNDICE FROM FUNDAMENTAL AND PRACTICAL STANDPOINTS

Retention jaundice—hepatocellular inability to remove bilirubinglobin from the blood. Hemolytic jaundice Constitutional hepatic dysfunction Mild hepatocellular injury	Medical
Regurgitation jaundice—cholangiolar leakage of bile to lymph and thence to blood. Infectious hepatitis Moderate or severe hepatic injury of various causes Hepatic cirrhosis Diffuse hepatic carcinomatosis, Hodgkin's disease, or lymphoblastoma	Medical
Extrahepatic biliary obstruction due to: Cancer and related conditions Calculus Stricture And with or without a secondary, obstructive biliary cirrhosis.	Surgical

It is noted in Table I that all of the types of retention jaundice are medical (except for the question of splenectomy in cases of hemolytic jaundice). It is also noted that there are many examples of medical jaundice in the regurgitation group, and this should be emphasized because it has often been thought that if the van den Bergh reaction on the blood serum is of prompt direct type and there is bilirubin in the urine, the patient is suffering from an extrahepatic biliary obstruction which requires surgical treatment. As a matter of fact there are fully as many and probably more cases of medical regurgitation jaundice. It should also be noted that all of the types of regurgitation jaundice listed are undoubtedly associated with some degree of retention jaundice, generally more with the medical and less with the surgical types.

Although I have been discussing the pathologic physiology and biochemistry of jaundice, we may still consider ourselves to be at the bedside since there are two simple laboratory tests which may be thought of as bedside tests. Both are procedures which the practicing physician can carry out in the home since they require but little equipment, and this is such that it can easily be carried in the physicians' bag; and what is fully as important, they require but little time for execution. The first is the simple test for bilirubin in the urine. The method which we prefer is the barium strip modification of Harrison's test.[12] The barium impregnated strip is held briefly in the urine sample to be tested. The urine runs up the strip by capillary attraction, and at the surface of the

urine any bilirubin which may be present is concentrated. One then drops upon this surface area one or two drops of Fouchet's reagent, and a green color appears if bilirubin is present. The finding

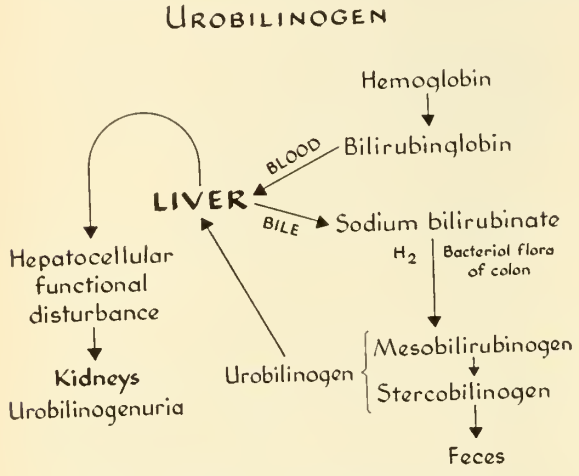

Fig. 2. Summary of urobilinogen physiology.

of bilirubin in the urine at once classifies the case in the regurgitation jaundice group but, as seen in Table I, it does not distinguish medical from surgical jaundice. It simply narrows the field.

The other bedside chemical test is the urine Ehrlich reaction to which urobilinogen is the main but not the sole contributor.[9,10,13,15] A brief summary of urobilinogen physiology is given in Figure 2.† Here it is seen that the sodium bilirubinate, to which we have already referred, is reduced in the colon to two chromogens, the composite of which is designated as urobilinogen. It is further seen that this urobilinogen is partly reabsorbed into the portal circulation returning to the liver. Under normal circumstances little or none of this reabsorbed fraction enters the general circulation, but, in most instances of hepatocellular functional disturbance, even though transitory, variable fractions are permitted to enter the general circulation and are excreted in the urine. In considering Figure 2, it may be noted that the feces Ehrlich determination,[13] or the determination of milligrams of urobilinogen per day in the feces,[9] which is preferable but is much more time consuming and difficult, gives an insight as to the interference in the outflow of bile from the liver. If there is complete biliary obstruction, as in cases of cancer of the pancreas, little or no urobilinogen is found in the feces. In cases of retention jaundice, the feces urobilinogen determination is of value because it serves to distinguish hemolytic jaundice in which the amount is significantly and often markedly increased.

The colorimetry of the urine Ehrlich reaction has been described in detail elsewhere[13,15] but may be summarized in Table II.

It will be noted in Table II that a urine sample collected from 2:00 to 4:00 p.m. is preferred. This is because of the fact that if an excessive amount of urobilinogen appears in the urine during a twenty-four-hour period, it is more likely to be observed in the afternoon, probably because of metabolic activity. The actual colorimetry which is referred to in Table II is of value in eliminating the personal equation in gauging the intensity of the color reaction and also for purposes of serial determination over a period of time. Further than this, if a short period sample covering a two-hour interval is employed, the factors of dilution and concentration are largely obviated. Nevertheless, a single observer, as for example a practicing physician, who cares to employ the simple qualitative test (line 1 in Table II) will be able to gain considerable information from it, especially if serial samples are employed. If the same individual is looking at the reactions, he is able to gauge fairly well the changes in intensity which may occur, and he can often draw valuable conclusions from these changes.

While it is true that the barium strip test for bilirubin in the urine and the urine Ehrlich reaction often, and in fact usually, do not permit a

TABLE II. COLORIMETRY OF URINE EHRLICH REACTION

2.5 c.c. of a urine sample (preferably the total amount obtained between 2 to 4 p.m. + 2.5 c.c. Ehrlich's reagent + 5 c.c. saturated aqueous sodium acetate solution.
2.5 c.c. of urine + 5 c.c. saturated aqueous sodium acetate solution + 2.5 c.c. Ehrlich's reagent. (This is the blank.)
Comparator block (pontacyl standard) or photoelectric colorimeter.
1 Ehrlich unit=color intensity of 1 mg. urobilinogen per 100 c.c.

TABLE III. SOME CHARACTERISTIC PATTERNS OF URINE EHRLICH AND BARIUM STRIP TESTS IN CASES OF JAUNDICE

	Urine Ehrlich	Urine Bilirubin	Type of Jaundice
1.	0	++++	Regurgitation jaundice; may be either medical or surgical. Little or no bile entering intestine.
2.	++++	0	Retention jaundice or liver disease without jaundice. Often noted in hemolytic jaundice; also in hepatic cirrhosis.
3.	++++	++++	Regurgitation jaundice; more likely medical, either hepatitis or cirrhosis.

†Permission to publish this figure granted by Annals of Internal Medicine. C. J. Watson and F. W. Hoffbauer: Liver function in hepatitis. Annals of Internal Medicine, 26:813, 1947.

definite diagnosis by themselves, they are nevertheless of considerable help in getting the examiner on the right track, when combined with the history and physical examination. What I mean by this is perhaps best indicated in Table III. This has been discussed in a previous communication.[11]

There is little doubt that one can often gain more exact information if the per diem urobilinogen excretion in urine and feces can be determined. The characteristic ranges are shown in Table IV.[11]

Unfortunately there are many cases of jaundice in which, despite a careful history, physical examination and the use of simple laboratory tests, the enigma persists and the question of medical or surgical jaundice has not been answered. If one would avoid a needless operation which may even prove to be the fatal straw in the case of severe parenchymal hepatic disease, or if one would not overlook a silent common-duct stone or a carcinoma that may be operable, it is necessary in such instances to turn to the laboratory for additional aid. Although I have not kept any exact records on the point, I am inclined to believe that 60 to 70 per cent of all cases of jaundice may be diagnosed at the bedside without the aid of any special laboratory methods. The use of the latter probably increases one's efficiency to from 85 to 90 per cent.

One has had to recognize in studying liver function clinically, and especially with respect to difficult problems of jaundice, that it is necessary to make a composite study rather than to pin one's faith on but one or even two so-called liver function tests. For some time we have used rather routinely and with considerable satisfaction, two liver function schedules: No. 1 for the non-jaundiced, and No. 2 for the jaundiced patient.[14] The No. 1 schedule includes the fractional serum bilirubin, the barium strip test for bilirubin in the urine, the thymol turbidity test (which probably relates in the main to increases of lipo-β-globulin),

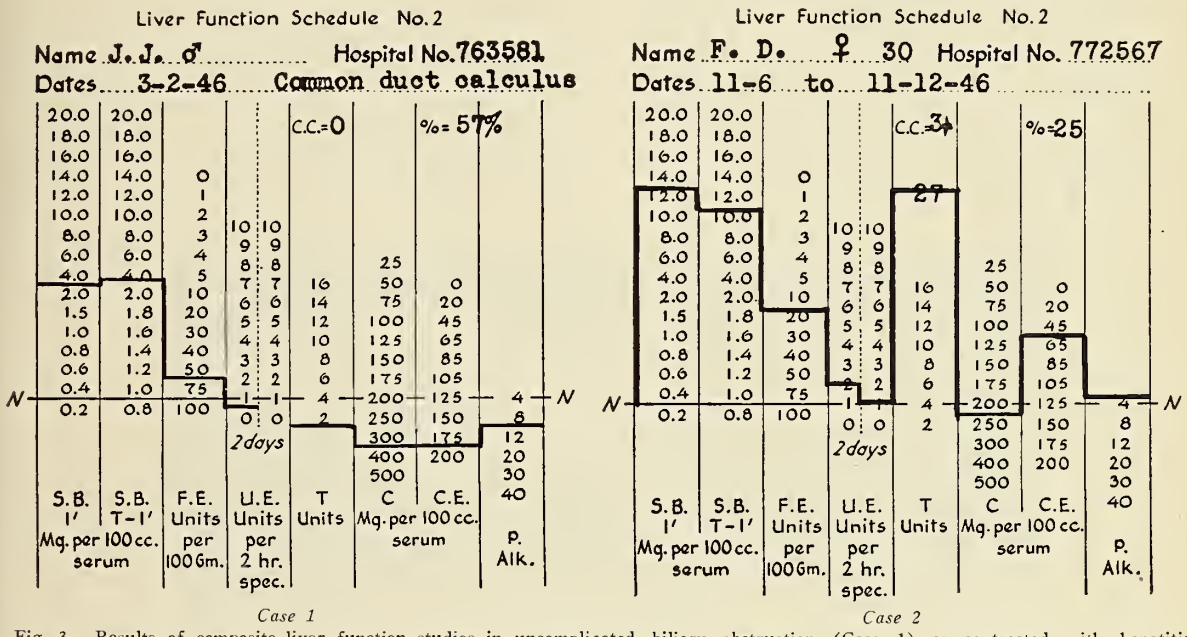

Fig. 3. Results of composite liver function studies in uncomplicated biliary obstruction (Case 1) as contrasted with hepatitis (Case 2).

TABLE IV. UROBILINOGEN EXCRETION

Type of Jaundice	Feces	Urine
Retention:		
Hemolytic jaundice	Markedly increased	Normal to greatly increased
Constitutional hepatic dysfunction	Normal	Normal or slightly increased
Regurgitation:		
Biliary tract cancer	$<$5 mg. per day in 90% of cases	$<$0.3 mg. in 90% of cases
Calculous	$>$5 mg. per day in 90% of cases	Normal to greatly increased (with complications)
Parenchymal (hepatitis, cirrhosis, or other diffuse liver disease)	Majority of cases $>$5 mg. per day. Some have less for several days or weeks at height of disease. Feces-urine ratio important: Ex. { 10 mg. 5.0 mg. / 600 mg. 500 mg.	0-300 mg. Depends largely on stage of disease.

the Hanger cephalin cholesterol flocculation test (which relates mainly to abnormalities of the serum albumin and increases of γ-globulin), and the bromsulfalein retention in per cent at forty-five minutes after intravenous administration of 5 mg. of the dye per kilogram. In addition, the urine Ehrlich reaction (Table II) is determined on two successive days. If not significantly increased, the urine urobilinogen in milligrams is determined on a twenty-four-hour sample, and on this sample the urinary coproporphyrin is also determined. Schedule No. 2, with which we are more particularly concerned in the distinction of medical and surgical jaundice, omits the bromsulfalein test and the urinary coproporphyrin and includes the serum total cholesterol and cholesterol esters, and the serum alkaline phosphatase. This schedule is shown in Figure 3, with the data from illustrative cases. The horizontal line between the N's represents the usual normal or upper limit of normal for the various determinations. The values above this line indicate functional impairment, especially of hepatocellular type. The cephalin cholesterol flocculation test is indicated and recorded simply as 0 to 4-plus at the top of the thymol turbidity column. The key for the various determinations is seen at the bottom of the figure.

The findings for Case 1 in Figure 3 may be said to characterize a surgical jaundice, in other words, a pure cholangiolar functional impairment with little or no evidence of hepatocellular injury. By contrast one may note the findings in Case 2 (Fig. 3). This is a profile from a case of homologous serum jaundice. It was of interest that this patient, a housewife, aged thirty, had had a cholecystectomy about four months previously. This was followed by a wound abscess, at which time the patient was given three blood transfusions. She then appeared to recover and felt quite well for a period of three months. At the end of this time she became jaundiced without pain or fever, and after several weeks of jaundice was referred to the University Hospital in the belief that she might require an operation to remove a common duct stone. The composite liver function study, however, clearly revealed extensive diffuse hepatic functional impairment. As noted in Figure 3,** the liver profile of Case 2 indicates marked regurgitation jaundice with almost complete exclusion of bile from the intestine, a severe disturbance of the plasma proteins, thymol turbidity greatly elevated, and a positive cephalin cholesterol test, little or no elevation of the total cholesterol in spite of marked evidence of regurgitation jaundice, and a low cholesterol ester percentage, also a low normal alkaline phosphatase (this should be considerably elevated if jaundice of this degree were due to simple biliary obstruction such as a common duct stone). A liver biopsy was done which showed a rather marked diffuse hepatitis and cirrhosis, clearly not the type of change that one would expect with an extrahepatic biliary obstruction. As a consequence of these findings an operation was avoided. With supportive treatment the patient improved considerably, although it seems unlikely that the liver will ever return completely to normal.

Hoffbauer, Frame, and Meinert[4] have recently analyzed the experience in this laboratory with the non-pigment group of determinations included in schedule No. 2 (Fig. 3). This study, which was limited to proven cases of medical or surgical jaundice, clearly reveals the relative value of the cephalin cholesterol flocculation, the thymol turbidity, the total cholesterol, cholesterol ester percentage and alkaline phosphatase determination, and of certain combinations of these procedures. I shall not consider their results in any detail, as anyone who is interested may study them in the original. It is sufficient to say that the total cholesterol and cholesterol ester ratio and the alkaline phosphatase were about of equal value in the distinction, each of the three showing considerable overlapping—in other words, results contradictory to the proven diagnosis. The cephalin cholesterol flocculation was the most reliable, exhibiting the least positivity in surgical jaundice and the greatest in medical jaundice. The results of the thymol turbidity test approximated those of the cephalin cholesterol flocculation, but it was of particular interest that the combination of the two tests was most reliable of all. In seventy-seven cases of proven extrahepatic biliary obstruction, in other words of surgical jaundice, only one had both tests positive. Nevertheless, there were a considerable number of cases of parenchymal jaundice in which one or both tests were negative. Recent work indicates that the zinc turbidity test of Kunkel[5] is less likely to exhibit "false" negatives in this group.

MELORHEOSTOSIS

A Case With Monomelic Distribution

GEORGE S. BOYER, M.D., and H. MILTON BERG, M.D.
Bismarck, North Dakota

MELORHEOSTOSIS is a rather rare form of osteosclerosis in that the bone changes in the involved area present a hyperostosis of a flowing type. In 1922, Leri and Joanny[22] reported the first case. They named it melorheostosis (Greek: *melos*—member, *rhoia*—to flow, and *os*—bone) because the hyperostosis appeared to flow down the bones as molten wax running down the sides of a candle. Although the term melorheostosis is most generally used, some authors have applied various names to describe the condition: Leri's disease,[49] rheostosis,[48] osteosis eburnisans monomilica,[34,40] osteopathia hyperostatica congenita unius membri,[49] rhizomonomelorheostosis,[49] monomelic flowing hyperostosis,[35] and others.

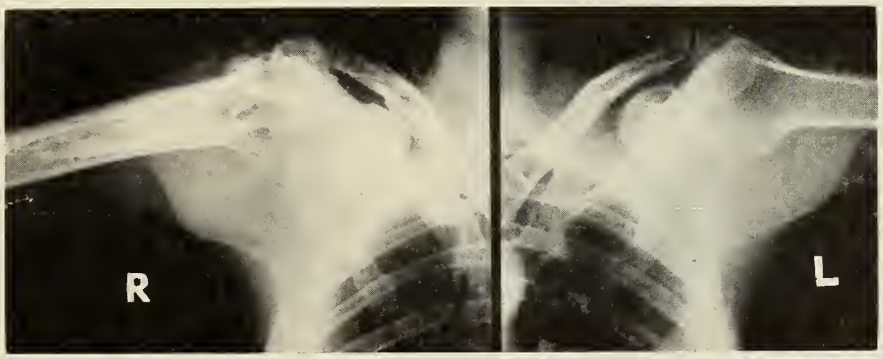

Fig. 1. The acromion process, coracoid process, and neck of the right humerus show areas of irregular, trabeculated hyperostosis with normal density between them. The neck of the scapula is normal. The upper end and head of the humerus show areas of increased and decreased density with trabeculae and bands of subperiosteal hyperostosis traversing the shaft of the bone in linear, wavy lines distally.

Case Report

H. H., a sixty-one-year-old married white male farmer, was seen at the Clinic on February 11, 1946, complaining of pain in the abdomen after eating. The pain, which was mild, had been noticed for several months and was not aggravated by fried or fatty foods, cabbage or cole-slaw. On physical examination the patient appeared well nourished and well developed. The positive findings revealed slight tenderness over the epigastrium, severe varicose veins of both legs, with associated areas of skin discoloration above the ankles. Cholecystography revealed a non-functioning, pathological gall bladder for which operation was advised. The test meal showed normal values. Roentgenological examination of the stomach and the colon was negative. X-ray examination of the chest showed some hypertrophy and enlargement of the left ventricle. Lung fields appeared clear. Atypical osteosclerotic changes were observed in the upper end of the right humerus and scapula. The patient had never complained of his right arm and the family history was essentially negative. Examination and measurement of the patient's arms showed no difference in size or length. No limitation of joint movement or elicitation of rheumatic pain was found.

Roentgenological Findings.—Further roentgenological studies of the right shoulder, arm, forearm and hand were therefore taken and, as shown in Figures 1, 2 and 3, revealed a flowing type of osteosclerosis extending from the right scapula, along the anterior and lateral aspects of the humerus, radius, navicular, greater and lesser multangular, first metacarpal and all the phalanges of the right first digit. The acromion process, coracoid process, and neck of the right humerus showed areas of irregular, trabeculated hyperostosis with normal density between them. The neck of the scapula was normal. The upper end and head of the humerus showed areas of increased and decreased density with trabeculae and bands of subperiosteal hyperostosis traversing the shaft of the bone in linear, wavy lines. These smaller bands tended to unite in the upper third of the anterior and lateral aspect of the humerus and flow down the shaft to the supracondylar area. In many places the medullary cavity was encroached upon by the osteosclerotic condensations. Along the humeral shaft, irregular punched-out areas occurred in the region of hyperostosis. There was considerable cortical thickening in the mid-humeral shaft. These proliferative changes ended abruptly just above the lateral epicondyle, and the

From the Department of Radiology, Quain and Ramstad Clinic, Bismarck, North Dakota, and the Department of Radiology, University of Minnesota Medical School, Minneapolis, Minnesota.

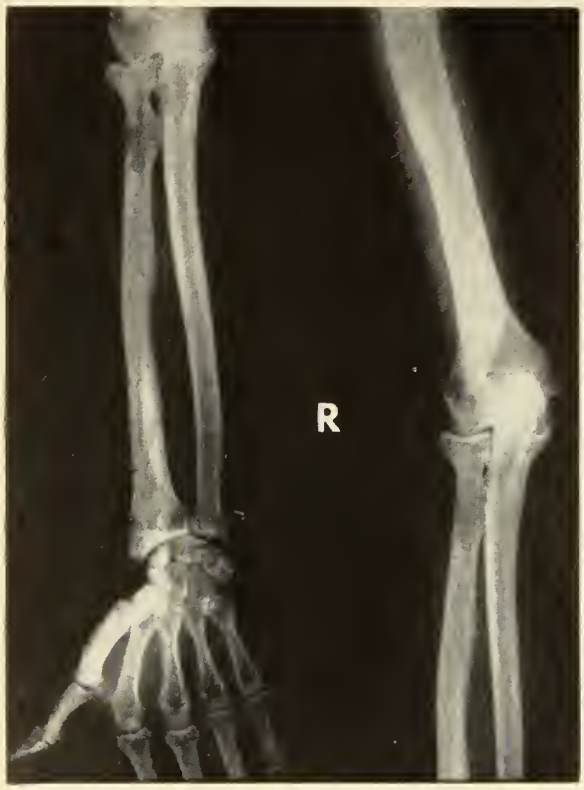

Fig. 2. Small bands of hyperostosis tend to unite in the upper third of the humerus on the anterior and lateral aspect of the shaft and flow down the shaft to the lateral supracondylar area. The elbow joint and periarticular structures are free of the pathology. There is considerable cortical thickening in the mid-humeral shaft with concomitant encroachment upon the adjacent medullary cavity. Similar changes are seen to involve the entire length of the right radius. A rather dense plate of bony hyperplasia is shown in the distal end of the radius just under the articular cartilage. No changes are observed in the right ulna.

elbow joint and periarticular structures were free of any pathologic condition. Similar osteosclerosis was observed in the entire length of the right radius. No changes were observed in the right ulna. A rather dense plate of bony hyperplasia was noted in the distal end of the radius just under the articular cartilage. Moth-eaten but osteosclerotic navicular, greater and lesser multangular bones were seen. The entire shaft of the first metacarpal and phalanges of the first digit were involved with an increase in diameter of the distal phalanx. No joint involvement or calcification in the adjacent soft parts was seen. A diagnosis of melorheostosis with monomelic distribution was made. Distribution of the osteosclerosis is shown in the sketch in Figure 4. Roentgenographic re-examination six months later showed no changes in the involved extremity. Roentgenographic examination of the skull, spine, pelvis, left shoulder, arm and forearm, and lower extremities did not reveal any pathologic process in these areas.

Laboratory Findings.—Blood studies, urinalysis, blood chemistry including calcium, phosphorus, serum phosphatase, plasma proteins, urea nitrogen, serology, sputum, and electrocardiographic tracings were within normal limits. A biopsy of bone was not obtained.

Fig. 3. The hyperostosis involves the navicular, greater and lesser multangular bones of the wrist, the entire shaft of the first metacarpal and the phalanges of the first digit of the right hand. The left hand and wrist are shown for comparison.

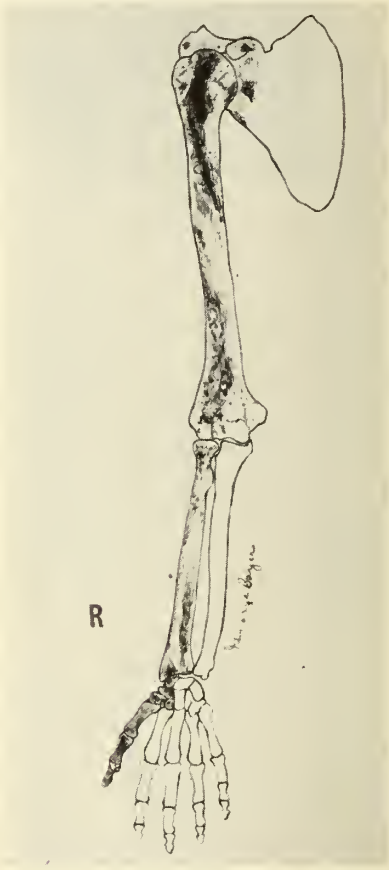

Fig. 4. A drawing showing the distribution of the hyperostotic lesions in the right upper extremity of the case herein reported.

This patient made an uneventful recovery following his cholecystectomy and returned to his farm, where he has been actively engaged since. He has been seen twice since then and re-examined because of the presence of melorheostosis. During this period of observation no

changes in the extent of the osteosclerosis or demonstration of weakness, pain or atrophy of the involved arm have been noted.

Review of the Literature

In 1921, Leri and Joanny[22] described, named and reported the first case in a thirty-nine-year-old woman with a bony deformity of her left hand.

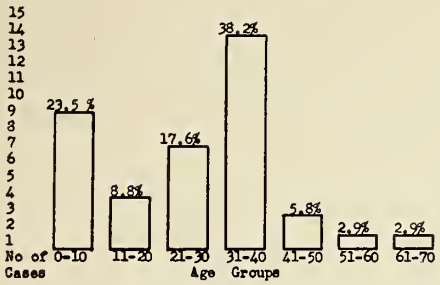

Fig. 5. Distribution of thirty-four cases of melorheostosis by age. Thirteen other cases have been reported or have appeared in the literature, for which the original articles have not been available to the authors or for which the abstracts do not give the age.

In the next ten years a total of fifteen cases were reported.[16,17,18,26,28,29,30,34,36,39,40,41, 46,47,52]

Four cases were reported in 1932,[42,48] and Kraft,[20] in an excellent paper, added two cases of his own to the literature and summarized, in tabular form, all the previously reported cases of melorheostosis. At the Bone Tumor Conference in 1932 at Johns Hopkins University, Parmalee presented a case of melorheostosis which was not published, but was referred to in a published paper on this subject by Widmann and Stecher in 1935.[49]

During 1933 five more cases were reported.[20,35,43,51] In Kraft's second paper,[21] on the pathology of this disease, he refers to a personal communication with Dr. Sussman regarding a case which the latter had seen diagnosed as marble bones. Reference is also made in this report to a case of melorheostosis seen in St. Louis, Missouri, by Sherwood Moore. Neither of the above cases has been published. Kraft[20] refers to and reports on a case in a man seen by Sante in 1923. Bury[4] refers to Sante's case in his report also.

From 1934 to 1940, twelve new cases were reported.[1,3,4,7,8,9,11,13,14,37,44,49] Two of these cases were associated with scleroderma.[8,14]

Kibby[19] in 1941 reported the youngest case found in the literature. His case occurred in a five-year-old Japanese girl. In 1942, Franklin and Matheson[10] reported a case and reviewed the literature. Carpenter, Baker and Outland[6] reported a case with bilateral involvement and also referred to a case seen at Johns Hopkins Hospital and another at Boston City Hospital. However, these last two cases have not been reported in the literature.

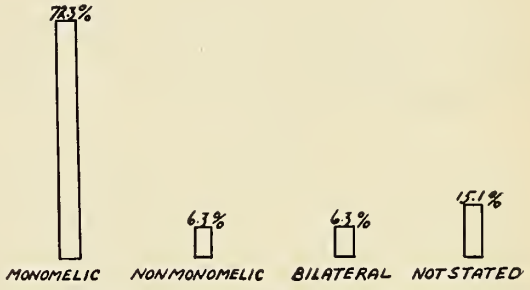

Fig. 6. Distribution of lesions in forty-seven cases of melorheostosis.

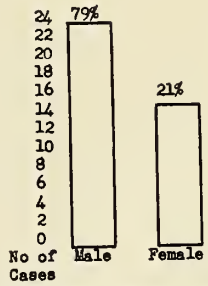

Fig. 7. Distribution of thirty-seven cases of melorheostosis by sex. Ten other cases have been reported or have appeared in the literature, for which the original articles have not been available to the authors or for which the abstracts do not give the sex.

LeVay,[27] Gottlieb,[12] Stutz[45] and Bade[2] reported additional cases. Canigioni[5] discussed the disease and Muller-Alberti[50] published a paper on the clinical aspects, etiology and pathogenesis of melorheostosis.

A total of forty-six cases are known which, together with this case, makes a total of forty-seven to date.* Kibby[19] reported the youngest patient, aged five; one patient was observed for fourteen years. The average age, in those patients whose age is known, is twenty-eight years. The most frequent age period is thirty to forty years, as shown in Figure 5. Thirty-four cases were monomelic, five non-monomelic, and eight not stated, as shown in Figure 6. Three patients

*Since this paper has been in the process of publication, Sear[43a] has reported a case of melorheostosis associated with leontiasis in which the melorheostosis involved the right side of the body of the eleventh thoracic vertebra and the corresponding rib. Fejer[9a] reported the forty-ninth case in 1948.

showed bilateral involvement. The upper limb was involved nineteen times, the lower limb twenty times. In several cases the involvement was not stated. The case of Stutz[45] involved only the pelvis. In twenty-three cases males were affected; females in fourteen; sex was not stated in ten cases, as shown in Figure 7. Biopsies have been done in only six cases. No autopsies have been reported. Countries where cases have been found, in the order of frequency, are the United States, Germany, Italy, France, England, Sweden, Poland, Russia and Switzerland.

Etiology

Although the exact cause of melorheostosis is unknown, many theories have been advanced to explain the etiological factors which produce the disease. Leri,[22] who believed that an infectious agent was causative, was unable, after repeated attempts, to isolate one. Putti[40] thought that a primary imbalance of local sympathetic nerves caused a secondary vascular angiospasm and later obliterative effects along the course of nutrient vessels. Hyperostotic changes along the affected vessels resulted. Other men adhered to a neuropathic theory, but were unable to prove it because exact neural pathways were not established. Endocrine imbalance, heredity, body fluid imbalance and constitutional states have all had their advocates, but cannot be proven. Tuberculosis, syphilis, malignancy and other disease processes have been ruled out. Zimmer[52] has many adherents for his theory of metameric disturbance in the embryo. Widmann and Stecher adhere to Zimmer's concept and, in reporting their case, make note of the fact that a bony deformity was present at birth. A newer idea has been advanced by Moore and DeLorimier.[35] They believe that, in the embryo or later, subperiosteal telangiectasis develops and causes local petechial hemorrhages in the bone. Secondary vascular obliterative changes follow resulting in further telangiectasis. The osteosclerosis represents a reaction to the vascular changes and hemorrhage.

The further study of these and other cases to be found may aid in solving this mystery.

Pathology

Very little is known of the pathology, either gross or microscopic, of this disease. Only six cases have had a biopsy study and no cases have been reported to have come to the autopsy table.

In general, the bones of one limb (monomelic) are involved, with linear bands of hyperostosis extending from the shoulder to the distal phalanges of the hand or from the pelvis to the toes of one leg. In the lower leg and forearm usually only one of the bones is involved, and in the hands and feet the disease is usually limited to one side.

Grossly, the essential findings in involved bones consist of dense bands of sclerotic new bone. The new bone may be endosteal, periosteal or both. Areas of normal bone supervene. Periosteal hyperostosis may cause increased thickening of the cortex and subsequent increase in the width of the bone. Rough, irregular contour of bones results. Widmann and Stecher believe that endosteal sclerosis is found in early developing lesions. Bowing of an affected femur was explained by Moore and DeLorimier as an impingement on muscle origins or insertions by the hyperostosis. This altered the muscle contraction and physiological cross section. They explain the clinical findings of progressive muscular weakness on this surmise. Several orthopedic surgeons have encountered bones diseased by this entity and have described them as very hard and sclerotic in most instances. The tendency of the hyperostotic bands is to spare joints, although in some cases severe involvement of adjacent bones or calcifications in periarticular structures leads to diminution of joint mobility. Many bones are shortened by the disease, and this is borne out by the number of cases of shortened arms, legs and pelvic obliquities. Leri and Joanny's patient, when examined several years later, revealed calcifications in the periarticular structures of the right shoulder joint. No cases have been reported in which there have been spontaneous fractures.

The association of melorheostosis with other conditions has been rare and probably of no significance. In several cases there has been a positive serology. In Hall's case there was an associated tuberose sclerosis. Scleroderma was found in the involved limb in the cases of Dillehunt and Chuinard, and Gillespie and Siegling.

Histology

Little has been written concerning the microscopic findings, since there has been a biopsy in only six cases. In Leri's case a primitive bone marrow was described together with interspersed islands of cartilage between crowded, irregular abnormal osseous lamellae and haversian canals.

Some writers have found a similar bone marrow. Others describe a dense ivory-like growth of bone with meager cellular structure. Junghagen believed the finding of concentric lamellae around the haversian canals pointed to an important clue in arriving at a diagnosis. Medullary encroachment by the hyperostotic bone was found in several cases. There was a tendency toward replacement of the fatty bone marrow by fibrosis. In general, the microscopic picture is so bizarre that no one could make a specific diagnosis of this disease from a biopsy study alone. The lesions are benign and have not shown any tendency toward malignancy in those few cases studied.

Clinical Findings

This discease is insidious in onset, chronic in nature with periods of arrest lasting many years in some cases, and presents, in general, bizarre or vague symptoms. In most cases the bones of one extremity are involved—monomelic. Prognosis is good. Physical findings do not point to any symptom complex which one could say was pathognomonic of melorheostosis. Bony deformity has been noted at birth in several cases. Mild and vague pain in involved limbs was usually noted, and it is amenable to physiologic rest. In patients with limp and weakness of a limb due to pelvic deformity, orthopedic procedures were of value. Stasis of blood vessels in affected parts, secondary to the encroachment of hyperostotic bone, results in edema, skin changes, and to ulcerations of the skin.[10]

Usually the patient has such minimal complaints that medical advice is not sought. As the disease slowly advances, the symptoms become more annoying and of a continuous rather than intermittent nature. Some patients, with shortening of limbs, atrophy of soft tissues or gait disturbance, seek medical advice and are diagnosed on roentgenological study. Few cases have been diagnosed without the aid of the roentgen film.

The first vague symptoms of low-grade pain or slight deviation of the involved fingers or toes are usually found in childhood. Later in life the pain becomes more severe, the deformity increases or becomes disabling and soft tissue atrophy and shortening of the limb ensue. These symptoms are sporadic and may cease for long periods of time. Some patients never complain of anything. Ankylosis of the joints is rare and occurs only late.

Laboratory aids in diagnosis have been disappointing Blood chemistry studies, serology, urine, et cetera, have, in nearly every case, given normal values. Imbalance of blood calcium and phosphorus has not been noted. In the differential diagnosis, however, the laboratory findings are important in ruling out other conditions.

Roentgenologic Findings

There is a paucity of definite clinical findings in this malady, and its most characteristic finding is the vagueness of symptoms. For this reason an accurate diagnosis can be made only upon roentgenologic findings. Where this disease is found, the entire skeleton should be studied roentgenologically. The finding of melorheostosis, in the author's case, was an accidental finding since the patient had never complained of symptoms in his right arm. Examination, with roentgenologic study, done seven months later revealed no changes in the involved extremity.

In the majority of cases—monomelic—the essential finding is an extensive flowing hyperostosis which appears to extend in dense, wavy lines along one side and down the bones of the involved limb. The cortex appears dense, thickened and ivory hard. Areas of translucency may be present, especially near the joints. The joints are usually not affected. Medullary encroachment is seen somewhere in the bones of the diseased limb in nearly every case. Where the pelvis, skull or vertebrae are involved, the hyperostotic areas are usually patchy and poise more of a differential point. The new bone may cause the cortex to thicken up to 3 centimeters in the long bones. The bands of sclerotic bone do not always extend continuously along a bone, but commonly are broken up leaving areas of normal or atrophic bone between them. Where the forearm or lower leg are affected, usually only one of the double bones is involved. In general the epiphyseal structures are free of the sclerosis. Isolated patches of irregular hyperostosis most commonly are found near the bone ends adjacent to the flowing band of sclerosis. In many-faceted bones, as in the carpal or tarsal bones, the sclerosis tends to occur in opposing surfaces of two involved bones. In the most commonly seen cases, where an entire single limb is diseased, the radiographic picture is most characteristic, since the bands of sclerosis extend distally in nearly straight lines from the top to the bottom of the limb. In nearly every case

studied there appears to be a pattern of selective involvement. Punched-out areas and moth-eaten patches are seen involving the condyles of the long bones. In a few instances laminations of hyperostosis have been present parallel to the length of the shaft of the bone.

Calcification of the periarticular structures has been reported and is not uncommon in melorheostosis. Pathological fractures have not been reported.

Differential Diagnosis

In the majority of cases, where an entire extremity is involved, the typical roentgenologic findings, together with a careful history and physical examination, are all that is needed to make a correct diagnosis. This is especially true if the condition is present in the mind of the roentgenologist or attending physician. The vagueness of symptoms should prompt an x-ray examination and if, following this, osteosclerotic areas are found, one should proceed to examine the entire skeleton.

Since the condition is so chronic, one should rule out tuberculosis and luetic osteitis by history, serological and other proper laboratory tests. History will aid in ruling out infectious and post-traumatic ossifying periostitis. Soft tissue atrophy and shortening of the involved limb in many cases are commonly associated with the typical osteosclerotic changes in melorheostosis. Although calcification in periarticular structures does not occur in some cases of long standing melorheostosis, the concomitant osteosclerosis in adjacent bones should differentiate it from myositis ossificans and calcinosis. In calcinosis the calcium deposits are irregularly scattered in adjacent soft tissues and commonly are associated with trophic skin changes, or the calcium deposits may be extruded through the skin periodically.

The roentgenologic study and clinical findings of primary and secondary bone malignancy seldom present such a picture of a flowing hyperostosis. Piergrossi[39] thought that in studying melorheostosis one should always consider such atypical osteosclerosis as osteopoikilosis, Albers-Schönberg's disease, Paget's disease of the bone, chronic osteomyelitis and Garre's nonsuppurative sclerosing osteomyelitis. In osteopoikilosis or spotted bones the distribution is more general, is not limited to one side of a bone, and the lesions are made up of disseminated bone islands within the bone and are not expansive. Albers-Schönberg's type of osteosclerosis involves large or entire parts of the bony skeleton with universal encroachment upon the marrow cavities, generalized and not regional involvement, resulting in very brittle bones which usually fracture spontaneously, and severe anemia due to loss of bone marrow. If only a portion of an involved bone is seen, as the upper humerus in a routine chest film, one would have to consider Paget's disease of the bone as a good possibility. Upon further roentgenologic study, however, the picture of melorheostosis is so typical that one would have no difficulty. Chronic osteomyelitis shows no predilection for regional involvement, does not show osteosclerosis along one aspect of a diaphysis, and gives a different history and clinical findings. This is also true of Garre's nonsuppurative sclerosing osteomyelitis.

Treatment

Rational, definitive treatment is at present unknown, since an exact etiology is lacking in this condition. To date, symptomatic treatment for pain, edema and disability have been given. On the basis of the theory of Moore and DeLorimier[35] that this entity is caused by subperiosteal telangiectasis, Widmann and Stecher[49] and others have attempted roentgen radiation therapy on their cases. The results of this type of therapy have not been found in the literature. In several cases associated with concomitant scleroderma, massage was found to ameliorate the skin changes. In several cases where gait disturbances were present because of the severity of the osteosclerosis, orthopedic surgical procedures have been accomplished with favorable end results.

Summary

1. Melorheostosis is a rather rare type of osteosclerosis, tending to involve one extremity. Thirty-four cases were monomelic, five non-monomelic, and eight unknown. The youngest and oldest patients were five years and sixty-one years, respectively. Males were involved twenty-three times, females fourteen; sex was unknown in ten cases. The average age in patients whose ages were known was twenty-eight years, and the most frequent age period was thirty to forty years. Three patients showed bilateral involvement.

2. Including the authors' report, forty-nine cases have been reported in the literature or observed and referred to in published reports on the subject.

3. The case of a sixty-one-year-old man in whom the entire upper extremity showed involvement is here reported. This is the oldest patient found in the literature. No complaints relative to the disease were elicited upon study of the case.

4. A chronological review of the literature is given.

5. The exact etiology of the disease is unknown. However, a brief summary is given of the several theories advanced to substantiate various authors' concepts as to cause.

6. Gross pathological findings may include thickened bones, bones with irregular contour, bowed long bones, shortened extremities, atrophy of muscles in an involved limb, associated skin changes overlying the osteosclerosis, and impaired vascular efficiency. Gait disturbances result where severe sclerosis has caused impaired joint mobility. Bones encountered by orthopedic surgeons were described as hard and sclerotic. Pathological fractures have not been reported. Joints are rarely involved. The disease tends to involve an entire extremity.

7. In only six cases has there been biopsy study. No autopsy findings have been reported. The microscopic picture is bizarre and does not present a diagnostic picture.

8. The symptoms, in general, are vague, insidious, intermittent, or may be absent entirely as in the authors' case. Prognosis is good and the disease is benign. Physical findings do not point to any symptom complex pathognomonic of melorheostosis. Usually the patient complains of low-grade rheumatic pains in one limb with secondary loss of strength. In severe cases limitation of motion in a joint may develop. The deviation of an involved digit, even at birth, is commonly reported and should put one on his guard for this disease. Associated soft tissue atrophy and bony atrophy is very common. Laboratory findings to date have been negative, but are important in ruling out other conditions.

9. An accurate diagnosis can be made only upon roentgenological examination. The entire skeleton should be studied. A brief differential diagnosis is given.

10. No rational definitive treatment is known. Symptomatic relief has been employed. The results of roentgen ray therapy have not been evaluated.

MULTIPLE MYELOMA

A Review of Ninety-five Proven Cases With Seventy-five Autopsies

R. B. BREITENBUCHER, M.D., and A. J. HERTZOG, M.D.

Minneapolis, Minnesota

IN RECENT years there have been several extensive articles[1,2,4,5,6,8,9,11] covering the subject of multiple myeloma in its various clinical and hematological aspects. The following report is based on a study of ninety-five proven cases of multiple myeloma. Seventy-five of the cases represent autopsies. The diagnosis in the remaining cases was confirmed by sternal aspiration.

Age and Sex

Males predominated, there being seventy-one to twenty-four females. In spite of a higher incidence of men in autopsy cases as a whole, the disease appears to be considerably more common in men than in women. The age incidence is shown in Table I.

TABLE I.

Age	No. of Cases
31 to 40 years	7
42 to 50 years	14
51 to 60 years	27
61 to 70 years	36
71 to 80 years	11

Bence-Jones Protein

Bence-Jones protein was demonstrated in the urine of twenty-three of fifty-four cases (42 per cent). There appeared to be no relationship between the level of total plasma proteins and the presence or absence of Bence-Jones protein in the urine, as Bence-Jones protein was found in the urine of 40 per cent of nineteen cases with hyperproteinemia and in 33 per cent of twelve cases with normal total plasma proteins. Most of these results were based upon the demonstration of Bence-Jones protein in a single specimen of urine.

Plasma Proteins

In fifty cases in which the plasma proteins were studied, an elevation of the total proteins ranging from 8.4 to 15.3 grams per cent was found in thirty-two cases (64 per cent). Fractional protein studies in thirty of these cases showed hyperglobulinemia ranging from 3.9 to 12.5 grams per cent in twenty-five cases. Three cases showed a hyperalbuminemia of from 7.3 to 8.0 grams per cent.

From the University of Minnesota Teaching Service of Northwestern Hospital and the Department of Pathology of the University of Minnesota Medical School.

Present address of Dr. Hertzog is Touro Infirmary, New Orleans, Louisiana.

Serum, Calcium, Phosphorus, and Alkaline Phosphatase

The osteolytic bone lesions are often associated with excessive renal excretion of calcium. Serum calcium levels in thirty-seven cases ranged from 7.9 mg. per cent to 23.7 mg. per cent. The serum calcium was above 11 mg. per cent in twenty-two of the thirty-seven cases (60 per cent). In sixteen cases (42 per cent), the serum calcium was above 12 mg. per cent. There was no correlation between the level of the serum calcium and the level of the serum proteins. Some of the highest calcium levels were associated with normal or low levels, and vice versa.

The serum phosphorus level was either normal or increased in twenty-two of twenty-four cases. In eleven of the twenty-four cases it was elevated (4.4 to 7.8 mg. per cent). Hypophosphatemia associated with hypercalcemia was found in only two of the twenty-four cases. An elevated serum calcium and elevated serum phosphorus was found in six of the twenty-four cases. In all six of these cases there was renal insufficiency. The presence of normal or increased phosphorus levels in cases of multiple myeloma associated with hypercalcemia is always suggestive of renal insufficiency.

In seventeen cases of multiple myeloma where the alkaline phosphatase was studied, only four showed a slight elevation. The greatest elevation was 19 King-Armstrong units. In all four cases there were pathological fractures to account for the elevated alkaline phosphatase.

Autopsy Findings

The lesions in the bones are commonly soft greyish-white or reddish tumor nodules. The widespread involvement of the bone marrow is shown by the success of sternal aspiration as a diagnostic procedure. The distribution of the bone lesions that could be recognized grossly at autopsy or seen on roentgenograms is shown in Table II. Many of the involved bones were probably not recognized either at autopsy or on roentgenograms.

Microscopically, the tumor nodules are composed of myeloma cells of varying degrees of dif-

ferentiation and pleomorphism, arranged in broad sheets. The typical myeloma cell is indistinguishable from an immature plasma cell. Occasional transitions from immature myeloma cells to typical mature plasma cells may be seen. The myeloma cells seem to arise directly from the reticulum. At times in viewing histologic sections and especially in material aspirated from bone marrows, it may be very difficult to distinguish myeloma from an inflammatory plasmacytosis. We have found that observing the degree of immaturity of the cells, the presence or absence of large compact groups of cells, the presence or absence of a marked macrophagic reaction, and the presence or absence of plasma cells arranged around capillaries or endothelial cells, is of help in distinguishing myeloma from an inflammatory plasmacytosis. Inflammatory plasma cells show a tendency to be arranged around capillaries and are usually associated with a marked increase in macrophages[10] (Fig. 1).

The study of histologic sections alone has led to a confusion of terminology. Such terms as myeloblastic, megakaryocytic, myelocytic, lymphocytic, erythroblastic, et cetera, myelomas are to be found in the literature. We are in agreement with those who do not believe that these varieties exist. All of the cases in our series could be classified under a plasma cell type, although considerable variation in cell size and maturity is often seen in the plasma-cell series.

Extraosseous Involvement

Of twenty-eight livers available for study, ten were involved by the myelomatous process. The cells could be seen to be proliferating either within the portal areas or the sinusoids or both, and resembled a leukemic involvement (Fig. 2). Most of the livers were normal in size, although one weighed 2,650 grams. Of twenty-three spleens examined, nine showed involvement by the myelomatous process. These spleens showed a proliferation of plasma cells within the sinusoids of the red pulp, with crowding out and atrophy of the white pulp in some cases (Fig. 3). Lowenhaupt[7] has described a similar finding. The spleens were usually not large. One, however, weighed 560

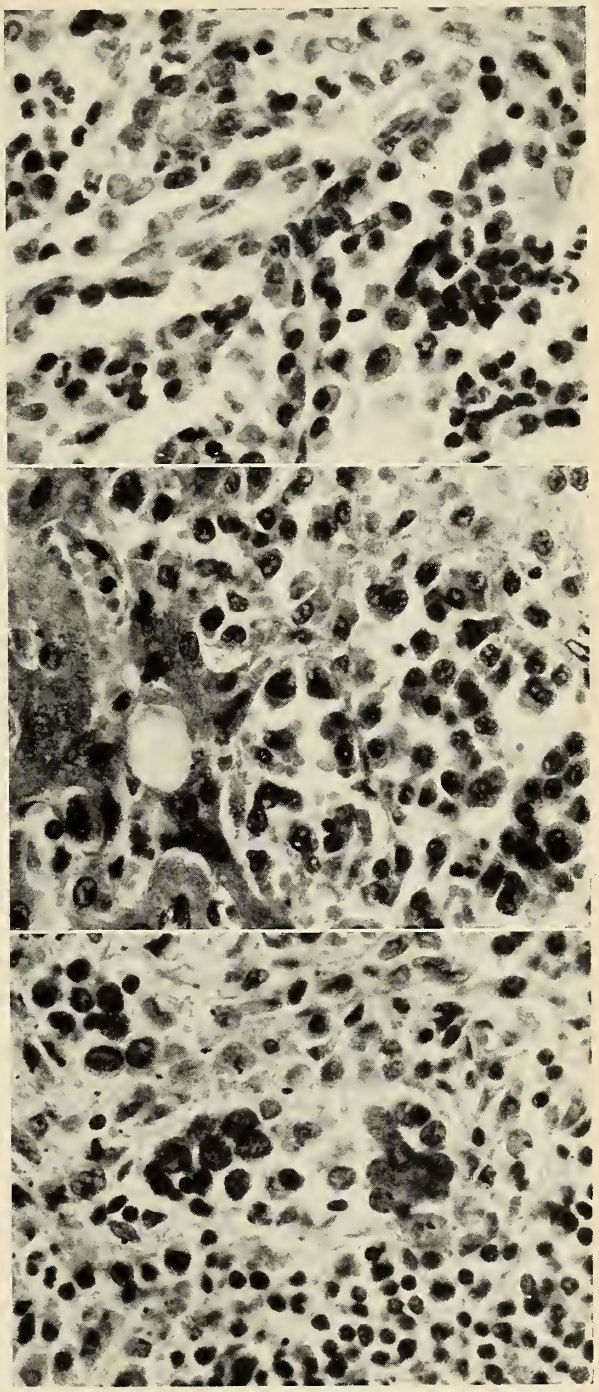

Fig. 1. (*above*) Bone marrow from sternal aspiration shows inflammatory plasmacytosis. Note the plasma cells clustered along the outside of the capillary.

Fig. 2. (*center*) Liver shows marked proliferation of myeloma cells in a portal space with atrophy of surrounding hepatic cells.

Fig. 3. (*below*) Spleen shows proliferation of myeloma cells within the sinusoids.

grams. Two cases were found with lymph node involvement. The plasma-cell proliferation completely replaced the normal lymph node structure. Two cases were found in which there was a marked proliferation of myeloma cells within the kidney parenchyma involving primarily the cortex and resembling that involvement seen in leukemias. One or more than one of the above mentioned organs may be involved in an individual patient.

Renal Disease

Obstruction of the tubules by casts, as described by Bell,[3] was common. In these cases the plasma proteins were high, low, or within normal range. When the plasma proteins were elevated, the increase was usually due to the globulin fraction. Bence-Jones proteinuria may be present but is frequently absent. There was no demonstrable relationship between the Bence-Jones proteinuria, increased serum protein, and presence or absence of tubular casts in this series. Another type of renal involvement which is quite common is calcification of the tubules associated with hypercalcemia.

Amyloidosis

One case was found in which there was amyloidosis of the liver, spleen, bone marrow, and voluntary muscle. This patient's serum globulin was 8.0 grams. Tests for Bence-Jones proteinuria were negative.

Conclusions

It seems reasonable to believe that multiple myeloma is a diffuse neoplastic proliferation of plasma cells from the hematopoietic reticulum. The frequent involvement of the liver and spleen, as well as the bone marrow, makes it more reasonable to believe that it is a disease of the hematopoietic reticulum and not exclusively a bone marrow neoplasm. It does not seem necessary to separate plasma cell leukemia from multiple myeloma. Plasma cell leukemia is simply an exaggeration of phenomena seen frequently in multiple myeloma. Careful examination of the peripheral blood will show an occasional circulating myeloma cell in most cases of multiple myeloma.[8]

Summary

A study of ninety-five proven cases of multiple myeloma with seventy-five autopsies is reported. Males predominated—seventy-one to twenty-four females. The age in seventy-four cases was over fifty years. Bence-Jones proteinuria was found in 42 per cent of fifty-four cases. Plasma proteins were elevated in 64 per cent of fifty cases. Serum calcium was elevated in 60 per cent of thirty-seven cases. Hyperphosphatemia is usually due to renal insufficiency. Alkaline phosphatase is normal except in the presence of pathological fractures. Proliferation of myeloma cells in the liver and spleen was not uncommon. Obstruction of the renal tubules by casts and calcification of the tubules was a frequent finding. The cytology in all of the cases could be classified as myeloma cells belonging to the plasma cell series. Cytological and histological criteria of separating myeloma cells from inflammatory plasma cells are discussed.

EDUCATION OF THE PATIENT

Education of the patient is a primary function of the tuberculosis institution. One of the greatest obstacles to control of the disease will have been overcome when patients and their families thoroughly understand the facts about tuberculosis and apply what they have learned. Tremendous effort goes into the finding and treating of cases, yet all of this is wasted without the sustained cooperation of the infected individual. As "the person expelling the bacilli," he must learn of his responsibility to prevent spread; he must learn how to participate in his own treatment, for in the best medical opinion much of the success of the cure is up to the patient. His education should continue until an economically competent and self-disciplined individual has returned to his community and himself become an active participant in tuberculosis control.—A. Edith Fenton, R.N. (Public Health Nurse, Mt. Sanatorium, Hamilton, Ontario), Canad. J. Pub. Health, May, 1948.

SARCOIDOSIS

A Clinical and Laboratory Study of Seventeen Cases

MYRON H. KULWIN, M.D., WILLIAM H. FELDMAN, D.V.M., H. CORWIN HINSHAW, M.D., and HAMILTON MONTGOMERY, M.D.

Rochester, Minnesota

THE PURPOSE of this report is to present certain clinical and laboratory data in a series of seventeen patients seen at the Mayo Clinic, in whom a diagnosis of sarcoidosis (Besnier-Boeck-Schaumann disease) was made, and in whom animal inoculation and cultural studies were performed on specimens of tissue. This problem was undertaken, chiefly, to perform thorough bacteriologic studies of tissue removed for biopsy from these patients in order to investigate further the question of the possible relation of tuberculosis to this entity. The literature on this subject will not be discussed nor reference made thereto, inasmuch as Freiman[1] has recently published an exhaustive survey.

Clinical Analysis of Data on Patients

Of the seventeen patients studied, eleven were between the ages of twenty-eight and thirty-seven years at the time of their first admission to the clinic. The youngest patient was fourteen and the oldest fifty-four years of age. Ten of the patients were female; seven were male. Three of them were Negro, and fourteen were white.

The duration of symptoms at the time of the first admission to the clinic ranged from two months to five years. Ages of the patients at the time of the onset of symptoms ranged from fourteen to fifty-three years, with eleven patients showing their first manifestations of the disease between the ages of twenty-three and thirty-six years.

Four of the patients—one white female, one Negro female, and two white males—had a history of tuberculosis in members of their immediate families.

The incidence of clinical evidence of involvement of various organs is shown in Table I. Involvement of the lymph nodes could probably be regarded as occurring in 100 per cent of the patients inasmuch as only a fraction of all the lymph nodes of the body are generally accessible to physical or roentgenologic examination. Some of the patients showed localization of the adenopathy to certain groups (for example, supraclavicular, mediastinal) while in others the involvement was generalized.

TABLE I. CLINICAL EVIDENCE OF ORGAN INVOLVEMENT IN SEVENTEEN PATIENTS

Organ	Patients
Lymph nodes	15
Skin	11
Lungs or hilar lymph nodes or both*	9
Eyes†	5
Bones**	3
Spleen	6
Gastrointestinal tract††	2
Liver	2
Parotid glands	1

*Roentgenologic examination revealed changes in the lungs characteristic of sarcoidosis.
†One additional patient showed unilateral keratic precipitation on ophthalmologic examination, indicative of previous uveitis.
**Roentgenologic examination revealed cystic changes in the small bones of the hands or feet or both characteristic of sarcoidosis.
††In one case there was involvement of the terminal ileum and colon, and in one case there was involvement of the terminal ileum and sigmoid portion of the colon.

The cutaneous lesions varied from a few discrete papules to generally distributed infiltrated plaques.

Ocular involvement consisted of inflammatory changes in the uveal tract which are characteristic of sarcoidosis. One patient had uveitis associated with bilateral parotitis, a symptom-complex described as the Heerfordt syndrome.

The gastrointestinal lesions were manifested clinically in one patient by diarrhea, lower abdominal tenderness and vague intermittent cramps. Roentgenologic examination of the gastrointestinal tract revealed ulcerohyperplastic ileitis and ulcerative enteritis of the colon. The other patient complained of loss of weight, diarrhea and bloody stools. Roentgenologic examination in this patient revealed a localized area of contraction of the sigmoid portion of the colon, due to an intrinsic lesion. In both of these patients, localization of the pathologic lesions was confirmed by exploratory laparotomy.

One patient complained of polyuria and polydypsia which could not be explained on the basis of primary disease of the endocrine glands; therefore, it might be assumed that localization of sarcoid lesions in the hypothalamic region and pitui-

Dr. Kulwin is a Fellow in Dermatology and Syphilology, and Dr. Feldman is in the Division of Experimental Medical, Mayo Foundation. Dr. Hinshaw is with the Division of Medicine, and Dr. Montgomery is with the Section on Dermatology and Syphilology, Mayo Clinic, Rochester, Minnesota.

tary gland in this patient caused secondary changes therein, producing the afore-mentioned manifestations of diabetes insipidus.

In two cases, pronounced hepatomegaly and splenomegaly were predominant findings, while splenomegaly was clinically evident in four other patients as well.

Clinical Laboratory Studies

Hemoglobin determinations or erythrocyte counts or both were normal in all patients. Leukocyte counts were within normal limits in thirteen patients. One showed mild leukocytosis (11,200 per cubic millimeter of blood) and three showed slight leukopenia (3,200, 4,400 and 4,400).

Differential leukocyte counts were recorded in ten patients. Five of the patients had a definite relative monocytosis (9, 17, 14, 9.5 and 14.5 per cent); one of them (with 17 per cent monocytosis) also showed eosinophilia ranging up to 14 per cent.

The erythrocyte sedimentation rate (Westergren) was elevated in eleven of thirteen patients in whom this determination was made. Abnormal readings ranged between 23 and 99 mm. per hour.

Serologic reactions for syphilis were negative in all patients except one. This patient, a Negro woman, aged thirty-seven years, had been discovered to have a positive blood reaction six months prior to her admission to the clinic, and she had been given some antisyphilitic treatment(?) at that time. Her serologic test reports at the clinic included a Kline—3-plus, Kahn—negative, Hinton—positive, and Kolmer—negative.

Determination of total serum proteins was done in fourteen patients. One showed mild hyperproteinemia (8.5 gm. per 100 c.c. of serum) and the others were well within normal limits. A total of sixteen albumin-globulin ratio tests were performed; six of these showed reversal of the normal albumin-globulin quantitative relationship, thus indicating the presence of both relative and absolute hyperglobulinemia.

Ten blood calcium levels were measured, nine of which were normal, the other being slightly elevated (11.2 mg. per 100 c.c. of serum). Of seven blood phosphorus determinations, one showed moderate decrease (2.6 mg. per 100 c.c. of serum), the remainder being within the limits of normal.

Intradermal tuberculin tests were performed on fourteen patients of this group of seventeen. These patients received 0.0001 mg. of purified protein derivative dissolved in 0.1 c.c. of isotonic saline solution intradermally in the forearm. The readings were uniformly negative in all cases. Nine of these patients were further tested with a more concentrated preparation of the same material, 0.005 mg. in the same diluent. Eight of the patients so tested again showed negative results, but the ninth gave a strongly positive reaction and tender axillary lymph nodes developed on the side tested.

Pathologic Studies

A total of nineteen tissue biopsies were performed at the clinic in seventeen patients. In two of the patients, two separate specimens were removed.

Each biopsy specimen was divided in half at the time of excision. One part was used for pathologic study, while the other part was immediately placed in a sterile container and sent to the laboratory of experimental pathology for study.

Of the nineteen biopsy specimens, eleven were cutaneous lesions, seven were lymph nodes, and one was a section of large bowel wall. The histopathologic diagnosis was sarcoidosis in all cases.

Bacteriologic Studies

These studies included some or all of the following procedures on each tissue specimen: (1) culture on Herrold's pea extract medium, Herrold's glycerinated medium, and Sesano and Medlar's medium; (2) inoculation of guinea pigs, chicks and rabbits with suspensions of the tissue.

More specifically, sixteen specimens were planted on the pea extract medium, thirteen on the glycerinated medium, and five on the Sesano-Medlar medium.

In sixteen cases, each tissue specimen was inoculated into at least two guinea pigs. In one case, two chicks also were inoculated with each specimen of material, and in five cases each specimen of tissue was inoculated into two rabbits in addition to guinea pigs.

The cultures and animal inoculations of tissue specimens from all the patients in this series showed no evidence of the presence of Mycobacterium tuberculosis.

(Continued on Page 1030)

MODERN CONCEPTS OF TREATMENT IN DISORDERS OF THE LACRIMAL APPARATUS

RALPH O. RYCHENER, M.D.
Memphis, Tennessee

WHEN ONE has practiced a specialty in medicine for more than twenty-five years, he is certain to have witnessed many changes in the interpretation of diseases in his particular field, for the practice of medicine is an ever-changing and never exact science.

In the author's personal experience in the small field of lacrimal disease, several noteworthy changes in treatment have been observed and it seems worth while to record some of them.

In congenital stenosis where it was formerly advised either to utilize no treatment at all or to pass giant Ziegler probes after slitting the upper punctum, the modern concept is to pass tiny, 0 or 00, Bowman probes, in the first few weeks or months, with the result that one or two treatments cures a condition which by delay may result in acute dacryocystitis with all its complications, including osteomyelitis of the maxilla, which the author has personally witnessed.

Epiphora used to be managed by slitting the canaliculus even though a real constriction of the lacrimal duct could be demonstrated, with the result that tearing always persisted even though the real pathologic condition in the duct was corrected. Lacrimation due to hypersecretion is now attacked at its source, either by x-ray therapy directed at the gland to diminish its output, or by cocainization or alcohol injection of the sphenopalatine ganglion to obstruct the nerve supply to the gland, as the tears are frequently increased by irritating lesions in the nose. Epiphora due to senile ectropion requires correction by one of the accepted treatments of lid shortening, but when it is due only to outward displacement of the lower punctum, a few well-placed Zeigler cautery punctures will yield a most satisfactory result.

Hyposecretion as evidenced by keratitis sicca is well managed by closure of the puncta with the actual cautery, whereupon the mucous glands of Krause furnish enough lubrication to keep the cornea moist and comfortable. It is well to seal off only the lower punctum at first as lacrimation may be sufficient to cause tears to stand constantly in the eyes if too enthusiastic treatment is employed. The upper punctum can always be closed at a later date if necessary.

As a resident on a fine ophthalmic service, the author was taught no surgical procedure on the lacrimal sac other than excision, which of course never cured chronic dacryocystitis as the canaliculi still remained to act as potential sources of infection for the debilitated cornea. Dacryorhinostomy of one form or other has been the greatest advance in this field in the past twenty-five years, and there exists no longer any excuse for any other procedure, provided the passageway from the punctum to the sac is intact. The evidence of any mucocele, no matter how small, in the lacrimal sac is an indication for such therapy, and one should not hesitate even though only one, and that an upper, canaliculus is intact.

Because of its good results in his hands, the author prefers the Dupuy-Dutemps dacryorhinostomy as modified by Chandler, which provides a three-sided tunnel of mucous membrane less apt to be occluded by bony ingrowth as is the case in the original technique. All ethmoidal cells which happen to be in the way should be completely exenterated and care taken not to close the mucous membrane of the lacrimal sac with that lining an ethmoidal cell, as the author once discovered when re-operating on a patient for a colleague whose first plastic procedure was a failure. A large bony window is desirable, at least 10 by 12 mm. or preferably more, as it facilitates the handling of the flaps. Special atraumatic sutures and a small mosquito hemostat as a needle holder are refinements which have been found valuable and time saving. This operation is feasible at any age, as the author has employed it from eighteen months to seventy-two years with complete satisfaction to all.

The history of lacrimal sac surgery was reviewed by illustrations and salient points of each procedure explained. A number of allied affections of the lacrimal apparatus and complications in their treatment were demonstrated by kodachrome slides.

Presented at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 11, 1949.

TREATMENT OF CARPAL NAVICULAR INJURIES

CARL G. CASPERS, M.D.
Minneapolis, Minnesota

FRACTURE of the carpal navicular bone is the most common of carpal injuries and is second only to Colles' fractures in injuries about the wrist. As such, it has occupied an increasingly important role in current medical literature. Surgeons writing on the treatment of this fracture repeatedly stress the importance of early diagnosis and early treatment, as healing varies directly with the time interval betwen injury and onset of treatment. Most fractures are readily diagnosed, but no fracture is overlooked more frequently than fracture of a carpal navicular bone. Every so-called "sprained wrist" should be considered a fracture until proven otherwise.

Fracture of the navicular bone occurs most frequently in young, robust, male adults from a fall on the outstretched hand. There is slight swelling of the wrist, with fullness in the anatomical snuff-box area. Motions of the wrist are slightly limited and painful. There is acute tenderness on palpation over the navicular bone dorsally and just below the radial styloid process. X-rays of the wrist must be taken in three planes, the anterior-posterior, lateral, and oblique. In the anterior-posterior view the hand is held in ulnar deviation. An initial negative x-ray report does not necessarily rule out a fracture of the navicular bone. The injury should be treated as a possible fracture by immediate immobilization and x-rays of the wrist should be taken again in one to three weeks. Immediate and proper treatment results in union in almost all cases, whereas delayed treatment results in delayed healing or non-union.

Fractures of the navicular bone occur either through the tubercle, the waist, or proximal pole. The mechanism producing the fracture is thought to be a transmission of force from the heel of the hand through the capitate bone, which impinges the navicular bone against the distal radial styloid process. Anatomically the navicular bone is thinnest at its midportion, the waist, and therefore, is most readily fractured in this area. The bone occupies a unique anatomical position. It is the longest carpal bone, articulating with five other bones, and lies in both the first and second carpal rows. The latter fact is important, for lateral carpal movement which normally takes place between the first and second row of carpal bones is, in the case of a fracture, directed through the fracture line as a shearing force. The articular surface of the navicular bone encases the bone almost entirely in articular cartilage, leaving only a small non-articular dorsal radial ridge for entrance of its blood supply through multiple foramina.[2] These foramina vary in number and position and are rarely seen extending proximal to the midportion of the bone. In fracture through the waist each fragment will receive a blood supply in the larger percentage of cases. In others, the proximal fragment may be devoid of a blood supply, and in fractures occurring through the proximal end of the navicular bone the small proximal fragment is avascular. Because healing of the fracture is dependent on its blood supply, certain predictions can be made regarding healing: fractures of the tubercle, having a good blood supply, usually heal rapidly; fractures through the waist heal in most cases if rigidly immobilized for a period of eight to ten weeks; but fractures through the proximal pole require a longer period of immobilization, even up to eight to twelve months. This time is required for re-establishing blood supply by creeping substitution, just as in other cancellous bone fractures.

Treatment of a fractured navicular bone is by continuous and uninterrupted immobilization in a snug-fitting cast. It has been repeatedly shown that union will occur if immobilization is complete and prolonged. Soto-Hall and Haldeman[4] have placed emphasis on position of the wrist and thumb in plaster. They advise a position of full radial flexion and 30° dorsal flexion of the hand, with full abduction and extension of the thumb. This position undoubtedly aids in securing better fixation, as the navicular fragments are locked together and the disturbing motion of a gliding flexor pollicis longus tendon is eliminated. Immobilization, however, is the most important factor in successful treatment. The snug-fitting cast should extend from the distal palmar crease to just below the elbow and should include the thumb. It should be changed only when it becomes loose. Immobilization is continued until x-ray evidence of union is present.

Presented at the annual meeting of the Minnesota State Medical Association, Saint Paul Minnesota, May 9, 1949.

When non-union of a fracture has occurred, the treatment of choice is bone-graft surgery. Schneck[3] has advised drilling of the navicular bone, first subcutaneously and then openly. This, however, has given way to bone grafting, as it has proved more successful in promoting healing. The technique of operation varies. Some surgeons use two or three small grafts; others use a single graft, of varying size, taken either from the radius, ulna, or tibia. Drilling of the navicular bone is not a simple task, and great care must be exercised in placing the drill hole properly so that adjacent articular surfaces are not injured. Bone grafting is difficult, even in experienced hands.

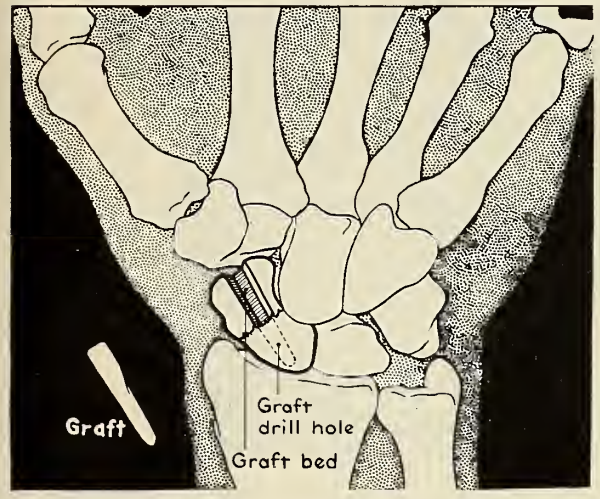

Fig. 1. Drawing of the operative procedure. The graft bed in the proximal navicular fragment is well visualized.

In our surgical procedure a channel is cut with a chisel in the proximal fragment, and the distal fragment is drilled under direct vision. This technique aids greatly in the accurate placement of the graft in the distal fragment. A fairly large graft (shown in the lower left corner of Figure 1) is then introduced into the channel and wedged securely into the distal fragment, impacting the fragments with the bone graft. Following operation, immobilization, as outlined earlier, is carried out until union is demonstrated on x-ray examination.

Case Reports

Case 1.—This illustrates treatment of a fresh fracture by prompt and continued immobilization. This thirty-six-year-old man suffered a fall on his outstretched hand on January 23, 1946, while visiting in another city. He had immediate pain, swelling, and disability in the wrist. He was seen by an orthopedic surgeon who took x-rays and then immobilized the wrist, even though the x-rays were negative for fracture. This patient was instructed to report to his own doctor on return home for re-examination and further x-rays.

He was seen and examined on January 29, 1946. X-rays taken at this time, six days after injury, showed a fracture through the waist of the navicular bone (Fig. 2). Examination revealed acute tenderness over the navicular bone dorsally, as well as in the anatomical snuff-box area, with limited motion. The wrist was immobilized in a plaster cast, incorporating the thumb for ten weeks. Figure 2 also shows the healed fracture on May 14, 1946, some fifteen weeks after starting treatment. Good bony union had been obtained, but there was still some bony atrophy present. He had a good result, having a complete range of painless motion.

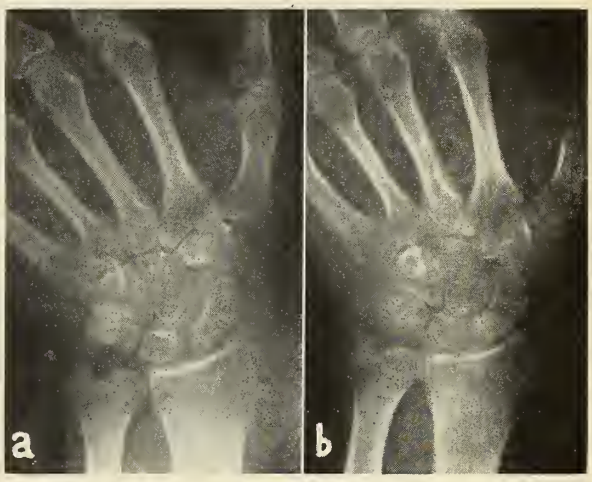

Fig. 2. *Case 1.* An acute fracture of the waist of the navicular bone (*a*) six days after injury, and (*b*) fifteen weeks later, following conservative treatment in plaster.

Case 2.—This illustrates treatment of a fracture with delayed union by bone-graft surgery. This young woman, aged twenty-four, fell on her outstretched hand in the winter of 1941, sustaining an injury to her wrist. She experienced some swelling, pain and disability in the wrist, but thought this was only a sprain and sought no medical help. Her symptoms gradually subsided, and she was able to carry on with her work. In the fall of 1941, her symptoms recurred. Examination at this time revealed tenderness over the navicular bone with pain on radial-abduction of the wrist. X-rays taken on October 6, 1941, showed a fracture of the waist of the navicular bone with widening of the fracture line through absorption with early cystic changes (Fig. 3a). She was treated by bone-graft surgery on October 31, 1941. The navicular bone was exposed through a lateral incision, drilled and grafted with a tibial graft. Figure 3b shows the graft well in place. The graft, however, is slightly small. Gordon Murray[1] states that larger grafts promote healing more readily. Following operation, immobilization was carried out in plaster for four months. X-rays taken in June, 1942, eight months following operation, show excellent bony union (Fig. 3c). Clinically, the patient had a normal functioning wrist.

Case 3.—This illustrates treatment of a fractured navicular bone with established non-union by bone-graft surgery. This eighteen-year-old boy gave a history of having injured his wrist playing football three years previously. He complained of immediate pain at the time of injury in his wrist and saw his doctor. The wrist was not x-rayed, and the injury was treated as a sprain. One year later, because of persisting disability, this patient sought the help of another doctor, who x-rayed his wrist and immobilized it in a leather brace for a period of five months. Some improvement followed, but his symptoms recurred. He was seen in September, 1946, when he complained of limited, painful, motion in the wrist and stated that cold weather aggravated his symptoms. Examination revealed marked tenderness over the navicular bone, especially in the anatomical snuff-box area. Pain was increased by radial and dorsal flexion of the wrist. X-rays taken September 26, 1945, show a definite fracture through the waist of the navicular bone, with marked widening of the fracture line, with associated cystic changes in both fragments (Fig. 4a). A bone-graft operation was performed on October 9, 1945. At operation, the fracture line was curetted of its fibrous tissue, the distal fragment slotted, and the proximal fragment drilled under direct vision. A tibial graft was introduced into the slot and wedged securely into the distal fragment. This graft, as shown in Figure 4b, was large and in excellent position within the navicular bone. Plaster immobilization was enforced for approximately three months and then fixation continued in a leather brace for an additional three months. X-rays taken on February 17, 1947, sixteen months postoperatively, showed good bony union present (Fig. 4c). The patient

THE SURGICAL MANAGEMENT OF INTESTINAL OBSTRUCTION

M. G. GILLESPIE, M.D., A. J. SCHLEPER, M.D., J. W. HALVORSON, M.D., and GEORGE W. HEINE, JR., M.D.

Duluth, Minnesota

DURING THE past decade the concept of the mechanistic factors in obstruction and their treatment as described by Wangensteen have become generally accepted. It has only been during this period that the mortality rate has shown any consistent decline.

This improvement in the mortality of intestinal obstruction is undoubtedly due to a better understanding of the mechanics of obstruction and its relief by gastrointestinal suction; to a better knowledge of the value of electrolytes, blood and plasma transfusions; to a keener awareness on the part of the physician of the importance of early recognition and the institution of prompt medical and surgical treatment; and finally to the exhibition of improved judgment and operative finesse in correcting the obstructive factor and performing aseptic decompressions and anastomoses.

Obstructions of the intestinal tract may be due to mechanical factors or they may be of functional origin. Obstructions of the latter type occur most commonly after operations, after spine injuries and in association with intra-abdominal inflammatory lesions. The treatment of this type of obstruction is largely medical. The most important therapeutic procedures are gastrointestinal suction and intravenous infusions.

Table I shows the relative frequency of occurrence of lesions producing obstruction in a series of 244 cases at St. Mary's Hospital, Duluth, in the decade 1937 to 1948. Adhesions and bands, hernias, tumors and intussusception in that order comprise almost 85 per cent of the factors producing obstruction. The remaining 15 per cent includes such lesions as volvulus, foreign bodies (such as gallstones), diverticulitis, regional ileitis, Meckel's diverticulum, stricture and almost an equal number in which the type of obstruction was not specified.

Obstructions by bands and adhesions, either occurring early after operation, late after operation or without previous operation, are the most frequent cause of intestinal obstruction. In this group of cases, 88 per cent had previous operations. Forty-five per cent had a previous appendectomy, and 25 per cent, a pelvic operation.

*Excluding intussusception 53

The most frequent cause of obstructions of the large bowel are neoplasms.

The most frequent cause of obstruction in children is intussusception.

In almost one-third of the cases there was evidence of recurring attacks of obstruction.

Males and females are equally susceptible to acute intestinal obstruction (Table II).

Obstructions by neoplasms affected chiefly the older age groups, the average age being 62.5 years. Obstructions due to bands and adhesions affected the younger adult age group, while the average age of the intussusception group was 1.3 years.

Treatment was limited to medical management in about 25 per cent of the 244 cases. This group of patients included those of minor degrees of obstruction which were relieved by gastrointestinal suction. There were five cases of intussuscep-

tion which were reduced by barium enema. The group also included several whom it was impossible to get into condition for operation and also included a few who entered the hospital in extremis (Table III). Interestingly, the mortality rate for this group was slightly higher than that for the group which was subjected to operation.

The chief factor in the high mortality rate of intestinal obstruction is delay: delay in seeking medical attention and delay on the part of the physician in making a diagnosis and instituting treatment. Those who died on the medical service without benefit of surgery had been ill an average of over eight days before medical treatment was instituted. On the surgical service, of those who succumbed, the average patient had been ill for 13.6 days before operation was performed.

The influence of length of illness before operation on the mortality rate is illustrated in Table IV. Of fifty-six patients who were operated upon within twenty-four hours of the onset of illness there were four deaths, or a mortality rate of 7.1 per cent, whereas within forty-eight or after forty-eight hours the mortality rate rapidly increased to 17.1 per cent and 21.8 per cent, respectively.

It is obvious that a continuing improvement in the mortality of intestinal obstruction demands early accurate diagnosis and the prompt institution of treatment. All too frequently when a patient with acute obstruction is admitted to the hospital, the doctor is satisfied with an admitting diagnosis of "acute abdomen" or at best one of "acute obstruction," no great attempt being made to diagnose the type or level of obstruction or whether it is a simple or strangulating obstruction.

Occasionally acute appendicitis, biliary tract disease, pancreatitis, perforated ulcer and acute ureteral obstruction may simulate acute intestinal obstruction.

The triad of symptoms characteristic of obstruction are colicky pain, vomiting and distention. The character and intensity of these symptoms will depend largely on the degree and level of the obstruction. High small bowel obstruction is characterized chiefly by profuse vomiting and, if the level of obstruction is below the duodenum, colicky upper abdominal pain. Low small bowel obstruction is characterized by the sudden onset of colicky abdominal pain and borborygmi heard at the height of the colic. One should keep in mind that in the early hours of obstruction distention is not present. Yellow-brown, sometimes foul-smelling, vomitus signifies low late ileal obstruction.

With colonic obstruction there is a more gradual onset of colicky pain. Abdominal distention becomes marked only with complete obstruction. Vomiting is not a striking feature. Because of the competency of the ileocecal valve (75 per cent), acute obstructions of the colon are largely of the closed loop type.

One of the stumbling blocks is the early differentiation between simple and strangulation obstruction. This is important because the latter group is associated with a much higher mortality. Because of the inability to distinguish strangulation from simple obstruction, some surgeons take the stand that all acute mechanical obstructions should be regarded as strangulating until proved otherwise. The surgical staff of the Massachusetts General Hospital follows the policy of immediate operation, after replenishing fluids, upon all patients with acute intestinal obstruction who are seen within twenty-four hours. Even those that are seen within forty-eight hours after the beginning of the illness are operated upon as soon as the electrolytes, plasma and blood are replenished.

In this connection, Moses makes a strong point in his insistence that the distention should be relieved and that the physiological alterations should be corrected before the patient is subjected to operation.

External hernias are the most frequent cause of strangulation obstruction and as such should offer no difficulty in diagnosis (Table V). As evidence of this is the relatively low mortality rate associated with external hernias. An exception to

this is femoral hernia where the mortality rate was 40 per cent.

The characteristic clinical picture is a patient with a tender tense mass at the site of herniation associated with signs and symptoms of intestinal obstruction.

It is the lesion within the abdomen producing obstruction that is associated with difficulties in recognition, differential diagnosis, and consequent delay in treatment. In this type of case it is important not only to establish a diagnosis but to estimate the degree, type and level of obstruction. In strangulation obstruction the colicky pain is more sudden in appearance, more intense and continuous. The patient tries to assume a position of relief. There is a more rapid progression of symptoms. The abdomen becomes tender. Shock may supervene early. A tender mass on abdominal or pelvic examination may be detected. A diagnostic paracentesis of the abdomen can be of great value. An 18-gauge needle is inserted through the abdominal wall in an upward oblique direction to either side and slightly below the navel. The aspiration of a few cubic centimeters of bloody fluid will clinch the diagnosis.

The x-ray evidence of obstruction is most important. Only too often the physician fails to utilize this diagnostic aid (Table VI). A large scout film of the abdomen is most helpful. Other exposures which may be of aid can be taken in the erect and in the lateral positions. The particular information which an x-ray examination may elicit is the degree of intestinal distention, the location of distended loops and whether air exists in the peritoneal cavity and colon.

In the event that the diagnosis is not immediately evident and a policy of watchful waiting is adopted, it is well to see and examine the patient at intervals of a few hours. The abdomen should be carefully re-examined, the general condition of the patient should be appraised, and it may be desirable to repeat the x-ray pictures. During this interval, of course, the preoperative treatment of the patient can and should be initiated.

Preoperative Treatment

It is safe to say that gastrointestinal suction should be started immediately in all cases of obstruction of the small bowel. The type of tube to be used is a Levine lead-tipped duodenal tube or the Miller-Abbott, or one of its modifications. The Levine tube will take care of all high intestinal obstructions as well as most of the cases of low small bowel obstruction where its use is resorted to before the obstruction becomes marked.

In the low ileal obstructions, the Miller-Abbott tube or one of its modifications should be resorted to especially in the case of marked distention. Various methods and contrivances have been suggested to insure the rapid passage of the tube through the pylorus and down the intestine. Its use is not without some danger.

Gastrointestinal suction is not indicated in large bowel obstruction unless there is an incompetent ileocecal valve with regurgitation and consequent distention of the lower ileum.

Granted that the case is one of intestinal obstruction, supportive treatment should be started at once. Morphine or one of its derivatives should be administered for relief of pain. In acute high intestinal obstruction, saline infusions should be administered. In low obstructions saline solutions have no specific merit. Where dehydration is present, as indicated by thirst, dryness of the skin, loss of turgor, and low urinary output, saline and glucose solutions should be administered in sufficient quantities to insure a urinary output of 700 to 1,000 c.c. daily. In low bowel obstruction and with great distention, the too liberal use of saline may result in greater accumulations of fluid in the obstructed gut; overchlorination may result in salt retention and edema.

If shock is impending or present, such as one sees in strangulation or in late simple obstruction, plasma and blood transfusions should be administered in adequate amounts.

The two most important measures in the preoperative treatment of a patient with intestinal obstruction are the administration of adequate fluids (electrolytes, plasma and blood) and gastrointestinal suction. These should be started early and should be continued throughout the operation and into the postoperative period until normal motility has been established.

Operative Treatment

The three cardinal principles in the successful treatment of intestinal obstruction are the institution of gastrointestinal suction, the administration of fluids in the proper amounts, and an operative procedure performed at an opportune time and wisely selected and executed in a skillful manner.

The choice of anesthesia is important. Spinal anesthesia is ideal in the good-risk patient but should not be used in the face of shock, in the patient who is very anemic or in the patient of advanced years. General anesthesia, skillfully administered, is preferred for these patients.

Local infiltration in the poor-risk patient where a minor procedure is contemplated is sometimes indicated.

The incision will depend largely on the level of obstruction. For exploration a midline lower abdominal or mid right rectus incision should be made. In the case of low obstruction of the small bowel, an incision on either side of the midline is preferred. If a mass can be palpated, a vertical incision over the mass is advantageous. In the case of obstruction of the pelvic colon, an incision parallel to and over the transverse colon is preferred. In the case of an obstruction of the right colon, a vertical incision on the left side of the abdomen is often indicated.

When the abdomen is opened, its contents should be inspected insofar as possible. Evisceration is to be avoided. Patients with prolonged acute bowel obstruction do not tolerate extensive manipulation. The ideal is to find the obstructing element directly, carefully divide the band or release the bowel. As a general rule, the early obstruction is corrected more easily and with less danger to the patient. The operative correction of obstruction in the late stages is more apt to be associated with more serious consequences to the patient and will require better surgical judgment and more complicated surgical maneuvers.

The operative treatment of acute intestinal obstruction depends on the nature of the obstruction and the pathological changes in the bowel wall. In the case of strangulation the question of the viability of the bowel must be judged. If the bowel is viable, the strangulation only is relieved. If the gut is nonviable, it must be excised. After release of the obstruction, time should be allowed for the circulation of the obstructed segment to return. To encourage this, the bowel should be covered with hot moist sponges. Whether the bowel is viable will be determined by its color, contractility and the pulsation of its vessels. If damage to the circulation is slight, consideration should be given to the performance of an enterostomy proximal to the strangulated area. In the event that a Miller-Abbott tube is already decompressing the small bowel, enterostomy will not be indicated. In the case where the bowel is nonviable, primary resection with aseptic end-to-end anastomosis is the procedure of choice. The danger is peritonitis. If there is a question about the anastomosis and the bowel is not adequately decompressed, an enterostomy proximal to the anastomosis is indicated, especially in low ileal obstructions.

Gastrointestinal suction has largely done away with the need of enterostomy; yet, at times there will be a clear indication for its employment.

With the development of aseptic anastomoses, exteriorizations are being abandoned. However, exteriorization operations sometimes will be indicated in low ileal and colonic obstructive lesions.

Entero-enterostomy will sometimes be indicated in the case of massive adhesions and an occasional case of inflammatory obstruction, as in regional and multiple jejunitis and in some cases of acute obstruction due to tumor.

In acute obstruction of the right half of the colon where there is an incompetent ileocecal valve, ileotransverse colostomy will be the operative procedure most commonly employed. Colostomy, and less frequently cecostomy, will sometimes be indicated. In cases of volvulus of the cecum and of the ascending colon where gangrene is impending, primary resection or exteriorization is usually performed. In lesions of the left half of the colon, transverse colostomy will be indicated. In volvulus of the sigmoid, if it is not too far advanced, untwisting of the volvulus and decompression of the segment by the use of a rectal tube is useful. When gangrene is present, exteriorization is advised.

The surgical maneuvers to correct rarer types

of obstruction will depend on the place and the type of the obstructing factor in the particular case.

Postoperative Treatment

Postoperative treatment begins when the patient is still in the operating room. The most common complications are shock, atelectasis and aspiration pneumonia, peritonitis, wound infection, and thrombophlebitis.

In a patient who is operated upon early and after adequate preparation, postoperative complications occur infrequently. Conversely, in the group that is operated upon late and without sufficient preparation, complications that may be lethal can be frequently expected.

Postoperative management is largely a continuation of preoperative treatment. Gastroduodenal suction should be started when the patient enters the hospital, continued through the operation and into the postoperative period until normal motility is re-established.

Intravenous fluids also should be started in the preoperative period, especially if there has been excessive vomiting with electrolyte depletion and dehydration, or in the case of impending shock. This fluid administration should be continued throughout the operation and into the postoperative period until recovery is well advanced.

Before the anesthesia is discontinued, the pharynx and the trachea should be thoroughly aspirated.

The patient should not be hurried from the operating room. Impending or actual shock should be combatted with sufficient intravenous fluids (blood or plasma). The pulse and the blood pressure should be stabilized. In some cases it may be desirable to transport the patient back to his room in a tilted (head down) position and, when transferred to his bed, kept in this position by elevating the foot of the bed. He is then maintained in that position until fully awake or until the blood pressure is stabilized.

Oxygen admisistered by the Boothby mask may be indicated, especially if cyanosis is present.

Penicillin administration, if not begun during the preoperative period, can be started by intramuscular injection in adequate doses.

Catheterization every six to eight hours may be necessary if the patient is unable to void. Fluids should be administered in sufficient quantities to insure an excretion of 800 to 1,000 c.c. of urine daily.

TABLE VII. SURGICAL MORTALITY, SMALL BOWEL OBSTRUCTION

	Total Cases	Deaths
Adhesions and bands	60	7
Hernias	49	
Inguinal		1
Femoral		4
Intussusception	19	2
Tumors	4	3
Mixed	13	
Volvulus		1
Regional ileitis		1
Gallstone		1
Type not specified	1	0
Total	146	20 (13.7%)

Early ambulation should be encouraged.

Enemas should not be given until all danger of peritonitis is passed. Usually the bowels will move spontaneously some time after the fourth postoperative day.

Atelectasis of a minor degree will usually clear up spontaneously if the patient is encouraged to change his position frequently and if he is encouraged to cough and expectorate. Collapse of a major lobe or of an entire lung will require bronchial aspiration. The danger of aspiration pneumonia will largely be eliminated by thorough gastrointestinal suction.

The treatment of peritonitis is largely by gastrointestinal suction.

Wound infection will become evident by fever and local tenderness, swelling and inflammation.

Thrombophlebitis will be largely combatted by elevation of the foot of the bed in the early postoperative period, and, later, by early ambulation. When phlebothrombosis or thrombophlebitis is present, consideration should be given to heparin and dicumarol administration and, in some cases, to bilateral ligation of the deep femoral veins.

In the case of other less common complications, appropriate treatment should be instituted early.

Mortality

In this series there was an operative mortality of 16.5 per cent. If one considers lesions of the small bowel only, the mortality rate was 13.7 per cent (Table VII). When strangulation obstruction is present, the mortality rate is substantially increased. The over-all mortality rate in the nonstrangulated group was 14 per cent compared to 25 per cent in the strangulated group.

Table VIII, taken from Moses' article, shows the mortality rates in reported series of acute obstructions of the small bowel.

The chief causes of death are peritonitis, shock, and pulmonary complications. This holds true not

Totals	30	42	72

only in the surgical group but also in those who die under medical treatment. Table IX shows the causes of death in a study of the autopsy records of St. Luke's Hospital, Duluth, between the years 1935 to 1948. Peritonitis and shock comprised 73.8 per cent of the surgical deaths and 86.6 per cent of the medical deaths.

Conclusions

Based on the above clinical and pathological studies of intestinal obstruction, the following conclusions can be drawn:

To expect a continuing improvement in the mortality rate, the patient must somehow be induced to seek medical attention earlier in his or her illness.

The physician's responsibility is to make an early, accurate diagnosis and begin treatment without delay. The two most important procedures in treating intestinal obstruction are gastrointestinal suction and the administration of intravenous fluids.

The surgeon's duty is to see that the patient is properly and adequately prepared, and that the operation is performed at a judicious time and in a skillful manner.

INSURED FOR HEALTH

PERCY T. WATSON, M.D., M.P.H.
Director, Division of Local Health Services, Minnesota Department of Health
Minneapolis, Minnesota

IN A LITTLE over 100 years, life insurance has become an important asset in nearly all countries. The exceptions are those countries where, because of such elements as unstable health and unfavorable economic conditions, life insurance is often unavailable, despite the fact that the people of those countries have the greatest need for its benefits. What has been accomplished in public acceptance of life insurance remains to be done in the field of health insurance. Certainly, the reasons for health insurance are as logical and valid as those for family protection after the death of the breadwinner.

A stable economic organization and a relatively high level of general health are essential to both types of insurance. Perhaps one reason that health insurance has not been so widely accepted as it deserves is that the principles of an ordinary life insurance policy are fairly simple and easily understood. The policy holder knows that a payment will be made to his beneficiary on his premature death, and because he is glad to be alive he is willing to pay the premiums as they come due.

Secondly, life insurance policy holders realize that if they pay their premiums until they reach a fairly advanced age, and leave the dividends to the credit of the policy to accumulate at interest, the cash value of the policy, upon which the size and type of all annuity payments depend, will finally equal or even exceed the total of the premiums paid. During the first years, the value of an insurance policy rests upon the certainty that one's family is protected financially in the event of the breadwinner's death or total disability. That certainty is, for the time, of more value than the amount of the premiums paid. For a considerable part of the time that the policy is in force, the death benefits are much greater than the amount of the premiums. It is man's longevity, and the earnings of the moneys invested by insurance companies operating under a stable economic system, that permit life insurance to function satisfactorily.

Thirdly, there is obviously no question about whether or not a person is dead. There is little chance of evasion on the part of the policy holder, and we practically never hear of an insurance company failing to pay death benefits.

The reasons for maintaining health insurance are just as logical as those in favor of life insurance. A person who maintains his health and earning power should be glad to pay premiums without getting any return from them, so long as health and earning power continue. His power to earn money is a much greater financial advantage than his possession of insurance. He should have a great deal of satisfaction in knowing that as long as he does not need medical care and retains his earning power, his premiums are helping individuals and families for whom illness has created a crisis. Similarly, the home owner who pays fire insurance premiums would prefer to make life-long payments rather than suffer one disastrous fire.

The need for educating the general public regarding this point of view was shown recently, when several college students on vacation were heard discussing health insurance and college health services. Usually colleges include a health service fee as part of the total tuition charge. Thus these fees constitute a type of health insurance. The students felt they had been deprived of something because they had not received in medical services the equivalent of what they had paid as a health service fee. They evidently lacked the ability to appreciate the principles of health insurance. A more thorough understanding of these principles would have convinced them that they were the gainers in the transaction, since they remained in good health and did not need the services for which they paid.

There are some people who prefer to budget their own medical and hospital needs, independently of any group. By far the larger number, however, cannot afford to set aside sufficient funds from their income, during the early years of budgeting, to protect themselves and their families against the catastrophe of serious illness or injury. The amount of money necessary to budget possible future medical and hospital costs will be less if the insurance principle is adopted. The

annual payments by individuals represent the *average* health costs for the group. A few subscribers each year have unusually heavy costs, while many make little or no demand upon the joint fund.

Furthermore, health insurance will be much less expensive for everyone if each individual subscriber is willing that slight or minor ailments be excluded from benefit payments. This principle has a precedent in the $50 deductible type of automobile insurance. Health insurance plans are striving to make their settlements fair and equitable, and it would be uneconomical to make payments for slight illnesses, the cost of which can be easily financed by the individual. The cost of such slight illnesses can usually be included in the living costs that the family regularly meets. These costs will rarely exceed those of entertainment or recreation. It is of course important not to neglect slight ailments, which might become major ones if not detected and treated in the early stages. But the cost of medical care for these minor needs can and should be borne, in the majority of cases, by the individual or his family, without recourse to his health insurance.

The success of any insurance plan depends upon everyone playing the game fairly. People who run up unnecessary bills, merely because they have insurance to pay the bills, are defeating the most essential principle of sickness insurance, which is medical care for unusual, unexpected, long-lasting or exceptionally costly illness. Good medical care can be provided satisfactorily in such an event only if everyone "plays fairly." In insurance of any type, the rates go up sharply when those concerned abuse the services provided. The public, innocent and guilty alike, pays for all demands, necessary as well as unreasonable, under the insurance principle.

A very much greater proportion of those insured for health will require insurance aid than those covered by life insurance. Death is a very much smaller hazard than illness. On the other hand, sickness benefits—in the majority of cases—are much smaller than death benefits.

We have stated that the basic principles of health insurance are very similar to the basic principles of life insurance. They are also quite similar to the basic principles of satisfactory living. Education and training in recognizing the significance and value of these basic principles should begin in early childhood and should be carried on through the grades and high school. The child needs to learn that team-work, fair play, and group effort apply to health insurance in the same way that they apply to other joint projects for a common good. Health insurance, covering especially catastrophic or prolonged illness, should be a part of every citizen's economic planning. Possession of such insurance actually bolsters health, because it gives people the feeling that, if sickness comes, financial help is always at hand.

Fifty-five million Americans have already protected themselves in this manner, and this number, fortunately, is increasing every month. All these people have a vital personal interest in the success of voluntary health insurance. They also share the hope that, as experience is gained, the benefits of health insurance may be improved and enhanced. What these fifty-five million have attained should not be destroyed in the interests of a much smaller group that cannot or will not plan for the health protection of themselves and their families. This latter group obviously does not include those now receiving or in need of public assistance because of old age, disability, and other conditions of this general nature.

It is believed by many that if health insurance for individuals and groups were to be made compulsory, the compulsory features would cause the insured groups to lose their initiative and would hamper individuals in developing group co-operation, team-work and fair play as these principles apply to health insurance. A compulsory health insurance system might foster the type of thinking illustrated by the college students who felt that they had not received any benefit from their health service fees.

Certainly there are few misfortunes as severe as a long, disabling illness of the breadwinner of a family. Insurance against such a calamity is becoming recognized as a worthwhile investment. Under the effective operation of the insurance principle, those whom misfortune overtakes will be cared for, and all will be assured of adequate protection.

HEMOPERICARDIUM WITHOUT RUPTURE OF THE HEART FOLLOWING DICUMAROL THERAPY FOR MYOCARDIAL INFARCTION

JAMES F. HAMMARSTEN, M.D.
Minneapolis, Minnesota

THE EFFECTIVENESS of dicumarol in preventing thromboembolic phenomena in patients with acute myocardial infarction has been repeatedly confirmed.[11] The hazard of hemorrhagic manifestations as a result of anticoagulant therapy has prompted careful clinical and experimental studies. Nonfatal hemorrhage has been frequently recorded but serious hemorrhage has been rare.[11] In experimentally produced myocardial infarction in dogs, dicumarol did not increase hemorrhage into the myocardium and healing of the infarction was not delayed.[1,3,7]

That dicumarol might increase the danger of ventricular rupture has been feared[9] but no reports of hemopericardium have appeared where anticoagulant therapy could be considered responsible. The following case is reported as an instance in which excessive hypoprothrombinemia induced by dicumarol may have been an etiological factor in the production of hemopericardium.

Report of Case

The patient, a fifty-eight-year-old Polish-American furrier, was admitted on January 2, 1948, for repair of a right inguinal hernia. The cardiovascular history was negative.

The physical examination was negative except for a right indirect inguinal hernia and mild hypertension (Blood pressure: 178/98 mm. Hg).

The urinalysis, erythrocyte sedimentation rate, hemoglobin concentration, serum bilirubin concentration, prothrombin time, and electrocardiogram were normal. The blood Kahn test was negative. A teleroentgenogram showed slight left ventricular hypertrophy and mild ectasia of the aorta.

Because of fatty food dyscrasia, a cholecystogram was performed on January 5, 1948. One hour after the intramuscular injection of pitressin (1 c.c.) the patient developed retrosternal pain with dyspnea and perspiration. The blood pressure was 106/70 mm. Hg and pulse rate was 52 per minute. The heart sounds were distant. An electrocardiogram showed depression of ST-2 and ST-3, small R waves in CF-2 and CF-4, and high takeoff of the ST segment in CF-2, CF-4 and CF-5. A diagnosis of acute myocardial infarction was made. On January 7 the prothrombin concentration was 55 per cent and dicumarol therapy was begun.

TABLE I. DAILY PROTHROMBIN CONCENTRATION AND DICUMAROL DOSAGE

Date	Prothrombin Time In Seconds		Prothrombin Concentration Per Cent	Dicumarol Mg.
	Control	Patient		
1/ 2/48	13	14.1	78	
1/ 7/48	14	16.6	55	200
1/ 8/48	13	20.9	29	0
1/ 9/48	13	21	29	75
1/10/48	13	21.1	29	150
1/11/48	12.8	38.8	10.9	0
1/12/48	13	26	19	50
1/13/48	13	32	15.8	50
1/14/48	14	34	13.5	0
1/15/48	14	44.1	9	0
1/16/48	14	44.7	8	0
1/17/48	14	30.8	15.8	0
1/18/48	14	22.3	27	0
1/19/48	14	33.4	13.8	0
1/20/48	13	24.5	21	50
1/21/48	13.5	31.7	15	50
1/22/48	14	40.6	10.4	0
1/23/48	14	40	10.5	0
1/24/48	14	34.8	13	0
1/25/48	14	30.1	16.2	50
1/26/48	13	26.3	18.8	50
1/27/48	14	63.3	7	0
1/28/48	14	66.5	6	0
1/29/48	14	132	0.5	0

The blood pressure remained about 96/68 mm. Hg, and the heart sounds continued to be faint. He developed slight fever, mild leukocytosis and an increased erythrocyte sedimentation rate. Serial electrocardiograms showed changes considered diagnostic of an anterior myocardial infarction (low voltage QRS in all limb leads, negative T-1, absent R waves in the precordial leads, and negative T waves in the precordial leads). A teleroentgenogram on January 27, 1948, showed increase in the heart size with bulging along the left border.

The patient proved to be more sensitive to dicumarol than usual. On several occasions the prothrombin concentration dropped to very low levels (Table I), but he exhibited no bleeding tendencies, and no vitamin K was given. Liver function studies were performed because of the sensitivity to small amounts of dicumarol. The bromsulfalein retention after forty-five minutes on January 28 was 19 per cent. A cephalin-cholesterol flocculation test on the same day was 1-plus in twenty-four hours and 2-plus in forty-eight hours.

At 9:00 a.m. on January 29 he was dyspneic and pale. Crepitant râles were heard at the right base and the neck veins were distended. The liver was not palpable and no edema was present. One hour later he became more severely dyspneic, apprehensive and cyanotic. His blood pressure was 40/0 mm. Hg. The pulse was weak and thready. Examination of the chest showed bilateral crepitant and sonorous râles. The heart sounds could not be heard. The symptoms and signs became steadily worse and he died at 1:50 p.m. The prothrombin

concentration, determined at 9:00 a.m. on the day of death, was reported after the patient died as 0.5 per cent.

The description of the significant portions of postmortem examination was as follows:

The pericardial cavity contained 800 c.c. of dark red blood. Numerous soft, dark red, fibrinous adhesions were present between the visceral and parietal pericardium.

A thin-walled aneurysmal dilatation, which measured 7 cm. in diameter, was located on the anterolateral surface of the left ventricle. The wall of the ventricle in the dilated area was 4 mm. thick. On the endocardial surface of the aneurysmal dilatation was a layer of reddish tan thrombus which measured up to 1 cm. in thickness. The anterior descending branch of the left coronary artery showed yellowish intimal thickening with complete occlusion by a thrombus 2 cm. from its origin. No gross laceration of the myocardium could be found, and "very careful and extensive search failed to reveal any small rupture of the ventricular wall or blood vessels of the heart."

Sections of the aneurysmal dilatation examined microscopically showed changes of a fairly recent infarction with early stages of healing. Microscopically no defect was found in the ventricular wall and no diffuse infiltration of blood could be found.

The liver sinusoids were congested with blood. The central portions of the liver cell cords showed extensive atrophy with vacuolization, loss of normal staining reaction and diffusely scattered polymorphonuclear leukocytes. The changes in the liver indicated passive congestion. Since the liver cell cords could be followed down to the central veins, the process was considered to be recent.

Discussion

The great majority of cases with hemopericardium secondary to acute myocardial infarction are associated with complete rupture of the wall of the heart, but partial rupture may occur. Krumbhaar and Crowell,[5] in a review of 654 cases of spontaneous rupture of the heart, found sixteen instances with partial rupture although "reports of partial ruptures were for the most part discarded." Ten of these sixteen patients had rupture of septa or papillary muscles. Three of the patients showed partial rupture from the epicardial surface that did not reach the ventricular chamber, and all of these had hemopericardium. Parkinson and Bedford,[10] Laignel-Lavastine et al[6] and Comes[4] each reported one case of partial rupture of the myocardium with hemopericardium. Nordmann[8] described a hemorrhagic infarction with a small defect in the epicardium and subsequent hemopericardium. Beresford and Earl[2] recorded two cases in which there was an epicardial laceration and hemopericardium but with an intact endocardium. The same authors state the hemopericardium may occur without visible rupture in hemorrhagic infarction, but they do not substantiate this concept with case reports or references. No instance of hemopericardium following acute myocardial infarction without laceration of the myocardium could be found in the literature unless Nordmann's case represents such an occurrence. In twenty-eight cases of hemopericardium following myocardial infarction, reviewed from the autopsy files of the Department of Pathology, University of Minnesota, macroscopic rupture of the ventricle was evident in each instance.

The case presented in this report of hemopericardium without laceration of the myocardium is evidently unique. The exact source of the hemorrhage is obscure. Hemorrhagic extravasation into the myocardium was not demonstrated. The gradual development of symptoms of cardiac tamponade indicate that bleeding occurred slowly. The defective hemostatic mechanism may have precipitated the bleeding and almost certainly permitted massive hemorrhage to occur. That the prolonged prothrombin time produced by dicumarol was deleterious seems probable.

Summary

1. A case is reported of hemopericardium without rupture of the myocardium, following an acute myocardial infarction.

2. Because this is a unique event and the patient had extreme hypoprothrombinemia, it is suggested that dicumarol was of etiological significance in production of the hemopericardium.

THYROID ADENOMATA IN CHILDREN

Review of the Literature and Report of a Case in a Nine-year-old Boy

LAWRENCE M. LARSON, M.D., Ph.D. (Surgery), and
JOHN H. ROSENOW, M.D., M.S. (Surgery)
Minneapolis, Minnesota

IT IS generally agreed that adenomata of the thyroid gland in children are quite unusual. The voluminous literature on nontoxic nodular goiter is replete with phrases such as: adenomatous goiter "occurs with increasing frequency with age," "is rarely seen before puberty," "begins at puberty or later," and the like. To arrive at any reasonably precise estimation of this incidence at the present time is well-nigh impossible, however. Geographic influences on the entire goiter problem and on statistical incidence of all types of goiter are well known and need no elaboration. Too, iodine prophylaxis has had a profound but as yet incompletely assayed effect on statistical incidences.[5]

Very extensive surveys of the geographical incidence of simple or so-called endemic goiter in both children and adults were carried on during the 1920's by many investigators. Only a few of these reports made any mention of the incidence of nodular goiter in the younger age groups. Olesen, for instance, in 1929, in a study of endemic goiter in Tennessee, a state at the edge of the "goiter belt," reported the results of examinations of 65,148 white and colored boys and girls in the schools. Among 1,049 children aged ten or under, no adenomatous goiters were found. There were forty-eight cases of adenomatous enlargement in a total of 12,487 children aged fourteen or under. Interestingly, thirty-four of these latter forty-eight adenomatous goiters were in the group of 5,560 white girls aged fourteen or under.

To quote only one of a multitude of European observers working on the problem of the incidence of goiter, Wegelin, reporting 696 routine autopsies during the year 1913-1914 at the Berne Pathological Institute, in a highly endemic goiter region, found 445 (63.9 per cent) to have macroscopically visible nodules. Of these, two were in children aged ten or under. Rice, in similar post-mortem studies of the thyroid glands of patients dying from causes unassociated with the thyroid (in Minnesota, another area of high endemicity), found nodules in the glands in 234 (47.4 per cent) of 493 cases examined. Of these, one was found in a patient aged ten or under, and this was a 2 mm. colloid nodule. He included all nodules visible macroscopically on gross serial section. Rice found nodules in 2 to 3 per cent of autopsies on individuals at puberty, and that the percentage incidence of nodules roughly paralleled the figures for age in the older groups. Jaffe studied 1,000 thyroid glands at autopsy at Cook County Hospital in Chicago. The youngest person presenting a nodose goiter was a white girl aged twelve, then there was a colored boy of fourteen, and a white boy of fifteen. All of these observations were made in endemic regions, before the use of iodine prophylaxis.

Schlesinger et al, in another post-mortem study, in New England, a non-goitrous region, reported that of a total of 1,371 autopsies there were nodules in the thyroid gland in 112 (8.2 per cent). However, they included in their study only those with nodules 1 cm. or larger in diameter, on the grounds that they wished to include only those which might have been palpable clinically. None occurred in fifty-two patients in the age group up to nine years of age, and only one (a female), in the thirty-three patients in the age group ten to nineteen years.

It can thus be seen that clinical experience with nodular enlargement of the thyroid gland in children might well be very limited, even in goitrous regions in the absence of the modifying factor of iodine prophylaxis. Cattell stated in 1933 that in his clinical experience he had seen only three instances of adenomatous goiter in children. Kennedy reported in 1940 that in the period 1917-1939, sixty-two patients with nodular enlargement of the thyroid were seen at the Mayo Clinic in children aged fourteen years or younger. Of the sixty-two patients, forty-eight had adenomas, twelve had carcinoma and two had thyroiditis. Of the forty-eight patients with adenomas, thirty-five were treated medically and thirteen surgically. Of particular interest is the fact that in no instance of thyroid adenoma, whether single or multiple, was there any evidence of overactivity of the gland. The number of patients with a single

adenoma and those with mutiple adenomata were equal. Kennedy felt that the reasons for surgical treatment of these adenomata in children were cosmetic or mechanical, or both. Pemberton and Black, reporting from the same institution about five years later, felt that in addition to cosmetic or mechanical indications for surgery, the possibilty of malignancy was often the most important reason for exploration of a nodular goiter in a child. In their material, of the nodular goiters operated upon, one in three proved to be carcinomatous. In many of these cases, the preoperative diagnosis of carcinoma had been made but in others, as in adults, the presence or absence of malignancy was determined only at the time of operation.

It is not within the scope of this paper to enter into a protracted presentation of the time-honored and extensively debated general issue of surgical indications in adenomatous goiter as regards prophylaxis or treatment of possible malignancy. The recent paper by Crile and Dempsey tends to cast doubt on the indiscriminate removal of all nodular goiters on these grounds. They point out, however, that "all adenomas in children must be regarded with grave suspicion, as must discrete adenomas in adults." Certainly all would agree on the advisability of the removal in the adult on the grounds of the possibility of neoplasm, of a single discrete, firm to hard nodule which showed definite evidence of gradual increase in size in a matter of months. One's degree of suspicion regarding such a nodule in a child should be even higher.

Case Report

The patient was a nine-year-old white male who entered the hospital on August 11, 1948. The family history was negative. Pregnancy, delivery, and the developmental history were all normal. He had had chickenpox, measles, and unilaternal mumps in his third year. Tonsillectomy and adenoidectomy had been performed in 1947, at which time a general examination was done and no abnormality of the neck had been noted.

The patient's mother stated that about nine months previously, she had noticed a small rounded swelling at the base of the neck just to the right of the midline anteriorly. This had slowly but definitely increased in size. There was no evidence or history of hyperthyroidism.

The patient's temperature, pulse and respirations were within normal limits. Blood and urine examinations gave negative results. The basal metabolism rate was +4 per cent. The blood pressure was 108/66 mm. of mercury. He weighed 65 pounds. A complete general physical examination was negative except for a moderate medial strabismus, and the presence of a fairly smooth, well-defined, rounded mass at the base of the neck anteriorly, just to the right of the midline, measuring about 4 by 3 cm. Its position and its ascent on swallowing indicated the thyroid gland as its most probable site of origin. There were no physical signs suggestive of hyperthyroidism.

On August 11, 1948, under intratracheal gas-oxygen-ether anesthesia, a typical collar incision was made. There was a solitary adenoma of the right lobe of the thyroid gland measuring 3 to 4 cm. in diameter. The adenoma was dissected free, taking along a margin of normal thyroid tissue around the entire nodule. After hemostasis had been effected, a small Penrose drain was placed in the thyroid space, the strap muscles were loosely approximated in the midline, and the skin was closed with a running subcuticular stitch of fine catgut.

The pathological examination indicated the following: The specimen consisted of a thyroid tumor that measured 3 by 4 cm. It was circumscribed, pale gray on cut section, and the center was partially cystic and showed some degenerative changes. The capsule was thick and fibrous. The surrounding gland showed nothing of note grossly. The microscopic picture indicated an adenoma composed of dilated acini that were well-filled with colloid, lined by cuboidal epithelium. In some areas the epithelium was hyperplastic and had a papillary appearance. The picture for the most part was that of a colloid adenoma. The surrounding thyroid showed nothing of note. The pathological diagnosis was benign adenoma of the thyroid gland.

The patient's postoperative course was uneventful. He was allowed out of bed on the second postoperative day. The drain was removed on the second day, and the patient was discharged from the hospital on the fifth postoperative day.

The boy was last seen on July 12, 1949, at which time he was in excellent health. He had gained 18 pounds since the operation (about one year previously), and there was no evidence of recurrence of thyroid adenomata.

Summary

1. Adenomas of the thyroid gland are unusual in preadolescent children. Indications for their surgical removal are cosmetic, mechanical, or the possibility of malignant change. It would appear that this latter possibility is greater in young children than it is in adults.

2. The case of a nine-year-old boy with a solitary adenoma of the thyroid gland is reported. Surgical excision of the adenoma was carried out.

Case Report

MALARIA WITH GENERALIZED PETECHIAE

Report of Case

FRANCES ELIZABETH SCHAAR, M.D.
Minneapolis, Minnesota

A REVIEW of medical literature devoted to a discussion of the signs and symptoms of malaria frequently mentions several types of skin involvement. Herpes, urticaria, jaundice,[2,3] spider nevi,[4] and erythematous desquamation[2,3] are described.

Bispham,[2] in a discussion of the pernicious fever in the hemorrhagic type of malaria, mentions that the body may have dense indurated swellings due to large extravasations of blood or may be covered with petechiae, but he reports no specific cases.

Case Report

E. C. K., a Korean man, aged forty, came to the dispensary April 2, 1948, stating he had been well until four days previously when he had developed a slight sore throat, coryza, anorexia and headache. Shaking chills and generalized malaise followed in twenty-four hours.

He had a temperature of 102° F., pulse rate 144, pharyngitis and petechiae on the ankles and wrists. He was admitted to the hospital with a tentative diagnosis of meningococcemia.

Pertinent physical findings after admission were as follows: There were numerous petechiae about 1 mm. in diameter about both the ankles and wrists. The petechiae did not blanch with pressure. The pharynx was moderately reddened without exudate. The liver border was palpated 1 to 2 cm. below the right costal margin and was not tender. The spleen was definitely enlarged, palpable 3 to 4 cm. below the left costal margin. It was not tender. A blood culture was taken immediately on admission, and 100,000 units of penicillin were given.

The laboratory findings on the day of admission were as follows: white blood cells, 4700; hemoglobin, 14.2 grams; 74 per cent neutrophiles, 18 per cent lymphocytes, 8 per cent monocytes. Examination of a blood smear revealed many malarial parasites. These were identified as plasmodium vivax by the parasitology laboratory. The urinalysis was negative. A nose and throat culture was negative for Neisseria intracellularis and showed many alpha streptococci. A blood culture taken on April second was sterile on the seventh day, and pour plates were sterile at seventy-two hours. The coagulation time was 1 minute and 30 seconds, and the bleeding time 4 minutes, on April 3. Prothrombin time was 16.2 seconds with a control of 14.1 seconds. The platelet count was 206,000 on April 6.

On the day of admission chloraquine was given with an initial dose of 1.0 gm., with 0.5 gm. in six hours, and 0.5 gm. on each of the two days following.

On the second day of his hospitalization the petechiae were generalized and the liver and spleen were noticeably tender. His temperature dropped to normal on this day and stayed normal throughout his hospitalization of six days. The pulse rate dropped to 80 per minute and remained at that level. The petechiae began to fade on the fourth day.

After the patient's discharge on the sixth day he was seen regularly in the dispensary. He felt somewhat tired but otherwise had no complaints. He took 0.5 gm. of chloraquine weekly for five weeks. He was last seen on May 25, 1948, fifty-seven days following the onset of his illness, and he had no complaints at that time.

Discussion

The patient was a forty-year-old physician from Korea who could not recall any case of malaria with petechiae in his country. He had left Korea to arrive in the United States six months prior to this illness. He spent six moths in Detroit and came to Minneapolis one week previous to this illness.

He gave a history of an illness at the age of eight, and it is his impression that it was malaria. He has had no illness since that time.

This case is presented because generalized petechiae are an unusual finding in malaria.

Summary

A case of tertian malaria with generalized petechiae was seen in a forty-year-old Korean physician who had been in this country six months.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY

Rochester, Minnesota

(Continued from the September issue.)

A physician of Rochester stated that in smallpox the emanations from the body of the diseased person were so heavy that they sank to the earth, whereas in scarlet fever the poison was so light that it permeated the atmosphere and one case might be sufficient to spread the disease over a whole city. From another source, a few years later, came the statement that smallpox was being scattered throughout the continent by thousands of buffalo robes that had been used by the Indians to cover the corpses of those among them who had died from smallpox.

There were warnings against too frequent bathing. Typhoid fever, in one statement, was ascribed to accumulations of old paper on the walls of rooms, where one layer upon another had been pasted for years. One editor decried the pernicious habit of backing infants around the streets in baby carriages as a cause of insanity in later life, and said that if the Creator had intended this way of amusing babies he would have located their faces on the other side of their heads. Another said that the majority of people who died from heart diseases were victims of congestion of the lungs also.

The danger of turning kerosene lamps low and of burning them all night was pointed out: "There is no doubt that the alarming prevalence of diphtheria of late years can be traced to this as one of the producing causes." Various prescriptions were published, evidently taken from other newspapers in different parts of the country, usually without giving credit, for the cure of diseases. One for use in diphtheria appeared in the *Rochester Republican* of February 18, 1863:

> Remedy for Diphtheria: Make two small bags that will reach from ear to ear, and fill them with hot ashes and salt; dip them in hot water and wring them out so that they will not drip and apply them to the throat; cover up the whole with a flannel cloth, and change them as often as they become cold, until the throat becomes irritated near blistering. For children, it is necessary to put flannel cloths between the ashes and the throat to prevent blistering. When the ashes have been on a sufficient time, take a wet flannel cloth and rub it with castile soap until it is covered with a thick lather; dip it in hot water and apply to the throat, and change as they cool; at the same time use a gargle made of molasses, in a teacupful of hot water, and when cool, add one fourth as much cider vinegar and gargle until the patient requires sleep. A gargle of castile soap is good to be used part of the time.

Rules of health were quoted from early medical publications, among them Trall's *Herald of Health* and Hall's *Journal of Health.* From the latter, from a list of ten rules on care of the eyes, comes the following: "Never pick any collected matter from the eyelashes or corners of the eyes with the fingernail; rather moisten it with the saliva and rub it away with the nail of the finger."

About Asiatic cholera, in 1866 one editor said, "We know of no better preventive for the cholera so much talked of but which we don't believe we can get here for a couple of years yet, at the soonest, than the following: 1. Never speak

or think of it. Banish it from your home and circle as a topic of conversation. 2. Be cheerful. 3. Be temperate. 4. Be cleanly. 5. Beware of whiskey and the Democratic party." As it happened, the only case of Asiatic cholera ever diagnosed in Olmsted County occurred in August, 1866, when the patient, an immigrant en route west, died at the City Hotel in Rochester. About the disease, in this period, a Winona editor said. "Don't get scared. If you get sick, go see an educated physician, and you will be in no more danger of dying than usual."

As to whisky, as early as 1862 the *Rochester Republican* warned against the pains and penalities consequent on the use of strychnine whisky that were becoming distressingly apparent in the streets of Rochester almost every day, and urged strong measures for the control of persons under the influence.

Scope of Medical Practice.—The early physicians were called on to give aid in all the ills of the day.

Highly annoying, in the earliest years, were the pestiferous prairie itch and sore eyes, and the sharp discomfort of harvest time that came with the binding of wheat by hand, before the days of mechanical binders. The wheat straw wore the finger nails of the workers down to the quick after a few days in the field, bringing acute pain and temporary disability. Some physicians recommended application of tannin or of a solution of alum to harden the fingers, but these remedies had little effect. Some farmers postponed the binding until night, when dew had softened the straw.

There were painful and crippling injuries requiring surgical treatment, which will be discussed later. There were fever and ague, the "dry, bracing climate" notwithstanding. "Yellow jaundice" was common. A true story runs that a visitor in Rochester in that early period wondered aloud what was wrong with the numerous saffron-colored persons he met at every turn; a Dutchman who overheard him said, "Dese am de yellow ganders." Coughs, colds, croup, catarrh and pneumonia were common. There were frequent, and often lethal, cholera infantum and cholera morbus and dysentery. In 1873, when there were many deaths among children from cholera morbus, the disease was described as "not unusually fatal." There were chickenpox, German measles and mumps, scarlet fever, the dreaded but accepted autumnal typhoid fever, and diphtheria and smallpox. Cerebrospinal meningitis took its toll; in 1870 Dr. Hector Galloway gave before the state medical society a detailed report of thirteen cases that he had observed in 1863 in Oronoco Township. Prior to 1872 epidemic diseases received such attention as the faulty knowledge of many of the practitioners and the lack of co-operation on the part of the laity made possible. After the establishment of the state board of health in 1872, and when the authority of the board in matters of public welfare had been increased, there came consistent study and attempted control of epidemic diseases, an undertaking in which all physicians were concerned.

In 1866 and later, hydrophobia broke out in different parts of the county, causing great loss among cattle and hogs, and among dogs, which were sacrificed in considerable numbers, either because they were affected or because they were under suspicion. At this time several persons suffered from an affliction that popularly was diagnosed as hydrophobia, but later was said by physicians of Rochester, "equal to any in the state," to be tetanus.

Trichinosis, variously referred to as trichinae and trichinae disease and trichiniasis, was a subject of editorial comment. The first item that has been noted in the Rochester papers appeared in March, 1866, and was headed "Diet of Worms: and We Do Not Mean the Diet That Bothered Luther." This was a facetious dissertation that ended, "There has never been a greater hoax or humbug

than the sensational articles about the trichina." Next it appeared that the disease was affecting the New York hog market seriously, and then came reports from the Federal Department of Agriculture, giving advice to farmers about the medical treatment of their hogs against all types of vermicular infestation. It was not until March 28, 1884, that the *Rochester Post* mentioned trichiniasis among human beings in Olmsted County, probably the first recognized occurrence of the disease in man in this region. A husband and wife and their six children, living in northern Olmsted County not far from Elgin, Wabasha County, had been attacked about six weeks earlier with "a severe and mysterious disease from which they suffered some time before the nature of it was known. They . . . called the Drs. Mayo [W. W. and W. J.] of this city, who at once pronounced it trichiniasis. The pork from which the family had been eating without cooking was examined through the microscope by the doctors and found to contain large numbers of the parasites." The mother died from the disease and it was expected that some of the children would not recover, as most of them were almost completely paralyzed. "The family removed to this state recently from Wisconsin, and it is understood that they brought the pork with them, so that there is not the least danger of the disease spreading. While there is probably no diseased pork in Minnesota, it will be best not to eat it without its being first thoroughly cooked."

In the first twenty-five years of the country's history, obstetrical work, except in the presence of recognized complications, was handled largely by midwives or by women who were neighbors of the patients. By 1880, chiefly in Rochester and the villages, physicians were being called more often to officiate at normal births. In the earlier period an occasional physician who was a member of the state medical society would report an obstetrical case or a gynecological case of special interest; some of the reports are preserved in the transactions of the society. By the early eighties, it is evident, the practitioners had better knowledge of these fields, and they were discussing at their official meetings, in addition to other conditions, postpartum hemorrhage, puerperal infection and peuerperal insanity.

The opening of the Second Minnesota Hospital for Insane at Rochester, in January, 1879, marked the beginning of a new and continuing interest on the part of the local general practitioners in nervous and mental diseases of all types. The cordial relations between these practitioners and the physicians of the hospital staff, and the active participation of the latter in due time in the work of the county medical society, led to broadening of scientific viewpoint.

Little evidence has been noted of special study of diseases of the blood in Olmsted County prior to the late eighteen seventies. In 1877 Dr. W. W. Mayo jotted brief notes in an old case book about a young girl of Rochester whom he was treating for purpura hemorrhagica. In the transactions of the Minnesota State Medical Society for 1878 appears his detailed report of the case, the second of the type in his experience, describing his method of diagnosis, which included microscopic examinations of blood and excreta, and his cure of the patient by rigid control of her diet and by administration of turpentine internally for more than a year. In his account the doctor took less credit than was given him sixty-eight years later by the patient's relatives, who said that after physicians from different cities in southern Minnesota had given the girl up to die, Dr. Mayo was called, with the result stated. The patient lived to the approximate age of seventy years.

As the eighties passed and as the nineties progressed, the physicians of Olmsted County were discussing at medical meetings, from changing points of view, a wide range of subjects. A few topics were, diseases of the blood, nephritis, cirrhosis of the liver, the pneumonias, asthma, rheumatism, heart disease and the uses of

digitalis, atrophic rhinitis, mastoid diseases, spinal disease, erysipelas and "facial poisoning," the intestinal diseases of children, leprosy, exophthalmic goiter, the therapeutic uses of electricity and, as will be shown, the diagnostic and therapeutic value of the x-rays and advances in the art and science of surgery.

Recorded Causes of Death Prior to 1900.—One estimable early physician, in reporting illnesses and deaths, used with great frequency the expressions apoplexy of the lungs, dropsy of the heart, and dropsy of the brain; when he performed tonsillectomy, he removed the "tonsil glands." In 1867 Dr. Galloway reported the death of a man in Cascade Township from glanders. When, in 1870, however, he described before the Minnesota State Medical Society his cure of glanders with carbolic acid, the disease having been transmitted from horse to man, the society resolved that the doctor should trace back to the animal from which the disease was contracted and should present the report in writing. In August, 1871, when a man died at Rock Dell after a bout of social drinking, Dr. D. S. Fairchild, of High Forest, and one of the Drs. Cross, of Rochester, performed a postmortem examination. They reported, "He died from an overdose of whisky taken on an empty stomach, which produced congestion of the brain and lungs and inflammation of the stomach, the two latter conditions causing death."

A list of the causes of death compiled from newspapers of Olmsted County prior to 1870 includes most of the pathologic conditions already mentioned in this paper as occurring in that period. Reference to the records of Olmsted County, beginning in 1870, has given the following causes of death, which are quoted here verbatim: No knowing disease, old age, died at birth, abortion, bastard, puerperal fever, croup, typhus, typhoid fever, bowel complaint, cholera morbus, cholera infantum, dysentery, bloody flux, defective bowels, inflammation of the bowels, stomach disease, cancer of the stomach, paresis, nervous fever, brain fever, congestion of the brain, scarlet fever, influenza, catarrhal fever, heart disease, cyanosis, pneumonia of the lungs, phthisis, consumption, ulcerations of the lungs, accident, general debility, and prostration. By the eighties the nomenclature was approaching standardization. Beginning in 1888, in addition to the foregoing causes of death, there appeared "Potts' disease of the spine," spina bifida, albuminuria, heart paralysis from overdose of Gelsemium, phthisis and exhaustion from chronic melancholia, epilepsy, erysipelas, sanguineous apoplexy, inflammation of the stomach, tumor, neuralgic affection of the sciatic nerve, and gallstones. The death from gallstones, in 1898, followed cholecystectomy.

Scope of Surgical Practice Prior to 1900.—In Olmsted County the advance in knowledge of surgical diagnosis and surgical technique and of anesthesia and anesthetic agents was more dramatic than was progress in the science of internal medicine.

Although in the ordinary course of practice there were occasions for bleeding, for excision of wens and other superficial growths, and for the setting of broken bones, the early major surgery was that of expediency. Many accidents occurred in the course of hunting, milling, lumbering, and especially in farming, after mowers, reapers, binders and threshing machines came into use. The earliest models of these labor-saving machines lacked protective devices, and as a result many farm workers were victims of accidents that necessitated drastic surgical procedures. There is record of trephination, crude débridement, amputation of mangled fingers and toes, and arms and legs, and attempted repair of injuries in thorax and abdomen. There were occasional crude attempts at plastic surgery.

Prosthetic surgery other than the use of peg legs and glass eyes was practically unknown.

Until the middle eighties medical ethics did not refuse the public the interest of reading occasionally about their neighbors' illnesses, accidents and, especially, surgical operations, and by the same token, about new equipment purchased by local physicians. If a member of the medical profession acquired an unusual instrument or therapeutic appliance, colorfully illustrated books or anatomical charts, an English gig or a Dexter side-spring phaeton or other vehicle, or installed a telephone (the drumhead type in 1879), or bought a piece of office furniture, the press described it in glowing terms: As when, on August 14, 1885, the *Record and Union* of Rochester announced that Dr. W. A. Allen had acquired a fine modern accessory for his office, "a beautiful and most convenient operating chair. It is upholstered in crimson morroco and is capable of being put into any desired position." From that period it is remembered that two able carpenters and contractors of Rochester, Mr. Nevin C. Pollock and Mr. William F. Riedell, built for local physicians and surgeons examining tables and operating tables of solid oak at twenty-five dollars each.

The best efforts of the press, however, were given to describing injuries and the surgical treatment carried out for their repair. One of the earliest of such operations reported was performed in December, 1860, by Dr. C. S. Younglove, of Rochester, on a citizen of High Forest who, in focussing a Sharp's rifle, shot himself: "The ball entered about the middle of the thigh, traveled along the leg and under the skin, severing some small blood vessels on the inside of the knee, and came out near the ankle making an ugly channel for itself." Under Dr. Younglove's care the man recovered. In August, 1865, Dr. E. C. Cross and his brother Dr. E. W. Cross had a notable case of gunshot wound. "The whole charge of the gun entered the person of Mr. B——— in the left side, passing from near the abdomen through to the hip and passing directly under the surface near the backbone. The surgeons decided to extract the charge by making an incision directly over the point where it lay. The operation was successfully and skillfully performed, the gun wadding, shot and fragments of clothing and several pieces of bone being removed from the wound. The patient bore the painful operation manfully, without the aid of anodyne of any kind, though feeling quite prostrated upon the completion of the operation." The patient lived.

During the early years the Drs. Cross, W. W. Mayo and Galloway were the surgeons of Olmsted County who carried out the greatest number of major surgical procedures. In August, 1869, for example, Dr. E. C. Cross, Dr. Mayo and Dr. Galloway amputated the left leg of a man fifty years of age for a sore that had existed, increasing in size, since the patient was ten years old. "The patient was put under the influence of chloroform and the operation was successful. . . . He is doing as well as can be expected" In 1878 Dr. Mayo, assisted by Dr. E. W. Cross, operated on a farmer whose arm had been injured in a threshing machine accident seven or eight months earlier. They removed the dead bone, shortened the arm and brought the ends of the bone together: "They used a new system of compression rubber bands instead of a tourniquet. . . ."

In the decades before there were local hospitals, patients who received surgical aid usually were operated on in their homes. By the seventies, in Olmsted County, Dr. Mayo and other surgeons of Rochester had begun to utilize rooms in local hotels for operating rooms and for postoperative care of patients from out of town. Beginning in the eighties Dr. Mayo had for several years a small hospital

of eight or nine beds in the home of a practical nurse in north Rochester,* where the Samaritan Hotel now stands. As he extended his surgical frontier in answer to conditions of emergency, there were editorial notes on various procedures: drainage of thoracic abscess, tracheotomy (on a child who had had diphtheria), amputation of the breast for cancer (the patient a woman eighty-three years old), removal of submaxillary blood tumor, repair of rectocele, and removal of ovarian tumor. About the last named, it is true, the accounts stressed chiefly the size and weight of the growths removed. In Minnesota, between 1874 and 1880, ovariotomy was done only ten times and only twice successfully. In December, 1880, after designing the necessary surgical instruments and having them made by the patient's husband, a local blacksmith, Dr. Mayo performed his first operation for excision of ovarian tumor and the first of the kind to be performed in Olmsted County. He was assisted by Drs. J. E. Bowers, as anesthetist, and S. W. Gould, both of Rochester, and G. B. Ayres, the professor of anatomy and clinical surgery at the Omaha Medical College of Nebraska; Dr. Ayres had been an early student of medicine under Drs. Galloway and Sanborn, in Rochester. The ovarian tumor removed weighed eighteen pounds: ". . . after removing the tumor there was a large abscess ruptured in the abdomen and two quarts of matter ran among the intestines. It had to be carefully removed with a soft sponge. This and to stop the bleeding took twice the length of time as to remove the tumor. The woman was over an hour under the influence of ether. . . . This operation and its success place Dr. Mayo among the first surgeons of the state."

With the entrance of Dr. W. J. Mayo into practice, in 1883, there was for a time editorial mention of surgical operations in new fields, among them removal of cataract, removal of an upper left jaw for cancer, correction of stenosis of the esophagus that had resulted from swallowing lye, orthopedic procedures, plastic operations on the face (one of these procedures was the creation of lips and nose on a child of three months, at Spring Valley, because of congenital deficiency of those parts), opening of a large renal abscess, procedure for correction of strangulated hernia, excision of a diseased portion of bowel for tumor or abscess and uniting of the sound ends of the intestine, and operations for "inflammation of the bowels." After the coming of Dr. C. H. Mayo, in 1888, the field was extended to include many other operations, including plastic and orthopedic and, particularly, operations on the thyroid gland. It is believed that Dr. W. J. Mayo, fresh from the teachings of Dr. Donald MacLean, professor of surgery at the University of Michigan, and later taught by Dr. Arpad C. A. Gerster, of New York, was the first in Olmsted County consistently to apply listerism. From the beginning, the surgical work of himself and his brother was carried out on principles of asepsis and antisepsis.

Although some practitioners of Olmsted County early accepted asepsis and antisepsis, there were many others who were slow to do so. Reminiscence has given sidelights on surgical practices long since discountenanced. A certain general practitioner of Rochester for some thirty years, beginning in 1885, no doubt was typical of many. The doctor pulled teeth "without pain," first washing out the patient's mouth with some preparation that tasted like carbolic acid, an old-time patient of his has said, a solution so strong that it nearly blistered the oral membranes and left them sensitive for days. For goiter he gave iodine internally and injected hot water and carbolic acid into the thyroid gland. In treatment for pneumonia he used linseed meal poultices and a pneumonia jacket.

*In the earlier decades of Rochester the large portion of the city that extended far north of the Original Town (so designated on an official map of 1874), which ended approximately at what is now Sixth Street, N. W., commonly was called "North Rochester." East Rochester was the official name of a portion, now in the southeastern section of the city, that lay east of the southern portion of the Original Town. Comparable designation was not given, it is believed, to the gradually developing western portion of the city.

Like many of his contemporaries in the eighties and nineties he performed a limited number of surgical operations in his office, among them an occasional amputation of the breast, and the last type, certainly, in a manner impressively casual. One day when he was in the midst of amputating a breast for cancer he needed help, and, leaving the patient, who was under general anesthesia, unattended on the operating table, he went to another building to seek a young businessman who sometimes lent him a hand. When he returned with the helper, the patient fortunately was still safely on the table. The doctor dissected out the breast, reached up on a shelf for a roll of gauze, tore off a length and stuffed it into the wound. During closure of the wound he happened to drop his needle and thread on the dusty floor, picked it up and went on sewing. Some time later, when the assistant inquired apprehensively how the patient had got along the doctor said, "Oh, she is doing all right."

By the middle eighties detailed references in the public print to the work of individual physicians and surgeons had become few and brief. When practitioners were mentioned in the papers, it was to state that they had attended medical meetings, had read papers before medical societies, had been elected to office in the societies, or were members of boards of health, local or state.

There were, however, a few exceptions to the tacit rule governing publicity. When St. Mary's Hospital† was projected and when it was opened, on September 30, 1889, the local papers gave it much space, and rightly, for there began with this hospital a new era of medical and surgical care of the sick in the county. Again, on September 12, 1895, there appeared in the *Olmsted County Democrat* the following note: "Caesarian Performed at St. Mary's. This is a very rare circumstance and there are very few cases of it on record in the country. All of the medical fraternity will be interested in the case, and it was very unfortunate that the neighboring physicians could not be informed in time to witness the operation. Another striking thing about it is that both mother and child are doing well." (The operation was performed on Mrs. Le B——— on September 6, 1895.) On March 6, 1895, the *Rochester Post* reprinted an article, "The Ray of Mystery," by George Grantham Bain, which had appeared in the *New Yorker* of February 28, 1896, from which one sentence is given here: "Probably no such popular furor for a purely scientific discovery was ever excited before as has grown out of exploitation of the new photography with the aid of the X-ray or Roentgen Ray, as it is popularly known." The x-rays had been announced to the world by Roentgen in 1895. In Olmsted County young Dr. J. Grosvenor Cross was the pioneer in making clinical application of roentgenography. He assembled a workable apparatus and after much study and experimentation was able to display before the Olmsted County Medical Society in January, 1896, and before the Southern Minnesota Medical Association in August, 1896, successful pictures of the hands of a living subject. The local newspaper in reporting these medical meetings stated that Dr. Cross's confreres had expressed great interest and pleasure in the demonstrations. Soon there was record in Rochester of the location with the x-rays of foreign bodies that had been swallowed or that had become embedded in bodily tissues. A few years later certain physicians of the county were reporting the beneficial results of roentgenotherapy in treatment for cancer.

Throughout the eighties and nineties the scope of surgery as practiced in the county continued to broaden, until by 1900 there were few, if any, procedures performed elsewhere that were not carried out successfully by the local surgeons.

†A brief history of the hospital is given elsewhere in this paper. Originally the name of the hospital was spelled "St. Mary's"; in recent years the apostrophe has been dropped. In this account the early form is used throughout.

The Drs. Mayo, of Rochester, because of superior facilities for work and for graduate study, and because of their recognition of need and opportunity, were leaders in this work.

Public Welfare

The earliest example of extra-home care was, no doubt, the relief and maintenance of the sick poor, always by local agents. The abating of nuisances injurious to health and comfort early followed, and there was quarantine against smallpox and other contagious diseases. The Minnesota Code of 1851 authorized justices of the peace, village trustees and city councils to exercise these functions. The General Statutes of 1866 made the supervisors local boards of health.

William Watts Folwell, *A History of Minnesota,* 1921, iv, 413.

Olmsted County, as stated earlier, was established by the territorial legislature on February 20, 1855. Within the next few months the county government was organized in accordance with territorial legislation, in the interest of public welfare. Supervisors of the poor were appointed and registration of marriages was instituted in 1855. Four years later the office of coroner began to function, preceding by several years the activity of county physicians and special health officers.

The County Coroner.—In Minnesota the elective office of county coroner was established by territorial legislation in 1849. Until 1854 the law authorized any justice of the peace or judge of probate, on occurrence of a death by violence and in the absence of the coroner, to appoint a suitable person as deputy coroner. Amendments, in 1854 and in 1871, improved the functioning of the office by more formal appointment and instruction of deputy coroners. In most localities for a decade or more after 1849 the coroners were laymen; the term of office, originally two years, in 1913 was extended to four years.

On January 4, 1859, the first coroner of Olmsted County, Abram Harkins, of Viola Township, was appointed by the county supervisors. In the autumn of that year the office was filled by the election of Stewart B. Clark, of Rochester, who served his full term, it is believed. Information is lacking about the coronership in the ensuing four years. There is some evidence that in 1865 D. L. King, of Kalmar Township, served for a time either as coroner or as deputy. In the autumn of 1865 Dr. Hector Galloway, of Rochester, was elected coroner.

An item from the *Rochester Republican* of January 31, 1867, to some extent lightens the obscurity of the earlier records:

County Coroner: Within the last year and a half several cases have arisen in this county especially requiring the services of a county coroner. Two or three infanticides have occurred in the city in the time referred to, involving, of course, guilt and criminality. For the one year chronicled, these outrages have been allowed to pass without investigation and the community is allowed to settle down into the belief that killing infants and casting their little bodies into the river is not very reprehensible after all.

The sudden death of Mr. Delano [Clark Delano, marble dealer, a suicide] last week suggested anew the necessity for the services of a coroner. The coroner is a county officer and we believe that Olmsted County has promptly elected a person to that office every other year since we have been a resident of the county. But the trouble is, those who have been elected have failed to qualify and serve in that capacity, and we more than suspect that this failure is attributable in some degree at least to the fact that the county commissioners have declined voting a reasonable compensation.

(To be continued in the November issue.)

President's Letter

THE COMING MEDICAL MEETINGS

DOCTORS who have vacationed themselves into a state of healthful relaxation are looking forward eagerly to the fall and winter schedule of medical meetings and their contingent opportunities for scientific advancement and comradeship with fellow doctors.

Two excellent meetings—those of the Northern Minnesota Medical Association and the Southern Minnesota Medical Association—were held last month, opening a season that will include state, national and international conferences of exceptional merit.

One large specialty group will be assembling next month: the Third Inter-American Congress of Radiology is taking place in Santiago, Chile, November 11 to 17.

Many another session will be heralded in MINNESOTA MEDICINE and the *MSMA Newsletter* so that doctors will be apprised of meetings abroad, and no further away than the University Continuation Center or County Medical Society assembly places.

Medical meetings serve another purpose, too, in these critical times. It is essential for all of us doctors to understand thoroughly the problems that we are facing, problems which not only affect our professional standards, but the lives and health of all our patients.

As we consider these philosophies and movements and the trend of events, we come to see the entire picture with forceful clarity. Because we are thinking together, with common motivation and objectives, we are able, as a profession, to make the most constructive moves on behalf of our patients and ourselves.

President, Minnesota State Medical Association

HYPERTENSION AND SYMPATHECTOMY

THE GENERAL practitioner and internist are frequently called upon to advise patients with elevated blood pressure. When, if ever, should he advise a dorsolumbar sympathectomy in preference to medical treatment?

The operation of sympathectomy is a serious operation which sacrifices part of the reflex nervous system, is frequently accompanied by serious symptoms of shock postoperatively, often prolonged convalescence associated with neuritic pains, and orthostatic hypotension requiring bandaging of legs and abdominal support for weeks and sometimes months following operation. It would seem that such a procedure should not be undertaken unless the symptoms warrant and unless the results of the operation are likely to relieve the symptoms for a long enough period to be worth while.

Evelyn et al have analyzed 292 of the sympathectomies performed for essential hypertension at the Massachusetts General Hospital during the past thirteen years. Of the 292 patients, 219 were living and seventy-three dead. The authors were able to carefully check 114 of the patients for comparison of blood pressures before and after operation, and found an average reduction of systolic pressure from 177 to 152 and diastolic from 116 to 100 with the patients lying in bed. They found that the common pattern was for the blood pressure to go down after operation and to remain down for a year or two and then, for many, progressively to return to preoperative levels. In a surprisingly large number of patients, however, the operation had little or no effect on either systolic or diastolic pressures. The striking reduction in blood pressure in the erect position encountered in some patients postoperatively tended to disappear at the end of a year.

The authors were able to study 100 patients who had been operated upon by the Southwick technique (removal of the ganglia from the 8th to 10th dorsal to the 1st or 2nd lumbar, inclusive) for as long as five years. They found that satisfactory results, as measured by lowering of blood pressure, had been attained in approximately two out of five patients two years after operation and in approximately one out of five after an interval of five years. While these results may not be impressive, the authors feel that the excellent results attained in a small percentage of cases cannot be equaled by any other available treatment.

What can be expected from medical treatment of hypertension as regards life expectancy? The answer, of course, as any life insurance company will verify, is that hypertension on the average reduces life expectancy. When it comes, however, to evaluating the life expectancy of an individual with hypertension several factors come into consideration. There is essential hypertension with little or no evidence of vascular degeneration or kidney involvement which is comparatively benign. And there is rapidly mounting hypertension with eye background hemorrhage and edema of the disc and evidence of severe renal damage, commonly known as malignant hypertension. The prognosis for the benign type is very favorable while that for malignant hypertension is very bad. Furthermore, individuals who develop hypertension after the age of fifty, as a rule, nearly reach their life expectancy. Hypertension, even of extreme degree in elderly people, especially if associated with relatively low diastolic pressure, the result of arteriosclerosis, does not carry with it as unfavorable a prognosis as in the younger group under fifty. According to Burgess,[1] hypertension even of excessive degree that has been present eight years or more and is not associated with well-established cardiac or venal disease usually does not indicate a poor prognosis as to life expectancy. Such hypertension, according to him, does not commonly develop into the malignant type. The most common causes of death in this group are cardiac failure and cerebral accident. Also, according to this author, hypertension of this comparatively benign type, even when making its

appearance before the age of fifty, is comparable with a considerable number of years of life, although life expectancy is materially reduced. He believes sympathectomy is therefore questionable in this group.

It would seem, then, that medical treatment with sedatives, a rest period during the day and at least nine hours of rest at night is unquestionably the treatment for benign hypertension irrespective of age. The physician must not be guilty of overemphasizing to the patient the importance of the hypertension but should watch for a sudden change in the picture with appearance of evidences of degenerative, vascular changes and headaches. Before this evidence becomes too marked, if the pressure is labile and responds to sedatives and rest, especially if the patient is under the age of forty, sympathectomy should be seriously considered.

Even in the presence of marked evidence of degenerative vascular changes, as evidenced by retinal hemorrhage and albumen with occasional casts in the urine, sympathectomy, according to Rogers and Palmer,[3] may be brilliantly successful. On the other hand, in the presence of marked impairment of renal function or frank heart failure, the operation is contraindicated.

Even though sympathectomy results in satisfactory lowering of blood pressure, which is sustained for two years in only two out of five patients operated upon and for five years in only one of five—and probably even that favorable a result is not obtainable if operation is limited to the more advanced cases—nevertheless, if several years of life with relief of symptoms can be added even in a small percentage of cases, sympathectomy is the best therapeutic means at our disposal.

We wish to emphasize however that individuals with hypertension even of considerable degree but without evidence of cardiovascular change beyond increased light reflex in the retinal vessels and slight albumenuria, will do well as a rule with medical direction and should not be subjected to sympathectomy.

CORTISONE AND ARTHRITIS

PHYSICIANS receive queries from arthritis patients as to Cortisone, also known as Compound E, the new "cure" for arthritis, which has received considerable publicity.

The answer is that the use of Cortisone is still in the experimental stage, the supply is very limited, the cost, like all newly developed extracts, is very great, and it is not on the market.

According to an article in the September issue of *Hygeia,* Cortisone is a hormone which was first extracted from the suprarenal glands of cattle by Dr. Kendall of the Mayo Clinic in 1935. Production of a sufficient amount for experimental work with Navy fliers at high altitudes was obtained by 1948. By that time the interest of the Navy had waned and the extract was made available to Dr. Hench of the Mayo Clinic for trial in patients suffering from rheumatoid arthritis. Dr. Hench reasoned that the remissions in the disease which sometimes occur during pregnancy and jaundice might be due to an increased production of some antirheumatic substance in these two conditions and that it might come from the adrenal glands. Bilirubin, it seems, contains many of the chemicals found in the suprarenal secretion. The trial proved successful in a necessarily limited number of patients with rheumatoid arthritis. Daily injections seem to be required for maintaining the improvement in symptoms.

A further approach to the research in rheumatic disease is the extraction of a hormone from the anterior pituitary gland of animals, called ACTH, which has an effect similar to Cortisone. The production of ACTH is also limited. Cortisone is at present extracted from animal bile, and the process is an expensive one. If and when it can be produced synthetically, its lower cost will allow more extensive trial.

E. T. BELL FUND

UPON the retirement of Dr. E. T. Bell, Professor of Pathology at the University of Minnesota on June 15, 1949, steps were taken at the suggestion of many of his admirers to raise a fund of $100,000 to establish and maintain a Museum of Pathology in the Medical School for teaching purposes.

Dr. Bell has served the Medical School since 1910. He first taught in Anatomy and from 1911 until 1949 in Pathology. Since 1921 he has been

chief of the Department of Pathology. During this period he has made valuable contributions to the science of pathology and has made his influence felt through his teaching and writing. Through his co-operation and his personal qualities he has endeared himself to many graduates of the Medical School and to practitioners throughout the state. It seems fitting that a Museum of Pathology should be established through voluntary contributions by his many friends.

Contributions have been received during the summer months and the campaign will be continued throughout the next year when it is hoped the goal will be reached.

Contributions designated for the E. T. Bell Fund should be sent to the Minnesota Medical Foundation, at 132 Medical Sciences Building, University of Minnesota, Minneapolis 14, Minnesota. Some confusion may have arisen with regard to the relationship of the Minnesota Medical Foundation to the Greater University Fund. The Medical Foundation has to do with contributions for medical school activities and formerly handled collections independently. Now the greater University Fund, which is concerned with donations for University activities at large and serves as a public relations agency, has placed its office facilities at the disposal of the Medical Foundation. Donors to the E. T. Bell Fund of the Medical Foundation will be listed also as donors to the Greater University Fund.

Since Dr. Bell's retirement in June, he has devoted himself to research in pathology at the Medical School.

ANTIHISTAMINICS—A WARNING

AN ARTICLE which recently appeared in *The Journal AMA** issues a warning that the antihistaminic drugs are not innocuous, and should be handled with respect.

Many antihistaminic drugs have been offered for the treatment of hay fever and other allergic conditions, which in itself indicates that none has proved 100 per cent efficacious. Untoward side reactions such as drowsiness, vomiting, diarrhea and headaches occur frequently and are doubtless sufficient to cause the patients to discontinue the medication of their own accord.

In the case reported in the article mentioned, a baby sixteen months old died from an acute kidney damage after taking one 100 mg. tablet of Thenylene. Another case is cited of convulsions in a child produced by the same drug. Prompt gastric lavage was credited in saving the child's life. In a third case cited, toxic gastrointestinal symptoms and hematuria resulted in a child three years old from taking 320 mg. of Benadryl over a three-day period.

The significance of the report is that the antihistaminic drugs should not be given to children and should not be left within their reach. Gastric lavage should be promptly initiated in case even one tablet is ingested. Adults should be instructed to discontinue the antihistaminic at the first appearance of an untoward reaction. Dosage should be limited to the minimal amount required to alleviate symptoms, and medication should not be prolonged longer than necessary.

A PSYCHIATRIST LOOKS AT COMPULSORY HEALTH INSURANCE

Good health for Americans is a goal upon which agreement is general. While the physician's professional concern with this goal does not lead him to consider himself as the sole instrument for its realization, yet wisdom about it should be most available to him. Human motivations and personality will finally determine the outcome whatever the plan. No system can function at a higher level than the people who participate in it. Congress cannot legislate a result; it can only legislate a plan. Regardless of the broad humanitarian objectives of the plan, if it is not geared to the motivational factors in American behavior it will be unsuccessful.

On this premise let us examine the personality needs and motives involved in a proposal for compulsory health insurance. This can be best approached by contrasting the present with the proposed situation. The first basic change involves simple arithmetic. There are two participants in the present medical relationship, the physician and the patient; three in the proposed situation, the physician, the patient and the government agency. Psychiatric experience, psychological experimentation and common knowledge agree that the greater the number of relationships the greater the complexity of problems. A person to person relation involves one major interpersonal variable. A three person situation involves three interpersonal variables and three reactions to the interaction of the two other persons—a total of six variables. This represents a six-fold increase in complexity. When we are dealing with three groups, interrelations of astronomical proportions develop.

Now let us contrast the probable motivations involved in the present medical situation with those in the compulsory health insurance proposal. Our present system includes primarily: (1) A patient who is at-

*Rives, Hugh F., Ward, Berl B. and Hicks, M. L.: A fatal reaction to Methapyrilene (Thenylene). J.A.M.A., 140:1022, (July 23) 1949.

tempting to regain or maintain adequate health. This patient's economic security, self-esteem and social prestige depend on a successful outcome; (2) a physician, who personally or by professional referral, is in a favorable position to help. The physician's self-esteem, economic security, social prestige and altruistic needs are directly dependent upon how adequately he can help. Thus both the patient's and the physician's motives converge toward the therapeutic goal. Both persons are anxious to relieve the health problem. The likelihood of favorable results is maximal.

Patients' Motivations

Contrast the present situation with the probable result of the compulsory health proposal. (1) The patient will view the physician as a public servant who has already been paid for his services and who is hence obligated to treat even a non-significant problem; (2) he will tend to feel that his deducted taxes need to be repaid in some way and will insist on being repaid. This will probably result in unnecessary calls, overly long illness disability and hostility toward the government agency and the physician when efficient termination of disability is attempted; (3) the patient is likely to develop a strong dependency relationship with extravagant expectations for help and extreme annoyance at failure. In our culture the emphasis upon self-reliance, and personal initiative makes the dangers of dependency greater than elsewhere. Dependency is generally disapproved here, and in any society results in deterioration and refusal to accept responsibility.

While the foregoing can be inferred from the motivational analysis we need not depend exclusively upon this reasoning. Experience in Great Britain, Germany, the U. S. Armed Forces and Veterans Administration demonstrate that the patients' motivations work in this fashion. These experiences demonstrate that the patient (1) makes unnecessary and picayune demands for attention; (2) has excessively long and frequent minor illnesses and disabilities; (3) becomes excessively and inappropriately critical of medical and governmental service with resultant loss of faith in the physician's ability to cure his illness.

Physicians' Motivations

Now let us examine the probable shift in the physician's motivations. Currently he is concerned with professional and therapeutic adequacy for reasons of self-esteem, social prestige, economic security and personal service. Currently he deals with a patient who attempts active co-operation for much the same reasons. The satisfaction of both persons depends upon their ability to solve the therapeutic problem. Under compulsory health insurance the physician's motivations would be shifted: (1) He will be dealing with a patient whose demands have become picayune and excessive; whose co-operation is reduced and whose hostility has increased. The physician can legitimately be expected to have less interest in the patient just because of these changes; he will also have less time for the patient's real problems. The physician may also be expected to develop a reactive hostility with a further deterioration in therapeutic adequacy; (2) supplementing the foregoing basis for "the brush-off" the physician would have an added incentive under (a) a salary system, to do as little as possible for the greatest financial return or, (b) under a per capita system, to see as many patients as minimally as possible for the maximal financial return; (3) since the physician's responsibility is no longer directly to the patient he would tend to feel less keenly than he now does the need for complete adequacy; (4) since the physician would no longer be completely responsible for the patient, but would share responsibility with a government agency his personal pride in professional excellence would tend to diminish; (5) since the incentive system to which our present generation of physicians is accustomed would be grossly changed they would be less adequately motivated; (6) an intense resentment of the noncreative possibilities of their work, the minor complaints and hostilities of their patients, the irksome dependency and submission to a government agency, and the lowering of the prestige level of the profession might be expected to develop; (7) the high type of person drawn to medicine by our present incentives of humanitarian service, social and self-esteem, and economic adequacy might no longer choose the medical profession. This change would result from the poorer quality of performance possible, the tendency of government to underpay public servants, and the lack of opportunities for personal initiative and gratification under government service. Hence the intellectual and personal qualities of newer doctors would probably be lower than the present levels.

The foregoing psychologically derived observations about physician motivations have also been demonstrated by experience. Various U. S. publicly supported and managed programs, and foreign governments with compulsory health insurance have found: (1) that the quality of medical service deteriorates; (2) that the physician substitutes for the development of clinical maturity a tendency to blame others and shift responsibility; (3) that the physician tends to reduce his adequacy of treatment of all patients for both practical and motivational reasons; (4) that hostility toward both the government and the patient develops with a consequent loss of personal satisfaction and professional effectiveness. All of these factors are reflected in a higher cost of and lower quality of medical service.

Government Agency Motivations

The third group whose motivations complicate the compulsory health insurance picture is the administering governmental bureau. The phenomenal growth of government bureaus in the past few years, and the tendency for each to expand its activities and personnel illustrates part of the problem from this area. The sheer clerical work added to the doctor's already overloaded program would be a source of disruptive irritation. Beyond this, the desire of non-medical administrators to run things would tend to harass and antagonize physicians. This would further facilitate a deterioration in the physician's sense of responsibility and capacity for quality service. Experience with non-medical administrators of health problems has shown that their lack of capacity to understand the ramifications of the problems and their desire to usurp control leads to restrictive interfering rules

and red tape. These inevitably result in deterioration of service. At the same time the physician subjected to these controls develops some apathy about his own adequacy and permits his service to deteriorate because he is unable to do anything about it. Dependency feelings may be expected to develop in physicians under these circumstances. He is no longer a responsible, self-reliant individual because the agency shares the control of the patient.

Cost of Service

Finally, the motivational problems discussed would have a direct and extreme effect upon the cost of service. With increase in patient demands, decrease in patient cooperation and deterioration of physician service we might expect a situation of rising medical costs and deteriorating medical service. The increased costs would constitute an additional motivational hazard for both physicians and patient. Both would be frustrated by the increasing discrepancy of service and cost.

This situation has also been demonstrated in countries which have adopted compulsory health insurance. In Germany between 1885 and 1939 the cost of insurance per member multiplied eight times. In New Zealand the cost has risen from less than $8 million in 1942 to $20 million in 1947. One can maintain that these increased costs are equally shared, but the stated objective of compulsory health insurance is to help people avoid the disastrous economic effects of illness, not to bring equal disaster to everyone.

In summary it appears on motivational grounds that the complexity of health problems would be increased, that disabling sickness would be prolonged, that the quality of medical service would deteriorate, that personal satisfaction and clinical maturity for the physician would be reduced, and that the progress of medical science would be slowed as a result of compulsory health insurance. Whether this deteriorated and inflated medical service would become more widely available can be evaluated on similar grounds.

The foregoing contrast has somewhat over-idealized our present system of medical services. That there are plenty of contemporary problems is quite apparent. These defects are now being remedied, however, by the adoption of voluntary health insurance, by improved medical education and quality of services, and a better distribution of physicians.—Franklin G. Ebaugh, M.D., in the *Rocky Mountain Medical Journal,* May, 1949.

COMPULSORY HEALTH INSURANCE AS A PARTY ISSUE

It would be unfortunate if Compulsory Health Insurance were to be made a party issue by either the Democratic or Republican parties. There is no evidence of a popular demand for the proposal, and it is safe to say that hundreds of thousands of members of both parties are violently opposed to it—so much so that the issue would influence their vote.

The Democratic National Committee was severely criticized by one of its own members, Dr. R. B. Robins of Camden, Arkansas, a committee member, at a committee meeting held in Washington, August 24, 1949, for its support of agitation for Compulsory Health Insurance.

Dr. Robins said, in part:

"The Democratic party is *not* on record in its party platform as favoring Compulsory Health Insurance. At the Philadelphia convention last year, the Democratic party announced support of a National health program for expanded medical research, medical education and hospital and clinic facilities. This does not constitute endorsement or recommendation of Compulsory Health Insurance.

"The Compulsory Health Insurance issue is a bad penny that turns up every few years. It has never obtained sufficient support to merit incorporation in the platforms of either of the major political parties. It has never obtained sufficient support to be legislated in Congress.

"The reasons for its weakness are apparent. In every large nation where government medicine has been attempted, there has been a decline in the quality and quantity of medical services and an increase in their cost. Only borrowed American dollars prevent its utter disintegration in these same countries today.

"Admittedly, some way must be found to take the financial shock out of illness. Voluntary Health Plans are one answer. The proof of this is the rapid growth of these plans. More than 60 million Americans are now insured against the expense of major illness through these plans. They are not yet perfect, but they are being improved all the time, both as to range of coverage and benefits.

"There is a wealth of factual material, including a study by the impartial Brookings Institution, in support of the argument that the voluntary way is the best way to meet the need for budget-basis medical care.

"Not only are hundreds of thousands of physicians and dentists opposed to government-controlled medicine, but there are more than 1500 civic, service, veteran and other organizations, with memberships totaling millions, that have gone on record against it.

"Do we (the Democratic party) want to serve notice on these millions that they are not wanted by this party because they have gone on record against socialized medicine? Compulsory Health Insurance is repugnant to the ideals and convictions of the American people."

NEW MEDICAL JOURNAL

A new journal entitled *Angiology, The Journal of Peripheral Diseases* will begin publication in February, 1950. Dr. Saul S. Samuels, chief of the Department of Peripheral Arterial Diseases, Stuyvesant Polyclinic, New York, will be editor-in-chief. Among the associate editors will be Dr. Alton Ochsner of Tulane University; Dr. Keith Grimson of Duke University; Dr. Leo Loewe of Long Island Medical College; Dr. D. W. Kramer of Jefferson Medical College, and Dr. Gerald Pratt of New York University Medical School.

The new journal will be published by Williams and Wilkins Company, Baltimore.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

STATE SHIFTS OPINION ON HEALTH INSURANCE

If Minnesotans had been given the responsibility, early in 1949, of deciding whether the United States should have compulsory health insurance, the Minnesota Poll indicates that they would have immediately deeded over medical care to the government.

That was in February.

The February 20 issue of the Minneapolis *Tribune* reported the results of the poll thusly:

"President Truman's proposal for government tax supported national health insurance is favored by a majority of Minnesota residents. . . . Almost two in every three adults in addition feel that such a program is needed."

The table of percentages showed that 40 per cent of the state's population had replied "yes" to the question of "Do you think national health insurance is needed in the United States?" Only 4 per cent thought people should take care of themselves and another 4 per cent asserted that private health insurance could do the job. Oddly enough, the same percentage—again 4—thought that "it's too socialistic."

A second report of the survey, published in the February 27 issue of the *Tribune*, began with these words:

"Fully two-thirds of Minnesota's adults feel that lack of money keeps people from getting doctors' care or hospital treatment when they need it. . . . Whatever the reasons, the opinions are important insofar as they shed light on the prevalent attitude among Minnesotans in favor of a government tax-supported national health insurance program."

"Only One-third Aware"

An interesting sidelight in this survey was the fact that only about "one-third of the persons interviewed were aware of the American Medical association's opposition to the kind of national health insurance advocated by President Truman and Security Administrator Oscar Ewing."

Three months later, Poll directors evidently were aware of a change in Minnesotans' thinking about medical care and the payment of medical and hospital bills. The survey was repeated, with people again given their choice between federal and private health insurance.

It was found that 48 per cent of the adult population preferred a private health plan; 28 per cent still favored government control.

"These are among the answers of people who would rather have private health insurance," stated the poll summary:

"'I'm against the government setup on medicine'; 'I believe in private industry'; 'I'd rather do my own deciding on doctors'; 'we have private insurance now and we're satisfied with it'; 'we'd get better service'; 'the federal plan would involve too much regimentation'; 'a private physician out for hire would give patients better care'; 'the federal plan would eventually mean less medical advancement because it would take initiative away from the doctors'; 'it would put too many insurance companies out of business'."

Change of Mind

The most recent survey made by the Minnesota Poll was published August 10. This time people were asked if they would like to see a program of health insurance, similar to that in England, adopted in the United States.

Here are the heartening results:

	All	City	Town	Farm
Yes	29%	31%	22%	27%
No	*53*	*53*	*55*	*53*
Qualified	5	5	6	2
No opinion	13	11	17	18

British Company Fights Socialization

Great Britain's biggest sugar company, is providing an example of persistence and strategy that is an innate criticism of the British medical profession, which with the health and well-being of all England at stake, still yielded to government control with scarcely a struggle.

Tate and Lyle, preparing to defend to the last

cube its right to operate as a private business, according to *Time* magazine, had "On the 2,000,000 cartons of sugar it sells daily . . . printed: 'Keep S Out of State'; 'Tate, Not State'; 'Untouched by Hand—Hands Off Sugar.'"

AMA COUNTS HEALTH POLICY HOLDERS

The Survey Committee of the AMA Council on Medical Service has just completed a study of the number of persons covered by the various forms of voluntary accident and health protection in the United States (as of December 31, 1948).

The findings show that 60,995,000 persons have hospital insurance; 34,060,000, surgical; and 12,895,000, medical.

Blue Cross plans and plans sponsored by medical societies head the list, accounting for 31,246,000 of the individuals covered by hospital insurance, 10,608,000 of those cushioned against surgical expenses, and 5,712,000 of the persons whose budgets are insulated with medical insurance.

"It will be noted that over 93 per cent of the hospital expense coverage and virtually all of the surgical and medical expense coverage effected through these organizations was added during the past ten years."

So reads the Committee report, entitled "A Survey of Accident and Health Coverage in the United States."

SEVENTEEN CONGRESSMEN TO STUDY HEALTH PLANS

Serenely indifferent to official and unofficial protests about the high cost of transporting congressmen, seventeen members of the House Interstate and Foreign Commerce Committee spent September in Europe, looking over the various forms of nationalized medicine and considering civil aviation and petroleum problems.

The reported itinerary was: five days in the British Isles, three in Sweden, a day in Frankfurt, a day in Geneva and two days in both Rome and Paris.

Meanwhile at home, the public, apprised that it cost $25,000 in tax money to fly a group of senators in a military transport from Cairo to Tokyo, was taking a dim view of most congressional and other tax-supported travel programs.

BROOKINGS INSTITUTION MAKING SECOND SURVEY

The Brookings Institution, impartial fact-finding group, has begun its second survey of medical and hospital care in the United States.

The Brookings prospectus of the study states, in part:

"If we are to have a sound national health program, the first requirement is to ascertain the facts as to the state of medical service in the United States today. For a comprehensive picture of the availability of medical care in the United States, both private and public organizations should be covered. These would include medical services provided by industry, trade unions, medical societies, philanthropic and fraternal organizations, national health associations, group health and other voluntary prepayment plans, state and federal medical aid programs, including the veterans and the armed forces, and industrial and commercial insurance."

The findings are expected to extend into two volumes: "The first part of the study would be a comprehensive, descriptive and statistical report designed to make available reliable data on the extent of medical care and the existing and potential provisions for meeting the cost through insurance or prepayment plans, and, in the case of those who cannot pay, through public services or private philanthropy. The second volume, based upon the facts assembled in Volume I, would be an evaluation of the numerous plans now in operation and those proposed. It would deal with the issues of public and private policy and indicate the means by which adequate medical care can best be provided."

The last survey on medical care that the Brookings Institution made was published in April, 1948, entitled "The Issue of Compulsory Health Insurance."

In the preface, the Institution pointed out that the survey had been made in response to an invitation by Senator H. Alexander Smith.

"The request was made in May, 1947, and if the results were to be of service to the Committee, they had to be available early in 1948. Limitations of time and resources necessarily restricted somewhat the scope of the analysis and the amount of original research."

This time, the Brookings Institution is evidently going to make a thorough probe of the situation. Its conclusions and the facts it discovers should be invaluable to everyone interested in increasingly better medical care for the American people.

GOVERNMENT PLANS BRITISHERS' LIVES

Socialism in England has become like a dominant wife who claims her husband's pay envelope and returns to him only money enough for carfare and a haircut. E. T. Leech, editor of the Pittsburgh *Press,* puts it this way:

"What happens to the individual is that the government spends a large part of his wages on what it thinks is good for him—and which the politicians refer to as 'free benefits'—and lets him spend the balance."

And still there are those in the United States who do not recognize compulsory health insurance as the important and opening wedge in a scheme to convert the entire economy of the country.

Minnesota Academy of Medicine

Meeting of April 9, 1949

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, April 13, 1949. Dinner was served at 7:00 o'clock and the meeting was called to order by the President, Dr. J. A. Lepak, at 8:20 p.m.

There were forty-one members and two guests present.

Minutes of the March meeting were read and approved.

Upon ballot, the following were elected as candidates for membership in the Academy:

John Culligan, M.D. .....Saint Paul
John Briggs, M.D. .....Saint Paul
Robert Priest, M.D. .....Minneapolis
Roy E. Swanson, M.D. .....Minneapolis

The scientific program followed.

TRANSVERSE COLOSTOMY VERSUS CECOSTOMY FOR ACUTELY OBSTRUCTING LESIONS IN THE LEFT HALF OF THE COLON

CHARLES E. REA, M.D., W. W. von AMERONGEN, M.D., E. W. SICKLES, M.D., and M. WINDMILLER, M.D.
Saint Paul, Minnesota

The purpose of this paper is to compare the mortality of transverse colostomy with that of cecostomy for acutely obstructing lesions in the left half of the colon. In this study, the statistics from four of the larger hospitals in St. Paul, Minnesota, from 1938 to 1948, were used.

Every surgeon agrees that acute obstruction of the large bowel is a surgical emergency. For obstructions in the left half of the colon, one may do an inguinal colostomy (if the lesion is below the rectosigmoid), a transverse colostomy, or a cecostomy. For acute obstructions in the right half of the colon, one may do an appendectomy, a cecostomy or a double-barreled ileostomy, threading a catheter through the ileocecal valve into the cecum. If the patient is not acutely obstructed, one may decompress the bowel by successful intubation with a Miller-Abbott tube.

For acute obstructions of the right half of the colon, most surgeons would perform a cecostomy. For similar lesions in the left half of the colon, most surgeons would do a transverse colostomy, but some would prefer to do a cecostomy. One of us (C.E.R.) cannot remember a cecostomy ever being performed in cases of acute obstruction of the large bowel at the University of Minnesota Hospitals over an eighteen-year period. At that institution, a transverse colostomy is preferred for acute obstruction of the left half of the colon and a double-barreled enterostomy, threading a catheter through the ileocecal valve into the cecum for acute obstructions of the right half of the colon. It should be said that the mortality at that clinic for acute and chronic obstructions of the large bowel is one of the lowest reported in the literature.

However, many excellent surgeons in this area prefer a cecostomy in the therapy of acute obstruction in the left half of the colon. The late Dr. A. R. Colvin, who for many years was Chief of the Surgical Staff at Ancker Hospital, Saint Paul, Minnesota, did only a cecostomy to decompress obstructive lesions of the colon. Interestingly enough, during his whole surgical career, he never did a Mikulicz obstructive resection; he performed a cecostomy to decompress the bowel and then later did a resection of the lesion and an end-to-end anastomosis of the colon if possible.

Cecostomy

Between 1936 and 1943 numerous papers appeared, principally by Allen, Graham, McNealy and Rankin, extolling the value of cecostomy in the treatment of carcinoma of the colon and rectum.

Rankin found it of value as a complementary procedure at the time of resection for obstructive carcinoma of the colon, but pointed out that its use in the treatment of acute obstructions was not without danger. Graham reported thirty-three acute obstructions of the colon for which cecostomy was done, with only two deaths, and Allen used cecostomy in the treatment of 250 cases of malignancies of the colon, with only eleven deaths which could be attributed to cecostomy.

In 1942 Wangensteen deplored the high mortality following cecostomy for acute malignant obstructions of the colon, which approached 50 per cent in his clinic. He advised transverse colostomy, or ileostomy and threading of a catheter through the ileocecal valve as a substitute. Coller and Ransom in 1944, reviewing 571 cases of carcinoma of the rectum, reported seven cases of cecostomy with five deaths, a mortality of 71 per cent. In all fairness it must be said that these cases were done for high grade obstructions in far advanced cases.

In 1945, Heyd, reporting the treatment of thirty cases of carcinoma of the distal colon, stated that cecostomy

Dr. Rea is Clinical Associate Professor of Surgery, Medical School, University of Minnesota; Dr. von Amerongen, Surgical Staff, St. Joseph's Hospital, Saint Paul; Dr. Sickles, formerly a Fellow in Surgery, Miller Hospital, Saint Paul; Dr. Windmiller, formerly a Fellow in Surgery, Ancker Hospital, Saint Paul.

TABLE I. MORTALITY FOLLOWING CECOSTOMY

			Cases	Deaths	Mort. %
Rankin	1936	All types of lesions	13	0	0.0
Rankin	1939	Complementary Operation	42	5	11.9
		Preliminary for Acute Obstruction	16	3	19.9
		Operable	8	0	
		Inoperable	8	3	
Graham	1939	Acute Obstruction	33	2	6.0
Allen	1941	Malignant Lesions	250	32	12.9
Wangensteen	1942	Malignant Obstruction	—	–	50.0
Collor	1944	Malignant Obstructive Lesions	7	5	71.4

was seldom a satisfactory method of decompression since it relieved only the gaseous distention and did not deflect the fecal current. He advocated the use of the Devine type of colostomy which completely defunctionalizes the distal colon and renders subsequent resection an easier and safer procedure.

The mortality for cecostomy reported by these authors will be found in Table I.

Several methods of doing a cecostomy have been described in the literature. The chief objection to most of these operations is that it is impossible to do them aseptically. Placing sutures in the distended cecum is impossible to do without leaving holes in the wall with resulting leakage of intestinal contents. Placing a catheter into the cecum after decompression with a suction trochar is synonymous with peritoneal contamination unless twelve to twenty-four hours have elapsed to allow the serosa of the cecum to become adherent to the peritoneum. An acutely distended cecum is often difficult to deliver. Wolfer, Beaton and Anson found the cecum to be mobile in only 11.2 per cent of 125 adult anatomical specimens. Thus it is rarely possible to deliver an entire loop of cecum through the incision; usually only a portion of the anterior wall of the cecum is deliverable above the level of the anterior abdominal wall so that later it will not retract below the skin level.

McNealy and Lichtenstein in 1937 described a simple technique aimed at obviating these dangers. Through a muscle-splitting incision the cecum is partially delivered, and two curved clamps applied to the cecal wall and left in place. No suturing is attempted and the bowel is not opened for at least twelve hours following operation. Howser presented eighteen cases using this technique in which no evidence of peritonitis developed.

Transverse Colostomy

Dennis in 1944 reported thirty-eight patients with acute obstruction of the colon treated by transverse colostomy, with three deaths, a mortality of 7.9 per cent. Perforation had occurred in two of these patients prior to operation and one died postoperatively from duodenal hemorrhage. Fallis in 1946 described sixty-two cases of transverse colostomy for acute obstruction, with only two deaths, one from pulmonary embolism the third day and one from uremia on the eighth day.

The technique of transverse colostomy involves a high transverse incision through the right rectus muscle, through which a loop of transverse colon is gently drawn and fixed by a glass rod underneath the bowel.

TABLE II. OVER-ALL MORTALITY

	Cases	Living	Dead	Mort. %
Cecostomy	81	52	29	36
Transverse Colostomy	35	29	6	18

The bowel is needled after a few hours and cut across after a day or two. In this way there is little chance of contaminating the peritoneum and the fecal stream is diverted. Generally speaking, it is the safest operation for decompressing the obstructed large bowel due to lesions in the distal half of the colon.

Cecostomy Versus Transverse Colostomy

There have been but few reports in which the results of cecostomy versus transverse colostomy for acute obstructions in the left half of the colon have been studied. An interesting series is that from the Cook County Hospital, reported by Hendricks and Griffin. W. S. Dorimer, Jr., in a ten-year study of 200 cases, found that up until 1944, a total of 135 consecutive cases of emergency colonic decompressions were done with a mortality rate of 44.5 per cent. In 1944 they began to employ transverse colostomies whenever possible. In 1945 there was a total of forty-nine cases of colonic obstruction with a total mortality of 20.5 per cent. In thirty-nine of these patients carcinoma was present. In the thirty-nine patients, twenty-four cecostomies were done with a mortality of 29 per cent, fifteen transverse colostomies with a mortality of 6.6 per cent, and ten Mikulicz procedures with a mortality of 20 per cent. From 1940 to 1945, inclusive, forty-seven transverse colostomies were performed with a 21 per cent mortality, and 142 cecostomies with a mortality of 40.5 per cent. They were thus able to lower their mortality from 44.6 to 20.5 per cent, apparently by the use of a transverse colostomy. However, the employment of transverse colostomy was only one of the factors which affected the mortality rate so markedly. Other important factors were early differential diagnosis of large from small bowel obstruction and surgical decompression without delay when conservative methods were ineffectual. The mortality rate immediately dropped from 40.5 per cent to 20.5 per cent within one year. This was due to strict attention to the above factors and not due to any operative procedure by itself, for in 1946 their mortality for twenty-one cases of emergency decompression was 23.3 per cent; twelve cases of transverse colostomy and nine cases of cecostomy gave the same mortality rate.

Analysis of This Series

As mentioned above all the cases of cecostomy and transverse colostomy recorded at Ancker Hospital, Bethesda Hospital, Miller Hospital and St. Joseph's Hospital, Saint Paul, Minnesota, for the years 1938 to 1948, inclusive, were studied in this series.

The over-all mortality in a total of 116 cases was almost twice as great for cecostomy as compared to that for transverse colostomy (Table II). These figures mean little, however, unless the type of case is analyzed.

he lesion in the proximal half of the bowel was nalignant or nonmalignant, operable or inoperable, obtructing or nonobstructing. The results are tabulated in Table III. While the series is small, the mortality for he malignant obstructing but operable lesions in the proximal half of the colon treated by cecostomy was over 40 per cent (three deaths in seven patients).

2. *Comparison of Cecostomy and Transverse Colostomy in Lesions of Distal Half of Colon.*—The results of this study are tabulated in Table IV.

It is interesting that the mortalities for cecostomy and transverse colostomy in malignant, operable, obstructing lesions in the distal half of the colon were the same (27 per cent).

It should be mentioned that the above-mentioned cases treated by cecostomy at Miller and St. Joseph's Hospital were done by one individual surgeon at each hospital. However for all malignant lesions in the distal half of the colon, the mortality for cecostomy was 40 per cent (twenty-two deaths in fifty-five cases) as compared to 15.4 per cent (four deaths in twenty-six cases) for transverse colostomy.

3. *Cecostomy and Transverse Colostomy Complementary to Other Operations.*—These cases are recorded in Tables V, VI, and VII. They are self-explanatory and are included only for completeness.

Conclusion

For the average surgeon, a transverse colostomy is preferable to cecostomy for obstructing lesions in the distal half of the colon. It is not only easier to deliver the transverse colon but the operation can also be done more aseptically. In this study, the mortality of cecostomy was the same as that for transverse colostomy (27 per cent) in obstructing, operable, malignant lesions of the left half of the colon. The reason was that most of these cecostomies were done by a few highly trained surgeons. Even then, a mortality of 27 per cent leaves much to be desired. Since the over-all mortality for cecostomy was twice that for transverse colostomy in this series, transverse colostomy would seem to be the operation of choice for obstructing lesions in the distal half of the colon.

Discussion

Dr. Logan Leven, Saint Paul: I enjoyed Dr. Rea's discussion of the value of cecostomy in the management of lesions of the left side of the colon. He stressed the point that cecostomy in some surgeons' hands carries a very low mortality. I believe that the operation of transverse colostomy is simpler than cecostomy, and in the same surgeon's hands would carry a lower mortality as a rule than would cecostomy. Of greater importance, however, is the question of the efficacy of the operation itself. Cecostomy as a rule results in merely a fecal fistula and does not divert the entire fecal stream as can be done by transverse colostomy. Because the operation is simpler, the mortality generally lower, and the operation more effective, I prefer transverse colostomy to cecostomy in the management of obstructive lesions of the left side of the colon.

Dr. E. A. Regnier, Minneapolis: I agree with what was said about the two types of decompression of the bowel. I think one is hard put with a lesion in the right half of the colon to do anything but a cecostomy for decompression. You don't always have a choice, but sometimes you can do an ileostomy. Many times I have used the Wetzel type of ileostomy with a long tube with multiple perforations. The tube is threaded down through the ileocecal valve. It prevents distention of the right colon and prevents rupture of the colon. Many of these cases in forty-eight to seventy-two hours will spontaneously open and decompress themselves. I believe that ileostomy is a better and safer procedure than cecostomy for decompression of the right colon and that a transverse colostomy is far superior to cecostomy for obstructive lesions of the left colon.

Dr. Rea (in closing): I am grateful for this discussion. What we are particularly interested in is this: given an acutely obstructing lesion in the left half of the colon, is it better to do a transverse colostomy or a cecostomy? Most of the older surgeons would seem to have a preference for cecostomy. I might say that while a Fellow in surgery at the University of Minnesota Hospital, I never saw a cecostomy performed, and yet the results of treatment of acute obstruction of the large bowel at that institution are equal if not superior to those reported elsewhere. One of my first patients on the surgical service at Ancker Hospital, Saint Paul, had an acute obstruction of the large bowel. The late Dr. Alexander Colvin saw the patient with me and asked what I planned to do. I replied "A transverse colostomy." He asked, "Why not a cecostomy?" I told him that I had never done one. He replied, in turn, that he had never done a transverse colostomy but that he always did a cecostomy in such cases. (He let me do a transverse colostomy.)

In general, a transverse colostomy is a simpler and safer operation to perform than a cecostomy in cases of acute obstruction of the large bowel. In expert hands, the corrected mortality of transverse colostomy is almost negligible. However, it is only fair to say that, in expert hands, the mortality from cecostomy in comparable cases is equally as low. With what we know now of fluid balance, blood and electrolytic replacement, antibiotics, the mortality of any of these operations is not what it was one or two decades ago.

PERIODIC PARALYSIS

GORDON R. KAMMAN, M.D.
Saint Paul, Minnesota

Periodic paralysis is recognized clinically by the development of intermittent attacks of flaccid paralysis of the skeletal muscles of the extremities, loss of the deep tendon reflexes, and loss of electrical excitability both to faradic and galvanic currents. During an attack of periodic paralysis the mental condition of the patient remains clear.

Etiology.—The condition is probably functional in nature. No gross changes have been consistently found in the spinal cord, peripheral nerves, or the involved muscles. The condition may be familial but it is not necessarily so, and many sporadic cases have been reported. Apparently the condition is the result of various etiologic factors. Some patients suffer attacks of paraplegia following bouts of malaria; in some cases there is enlargement of the thyroid gland, and some patients under treatment for Addison's disease have attacks of periodic paralysis following the assimilation of excessive amounts of desoxycorticosterone acetate.

Periodic paralysis is known by a variety of other names i.e. nocturnal paralysis, night palsy, paroxysmal myoplegia, paraplegia spinalis intermittens nervosa, et cetera.

Incidence.—The disease is considered rare but it is probably more common than is ordinarily believed. Up until 1941, 400 cases were reported in the literature with thirty-five deaths. Males outnumber females in the proportion of about three to one.

Age.—The disease usually develops in the first or second decade of life. It frequently comes on at puberty or during adolescence, and during this period the symptoms are usually more severe than they are later in

Much of the material in this article was obtained from an excellent monograph on "Periodic Paralysis" published by John H. Talbott in *Medicine*, 20:85-143, (Feb.) 1941.

ife. Later in life there is a tendency for the attacks o diminish in frequency and severity, and sometimes hey disappear entirely during adult life.

Inciting Factors.—Various forms of trauma, prolonged lebilitating diseases and fevers, and a great variety of ther incidents have been cited as inciting factors. Frequently an attack follows the ingestion of a high carbohydrate meal. The attacks frequently develop in the niddle of the night, and they are thought in this case o be the result of the ingestion of a high carbohydrate neal during the preceding evening. The glucose tolerance curve is normal in most of these patients.

An attack may be precipitated by the administration of adrenalin. This is probably due to the raising of the blood sugar and the depressing of the serum potassium resulting from the injection of the adrenalin. However, adrenalin is not as consistent in producing an attack as is a high carbohydrate meal.

Sometimes insulin with glucose will produce an attack, much as prolonged hyperglycemia. This seems paradoxical, but is presumably due to the stimulation of the secretion of adrenalin resulting from the parenteral administration of insulin.

Paralysis.—The paralysis begins peripherally in the extremities, usually the legs, and progresses centrally. In a few patients the paralysis may begin in the hips and shoulders and spread peripherally. It may be partial or complete, localized or generalized, involve either the upper or lower extremities, or it may be unilateral. The paralysis is flaccid, and it spares the muscles of the face, mouth, and throat. The accessory muscles of respiration and the sphincters also are spared. However, some fatal cases have been reported in which the muscles of respiration and deglutition were involved.

There also is an abortive type of the paralysis known as "crises frustes." These abortive attacks vary from stiffness and weakness in the extremities to paralysis with reduced deep reflexes. In some patients these abortive attacks may last for as long as a week without paralysis. As said before, there is never any mental clouding. Some reports on patients who have died indicate that the patients remain mentally clear until the end.

In some cases there may be enlargement of the extremities during paralysis. In one patient the circumference of the thigh increased 8 centimeters and of the forearms 2 centimeters during the period of paralysis, and returned to normal after the paralysis had passed.

The changes in electric excitability are different from those found in curare. In periodic paralysis the reaction to both galvanic and faradic stimulation is absent. In curare paralysis, only the response to faradic stimulation is lost, i.e., galvanic stimulation which stimulates the muscle fibers themselves results in a muscular contraction. This indicates that the dysfunction in periodic paralysis is not at the myoneural junction.

Recovery from the paralysis occurs anatomically in the reverse order to that in which the paralysis developed.

Frequency and Duration of Attacks.—There is extreme variability in the frequency and duration of attacks, all the way from one to two in a lifetime to several a week. The attacks last for six or eight hours and sometimes for as long as two or three days. In a case reported by Machalachlan in 1932 the paralysis lasted for eight days. This is the longest case on record.

Laboratory Findings.—There is a slight leukocytosis with relative increase in lymphocytes. There is also a transient albuminuria and oliguria.

The basal metabolic rate may be increased in patients suffering from thyrotoxicosis. One case was reported in which the basal metabolic rate increased from plus 17 to plus 59 during the period of paralysis. This again sounds paradoxical because one would expect a decrease in oxygen consumption when the muscles are paralyzed. The probable explanation is that there is a transient disturbance of the intermediary metabolism of carbohydrates during the paralysis, and this demands an increased oxygen intake.

The electrocardiogram shows striking and unusual changes all the way from normal to decreased amplitude of the T waves, prolongation of P-R, Q-R-S, and Q-T intervals. Left axis deviation was observed in many cases, and one case of left axis deviation was observed in a child seven years of age.

Blood Chemistry.—The most striking change in the blood chemistry is a decrease in the serum potassium and serum phosphates during an attack. These changes are believed to be intimately concerned with the pathogenesis of the attacks. The potassium does not leave the body but probably migrates to the liver along with glycogen. In other words, the liver is enriched with glycogen as well as with potassium. Such migration is consistent with the empiric observation that attacks of paralysis follow high carbohydrate meals.

It is important to note that a reduction in serum potassium will not always result in paralysis, but paralysis is always accompanied by reduction in serum potassium. Furthermore, reduction in potassium will not produce paralysis in all people. The individual must be susceptible to paralysis in order to suffer this condition following a reduction in serum potassium. Moreover, 1 gram of KCl intravenously will result in recovery from the paralysis in a few minutes. This is not a local effect because 0.1 gram of KCl injected into the brachial artery will not relieve the paralysis if the venous return is obstructed for a period of eight minutes. However, upon release of the venous obstruction, recovery from the paralysis is seen. Therefore, the curative action of potassium either is central, or some substance is formed in the viscera by the action of potassium and is carried to the muscles to restore power.

Treatment.—General hygienic measures, avoidance of high carbohydrate intake, and the daily administration of 10 to 15 grams of KCl a day are the best known methods of treatment.

Case Report

G. R., male, single, aged twenty, was referred on February 22, 1949, by Dr. R. M. Kilgard of Watertown, South Dakota. The family and past histories were noncontributory to the patient's present illness. During the Thanksgiving vacation of 1948, Mr. R. was riding in a car en route to his home from college. About four o'clock in the afternoon he fell asleep. When he awakened, his legs seemed to remain "asleep," i.e., he was unable to use them. When he tried to walk, he staggered and fell. There were no sensory disturbances. The paralysis lasted for about twenty-four hours and then gradually left and Mr. R. made a complete recovery. His local physician examined him shortly after the attack and was unable to demonstrate any muscular weakness.

On February 10, 1949, Mr. R. suffered a second attack. He again had been riding in a car and had fallen asleep. When he tried to get out of the car, he fell to the ground and was unable to walk. He was carried to his bed, and the following day the muscle strength gradually returned in his lower extremities.

There were no symptoms suggestive of multiple sclerosis, there was no impairment of the sensorium, and no other disturbances in consciousness.

The neurological examination was negative throughout for organic signs.

The basal metabolic rate was —3.

The spinal fluid was clear and under normal pressure; it contained 3 cells, 50 mg. protein, and had a negative Wassermann test and negative colloidal gold curve.

The glucose tolerance test showed the following:

Fasting blood sugar	102 mg.	Urine negative
½ hour	148 mg.	Urine negative
1 hour	150 mg.	Urine negative
2 hours	112 mg.	Urine negative
3 hours	82 mg.	Urine negative
4 hours	92 mg.	Urine negative
5 hours	93 mg.	Urine negative

Serum potassium 26. mg.
Serum phosphorus 3.9

Mr. R. was placed on 15 grains of potassium chloride three times a day and instructed to increase the dose gradually to 30 grains three times a day. He returned home and has not had any difficulty since.

Discussion

Dr. E. M. Hammes, Saint Paul: Dr. Kamman has presented a very interesting syndrome, namely, periodic paralysis. There are two main groups of diffuse paralysis of the extremities. In the one group, we have acute anterior poliomyelitis, postdiphtheric neuritis, other forms of toxic neuritis, multiple sclerosis and hysteria. All of these diseases have a normal serum potassium. The second group comprises periodic paralysis, also similar syndromes associated with acidosis nephritis, overtreatment for Addison's disease and occasionally thyrotoxicosis. The mortality rate in periodic paralysis is about 10 per cent. While determining the diagnosis in some of these rather puzzling disorders, it might be a safe procedure to administer to these patients potassium in some form. If it is not due to potassium deficiency, no harm is done; if it is, the early administration of potassium will greatly lessen the mortality rate.

Dr. Kamman's case had a serum potassium of 36, as I recall. I presume this was due to the fact that the patient was practically over the attack.

There are two disorders which respond miraculously to a single therapeutic dose and the result confirms the diagnosis—namely, prostigmine for myasthemia gravis, and potassium for periodic paralysis. When the effect of the drug subsides, the symptoms usually recur.

Dr. Vernon L. Hart, Minneapolis: I would like to ask a question. Do any of the paralyses remain permanent with subsequent development of deformity?

Dr. C. J. Watson, University of Minnesota: I think we have all become increasingly aware of the importance of hypopotassemia. Dr. Hammes referred to diabetic acidosis. We have seen persons in diabetic coma with rather characteristic breathing who are promptly benefited by the administration of potassium. I have seen cases in the past where the ketosis was taken care of, yet the patient died. Quite a few have since been shown to be due to lowering of serum potassium. Darrow showed that the cause of death in infantile diarrhea is often a hypopotassemia.

I think that it is difficult to understand just how the potassium is lowered in these cases such as Dr. Kamman has described so well. It seems evident that the potassium and glucose mechanisms are disturbed. There may be an enzyme lacking in the liver which prevents too rapid utilization of potassium in glucose metabolism. Insofar as uremia is concerned, a situation can arise where one has to be very careful because there are cases of uremia with hypopotassemia, and others with hyperpotassemia may die if given more potassium. I do think that within the not too distant future the use of the flame photometer will become more and more routine in hospital laboratories, for determinations of sodium and potassium. It is only in the last few years that we have become aware of the great importance of the intravenous administration of KCl.

Dr. Kamman (in closing): In answer to the question as to whether these paralyses ever persist long enough to produce permanent contracture (Volkman contracture), I would say no. The paralysis does not last long enough to produce such a contracture. When recovery from paralysis takes place, it is complete, and it is my understanding that it takes more than just a few hours of muscular paralysis to result in a contracture. One of the most fascinating things in periodic paralysis is the completeness with which a person can be paralyzed, and the prompt and complete recovery which can occur. One case of quadraplegia was described in which a patient was able only to lift his head, and the clinical picture was like that of a person with a broken neck with transection of the cord in the high cervical region. He was completely flaccid, and yet he recovered after the intravenous administration of KCl.

The meeting was adjourned.

A. E. Cardle, M.D., *Secretary*

SARCOIDOSIS

(Continued from Page 990)

Summary

The clinical and laboratory findings in seventeen patients with sarcoidosis are reviewed. The clinical diagnosis in each case has been substantiated by histopathologic study of either a section of skin or lymph node. Laboratory studies, including cultures and the inoculations of animals to determine the presence of Mycobacterium tuberculosis, were done on tissue specimens in each case. Material from all seventeen cases gave negative results.

In Memoriam

LEO S. BURNS

Dr. Leo S. Burns of South Saint Paul died suddenly on September 7, 1949, at the age of forty-eight.

Dr. Burns was born at St. Thomas, Minnesota, October 29, 1901. He attended St. Thomas College in Saint Paul and obtained his medical degree from the University of Minnesota Medical School in 1930. He interned at the University Hospital, Minneapolis.

Dr. Burns served as South Saint Paul school physician from 1937 to 1942 and was a past president of the Dakota County Medical Society. During World War II he was a captain in General Patton's army.

Surviving are his mother, Mary E. Burns of Saint Paul, and two sisters, Mrs. Leo McCue of National City, California, and Mrs. Howard Prairie of Farmington, Minnesota.

HOMER C. COLLINS

Dr. Homer C. Collins of Duluth died July 31, 1949, at the age of ninety.

He was born at Fairport, New York, January 4, 1859. After attending public schools at Rochester, New York, he obtained a B.S. degree from Cornell and studied medicine at Cornell and the College of Physicians and Surgeons in New York, where he obtained his medical degree in 1884.

From 1884 to 1889 he was superintendent of the State hospital in Rochester, Minnesota. After taking postgraduate training at the New York Postgraduate Eye and Ear infirmary, he located in Duluth in 1890—the first eye, ear, nose and throat specialist in the city. In 1941 Dr. Collins celebrated his fifty years of practice in Duluth.

Dr. Collins was a member of the St. Louis County Medical Society, the Minnesota State and American Medical Associations and the American Academy of Ophthalmology.

He is survived by his widow, Gertrude, a son, Homer Jr., and three daughters—Mrs. A. Laird Goodman, Duluth; Mrs. Eric Calman, Madera, California, and Mrs. E. L. Hemenway, Englewood New Jersey.

GEORGE E. MALMGREN

Dr. George E. Malmgren, formerly of Saint Paul, died August 24, 1949, in Los Angeles, following an operation. He was forty-seven years old.

Dr. Malmgren was born in Saint Paul, obtained his medical education at the University of Minnesota, graduating in 1926. He was on the staff of the Mayo Clinic for several years before moving to California, twelve years ago.

NORMAN REUBEN SCHNEIDMAN

Dr. N. R. Schneidman, chief of the pulmonary diseases section at the Veterans Hospital, Minneapolis, died September 6, 1949, at the age of forty-two.

Born in Russia, Dr. Schneidman came to Minneapolis at the age of fourteen and obtained his medical education at the University of Minnesota. After serving an internship at the Minneapolis General Hospital, he practiced at Pipestone and at the White Earth Indian Reservation. He served as a lieutenant in the Navy.

Dr. Schneidman was a member of the Hennepin County Medical Society, the Minnesota State and American Medical Associations, the Minneapolis Society of Internal Medicine, the Trudeau Society, the Beth El Synagogue and B'nai B'rith.

BAXTER A. SMITH

Dr. Baxter A. Smith of Crosby, Minnesota, died in August, 1949. He was born in Harrowsmith, Ontario, February 17, 1876.

Dr. Smith obtained his M.D. degree at Queens College, Kingston, Ontario, in 1905. He practiced at Biwabik from 1906 to 1913. His specialty was industrial surgery.

He was a member of the Upper Mississippi Medical Society, the Minnesota State and American Medical Associations.

CHARLES CARROLL WALKER

Dr. Charles C. Walker, a pioneer Lamberton physician, died at the Redwood Falls rest home on August 13, 1949, at the age of seventy-nine.

He was born May 27, 1870, at Kilbourn Dells, Wisconsin. He received his medical degree from Northwestern University Medical School in 1896 and had practiced medicine at Curry, Raymond, and Lamberton for over fifty years. He retired two years ago.

Dr. Walker was married to Julia Cole who passed away two years ago. He is survived by a son Harold, of Duncan, Oklahoma, and a daughter, Mrs. Katherine Smith, of Denver, Colorado, both foster children.

He was a medical officer in World War I and a member of the American Legion.

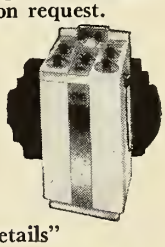
new possibilities for the radiologist

the KELLEY-KOETT MULTICRON 300MA GENERATOR with 140 KVP



THE Kelley-Koett Multicron 300 MA is a heavy duty X-ray generator with capacity and operating features surpassing any previous diagnostic unit yet available in its range.

The therapy rating is 140 KVP at 10 milliamperes for four hours of continuous operation. Diagnostic rating provides 120 KVP at 300 milliamperes in intermittent operation. Fixed milliamperage control and a unique electronic-mechanical timer make operation outstandingly simple . . . results extremely accurate in every technic.

These and other features of interest to the hospital radiologist are detailed in descriptive literature available on request.

Instantly accessible, integral units make the Multicron 300 MA unit easy to adjust and service.

Reports and Announcements

INTERNATIONAL MEDICAL ASSEMBLY

The thirty-fourth annual assembly of the International Medical Assembly of the Inter-State Postgraduate Medical Association of North America will be held at Philadelphia in the Public Auditorium, October 31 to November 3.

This assembly will hold its scientific sessions in the morning, afternoon and evening for four days, and the sessions will consist of addresses by outstanding professors from the various medical schools of the United States and Canada. The assembly dinner will be held Wednesday evening in the Crystal Ballroom of the Benjamin Franklin Hotel, following which the president of the Assembly, Dr. Evarts A. Graham, will make an address on "Changing Concepts in Surgery." At the dinner the president-elect, Dr. Waltman Walters of the Mayo Clinic, will be presented.

The assembly has rightfully taken its place as one of the outstanding medical meetings of the year. All physicians are invited to attend. The registration fee is $5, and registration may be made at the Hotel Benjamin Franklin on Sunday, October 30, the day preceding the opening of the sessions.

AMERICAN COLLEGE OF CHEST PHYSICIANS POSTGRADUATE COURSE

A postgraduate course in diseases of the chest, sponsored by the Council on Postgraduate Medical Education and the New York State Chapter of the American College of Chest Physicians, will be held at the Hotel New Yorker, New York, November 14 to 18.

The meeting will consist of morning and afternoon sessions, with addresses by specialists in chest diseases and related fields. Registration fee is $50 and application should be made to the American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois.

VAN METER PRIZE AWARD

The American Goiter Association again offers the Van Meter Prize Award of $300 and two honorable mentions for the best essays submitted concerning original work on problems related to the thyroid gland. The award will be made at the annual meeting of the Association which will be held in Houston, Texas, March 9, 10 and 11, 1950, providing essays of sufficient merit are presented in competition.

The competing essays may cover either clinical or research investigations, should not exceed three thousand words in length, must be presented in English, and a typewritten double-spaced copy in duplicate sent to the Corresponding Secretary, Dr. George C. Shivers, 100 East St. Vrain Street, Colorado Springs, Colorado, not later than January 15, 1950. The committee that will review the manuscripts is composed of men well qualified to judge the merits of the competing essays.

A place will be reserved on the program of the annual meeting for presentation of the prize award essay by the author, if it is possible for him to attend. The essay will be published in the annual *Proceedings* of the Association.

UROLOGY AWARD

The American Urological Association offers an annual award of $1,000 (first prize of $500, second prize $300 and third prize $200) for essays on the results of some clinical or laboratory research in urology. Competition shall be limited to urologists who have been in such specific practice for not more than five years and to residents in urology in recognized hospitals.

The first prize essay will appear on the program of the forthcoming meeting of the American Urological Association, to be held at the Hotel Statler, Washington, D. C., May 29—June 1, 1950.

For full particulars write the Secretary, Dr. Charles H. de T. Shivers, Boardwalk National Arcade Building, Atlantic City, N. J. Essays must be in his hands before February 20, 1950.

OMAHA MID-WEST CLINICAL SOCIETY

The Omaha Mid-West Clinical Society will hold its seventeenth annual assembly at Hotel Paxton, Omaha, Nebraska, October 24 through 28.

Scientific motion pictures will open the daily programs. Timely subjects have been chosen for round table discussions immediately following luncheons and dinners. Scientific and technical exhibits will be presented.

Further information may be obtained by writing to the executive office, 1031 Medical Arts Building, Omaha, Nebraska.

COUNTY MEDICAL SOCIETY OFFICERS NATIONAL CONFERENCE

The sixth national conference of county medical society officers (the "Grass Roots Conference") will be held at Hotel Statler, Washington, D. C., on December 8. Among the features of the conference will be descriptions of several of the nation's "Outstanding Achievements in Community Medical Leadership." All registrants for the AMA Clinical Session and their wives are invited to attend the conference, which is sponsored by the Board of Trustees of the AMA.

OLMSTED-HOUSTON-FILLMORE-DODGE COUNTIES SOCIETY

A meeting of the Olmsted-Houston-Fillmore-Dodge Counties Medical Society was held in Rochester on September 7. Dr. M. M. Hargraves, Rochester, presented a paper on the differential diagnosis of chronic myelogenous leukemia, and a thirty-minute colored sound motion picture on the use of the Mayo Clinic library

was shown. Dr. H. W. Woltman, Rochester, is president of the four-county society.

ST. LOUIS COUNTY SOCIETY

The principal speaker at a meeting of the St. Louis County Medical Society in Duluth on September 8, was Arthur M. Calvin, Saint Paul, executive director of the Minnesota Medical Service Association and the Minnesota Hospital Service Association. Mr. Calvin discussed "The Cost of Hospital Care in Duluth." Under the leadership of Dr. M. H. Tibbetts, Duluth, president of the society, the members studied a proposed revision of their constitution and by-laws.

WASHINGTON COUNTY SOCIETY

The regular monthly meeting of the Washington County Medical Society, held September 13, was devoted to a consideration of the actions taken by the House of Delegates of the Minnesota State Medical Association at the May session. Much attention was given to the five resolutions that were referred to the county societies. Resolution No. 1 was rejected, but the other four were endorsed.

The society has sponsored the placing of twelve large copies of the picture entitled "The Doctor," by Luke Fildes, in the Lake View Memorial Hospital, the county court house and the large schools of the county. Forty-three smaller pictures will be placed in the rural schools.

CONTINUATION COURSES

Traumatic and Pediatric Surgery

The University of Minnesota announces a continuation course in traumatic and pediatric surgery to be presented at the Center for Continuation Study on November 10, 11, and 12, 1949. The course, which is intended for general physicians, will emphasize the diagnosis and management of surgical conditions occurring in children. Special attention will be paid to the treatment of fractures, especially those occurring during childhood.

Child Psychiatry

A course in child psychiatry will be presented at the Center for Continuation Study on November 28 through December 3, 1949. This continuation course, which is intended for pediatricians and general physicians, will emphasize normal, emotional, intellectual, and social development of infants and children and the emotional and behavior problems seen in infancy, childhood, and adolescence. Dr. Adrian Vander Veer of the Department of Psychiatry, University of Chicago, will participate as a visiting faculty member.

City-wide x-ray surveys can be conducted with relative economy of means and money. Previous experience in cities already surveyed and preliminary studies of other communities indicate that if present facilities are fully utilized and if newly discovered cases are given realistic disposition, the increased case load of tuberculosis will not present a grave problem to the community.—Francis J. Weber, M.D., *Ohio Public Health*, Feb., 1948.

Correspondence

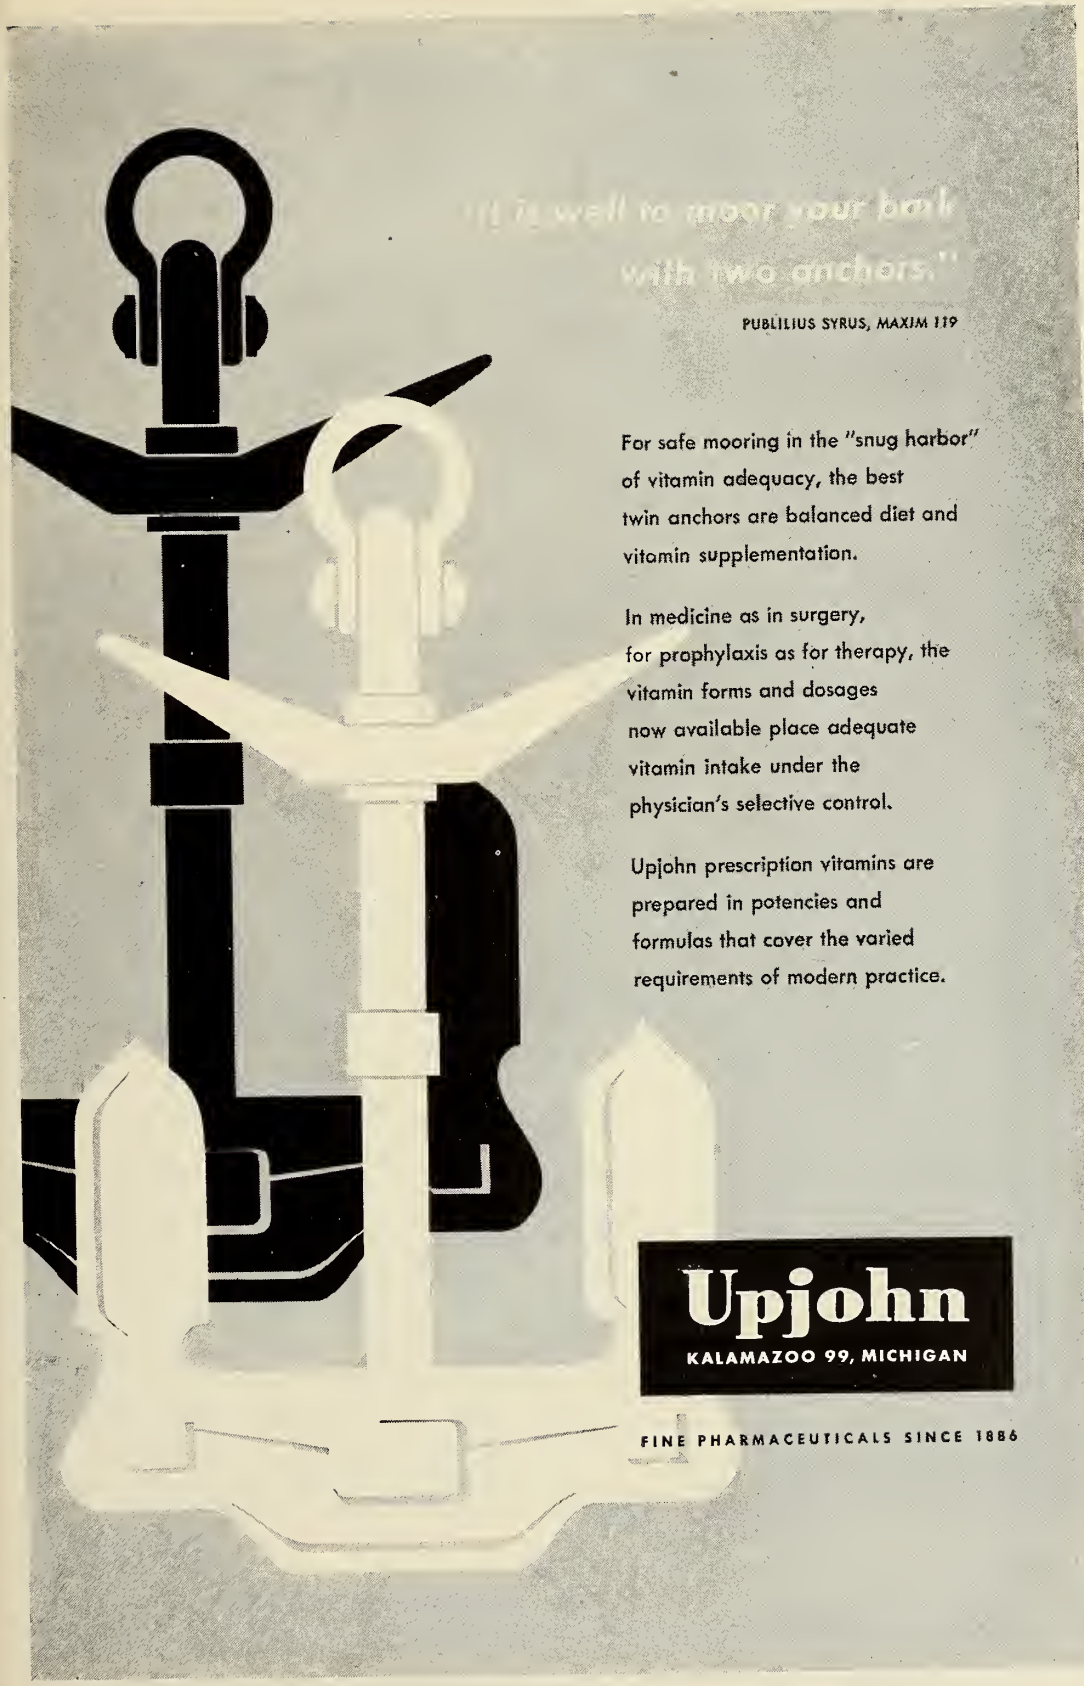
To the Editor:

The study of twins is of great value in providing information concerning the respective importance of hereditary predisposition and environmental influences in disease in man. The results of the use of this method have shown a hereditary predisposition to tuberculosis, diabetes, and tumor formation, and a high, medium or low intelligence quotient.

There is some *a priori* evidence showing an hereditary predisposition for peptic ulcer. Only six cases of the occurrence of peptic ulcer in the one or both of mono- or dizygous twins have been reported in the readily accessible literature. Since twins are born in 1 of 86 births and identical twins in 1 of 344 births and the general incidence of ulcer is from 5 to 10 per cent there should be plenty of material available.

I should like to ask physicians to co-operate in assemblying such material by sending me cases in which (1) one or both twins develop peptic ulcer, (2) the site of the ulcer, (3) the age of onset of ulcer, (4) the type of twins (monovular or diovular), (5) the sex of the twins, (6) the date of birth of the twins, and (7) the number and age of the brothers and sisters and the absence or presence of ulcer in each.

Yours sincerely,



A. C. Ivy, M.D.

Woman's Auxiliary

INFORMED AUXILIARY DOUBLY IMPORTANT

Mrs. David Halpern

"This year is a critical one and must be one of study," writes Mrs. Leo J. Schaefer, Salina, Kansas, national Auxiliary program chairman, as she presents an outline of program material for state Auxiliaries and their component county Auxiliaries.

"The suggested material is not new," Mrs. Schaefer explains, "but we feel that greater emphasis must be placed on the program given at Auxiliary meetings. A background of information then may be built up to act as a bulwark against any force which may endanger the place of the doctor in our country. A national, state or county program is only as effective as the information each member is able to give when questioned."

"This year let us aim to have each subject presented and discussed as in a study club, group discussion, panel discussion or lecture form. As busy adults, too often we acquire a 'reading knowledge' instead of a speaking knowledge of current affairs. In this period of American thinking, we must develop a speaking knowledge, fortified with authentic information. It is your duty and privilege to interpret and support the ideals of organized medicine."

Program 1949-1950

I. Twelve-point program of the American Medical Association, for the advancement of medicine and public health (1) (4) (6)*
   1. A federal Department of Health
   2. Medical research
   3. Voluntary insurance
   4. Medical care authority with consumer representation
   5. New facilities
   6. Public health
   7. Mental hygiene

(7) National League of Nursing Education, 1790 Broadway, New York 19, New York.

HYGEIA CONTEST DEADLINE

Mrs. J. A. Cosgriff

The American Medical Association has announced another *Hygeia* contest, extending from September 1, 1949, to January 31, 1950, with cash awards going to the following Auxiliary groups: Group 1, membership of 1 to 18; group 2, membership of 19 to 35; group 3, membership of 36 to 99; group 4, membership of 100 or more; group 5, State Auxiliaries.

No Auxiliary will be given a cash prize nor special recognition unless it has secured at least 25 subscription credits. For example: if an Auxiliary has 10 members and secures 10 subscription credits, its percentage is 100; but, in order to be eligible for a cash prize, the Auxiliary must have gained a minimum of 25 subscription credits. Auxiliaries with a membership of 25 or more must have a percentage of 100 to be eligible for a cash prize. No county Auxiliary will be given credit for subscriptions taken from members at large or other county auxiliaries that are organized.

Prizes are based on the group quota and the number of subscription credits obtained. The quota is the number of members in the Auxiliary who have paid their Auxiliary membership dues at the close of the previous fiscal year. This arrangement gives the Auxiliary with a small membership an equal chance with the larger ones in its particular group. An Auxiliary, for instance, that has 20 members and secures 20 subscriptions would have reached its quota and have a rating of 100 per cent. Furthermore, if an Auxiliary has only 20 members and secures 80 subscriptions, it would have a rating of 400 per cent and would win over an Auxiliary that has 30 members and secures 90 subscriptions, with a rating of 300 per cent.

A one-year subscription will count as one credit; a two-year subscription as two credits; a three-year subscription, three credits; a six-month subscription, one-half credit. No distinction in credits is made with regard to new or renewal orders. In the event of a tie, the county sending in the largest number of two-year and three-year subscriptions will be awarded the prize.

Each county president has received, or will receive, all the necessary information from the circulation director of *Hygeia*. She should appoint a *Hygeia* chairman and urge her to contact schools, libraries, beauty parlors,

Of General Interest

The American Medical Association reported in September that the 1949 class of graduating physicians numbered only 5,094—the smallest class in ten years. It was expected, however, that the incoming group of medical freshmen this fall would be the largest on record, about 6,900.

* * *

During the second half of August and early September, Dr. John A. Watkins of Windom conducted the practice of Dr. A. T. Kapsner in Princeton while Dr. Kapsner was on vacation. A graduate of the University of Minnesota Medical School in 1947, Dr. Watkins served his internship at St. Luke's Hospital in Duluth and at Wayne County General Hospital in Detroit.

* * *

"Common Neuropsychiatric Problems Encountered in General Practice" was the title of an address given by Dr. Gordon R. Kamman, Saint Paul, at a meeting of the Cerro Gordo County Medical Society in Mason City, Iowa, on September 13.

* * *

Dr. R. E. Johnson, superintendent and medical director of Sunnyrest Sanatorium in Crookston since October, 1943, resigned his position in August. He announced at the time that he had no immediate plans other than taking a rest for several months. He was replaced in the sanatorium post by Dr. R. R. Hendrickson, formerly of Lake Park.

* * *

An editorial in the Blue Earth *Register* on September 6 stated that the village of Bricelyn had been without a physician for more than a year and that residents of the community were trying to arrange for an office and a home as an inducement for an interested physician. The editorial recommended Bricelyn to any young medical graduate looking for a location.

* * *

The resignation of Dr. E. S. Mariette, superintendent of Glen Lake Sanatorium since 1916, was accepted by the Glen Lake Sanatorium Commission, September 8, it was announced by Dr. S. Marx White, president of the Commission. Dr. Mariette has been ill since early August when he was sricken by a cerebral hemorrhage.

Dr. Mariette came to Glen Lake Sanatorium as its first resident physician January 1, 1916. Within the same year, he became its superintendent and medical director, a position he has occupied continuously for the past thirty-three years.

Under his direction, Hennepin County's hospital for the tuberculous has achieved national recognition as one of the great tuberculosis sanatoria of the United States. It was the first tuberculosis hospital in the country to receive a Class-A rating from the American College of Surgeons (1927).

Dr. Mariette, throughout his career as medical director of Glen Lake Sanatorium, has been a participant in tuberculosis control work in Minnesota and on a national scale. A member of the board of directors of the National Tuberculosis Association, he served as president of the Mississippi Conference on Tuberculosis, as president of the Minnesota Trudeau Society and from 1946 through 1948, as president of the Hennepin County Tuberculosis Association. He was chairman of the American Trudeau Society's Committee on Rehabilitation. He was a member of the Hennepin County Medical Society, the Minnesota State Medical Association, the American Medical Association and the American Hospital Association. He is an assistant professor of medicine at the University of Minnesota.

Many outstanding physicians in tuberculosis work were trained under his direction at Glen Lake Sanatorium. Among these: Dr. Frank L. Jennings, superintendent and medical director of Sunnyside Sanatorium, Indianapolis; Dr. Charles K. Petter, medical director of Lake County Tuberculosis Sanatorium, Waukegan, Illinois, and Dr. R. Backus, assistant superintendent of Nopeming Sanatorium, Nopeming. Tuberculosis specialists from many foreign countries have come to Glen Lake Sanatorium to observe its methods of treatment.

A special contribution of Dr. Mariette was his pioneer use of BCG vaccine in the protection of nurses caring for the tuberculous, and in initiating an in-sanatorium program for the rehabilitation of tuberculosis patients. Under his direction, Glen Lake was one of the first sanatoria to establish a co-ordinated rehabilitation program, offering educational training and vocational counseling to patients while under treatment.

Because of Glen Lake Sanatorium's reputation for exact techniques, it was one of few sanatoria frequently selected for special studies, according to Dr. S. Marx White, president of the Glen Lake Sanatorium Commission.

Dr. Mariette is the author of many articles, published in medical and nursing journals, on various aspects of the control and treatment of tuberculosis.

Dr. Mariette was born January 3, 1888, in southern Minnesota. He received his training at the University of Minnesota, obtaining his medical degree in 1913. From 1913 to 1916 he was on the staff of Nopeming Sanatorium.

He has participated directly in the tuberculosis control work of all official and voluntary health agencies in Minneapolis and Hennepin County. His special interest has been in providing medical examination, including tuberculin tests, for rural Hennepin County school children, and in all projects to locate unknown tuberculosis cases.

His resignation will become effective November 1.

On September 5, Dr. Catherine Burns announced that she had become associated in practice with Dr. S. A. Whitson, Dr. J. P. Person and Dr. T. M. Hansen in the Medical Arts Clinic, Albert Lea. A graduate of the University of Minnesota Medical School, Dr. Burns served in the Navy at Great Lakes, Illinois, during the recent war. She then studied at the New York Postgraduate Medical School before opening a practice in Duluth. During last winter she practiced in Fairbanks, Alaska. She is the daughter of the late Dr. H. D. Burns.

* * *

Red Wing acquired a new physician early in September when Dr. Byron B. Cochrane, formerly of Saint Paul, joined the staff of the Interstate Clinic. An ophthalmologist, Dr. Cochrane is heading the eye department of the clinic.

After graduating from the University of Minnesota Medical School in 1937, Dr. Cochrane served his internship at Miller Hospital, Saint Paul, and then engaged in general practice in Saint Paul for two years. From 1940 to 1945 he served in the army part of the time in the Pacific area. Following his discharge, he completed a four-year combined residency in ophthalmology at University and Miller Hospitals. He was associated with Dr. F. E. Burch of Saint Paul until August 31 of this year, when he moved to Red Wing.

* * *

Dr. H. G. Rice, after being associated with the Aitkin Clinic since March, 1946, left for Moorhead on September 1 to resume a private practice that he conducted there before World War II. Dr. Rice served during the war as a Naval flight surgeon.

* * *

Change of address was announced recently for six Minneapolis physicians. The physicians and their new addresses are as follows: Dr. Milton E. Baker, 1409 Willow Street; Dr. Robert G. Tinkhaw and Dr. Curtis V. Rockwell, 3940 Market Street, Edina; Dr. Benedict Trach, 4204 Cedar Avenue; Dr. Barton G. Olson, University of Minnesota Hospitals; Dr. John E. Twomey, General Hospital.

A public meeting, sponsored by the Bloomington Community Health Council, was held in Bloomington on September 9 to discuss the proposed centralized health authority for rural and suburban Hennepin County. Among the speakers at the meeting was Dr. A. B. Rosenfield, director of District Health Unit No. 6, State Department of Health.

* * *

Dr. Tom Davis, II, planned to leave Wadena in October to spend three months doing specialized work in eye surgery in India, at a mission in the town of Patna. A graduate of the University of Minnesota Medical School, Dr. Davis has been a member of the staff of the Davis Clinic in Wadena.

* * *

The Minnesota Division of the American Cancer Society announced on September 8 that it had received a $25,000 grant toward completion of the Minnesota Cancer Research Institute at the University of Minnesota. The grant increases funds made available to the institute in the past two years to $225,000. The institute is designed to occupy two floors of the proposed Mayo Memorial building on the University campus.

* * *

It was announced on August 20 that Dr. Nesmith P. Nelson of Brainerd planned to retire about September 1, and that Dr. George J. Halladay, formerly of Minneapolis, would occupy Dr. Nelson's office. Dr. Nelson has practiced in Brainerd for twenty-eight years, maintaining the same office throughout that time. Before moving to Brainerd, he practiced in Washington, D. C., and Minneapolis.

* * *

Dr. S. R. M. Reynolds of the Carnegie Institution of Washington and Johns Hopkins Medical School, Baltimore, Maryland, will be guest faculty member at a continuation course in obstetrics to be presented by the University of Minnesota on November 17, 18 and 19. The course, which is intended for specialists in obstetrics and gynecology will be held at the Center for Continuation Study. Dr. Reynolds will speak on the subjects, "The Development of the Pregnant Uterus" and "Uterine Mechanisms in Normal and Abnormal Labor."

* * *

On August 11 it was announced that Dr. Warren Haesley of Winona had purchased the medical practice of Dr. Richard F. Herbst in Wykoff and would open his office there soon.

* * *

Formerly of Mankato, Dr. Albert E. Krieser became associated in practice with Dr. L. J. Hoyer in Windom on September 1. During the recent war Dr. Krieser was in military service in Alaska and Germany.

* * *

The Arrowhead Clinic in West Duluth announced on August 4 that Dr. John Van Duyn, formerly of Syracuse, New York, had joined the clinic staff. A graduate of Johns Hopkins Medical School, Dr. Van Duyn was an

instructor in general surgery at the University of Syracuse before he became affiliated with the clinic in Duluth.

* * *

Dr. O. A. Eide opened offices for the practice of medicine in Hancock on August 15. In addition to his practice in Hancock, he is assisting his father-in-law, Dr. A. I. Arneson of Morris, at the Stevens County Hospital. A graduate of the University of Minnesota Medical School, Dr. Eide interned at General Hospital in Salt Lake City, Utah. He then served for nearly two years at an Army hospital in Osaka, Japan, returning to the United States in June of this year .

* * *

During August, Dr. Daniel L. Donovan, of the Albert Lea Medical and Surgical Center, attended a two weeks' postgraduate course in diseases of the heart at the University of Chicago.

* * *

The clinical use of anticoagulants was the subject discussed by Dr. E. V. Allen, Rochester at a meeting of the Black Hills District Medical Society at Spearfish, South Dakota, On August 11. Dr. Allen is senior consultant in the diagnostic division of general medicine and surgery at the Mayo Clinic.

* * *

The appointment of Dr. Joseph L. Whelan as chief of the neurology service at Minneapolis Veterans Hospital was announced in August. A graduate of the University of Minnesota Medical School in 1942, Dr. Whelan interned at Detroit Receiving Hospital and then served with the U. S. Air Forces for three years. After his discharge he took postgraduate training in neurology and psychiatry at the University of Pennsylvania Hospital, Wayne University College Hospital and the University of Minnesota Medical School.

* * *

Dr. Leong Hom arrived in Monticello early in August to be associated in practice with Dr. W. E. Hart. A graduate of the University of Minnesota Medical School, Dr. Hom served his internship at St. Barnabas Hospital, Minneapolis.

* * *

Dr. Thomas G. Wellman, practitioner in Lake City, moved to Clinton, Iowa, on July 29 to accept an appointment to Schick General Hospital, which is operated by the Veterans Administration. Dr. Wellman began practice in Lake City in 1940. He entered military service with the Army Air Forces in 1943 and served for three years. Following his discharge, he returned to his practice in Lake City.

* * *

Guest of honor at a tea on August 14 in the Mayo Clinic Women's Club was Dr. Della G. Drips, Rochester, who was presented with a silver service in appreciation of her years of service to the club and to thank her for acting as club physician since 1937.

* * *

Dr. H. H. Theissen who began practicing in Excelsior about August 1, is associated in practice with Dr. M. H. Seifert and Dr. J. A. Dupont of that city. Dr. Theissen served his internship at St. Mary's Hospital, Minneapolis.

A sixty-day leave of absence was granted Dr. Frank J. Hill, Minneapolis health commissioner, by the Minneapolis board of public welfare on September 2. The purpose of the leave of absence was to enable Dr. Hill to recover from what his personal physician described as nervous exhaustion caused by overwork. Dr. F. G. Gunlaugson, director of communicable disease control in the health department, was named by the board as acting city health commissioner.

* * *

The Minneapolis Children's Cerebral Palsy Center, the first of its kind in the city, opened on August 30 to provide pre-school training for spastic children from two to four years old. The Center officials stated that about twenty children would be cared for five days a week during the next eleven months. Registered therapists have been hired to staff the Center, and a medical committee of ten physicians, headed by Dr. E. J. Huenekens, provides professional guidance.

* * *

Dr. Orville N. Nelson, formerly a practitioner in Battle Lake but who has been located for the past several years in St. Petersburg, Florida, was a guest at a Rotary Club meeting in Fergus Falls on August 17. He was spending his vacation at his summer home on Bottle Lake.

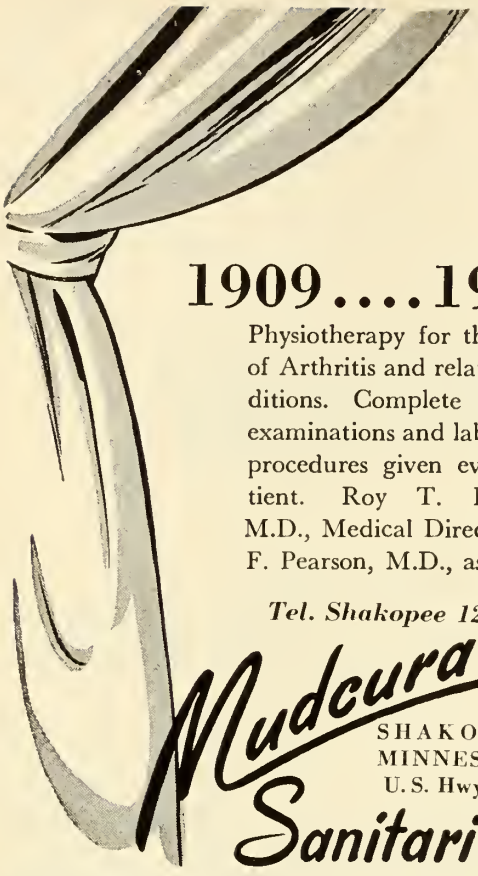
* * *

Head of the surgery department of the new Royal C. Johnson Hospital in Sioux Falls is Dr. Nicholas G. Booselis, who was appointed to the post in August. A native of Faribault, Dr. Boosalis received his medical training at the University of Minnesota Medical School. After completing his internship at St. Mary's Hospital, Duluth, he practiced for a short time at Sauk Center, then entered military service in 1942. Following his discharge in 1946, he completed a residency in general surgery at the University of Minnesota Hospitals and Minneapolis Veterans Hospital.

* * *

Dr. Grant Garlock has become associated in practice with Dr. D. H. Garlock, Dr. A. V. Garlock and Dr. J. K. Hartjen in Bemidji. The son of Dr. D. H. Garlock, Dr. Grant Garlock recently completed his internship at the West Suburban Hospital in Chicago.

* * *



Dr. Wallace Hill moved from Windom early in August, planning to tour Minnesota and North Dakota in a search for a new location for his practice. During the past year Dr. Hill was associated in practice with Dr. L. J. Hoyer in Windom.

* * *

Forty-two years of medical service and civic leadership by Dr. William H. Barr were commemorated by Wells residents at an honor banquet given for the physician on August 31. The banquet and program of tribute were given by the Boy Scouts, Cub Scouts, Campfire Girls and Blue Birds of Wells in recognition of Dr. Barr's service to the children of the community.

The program at the banquet consisted mainly of vocal selections, short talks and skits presented by members of the youth organizations. At the conclusion a scrapbook containing pictures of Dr. Barr's "children" was presented to the physician.

Medical School, has practiced in Wells since 1907. In his forty-two years there he has served in numerous civic capacities, having been mayor, school board member, chairman of the board of health, and a leader in many other fields of activity. He was a member of the state board of medical examiners for ten years and a member of the state board of health for eight years. In addition to his private medical practice, he is president of the Peoples State Bank, president of the Wells Cemetery Association, and district surgeon for the Milwaukee Railroad.

* * *

Dr. Earl C. Elkins, Rochester, took office as president of the American Congress of Physical Medicine on September 8 at a meeting of the group in Cincinnati, Ohio. The title of his presidential address was "Education in Physical Medicine and Rehabilitation."

* * *

It was announced late in August that Dr. Lyle V. Berghs would resume his practice in Owatonna on September 1, after several months of convalescence in Montana following a major operation.

* * *

Dr. R. I. Gruys, formerly of Detroit, is now associated in practice with Dr. H. C. Stratte and Dr. L. L. Sogge in Windom. A graduate of the University of Minnesota Medical School, Dr. Gruys recently completed three years of practice at Wayne County Hospital in Detroit.

* * *

Major construction work had been completed early in September on a new medical clinic building being erected in Moose Lake by Dr. Alvin Sach-Rowitz. When finished, the structure will house a reception room, consulting room, laboratories, x-ray room, operating room, four examining rooms, and a dental office with laboratories, and a dark room. The upper floor of the two-story building will be divided into three modern apartments. Dr. Sach-Rowitz hoped to be able to move into the new clinic before the end of the year.

* * *

In a talk before the Kiwanis Club in Austin on August 17, Dr. Paul C. Leck of that city denied that a health crisis existed in the United States. In pointing out the progress made by medical science—reducing infant mortality, increasing life expectancy, et cetera—he showed that the claims made by the government officials that a health crisis exists are false. He stated that under socialized medicine there is no assurance that voters would get complete medical service for nearly nothing. "About the only thing the people could be sure of under the government plan," Dr. Leck added, "would be that they would have to pay through special taxes."

* * *

Dr. Edward P. Burch of Saint Paul has been appointed surgeon of the Minnesota Department, Reserve Officers Association. Dr. Burch has been active in the direction of the association's affairs since its reactivation following World War II. He also holds the grade of colonel in the Medical Service Corps Reserve and

ommands the 803rd Medical Center comprising ORC nedical units in Minnesota.

As department surgeon, Dr. Burch will formulate the lepartment's policy with regard to medical affairs as they ertain to the Organized Reserve Corps. The association, n turn, works closely with the Department of Defense n all matters related to the Reserve program. It serves is the collective voice of Reserve officers of the Army, Navy (including Marine Corps and Coast Guard) and Air Force.

* * *

The health committee of the Virginia Chamber of Commerce sponsored a diabetic survey during the week of October 10 through 16. Believed to be the first project of its kind on a community-wide basis, the survey was aimed to uncover unsuspected cases of diabetes. All Virginia residents were urged to participate in the survey and have detection tests made. In charge of the survey was Dr. R. P. Pearsall, city health officer and chairman of the Chamber of Commerce health committee.

Dr. Owen H. Wangensteen, chief of surgery at the University of Minnesota, was the recipient of the first award made by the Minnesota division of the American Cancer Society for distinguished service in cancer control at a meeting held September 23, 1949. Dr. Wangensteen has been chief of surgery since 1930, having received the appointment at the age of thirty-two. He has been particularly interested in methods for the detection and treatment of early cancer of the digestive tract.

HOSPITAL NEWS

The new administration and receiving building at the Hastings State Hospital will be completed in May, 1950, at a cost of $917,000. The structure will have two wings, one 131 feet and the other 200 feet long. It will house offices, public reception facilities, a lounge and lunch counter for visitors, a library and gymnasium-auditorium, a cafeteria and forty private bedrooms.

* * *

Mr. Lyle Horton, former assistant manager of the Colonial Hospital in Rochester, has been appointed manager of the Kahler Hospital in the same city. He succeeds Mr. Frank A. Menk, who is now assistant administrator of the George Washington University Hospital.

* * *

Glen Lake Sanatorium will be able to have a balanced budget in 1950, for the first time since 1945. The sanatorium will be "in the black" because of the allowance of the full 4.75 mills which the 1949 legislature authorized the county board to levy for current operations. The full allowance will raise at least $1,589,675 next year and will permit the institution to pay off an expected deficit of $145,000 from 1949.

* * *

It was announced on August 10 that construction work on the $320,000 Community Hospital in Baudette was proceeding at a rapid rate. Brickwork was near completion and plumbing was being installed.

BLUE SHIELD NEWS

Blue Shield is rapidly increasing from month to month. From January 1 to August 31 this year, care given Blue Shield members amounted to $676,693.87, covered 17,790 cases and 3,992 separate services. This is an increase of 1116.36 per cent over last year's $55,-632.74 paid out on Blue Shield cases during the same eight-month period.

As of August 31, 1949, there were 2,468 Blue Shield participating doctors of medicine, and the latest count shows approximately 225,000 persons covered by Minnesota Blue Shield.

HOMEWOOD HOSPITAL

Corner Penn and Plymouth Avenues North

Minneapolis Minnesota

Because of increased growth it has become necessary for the Blue Shield office to devise and put into operation a new method of processing Blue Shield cases. Procedures of older and larger Blue Sheild plans were studied and observed, and the wishes of the physician were kept in mind in planning the new process.

The new method will be used in Minnesota in the very near future, but before it becomes effective each doctor and his office personnel will receive a detailed account as to how it works.

The new procedure requires a new report form of three parts with carbon inserts. The second carbon is to be retained by the attending physician for his files. The original and first carbon is to be mailed to the Blue Shield office. The Blue Shield office will process the case and return the original to the physician with his check.

Many physicians have difficulty identifying the patient from the check voucher as it lists the patient's name only while the doctor's office records may be kept in the name of the family head. The new report form contains the names and addresses of both the patient and the family head on the original copy.

In order to avoid unnecessary work in completing forms, it will be advisable for the doctors' office personnel to become familiar with the benefits provided by the Minnesota Blue Sheild. Every assistance will be given by the Blue Shield office in supplying the needed information.

In addition to streamlining the procedure for handling of cases, the new process will indicate to the Blue Shield patient and to the public in general that the medical profession of Minnesota is supporting voluntary prepaid health care in preference to government controlled medicine. It will be concrete evidence that the family doctor has the interest of his patients at heart and that he is willing to aid them in receiving Blue Shield benefits, which, incidentally, have been increased twice within sixty days at no increase in cost to the subscriber.

The Medical Advisory Committee's recommendation to increase the payment to participating doctors of medicine from the present $75 to $100 for appendectomy procedures performed on and after October 1, 1949, was approved by the Board of Directors of Minnesota Medical Service Inc. All Blue Sheild participating doctors of medicine have received letters to this effect.

Blue Cross is still growing. From January 1 to August 31, 1949, Minnesota Blue Cross provided benefits to 95,702 Blue Cross subscribers, amounting to $5,556,564.76. There are now 950,266 persons covered by Minnesota Blue Cross.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

MANUAL OF HUMAN DISSECTION (Shearer's). Second Edition. Charles E. Tobin, Ph.D., Editor. Associate Professor of Anatomy, University of Rochester School of Medicine and Dentistry. 286 pages. Illus. Price $4.50, cloth. Philadelphia: The Blakiston Co., 1949.

PHENOL AND ITS DERIVATIVES: The Relation Between Their Chemical Constitution and Their Effect on the Organisms. W. F. von Oettingen, U. S. Public Health Service. 408 pages. Price, 70c, paper cover. Washington: Federal Security Agency, 1949.

MANUHUANA IN LATIN AMERICA—The Threat It Constitutes. Pablo Osvaldo Wolff, M.D., Ph.D., M.A. Member of Expert Committee on Habit Forming Drugs of the World Health Organization. 56 pages. Price $1.50, paper cover. Washington: The Linacre Press, 1949.

EVERYDAY PSYCHIATRY. John D. Campbell, M.D. Diplomate, American Board Neurology and Psychiatry; Psychiatrist to St. Joseph's Infirmary and Crawford W. Long Hospital, Atlanta, Ga.; Instructor in Psychiatry, Emory University Medical School; Captain, M.C., U.S.N.R. 2d ed. 394 pages. Price $6.00. Philadelphia: J. B. Lippincott Co., 1949.

Everyday Psychiatry is the scientific book written in a style easy to read. The book is highly recommended as an aid to the understanding of motivations and behavior of patients in all specialties of medicine. Each reader will probably find a different application of the information obtained from this text.

This reviewer found especially valuable the clarity of classification of the psychoneuroses, making it possible to classify easily the majority of psychoneurotic patients. The problem of futility in treating the immutable psychopathic patient is well presented documented and convincing.

B. J. MEARS, M.D.

RYPINS' MEDICAL LICENSURE EXAMINATIONS. Edited by Walter L. Bierring, M.D., F.A.C.P., M.R.C.P. (Edin. Hon.) 6th ed. 690 pages. Price $6.00. Philadelphia: J. B. Lippincott, 1947.

This book offers a brief review of anatomy, pathology, physiology, chemistry, bacteriology, pharmacology, surgery, medicine, obstetrics and gynecology, hygiene and preventive medicine, psychiatry. The plan of the book

is to present a summary of the subject, and to follow it by a list of questions commonly found on State Board examinations.

The book affords an excellent basis for review of the subjects covered (all that are usually required for State Board examinations), especially for one who is not a recent graduate Anatomy and pathology of course must be studied in conjunction with specimens and slides, or at least an illustrated standard textbook, but the various chapters form an excellent outline of the essential material.

The book might also prove useful to medical students as a final pre-exam review. It would not be suitable as a general quick reference book because there is little detail, and due to the large amount of material covered the index is necessarily sketchy.

Introductory notes on the philosophy and nature of examinations, with particular reference to National and State Boards are helpful and well thought out.

The latest edition features a new chapter on psychiatry.

J.A.M.

HANDBOOK OF MATERIA MEDICA, TOXICOLOGY, AND PHARMACOLOGY. By Forrest Ramon Davison, B.A., M.Sc., Ph.D., M.D. Consultant and Toxicologist, Minneapolis, Minnesota; formerly Assistant Professor of Pharmacology in the School of Medicine, University of Arkansas, Little Rock; Medical Department, The Upjohn Co., Kalamazoo, Mich., Assistant professor of Pharmacology, University of Tennessee Medical School, Toxicologist to University Clinics, Memphis, Tennessee, 4th ed., 730 pages, illus. Price $8.50. St. Louis: C. V. Mosby Co., 1949.

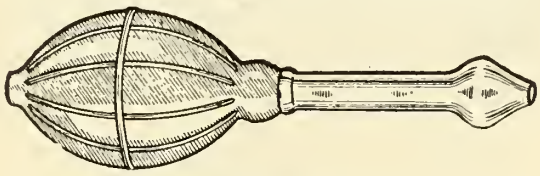
of the new drugs. This has been done without crowding out those drugs and preparations with well-established therapeutic value.

This, as well as the previous editions, is a middle of the road type; that is, it does not treat the subject superficially, but gives enough scientific detail to satisfy the student and the busy practicing physician. At the end of each chapter, a list of references is given to guide those wishing to make a more thorough study of any certain drug.

F. H. Magney, M.D.



MANUAL OF MEDICAL EMERGENCIES. By Stuart C. Cullen, M.D., Professor of Surgery, Chairman, Division of Anesthesiology, State University of Iowa College of Medicine, and E. G. Gross, M.D., Professor and Head of Department of Pharmacology, State University of Iowa College of Medicine. 267 p. Illus. Price $3.75, cloth. Chicago: Year Book Publishers, Inc., 1949.

Any physician at any time during his lifetime will find himself at the scene of an acute medical emergency. His conduct at that time is important not only because of its reflection on his prestige but because the victim's life depends on it.

This book discusses principles of emergency care, some of which are not commonly known among physicians but are, nevertheless, very important. Especially valuable are the chapters on artificial respiration, circulatory emergencies, and acute poisonings. This is a concise, well-written book which may readily be used for reference.

TREATMENT OF CARPAL NAVICULAR INJURIES

(Continued from Page 994)

had an excellent result, with complete range of normal painless wrist motion.

Conclusions

These are the important points to be remembered in treatment of carpal navicular fractures:

1. All injuries of the wrist should be carefully examined for possible navicular bone fracture and x-rayed immediately.

2. Initial negative x-rays with positive clinical findings for fracture do not necessarily rule out a fracture. The wrist should be immobilized immediately and x-rays taken again in from one to three weeks.

3. Immobilization should be immediate, continuous, and prolonged until x-ray evidence of the union is demonstrated.

4. Almost 100 per cent of acute fractures of the navicular bone heal with little or no residual disability in the wrist if immobilization is instituted immediately.

5. Bone-graft operation, in experienced hands, offers the best chance for healing in cases of delayed union and non-union.

6. Bone grafting is more accurate when the proximal navicular fragment is slotted with a chisel and the distal fragment drilled under direct vision.

Supplements the sun...
removes the shadow of RICKETS

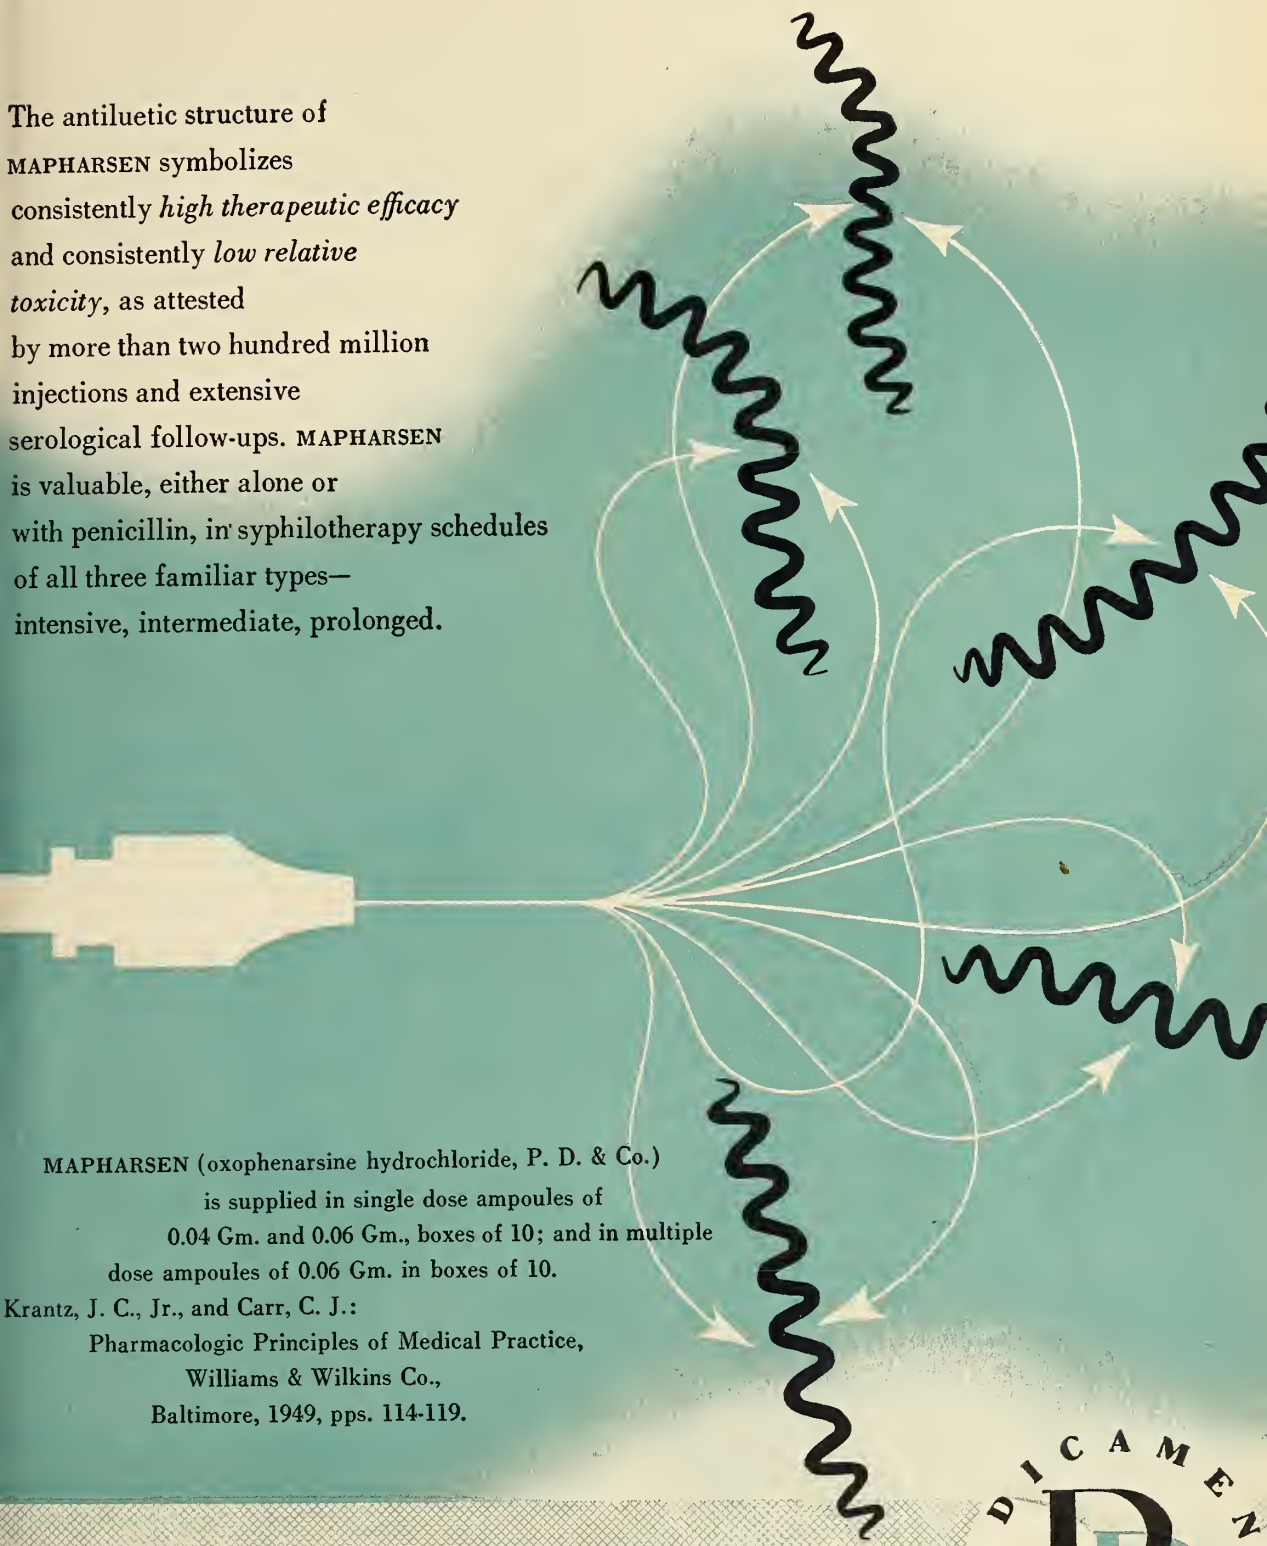
Rickets may be found in apparently healthy and well nourished infants due to an insufficient intake of vitamin D plus inadequate exposure to ultraviolet rays.

It is now generally accepted that a vitamin D supplement should be given regularly not only to infants but to older children and adolescents. Mead's Oleum Percomorphum With Other Fish Liver Oils and Viosterol is useful for this purpose.

Mead's Oleum Percomorphum

1. Is a highly potent† source of natural vitamins A and D.

2. May be given in drop doses that are easily administered and well tolerated, and is supplied in capsule form also.



3. Has a background of sixteen years of successful clinical use.

†Potency: 60,000 U.S.P. units of vitamin A and 8500 U.S.P. units of vitamin D per gram. Each drop supplies 1250 units of vitamin A and 180 units of vitamin D; each capsule, 5000 units of vitamin A and 700 units of vitamin D.

Supplied in 10 cc. and 50 cc. bottles; and in bottles of 50 and 250 capsules.

The antiluetic structure of
MAPHARSEN symbolizes
consistently *high therapeutic efficacy*
and consistently *low relative*
toxicity, as attested
by more than two hundred million
injections and extensive
serological follow-ups. MAPHARSEN
is valuable, either alone or
with penicillin, in syphilotherapy schedules
of all three familiar types—
intensive, intermediate, prolonged.

MAPHARSEN (oxophenarsine hydrochloride, P. D. & Co.)
is supplied in single dose ampoules of
0.04 Gm. and 0.06 Gm., boxes of 10; and in multiple
dose ampoules of 0.06 Gm. in boxes of 10.

WISHFUL THINKING

Those of you who haven't yet paused in your busy day to provide for adequate income protection, are guilty of wishful thinking. You are hoping that the law of averages will pass you by. Most of us know that you can't depend upon a four-leaf clover.

This Special Disability Policy offers more protection per dollar than any other contract on the market.

Our counsel is to stop depending upon a four-leaf clover. Call or write this office NOW—the result will be much safer!

WORLD TRAVELER . . .
Dietary Dub

Food customs? He can describe the bill of fare in far away places some people never heard of. His personal eating habits, however, are those of most men in public life—a feast when the hectic schedule permits, just a bite here and there between times. And like innumerable others who will not or cannot eat properly, these are the half-well, half-sick cases you recognize as subclinical vitamin deficiencies. Your first move in such cases is dietary reform, but when it comes to the right vitamin supplement, remember the name Abbott. In the complete Abbott line are single and multivitamin products . . . in liquid, capsule and tablet form . . . for oral and parenteral use . . . for supplemental and therapeutic dosage. Your pharmacist can supply them in a variety of package sizes.

ABBOTT LABORATORIES, North Chicago, Illinois.

about the LARYNX, the PHARYNX... and CIGARETTES

Here is the simple reason why many leading nose and throat specialists suggest "Change to Philip Morris."*

The sensitive tissues of the upper respiratory tract are often affected adversely by the irritants in the smoke of ordinary cigarettes.

Philip Morris, on the other hand, are specifically processed to *minimize* such irritants . . . the only one of all leading cigarettes to offer this advantage.

Why not give your patients the benefit of this proved** superiority . . . why not suggest Philip Morris. Many leading doctors make it a point to say to their patients who smoke . . . *"Change to Philip Morris Cigarettes."*

PHILIP MORRIS

Philip Morris & Co., Ltd., Inc.
119 Fifth Avenue, New York

ARE YOU A PIPE SMOKER? . . . We suggest an unusually fine new blend—COUNTRY DOCTOR PIPE MIXTURE. Made by the same process as used in the manufacture of Philip Morris Cigarettes.

**Completely documented evidence on file.*

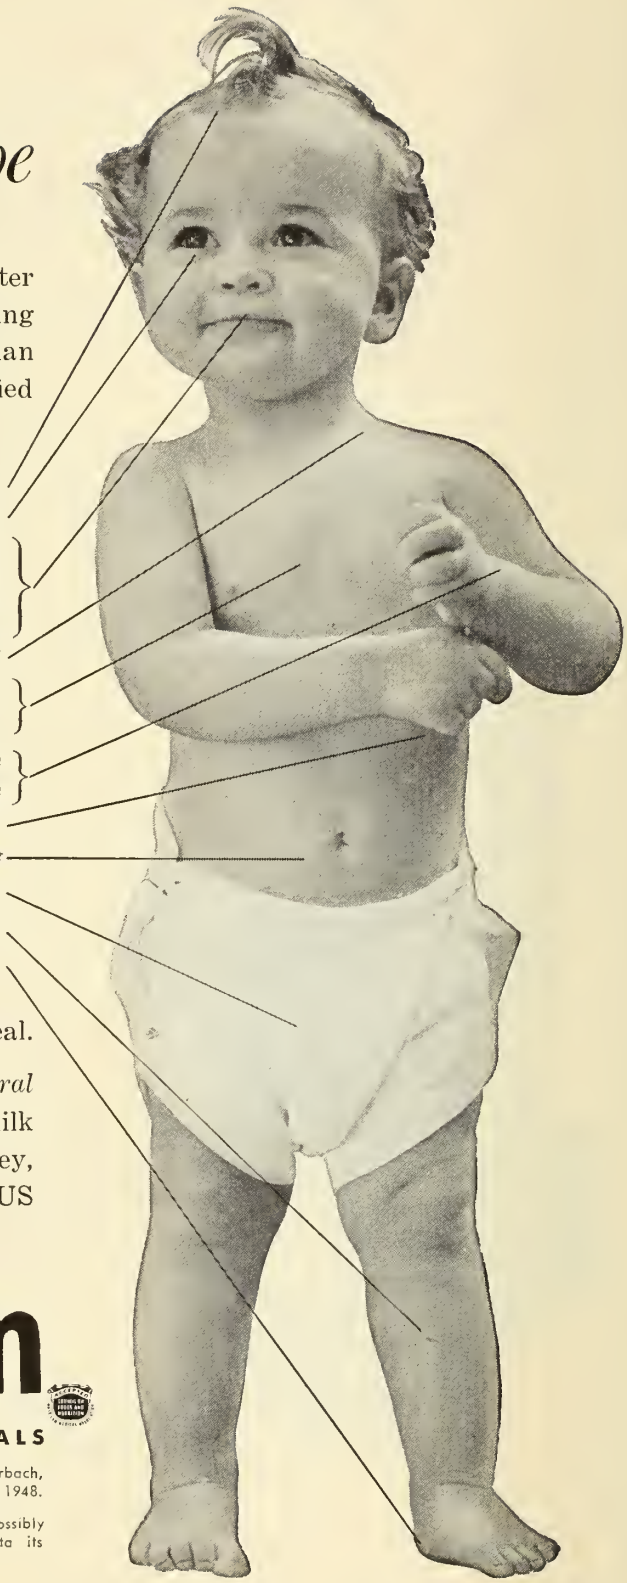
Antibiotics

For the past several years, *Lederle* has conducted extensive research in the production and isolation of antibiotics. Scientific competition in this field has been keen and *Lederle* leadership has been achieved at the expense of a heavy investment in personnel, materials and money. Two antibiotics are widely used throughout the world—aureomycin and penicillin. The former is produced solely by *Lederle*. Penicillin in many new forms, both oral and parenteral, has been pioneered by *Lederle*.



Lederle research never comes to a standstill, but on the contrary, proceeds apace; and will in due course produce many additional weapons for man's fight against parasitic microorganisms.

For Cold Sterilization of Surgical Instruments

PHENEEN "Ulmer"

A highly effective germicide and fungicide intended primarily for the cold sterilization of surgical instruments. An efficient antiseptic of high potency with many daily uses in the hospital and laboratory.

PHENEEN "Ulmer"

- non-toxic
- non-staining
- non-corrosive
- non-irritating
- non-poisonous

The germicidal ability of this specialized brand of high molecular alkyl-dimethyl-benzyl ammonium chloride 1% is well established. Tests on Staphylococcus Aureus and Eberthella typhosa exposed one minute show no growth or resubculture. PHENEEN "Ulmer" contains rust inhibitants which prevent rust and corrosion. It has a pleasant odor, contains no phenol, formaldehyde, iodine, mercury or other metals and does not leave residues on glass containers. May be diluted 1 to 40 for removing odors in lavatories, kitchens, laboratories and operating rooms.

much to recommend it

SOLGANAL*

(aurothioglucose)

Schering's aurothioglucose has much to recommend it for the treatment of active rheumatoid arthritis. Water soluble, but suspended in oil to provide prolonged absorption, it is effective in small dosage, frequently inducing remissions in early acute phases of the disorder.

in active rheumatoid arthritis

Marked improvement has been reported in "50 to 60 per cent of patients, moderate improvement in 20 to 25 per cent. . . ."[1] Among 1000 patients treated recently with SOLGANAL, there were no fatalities and few instances of severe toxicity.[1]

SOLGANAL

SCHERING

sequence in biliary tract surgery

preoperatively-Decholin

brand of dehydrocholic acid stimulates an abundant flow of thin bile, helping to "clear the arena" for surgery by the removal of inspissated bile, mucus, small stones and other accumulations from the choledochus. This powerful hydrocholeretic action also produces functional distension of the gallbladder and ducts, aiding in identification and surgical procedure.

postoperatively-Decholin

provides an effective means of flushing out the biliary tract. Used together with antispasmodics such as atropine and nitroglycerin, *Decholin* helps to remove blood clots, residual debris and hidden, small calculi. This method, recently re-emphasized by Best,[1] is useful with or without T tube drainage. In reflex biliary stasis, *Decholin* serves to prompt an adequate secretion of bile.

For more rapid and intense hydrocholeresis, *Decholin Sodium*, brand of sodium dehydrocholate, is given intravenously, followed by a course of *Decholin* tablets.

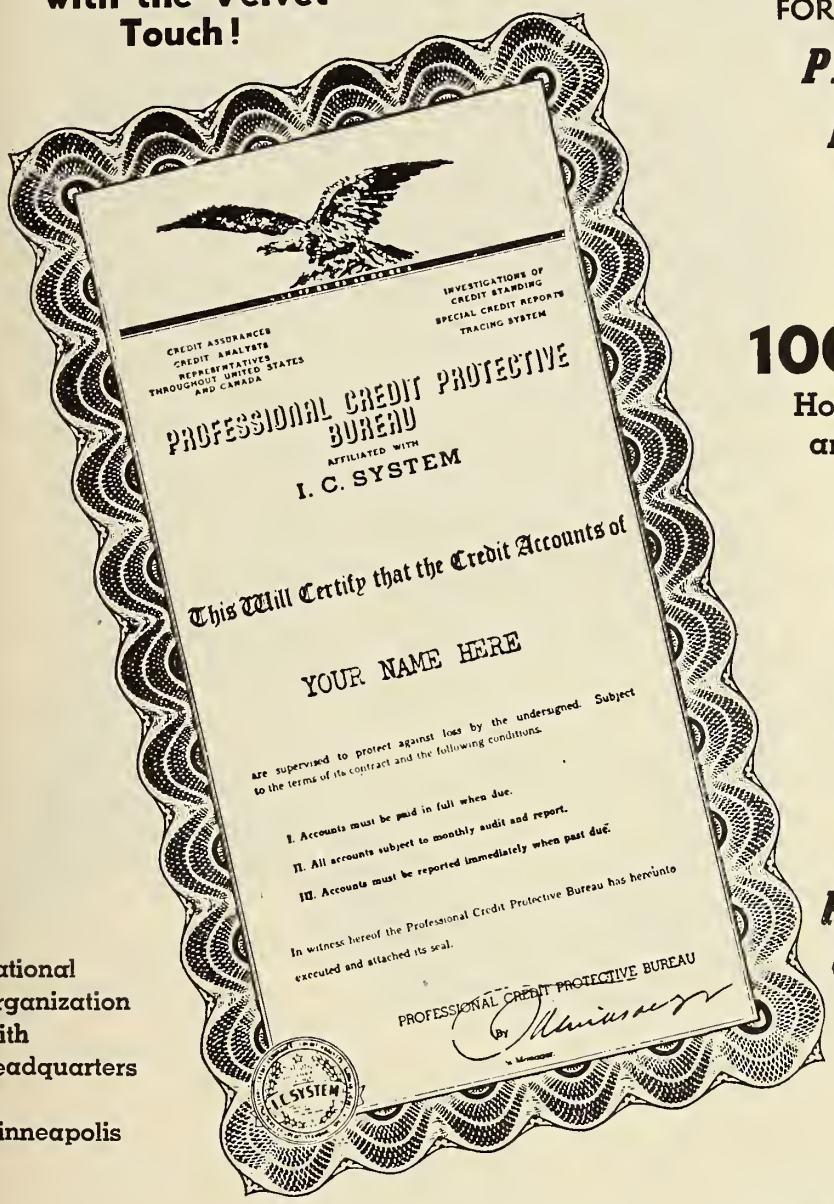
Decholin

brand of dehydrocholic acid

Decholin (brand of dehydrocholic acid) Tablets of 3¼ grains, in bottles of 25, 100, 500 and 1000.

Decholin Sodium (brand of sodium dehydrocholate) 20% solution, in ampuls of 3 cc., 5 cc. and 10 cc., boxes of 3 and 20.

1. Best, R. R.: Ann. Surg. *128*: 348 (Sept.) 1948.



DECHOLIN and DECHOLIN SODIUM: Trademarks registered in U. S. and Canada.

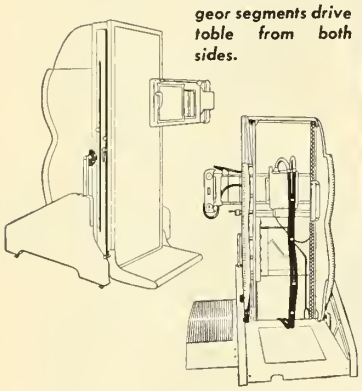
The new KELEKET "C-SUPERTILT" TABLE...



...with 45° TRUE TRENDELENBURG

135° angulation from 45° Trendelenburg through horizontal to vertical.

Geared head motor drive and double gear segments drive table from both sides.

Moves from horizontal to 55° in 12 seconds. Bucky travels to within 3" of foot end.

Years in advance of any table yet developed

KELLEY-KOETT, the oldest medical X-ray manufacturer in the field, introduces its golden anniversary model, the "C-Supertilt" Table.

Years in advance of any table yet developed, the "C-Supertilt" Table has undergone five years of the most rigid testing . . . offers the radiologist improved technic, easier operation, greater safety for operator and patient. Perform fluoroscopy, radiography and fluorography with increased facility and visualization. Procedures such as encephalography, ventriculography, myelography and genitourinary work are performed with ease and safety never before possible.

Write for detailed information on this great new table.
You'll agree there's nothing like it!

KELLEY-KOETT X-RAY SALES CORP. OF MINN.

1111 NICOLLET AVE. MINNEAPOLIS 3, MINNESOTA

if she is one of *your* patients...

...She depends on your help for a speedy return to gainful occupation. INTRODUCING...

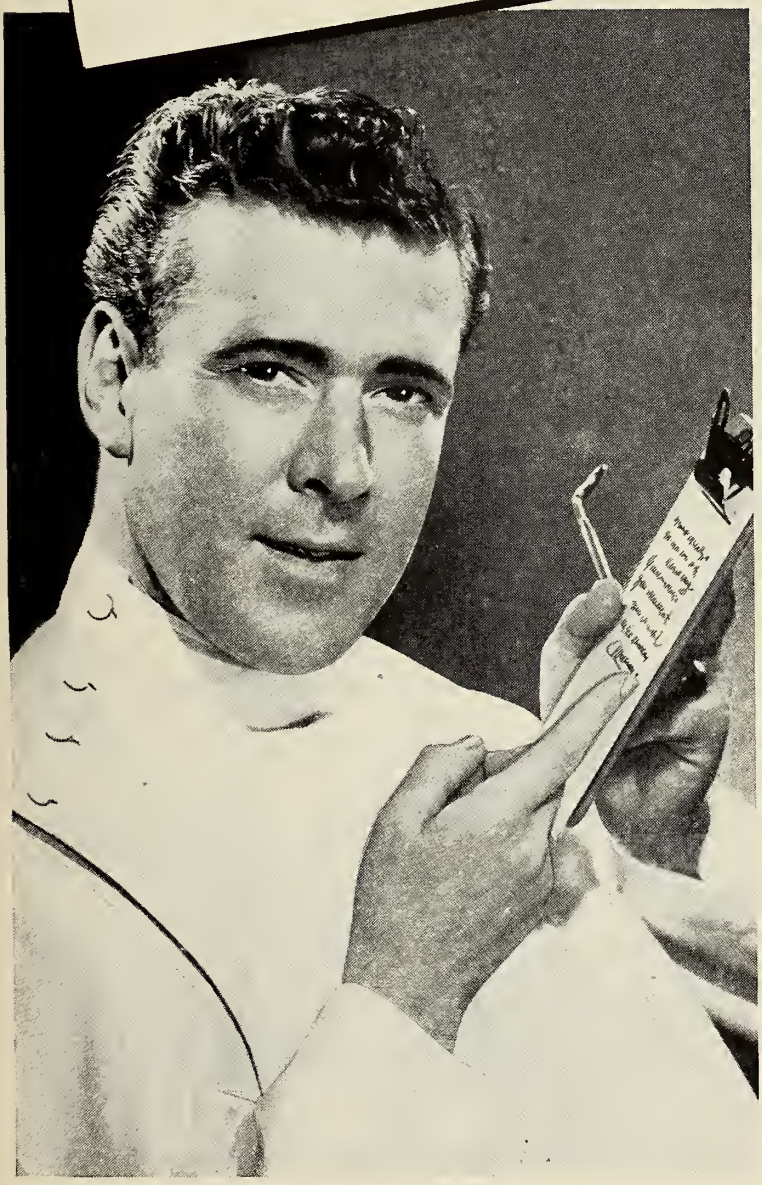
THE KOROMEX JELLY REFILLABLE UNIT

Physicians acclaim the new Koromex all inclusive contraceptive unit. This fine container is ivory-colored plastic, permanent, dust-proof, attractive for home use and ideal for traveling. It contains two regular size tubes of Koromex Jelly which rest in individual compartments . . . a Koromex Diaphragm stored in the ingeniously constructed cover compartment . . . and a Koromex Measured Dose Plunger Applicator that rests securely on its own rack.

Where pregnancy is contra-indicated, recommend the complete Koromex Jelly Refillable Unit to your discriminating women patients.

For those of your patients who require a slightly less lubricating but equally effective spermicidal preparation, a similar companion package containing two tubes of Koromex Cream instead of Koromex Jelly is also available.



ACTIVE INGREDIENTS: BORIC ACID 2.0% OXYQUINOLIN BENZOATE 0.02% AND PHENYLMERCURIC ACETATE 0.02%, IN SUITABLE JELLY OR CREAM BASES.

THROAT SPECIALISTS REPORT ON 30-DAY TEST OF CAMEL SMOKERS—

"Not one single case of throat irritation due to smoking CAMELS!"

YES, these were the findings in a total of 2,470 weekly examinations of hundreds of men and women from coast-to-coast who smoked only Camels for 30 consecutive days! And the smokers in this test averaged one to two packages of Camels a day!

According to a Nationwide survey:

MORE DOCTORS SMOKE CAMELS

than any other cigarette!

Doctors smoke for pleasure, too! When three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel!

Effective and Convenient ANTACID MAINTENANCE

Creamalin, the first aluminum hydroxide gel, readily and safely produces sustained reduction in gastric acidity. With Creamalin there is no compensatory reaction by the gastric mucosa, no acid "rebound," and no risk of alkalosis. Through the formation of a protective coating and a mild astringent effect, nonabsorbable Creamalin soothes the irritated gastric mucosa. Thus it rapidly relieves gastric pain, speeds healing of peptic ulcer and helps to prevent recurrence.

Average dose: Peptic ulcer, 2 to 4 teaspoonfuls (or tablets or capsules) with a little milk or water every two to four hours. Dyspepsia: 2 teaspoonfuls (or tablets or capsules) one-half to one hour after meals.

WINTHROP-STEARNS INC.
New York 13, N. Y., Windsor, Ont.

Creamalin liquid N.N.R. (peppermint flavored) in bottles of 8, 12 and 16 fl. oz.

Creamalin tablets (not N.N.R.), tins of 12, bottles of 50 and 200. Creamalin capsules (not N.N.R.), bottles of 24 and 100. Each tablet or capsule is equivalent to 1 teaspoonful of Creamalin liquid.

Creamalin®

THE ROENTGEN DIAGNOSIS OF LESIONS OF THE URINARY TRACT

H. DABNEY KERR, M.D.
Professor of Radiology
University of Iowa Medical College
Iowa City, Iowa

It is a great honor to be asked to give the Russell D. Carman Memorial Lecture before this Society. One does not have to have been a friend of Dr. Carman or even to have known him personally in order to be influenced by his great contribution to radiology, and indeed to medical practice generally. His work was the foundation of gastrointestinal roentgenology, which in turn is the mainstay in the diagnosis of diseases of the gastrointestinal tract. Many eminent radiologists have given this lecture in years past, and it is with a sense of great humility that I follow in their path. I have chosen as the subject of my remarks today "The Roentgen Diagnosis of Lesions of the Urinary Tract."

ALTHOUGH there are times when the roentgen findings in disorders of the urinary tract seem unequivocal, it is wise to consider all of the other data, i.e., history, clinical examination, laboratory findings with the roentgen examination, before arriving at a final impression. Radiologists must always be willing to discuss the clinical findings with the urologist, surgeon or internist, and vice versa, and an attempt should be made to reconcile all the data. In other words, the radiologist should try to be as much a practitioner of medicine as his consultants and confréres in appreciating the significance of nonradiologic data. In my presentation this afternoon I shall avoid technical details and confine my remarks and illustrations to clinical and roentgen entities.

The Russell D. Carman Memorial Lecture presented at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

There are so many conditions of the urinary tract that can be identified or suspected by the roentgenographic appearance that it is obviously impossible to discuss or depict them all in one short hour. I have, therefore, selected such conditions as I thought would interest you and crave your indulgence for what may appear to be gross omissions.

Kidney

In the diagnosis of renal lesions, one can use in addition to the plain films either intravenous or retrograde pyelography. While it is true that intravenous urography has been of distinct advantage in the diagnosis of lesions of the urinary tract, it should rarely be taken as the sole criterion in arriving at diagnoses of pathologic conditions. It is much more valuable in ruling out disease when the findings are normal than in establishing a diagnosis from apparently abnormal findings. We, therefore, prefer to have retrograde pyelograms whenever possible, and to correlate the appearance with the clinical data. This correlation is of paramount importance and no radiologist should be satisfied with seeing only the films.

It is trite to say that in order to recognize the abnormal, one must have a broad knowledge of and acquaintance with the "normal" and its variations. One of the most common sites of such anatomic variation is the renal pelvis and calices. This variation shows itself in the number and size of the calices, the size and shape of the pelvis and of the calycine infundibula. Pelvic anomalies vary from a suggestive bifid pelvis to a double pelvis and ureters.

Duplex kidney is a rather common anomaly which is easily recognized when both pelves are visualized. If only the lower is seen, however, the diagnosis is not so obvious because this pelvis

Fig. 1. (*A*) Duplication of pelvis and calyces of right kidney. (*B*) Hypoplastic left kidney with pelvis somewhat distended.

closely resembles a normal single one. Careful inspection may indicate renal tissue which cannot drain into the visualized pelvis, and then an upper pelvis should be sought. Occasionally it cannot be found, although it may be infected and be the cause of a long period of poor health. Sometimes one or the other of the ureters may end in a blind pouch with little or no renal tissue visible. When no kidney is visualized on one side, one must keep in mind the possibility of ectopic kidneys. Such kidneys may be of the crossed or uncrossed varieties. When crossed, close association of the pelves probably means fusion of the kidneys. These kidneys may also be the site of hydronephrosis or stone.

Horseshoe Kidney.—This anomaly is a fusion, usually of the lower poles of the kidneys, across the midline. There is incomplete rotation of the kidneys, and the pelves are anterior while the calices point posterior. The axes of the pelves lie downward and medial instead of down and lateral as is normal. This condition may occasionally be suspected from the plain film.

Simple Cyst.—This uncommon lesion is either serous or hemorrhagic. A single spherical cyst may arise in any portion of the kidney. These lesions are usually large when discovered and pyelographically cause smooth compression of adjacent calices. Occasionally they are large enough to cause downward displacement of the entire kidney. It is important to keep in mind that they may be exactly simulated by cysts which contain carcinoma and that the malignant and nonmalignant cysts cannot be differentiated roentgenographically. They must, therefore, all be attacked surgically as though they were malignant.

Polycystic Kidney.—As the name implies, in this condition the kidneys are the sites of multiple cysts. The condition is bilateral, familial and congenital. In the stage in which they are usually seen, there are bilateral abdominal masses. The renal shadows are grossly enlarged, the calices are distorted, compressed and elongated and there is relative decrease in the size of the pelvis. Excretory urograms are unsatisfactory because function is poor. Bilateral examinations should always be done because the deformity may closely resemble a malignant neoplasm. A hypoplastic kidney is essentially of normal configuration, but the pelvis and calices are smaller than normal. With retrograde pyelography, the pelvis is somewhat dilated because its presence is usually unsuspected.

Renal Calculi.—Renal calculi are ordinarily visualized because of their content of calcium in the form of carbonate, oxalate or phosphate. They may also contain other urinary constituents such as uric acid, xanthine, cystine, the urates and cellular debris, but the resultant "stones" will then probably be radiolucent. Renal calculi are most commonly unilateral, although they may occur on both sides. The first roentgen examination in cases of suspected renal calculi should be a plain film. This must be of excellent quality if small stones are to be found. Retrograde studies may be valuable in determining the presence or absence of renal damage, but it must be remembered that these opaque pyelograms will obscure an opaque calculus. Stones free in the pelvis tend to be spherical while those in the calices may be flat or conform to the space which contains them. Calculi of low density may be discovered because they displace the opaque medium or if an air pyelogram is made they will stand out in contrast to the air. Stones are a frequent cause of renal damage both when in the kidney and when they cause ureteral blocking. As intracalycine calculi grow, they may completely fill the pelvis and cal-

ices and form a staghorn or coral calculus which renders the kidney relatively functionless. However, continued growth of a calculus means that some renal function has been maintained.

The calcium oxalate stone has a characteristic "mulberry" appearance and can be recognized on the film. Small groups of stones in the parenchyma are frequently indicative of a calycine diverticulum. These are outpouchings of the mucosa of a calix. Multiple renal stones are not too uncommon but they are rarely facetted. When they are facetted and especially when they lie on the patient's right side, they must be distinguished from gall stones, pancreatic stones, et cetera. Diffuse and rather generalized deposits of calcium throughout the kidneys (nephrocalcinosis) may occur as a part of the picture of hyperparathyroid disease or excessive intake of calcium and vitamin D. Also any factor which causes necrosis of the renal tissue may lead to amorphous calcific deposits in the kidneys. These conditions may be infectious or toxic from such substances as mercury or uranium.

Renal Infections (Nontuberculous).—The kidney is not infrequently the site of acute inflammatory lesions. Pyelitis without nephritis probably never exists independently for more than a very short time so that the term pyelonephritis is probably a better general term. The condition seems to be brought about mainly by a blood-borne infection, although ascending infection through the ureteral lymphatics either before or after catheterization appears to be a definite etiologic factor in some cases. Infection through the blood stream is due most commonly to the staphylococcus while either the colon bacillus or the staphylococcus may be the causative organism in the ascending variety.

In the acute infections, the roentgenological evidence may be chiefly of a negative character, although definite pathologic changes may be seen in the pyelogram. Frequently excretory urograms show no evidence of renal function. In the blood-borne coccic infections, the pathologic changes are chiefly in the renal cortex, and these will not be evidenced on the retrograde pyelogram unless there is extensive breaking down of cortical tissue with communication of the abscesses with the pelvis. If the condition is suspected, it is better not to do retrograde pyelography.

"Carbuncle" of the kidney usually arises subsequent to a distant infectious process such as osteomyelitis or furunculosis. If the lesion is suspected clinically because of leukocytosis, costovertebral angle pain and tenderness, only plain films should be made. These may show enlargement of the renal shadow and loss of visualization of the psoas border. With normal findings, however, the diagnosis can still be made from the clinical history, examination and laboratory data. Acute pyelitis frequently shows no pyelographic changes or perhaps only a little relaxation or mild dilation of the pelvis. Soon, however, there is a fuzzy outline of one or more of the calices with slight increase in size.

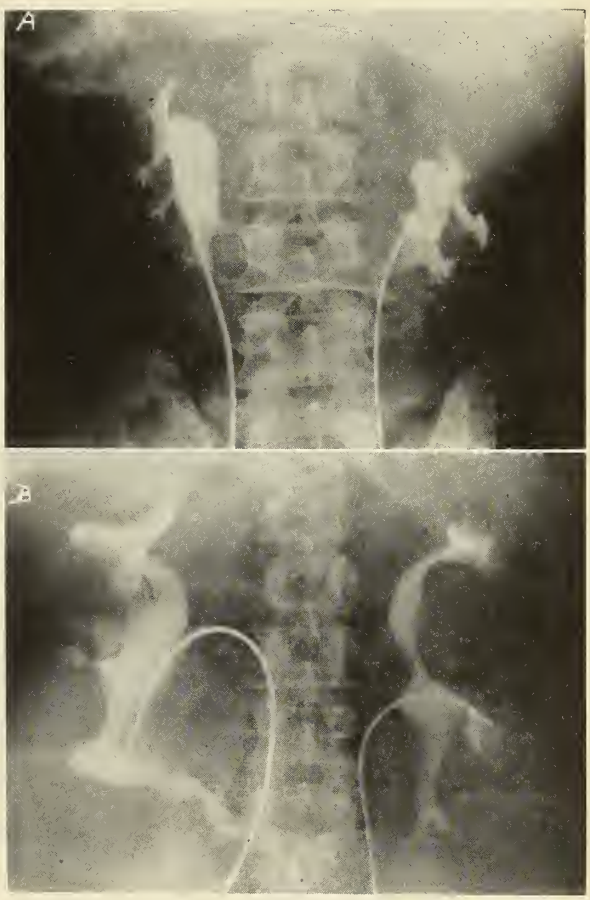

Fig. 2. (*A*) Horseshoe kidney. Axes of pelvis run inferomedial instead of inferolateral as is normal.
(*B*) Distortion of pelvis and elongation of calyces in polycystic kidneys.

As the pyelonephritis becomes chronic, more definite and characteristic changes are noted radiographically. The calices become blunted and more dilated and the infundibula or necks become progressively narrowed. This is accompanied by more caliectasis and ureterectasis.

In the late stages of the disease, it becomes ob-

vious that there is extensive renal damage, and with the development of large necrotic, infected pockets the condition becomes known as pyonephrosis. This may also be the result of an infected hydronephrosis.

Perirenal or perinephritis abscesses may be suspected on the basis of one or more of several roentgen signs: (1) failure to visualize the psoas border, (2) scoliosis of the spine with concavity toward the affected side, (3) displacement and/or rotation of the kidney, (4) immobility of the kidney, (5) obliteration of the normal renal outline, and (6) extravasation of the opaque material outside the kidney. Immobility of the kidney can be determined by fluoroscopy or by making exposures in deep inspiration and expiration on the same film. Occasionally, a colon bacillus infection in a patient with uncontrolled diabetes will present a picture of perirenal and intrarenal formation of gas. This can be recognized by the linear and radiating shadows of decreased density.

Renal Tuberculosis.—Tuberculosis of the kidney is usually a localized manifestation of a more generalized disease. Spread is probably through the blood stream from foci in the lungs, bone, et cetera. The first detectable change to be noted on the pyelogram is a ragged appearance of one calix. This occurs only when the infection, which originally was cortical or medullary, becomes closely associated with a calix. As the tubercle grows and causes more swelling, localized edema or scarring, one or more calices may be closed off and not be visualized, more and more calices are involved and a rough, irregular outline of the pelvis and calices results. The pelvis is rarely enlarged. The ureter is involved fairly early in the process and becomes irregular, with areas of constriction and dilatation which gives it a so-called beaded appearance. This is so constant that any "beaded" ureter is likely to be a concomitant of renal tuberculosis.

As the disease becomes farther and farther advanced, the kidney assumes the appearance of a pyonephrosis, at which time the beading of the ureter may be the only feature distinguishing it from a nontuberculous process.

Calcific deposits may follow the tuberculous necrosis and caseation, so that amorphous calcium in a kidney with any of the above characteristics is additional evidence of the tuberculous basis of the findings.

In the most advanced and healing cases, there is partial calcification of the large tubercles into a lobulated whole. This is the stage of so-called "autonephrectomy." When this occurs, the size of the visualized calcification is about that of a normal kidney. This point is helpful in distinguishing it from calcific deposits in large renal tumors.

Hydronephrosis.—Hydronephrosis is a dilatation of the renal pelvis and calices. In the early cases it is not easy to be sure that a hydronephrosis exists because of the possibility of overdistension of the pelvis at the time of making the retrograde pyelogram. In these cases an excretory pyelogram will give a more accurate impression regarding pelvic volume. Hydronephrosis can be caused by anything that obstructs the normal flow of urine anywhere along the urinary pathway from the calices to the urethra. The causes may be stones, new growths, kinks, aberrant vessels or strictures, either congenital or acquired. Congenital thickening of the musculature and connective tissue about the pelvic outlet is also said to be a common etiologic factor in the production of so-called congenital hydronephrosis. Aberrant blood vessels cause hydronephrosis by pressure on the ureter at the ureteropelvic junction. These may also be associated with a ureter that is placed abnormally high. This position precludes proper drainage of the pelvis and tends, therefore, toward the production of hydronephrosis. As dilatation occurs, the kinking increases and thus a vicious circle is established. The enlargement in these cases may be huge. In the mild forms, there is an increase of the volume of the pelvis with gradual extension of the process to the calices, as indicated by blunting of the fornices. Further dilatation is made at the expense of the parenchyma. Localized caliectasis can be caused by a stone or by stricture of an infundibulum. If the lesion is distal, the ureters may also show extreme degrees of dilatation.

Moderate degrees of hydronephrosis whether infected or uninfected have practically the same appearance, but later as the condition becomes a true pyonephrosis the outlines become hazy and irregular.

Dilatation during Pregnancy.—This is a normal finding and seems to be due to a combination of pressure of the growing fetus on the ureters and

an endocrine or hormonal effect of the pregnancy. This condition is frequently called "pyelitis of pregnancy," but many times there is no infection. Involution begins as soon as the pregnancy is terminated. Repeated pregnancies appear to predispose to increased dilatation, but infection probably plays its part in the residual dilatation.

The roentgen examination should consist of plain films, retrograde pyelograms in the anteroposterior projection, and other views, such as laterals or obliques, as they are indicated. The pyelographic changes will be those caused by the growth of the mass. This will cause pressure defects or filling defects in the contrast medium. A single calix may be deformed, calices may be separated or encroached upon and the kidney may be enlarged in whole or in part. A not infrequent finding is the so-called "spider leg" deformity which may resemble a polycystic kidney. Calcification is a fairly common accompanying finding with renal neoplasms and occurs in about one-third of the cases. The more advanced lesions with necrosis are more prone to show these calcific deposits. They occur most commonly as amorphous flecks scattered throughout the tumor, although larger masses may be seen. It has been said that any "crazy" pyelogram, i.e., any that does not suggest a definite entity, should be looked upon with suspicions of a malignant renal neoplasm in mind.

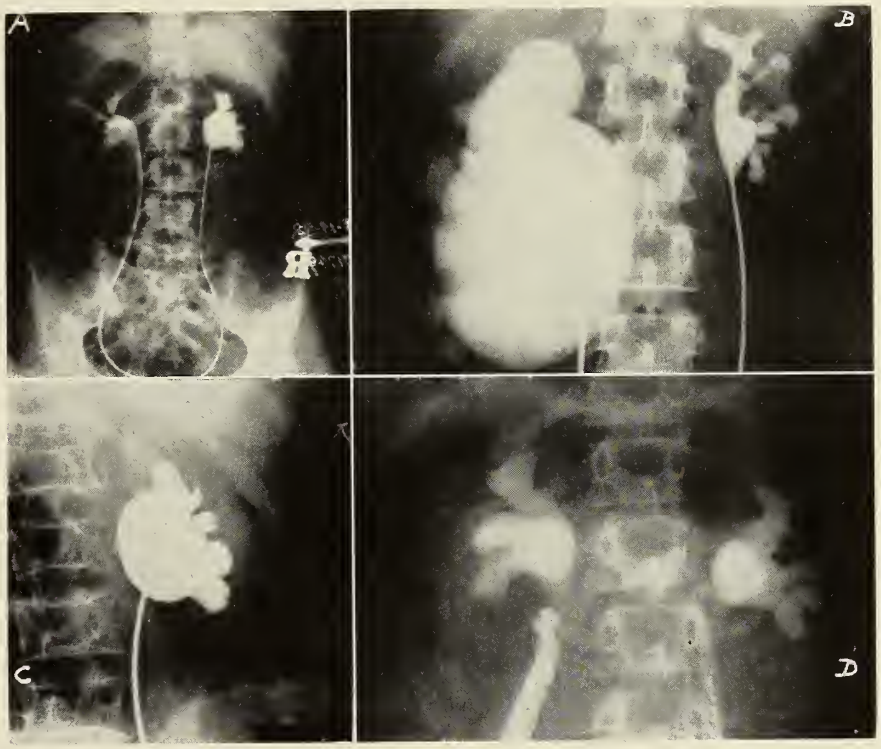

Fig. 3. Hydronephrosis. (*A*) Mild. (*B*) "Congenital" from aberrant vessel. (*C*) Moderately extensive from obstruction. (D) In pregnancy.

Renal Neoplasm.—In no other condition of the kidney is it so important to make an early diagnosis as in malignant neoplasms. In suspected cases, retrograde pyelography should always be done because in no other way can as good visualization be obtained. There is no single "typical" picture of a renal cortical tumor because the changes produced depend upon its site of origin, its relationship to the pelvis and calices and its method and direction of growth. These tumors comprise about 90 per cent of the primary renal tumors of adults, are three times as common in men and appear most frequently in the fifth and sixth decades. The commonest symptom is hematuria which may be intermittent or continuous, slight or hemorrhagic in character. A mass is frequently found and pain is common.

Pelvic neoplasms are not nearly so common as the cortical group. They may, of course, be be-

nign in character, but any lesion of the pelvis which is not a stone should be regarded with frank suspicion. These may show as filling defects in an otherwise normal pelvis or they can be detected by air pyelograms. Most commonly, however, when they are first seen they are extensive and have already grossly deformed the pelvis and invaded the parenchyma. The most common malignant tumor of the kidney in childhood is the Wilms' tumor or embryomal adenomyosarcoma. It is usually found by the mother and presents as an abdominal mass in a child who is ill and listless. Hematuria is uncommon. Films of the abdomen show a large soft tissue mass and pyelograms show renal displacement and pelvic distortion.

Fig. 4. Renal calculi. (*A*) Small single stone at tip of catheter.
(*B*) One kidney in nephrocalcinosis due to hyperparathyyroid.
(*C*) Coral or staghorn calculus.
(*D*) Epithelial detritus or cholesteatoma visualized against air injected into renal pelvis.

Metastatic lesions to the region of the renal pedicle, particularly from testicular neoplasms, may masquerade as primary tumors. Correlation of clinical data is of the utmost importance in these cases.

Blood Clots.—With renal bleeding from any cause (and almost any renal lesion may be accompanied by small amounts of blood) clots may form in a calix or pelvis. These must be differentiated from non-opaque stones and tumors of the pelvis or parenchyma. Their presence is indicated by a filling defect in the opaque medium. Due either to a shrinkage of the clot or distention of the calix, the defect caused by the clot is surrounded by the opaque material. The apparent extent of involvement by tumor is increased when blood clots are present.

Ureter

The ureter is not the site of as many pathologic conditions as is the kidney.

Congenital Anomalies.—These consist mainly of duplication and are usually a concomitant of a bifid or double kidney. The two ureters on one side may unite at any height, enter the bladder separately or one may empty into the urethra. One importance which may be attached to the anomaly of complete duplication of a ureter is that only one orifice may be found and consequently a second kidney, which may be the site of an active or recurring infection, may not be discovered.

Calculi.—Ureteral calculi are practically always found in the kidney and pass into the ureter. From here they may pass into the bladder or they may remain in the ureter and cause urinary obstruction. They may even grow to large size and cause complete destruction of the kidney with hydronephrosis and hydroureter. It is, therefore, important to localize a stone in the ureter even though it is small. Films of good quality are of great importance to this end. These calculi may be confused with (1) phleboliths, (2) calcific arterial plaques, (3) transverse vertebral processes, (4) calcified lymph nodes, (5) detached vertebral osteophytes and (6) artefacts produced by blemishes on the intensifying screen. Calculi in a ureter may be multiple but are ordinarily single.

As noted above under tuberculosis of the kidney, the ureter frequently shows "beading" or alternate points of constriction and dilatation. In far-advanced cases of renal disease, this may be the only indication that the condition in the kidney is tuberculous.

Primary neoplasms of the ureter are rare, but implants from tumors of the renal pelvis are not uncommon. They cause a ragged appearance when the ureter is filled with an opaque medium.

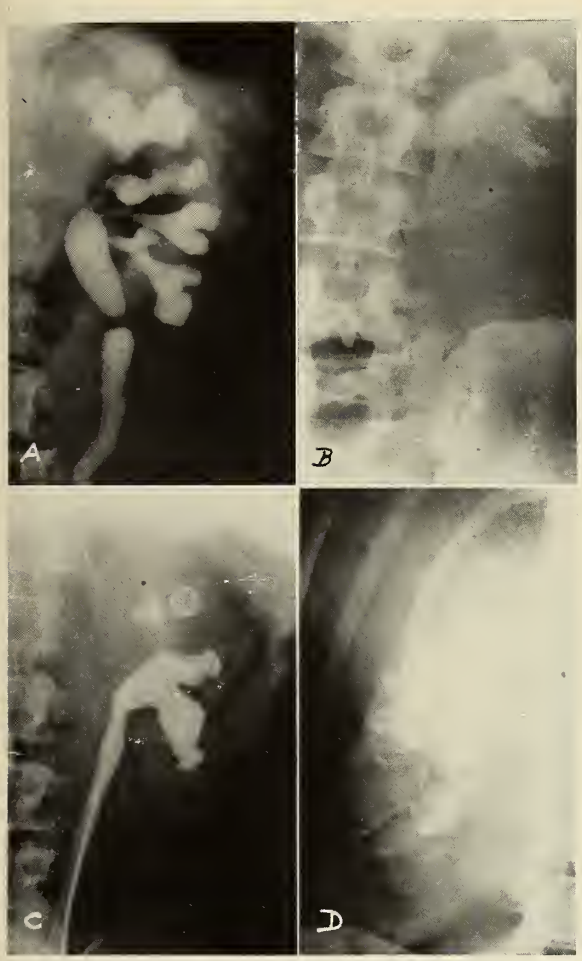

Fig. 5. (*A*) Chronic pyelonephritis with narrowing of infundibula.
(*B*) Elevation and rotation of kidney with compression of lower calyces from perinephritis abscess.
(*C*) Early tuberculosis showing distortion of calyces in upper pole with formation of small abscess.
(*D*) Late renal tuberculosis with so-called autonephrectomy, i.e., "putty" kidney.

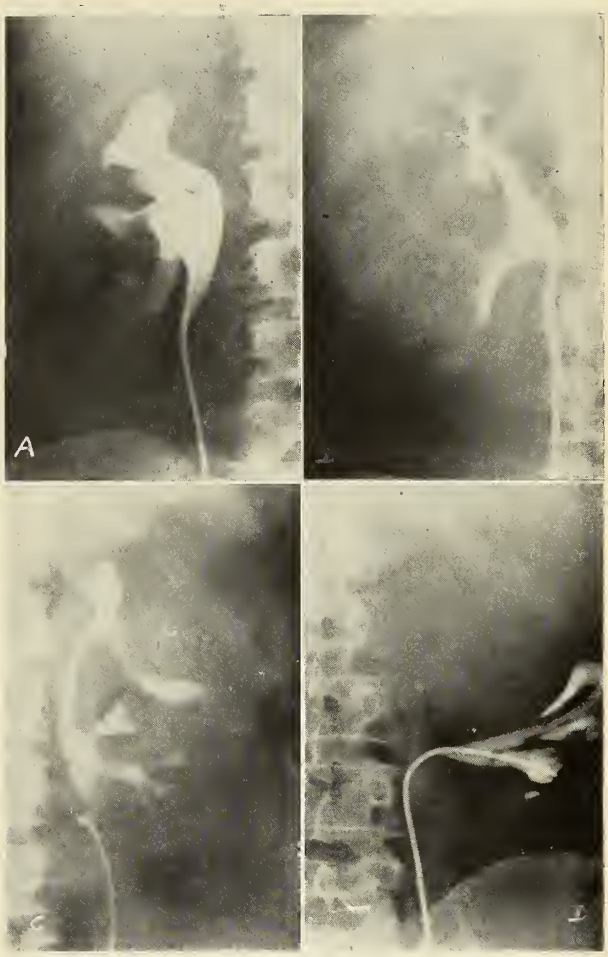

Fig. 6. Various types of renal neoplasm.

Any condition which causes obstruction of the ureter will cause its dilatation. These conditions may be congenital and acquired stenoses, calculi, benign or malignant neoplasms or infection. The condition is generally, therefore, the result of a process elsewhere.

Ureterocele shows a bulbous protrusion from the lower end of the ureter into the bladder and can be visualized by either opaque or air cystograms. It may also contain stones.

Bladder

The best way to examine the bladder, perhaps, is visually through the cystoscope. There are many times, however, when additional information may be secured by a good roentgen examination. This consists of (1) a plain film, (2) an opaque cystogram and (3) an air cystogram. Done carefully, this last type of examination is without danger of causing air emboli.

The normal bladder may be spherical or ovoid, and its size depends somewhat on the distention. An impression in the upper surface from the uterus is not infrequently seen in women.

Occasionally a fluctuant mass is present in the inguinal region when the bladder is full, but this mass disappears or shrinks on voiding. This event should arouse the suspicion of an inguinal cystocele or vesical diverticulum in an inguinal hernia. It can be found best with the aid of an opaque cystogram.

Exstrophy of the bladder is indicated by a wide separation of the pubic arch, but of course a radiograph is unnecessary to diagnose the condition. It is interesting to note, however, that epispadias is also accompanied by the same osseous maldevelopment.

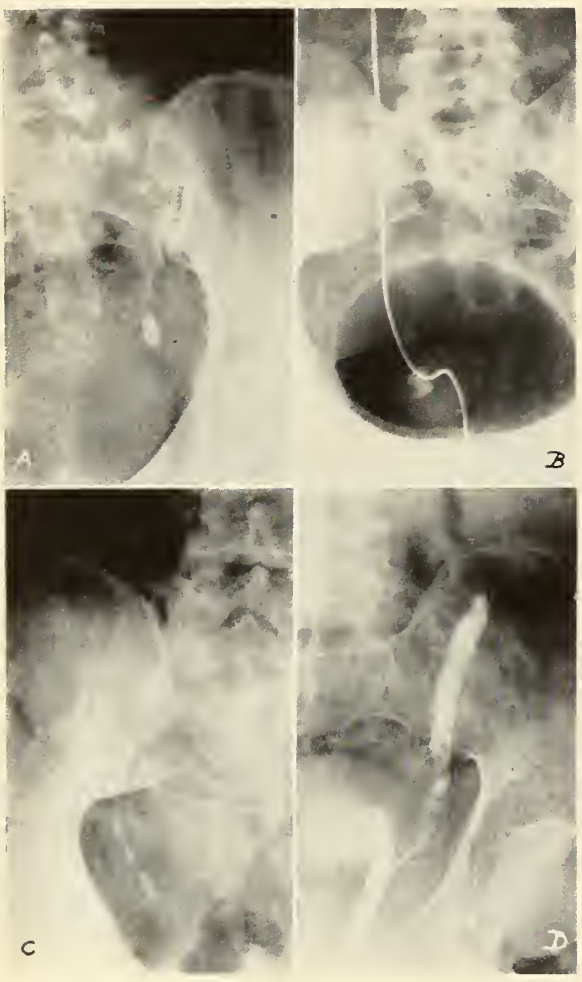

Fig. 7. (*A*) Ureteral calculus.
(*B*) Ureterocele with calculi.
(*C*) Scarred, calcified ureter with renal tuberculosis.
(*D*) Neoplastic involvement of ureter secondary to carcinoma of renal pelvis.

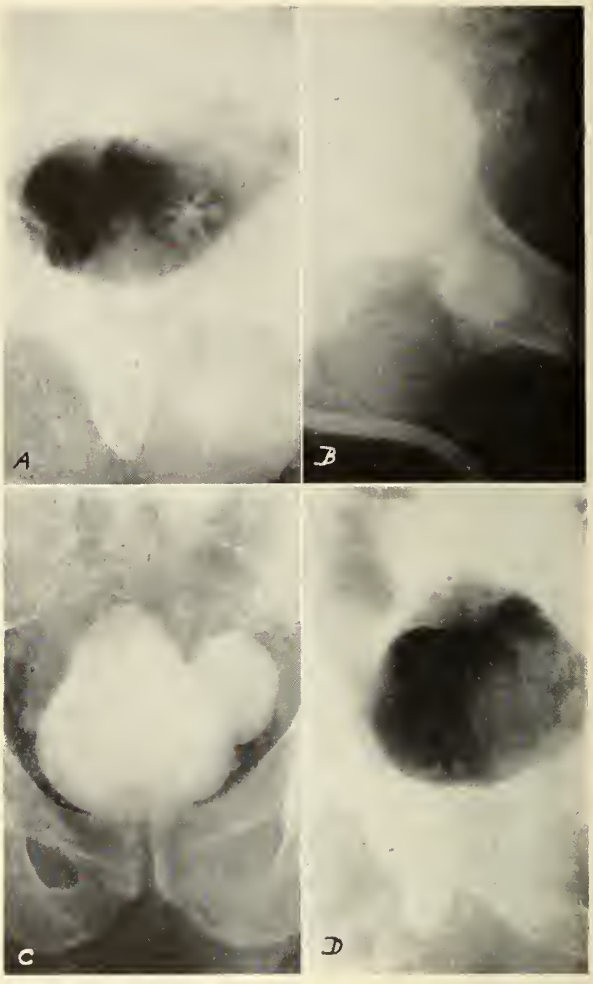

Fig. 8. (*A*) Jack stone (oxalate) vesical calculus.
(*B*) Inguinal cystocele.
(*C*) Diverticula of bladder.
(*D*) Fungating carcinoma of bladder.

Calculi.—Calculi in the bladder are common and vary from very small to large stones. They are usually ovoid and are not uncommonly multiple. Facetted stones are infrequently seen, however. Ordinarily, vesical calculi contain sufficient calcium in one form or another to show on a plain radiograph, but if they are of low density they will show best on an air cystogram. Uric acid and urate stones which are common in the bladder are best depicted this way. Opaque cystograms are likely to obscure any calculi. Occasionally a stone will form in a diverticulum and will then appear outside the visualized bladder. Oxalate stones have an appearance suggestive of a "jackstone" or "mulberry" and can be distinguished by their form alone. Foreign bodies introduced into the bladder of a sexual pervert may have stones form around them. Matches, vials, catheters and other articles may occasionally be found. Needles and sponges left in the abdomen or pelvis may also erode into the bladder. Under these circumstances a sponge may clinically and roentgenographically resemble a vesical neoplasm. The differentiation can usually be made on cystoscopy, however.

The use of cystography for the detection of suspected placenta previa was an important contribution to the subject. We prefer the air cystogram, and anteroposterior and oblique films seem to us to give the most information. The usual width of the space between the fetal skull in the third trimester of pregnancy and the vesical wall is about one centimeter. A placenta previa will cause an increase in the width centrally or laterally in marginal cases.

Infection.—This can best be detected by cystoscopy or by examination of the urine. In the rare case of cystitis emphysematosa, however, where there is gas beneath the mucosa, a plain radiograph will graphically show the extent of the lesion.

Cord bladders are best depicted by visualizing also the prostatic urethra and vesicle neck. The vesical neck is conical due to relaxation of the internal sphincter while the function of the external sphincter remains unimpaired.

Neoplasms.—Neoplasms of the bladder can usually be seen satisfactorily through the cystoscope, but their extent can frequently be better demonstrated with air cystograms in which the tumor is silhouetted against the air.

Bladder Secondary to Urinary Obstruction.—Obstruction distal to the bladder may be from strictures, congenital or acquired, calculi, benign or malignant neoplasms, neurogenic dysfunction, valves, bars, et cetera. The first visible change is a roughening of the vesicle outline caused by hypertrophy of the muscular fascicles. The mucosa is later pushed between the muscle bundles, and cellules or small diverticula appear. These may enlarge to almost any size, even larger than the bladder itself. A large diverticulum may displace the bladder and of itself cause dysuria, or it may contain calculi or be the site of a neoplastic growth.

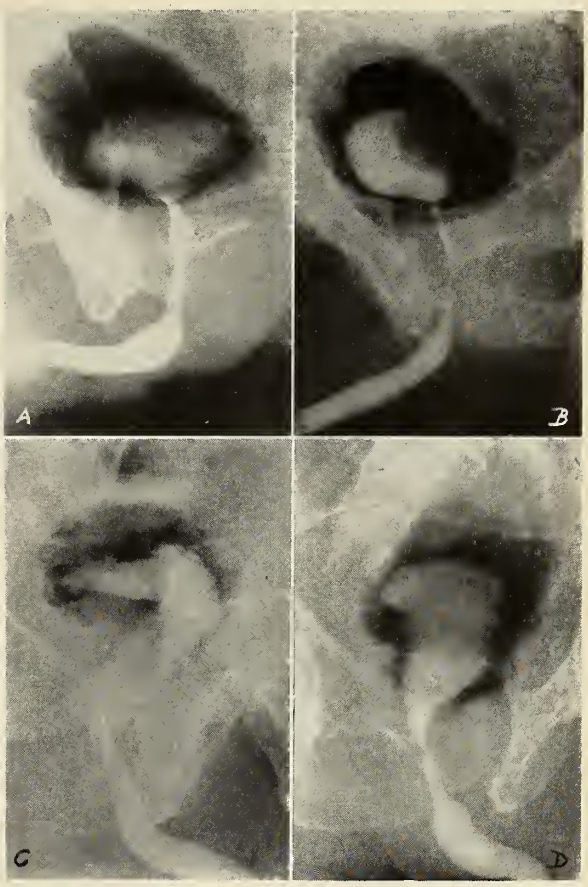

Fig. 9. (*A*) Normal cystourethrogram.
(*B*) Carcinoma of prostate showing constriction of prostatic urethra.
(*C*) Benign hyperplasia of prostate with angulation and widening of urethra.
(*D*) Same patient showing funneling of vesical week after transurethral resection.

Prostatic or Posterior Urethra.—Examination of this portion of the urethra by the roentgen ray does not and should not displace the use of the cystoscope, urethroscope or examining finger, but it frequently adds to the information that can be obtained by the conventional methods.

In our experience, roentgen examination of the vesical neck should consist of at least an anteroposterior opaque cystogram and an oblique film with air in the bladder and an opaque jelly in the urethra. These films give information regarding the relative enlargement of the lateral lobes and the posterior commissure and whether or not there is enlargement of the subcervical node of Albarran. The visualization of the urethra gives information relative to the adequacy of the urinary pathway and whether or not there is probable neoplastic involvement of the prostate. One of the main values of cystourethrography is in demonstrating the adequacy of the urinary pathway following resection for benign prostatic hyperplasia or carcinoma.

Other abnormalities of the urethra such as congenital valves, and strictures, inflammatory and traumatic strictures, abscesses, fistulas, et cetera, can be demonstrated on films after the injection of opaque material. The infrequent stone can also be demonstrated on a plain film.

Conclusions

Roentgen ray examination of the urinary tract is a valuable and frequently an indispensable method of determining the type and extent of pathologic processes which involve this system.

CLINICAL ASPECTS OF THE MANAGEMENT OF ENDOMETRIOSIS

CARL P. HUBER, M.D.

Chairman and Professor of Obstetrics and Gynecology, Indiana University School of Medicine

Indianapolis, Indiana

THE SYMPTOMS of endometriosis are characteristic. They may appear at any time during the reproductive age period but most frequently after the age of thirty. Endometriosis occurs more commonly in individuals who have not been pregnant or after a period of several years without conception. The characteristic symptom is pain associated with the menstrual periods. It is typically progressive in severity and gradually antedates the period by a longer interval until the patient complains of pain during the second half of the cycle and throughout the menstruation. In advanced cases, some pain may be present all of the time but is exaggerated as the menstrual period approaches. Many patients with endometriosis show a disturbance of the menstrual cycle with profuse and prolonged periods or occasionally with irregular bleeding episodes.

The physical findings are also readily recognized and include the demonstration upon pelvic examination of fixed nodular, often cystic, adnexal masses associated particularly with nodulation in the posterior cul-de-sac, sacro-uterine ligaments, and the posterior surface of the uterus. Superficially located nodules of endometriosis may be the source of external bleeding, and thus confirm a suspected diagnosis. These may be encountered in the abdominal wall, the inguinal canal, the cervix, the vaginal vault, the rectovaginal septum, or on the vulva. Gross inspection within the pelvis of a patient who has endometriosis reveals the characteristic scarred, blood-filled discolored islands of endometriosis which are considered diagnostic.

The diagnosis of endometriosis is easy. Let me illustrate by the following case report:

Case 1.—R. W., a thirty-eight-year-old woman, was admitted to the hospital on March 8, 1949, and discharged on March 19, 1949.

Chief Complaint: Lower abdominal discomfort.

Present Illness: She had suffered pain during the past year. Dysmenorrhea had always been present but had increased in severity in the past few years. Menstrual periods had been regular at thirty-day intervals, lasting three days. She had had an acute episode with severe abdominal pain and distension a year ago, at which time she had been hospitalized and a left adnexal mass had been described. She had been married eight years and had never been pregnant.

Physical Examination: The patient was obese, the perineum intact, the cervix posterior, with the body of the uterus forward, normal in size and limited in mobility. A fixed cystic mass about 8 cm. in diameter was palpable in the region of the left ovary.

Laboratory: The urine was normal. Hemoglobin was 13 gm.; white blood cell count, 8,500, with a normal differential.

Operation: A left salpingo-oöphorectomy was done. The tube and ovary formed a mass adherent to the posterior surface of the broad ligament, extending from the lateral pelvic wall to the uterine horn. Upon the surfaces of the mass there were a number of hemorrhagic areas, and during the dissection small blood-filled locules were opened. Inspection deep in the cul-de-sac revealed some old blood with surrounding scar tissue producing fixation to both the rectum and the posterior surface of the uterus.

Pathological Report: Cystic ovary with tubo-ovarian adhesions. The blood-filled spaces as well as the tissue removed from the posterior cul-de-sac contained degenerated chorionic villi.

Final Diagnosis: Ectopic pregnancy, old. Residual inflammatory disease. Cystic ovary. No evidence of endometriosis.

This patient exhibited all of the characteristic symptoms and physical findings of endometriosis, and at laparotomy the gross appearance of the tissue confirmed that diagnosis. Actually, then, the diagnosis of endometriosis is often a difficult one to make. In many instances the history is suggestive but characteristic physical findings are absent. In other instances the patient may give no history of pain and still have a well-developed endometriosis. The possibility of endometriosis should be considered whenever either the history or physical findings suggests its presence. The frequency with which the diagnosis is correctly made will depend upon the routine consideration of this possibility and careful investigation of all patients with obscure pelvic complaints.

Pain is frequently the predominating symptom and may be difficult to evaluate, particularly when it is out of proportion to the physical findings.

Presented in Symposium on Endometriosis at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 11, 1949.

This situation is illustrated by the following case report:

Case 2.—E. C., a forty-one-year-old woman, para 2, gravida 2, was admitted to the hospital on March 4, 1949, and was discharged on March 31, 1949.

Chief Complaint: Abdominal pain.

Present Illness: Intermittent cramping pain in the right lower quadrant had had its onset a year prior to admission. The pain had been associated with menstrual periods and had been increasing in severity. In recent months the pain had been continuous. Intermenstrual spotting had been present for the two months prior to admission. Otherwise the menses had been regular at twenty-eight to thirty day intervals, lasting three to five days. There had been no change in the character of the flow. The referring physician had administered penicillin for three weeks antedating admission, with no relief of pain.

Past History: A thyroidectomy had been performed four years previously for a toxic goiter. Appendectomy and a left oöphorectomy had been performed thirteen years previously.

Physical Examination: There was localized tenderness in the right lower quadrant. The outlet was parous, with adequate support. The cervix was posterior, and the body of the uterus was forward, rather large and limited in mobility. The left adnexa were not palpable, but there was a sense of resistance in the right adnexa, with fixation and an indefinitely outlined mass.

Laboratory: The urine was normal. The hemoglobin was 13.5 gm.; white blood cell count, 7,300, with a normal differential.

Operation: Dilatation and curettage were done, with conization of the cervix, right salpingo-oöphorectomy, left salpingectomy, and subtotal hysterectomy.

Pathological Report: Endometriosis of tube and ovary. Leiomyomata of the uterus. Chronic cervicitis.

Course: The patient was discharged on the tenth postoperative day in good condition, only to be readmitted two days later with a small bowel obstruction. A Miller-Abbott tube failed to relieve the obstruction. Laparotomy revealed a loop of small intestine adherent in the pelvis. Subsequent course was uneventful.

Abnormal bleeding may be the predominate symptom of endometriosis. Bleeding may occur at an age period when other causes for bleeding are more frequently encountered. This situation is illustrated by the following case report:

Case 3.—M. U., a forty-nine-year-old woman, para 2, gravida 2, was admitted on April 27, 1949, and discharged on May 7, 1949.

Chief Complaint: Excessive vaginal bleeding.

Present Illness: There had been hypermenorrhea during the past two and a half years, increasing in amount in the last six months. There had been irregular bleeding for three months. Dysmenorrhea had always been present and had recently increased in severity.

Past History: The latter of two deliveries had occurred eighteen years previously. Bilateral salpingectomy had been performed twelve years ago.

Physical Examination: The parous outlet showed a mild relaxation. The cervix was posterior. The corpus was slightly enlarged with bilateral fixed adnexal masses adherent on the posterior surface of the broad ligaments. Fixation extended into the cul-de-sac. On the anterior lip of the cervix was a bluish nodule 3 mm. in diameter.

Laboratory: Urine was normal. The hemoglobin was 7.3 gm.; red blood cell count, 2,900,000; white blood cell count, 8,000, with a normal differential.

Operation: Dilatation and curettage were done, with conization of the cervix, subtotal hysterectomy, and bilateral oöphorectomy.

Pathological Report: Endometriosis of the cervix and both ovaries, with multiple bilateral chocolate cysts. Normal uterus, chronic cervicitis.

Surgical procedures are often the most satisfactory solution for patients with endometriosis. The importance of conservative surgery cannot be overestimated. Conservation of the childbearing function is indicated whenever pregnancy is desired although relatively extensive processes may be present. The following case report demonstrates the possible result in such situations:

Case 4.—P. S., a thirty-six-year-old woman, para 0, gravida 0, was seen in September, 1942.

Chief Complaint: Right lower quadrant pain.

Present Illness: Attacks of right lower quadrant pain had occurred during the past year, usually during the week preceding the menses. There had been moderate dysmenorrhea with little increase in severity. Menses had been regular, of the twenty-eight day type, lasting four days. She had been married for six months.

Past History: General health had been good.

Physical Examination: The perineum was intact, the cervix posterior, the corpus forward, and small leiomyomata were palpable. The right ovary was enlarged, forming a firmly fixed mass, 6 to 10 cm. in size.

Operation: A right salpingo-oöphorectomy was performed, and three subserous leiomyomata were removed from the uterus. A routine appendectomy was also performed.

Pathological Report: Endometriosis of tube and ovary, with chocolate cysts. Multiple leiomyomata. Normal appendix.

Subsequent Course: Spontaneous abortion occurred at four and a half months' gestation, with the cause unknown, on September 18, 1943. A term delivery of a normal infant occurred on December 14, 1944. Examination one year post partum showed an enlargement and fixation of the left ovary, with tenderness behind the cervix.

Even though patients such as this may require subsequent pelvic operation, less radical procedures are certainly justified. In many instances

subsequent operations are not necessary. The possibility of pregnancy occurring after resection of even extensive unilateral masses cannot be denied. When involvement is predominately unilateral, subsequent pregnancies are quite frequent.

Endometriosis does occur in young individuals in whom there has been no preceding infertility. This is illustrated by the following case report:

Case 5.—H. C., a twenty-three-year-old woman, para 1, gravida 1, was seen on March 14, 1949.

Chief Complaint: Pain accompanying periods.

Present Illness: A normal pregnancy with delivery had taken place three and a half years previously. There had been no previous infertility. Pregnancy had been desired during the past year. Her general health had been good. Severe cramping, rectal pain had accompanied her periods during the past year and a half. Menses had been regular, at twenty-six to twenty-eight day intervals, lasting five days and with normal flow.

Physical Examination: There was good perineal support. The cervix was posterior, the corpus forward and normal in size. The right ovary was large, cystic and fixed. The left ovary was normal. Severe tenderness was present on the left and behind the cervix, and was exaggerated by moving the cervix. There was a fixed tender nodule, palpable on rectal examination, in the region of the left sacro-uterine ligament.

Clinical Diagnosis: Endometriosis.

Although this diagnosis has not been proven, it is certainly to be strongly suspected. A patient such as this presents a very definite problem and one which may be difficult of solution. If the presumptive diagnosis is correct, the chance of pregnancy occurring is minimal. A prolonged period of observation is not indicated. If the desired pregnancy does not occur in a few months, surgical exploration and resection of the endometriosis is the recommended procedure.

The medical management of endometriosis is at best temporary and unpredictable. Two types of hormonal therapy have been suggested and some good results have been reported following each.

The use of male sex hormone is based upon its recognized effectiveness in producing atrophy of endometrial tissue. This occurs in the extrauterine endometrium as well as in normally located endometrium. A decrease in symptoms may well follow its administration, but it is to be expected that activity of the endometrial nodules will occur with the resumption of ovarian activity following cessation of its administration. Masculinization may be produced by the prolonged administration of an amount of testosterone sufficient to produce alleviation of symptoms and decrease in size of masses. This is important and cannot be predicted. In order to decrease this possibility, dosages should certainly be less than 150 mg. per month.

The other type of hormonal therapy that has been suggested is the administration of stilbestrol. The use of stilbestrol is based upon the occasional observation of improvement of endometriosis during the course of pregnancy and upon its known ability to control bleeding. It is doubtful whether permanent cessation of function in endometrial nodules can be produced without at the same time interfering with the ovarian cycle. Insufficient data is available at present to justify conclusions concerning this type of therapy. There is, however, no evidence of any permanent damage associated with its exhibition.

Irradiation is another type of therapy which may be successful. Unquestionably sufficient irradiation to stop ovarian function will be associated with the cessation of symptoms and atrophy of the nodules of endometriosis. This amount of irradiation therapy is less desirable in many instances than surgical removal, particularly when incomplete surgical removal can preserve ovarian function and and the child-bearing capacity. Irradiation may, however, offer a satisfactory approach to the problem in those instances in which extensive endometriosis makes surgical removal technically hazardous. It may also prove to be a satisfactory type of treatment for those patients in whom previous operative procedures have been followed by recurrence of symptoms and continued growth of the endometriosis. It is recommended as satisfactory treatment in patients in whom endometriosis has involved the bowel and in most reports is considered preferable to bowel resection. In a number of reported patients amounts of irradiation insufficient to produce permanent cessation of ovarian function have been followed by satisfactory results. On the bases of these reports and the frequency with which pregnancy has followed such therapy, this possibility should be seriously considered.

It is to be noted that in none of the four patients reported was the uterus retroverted. The frequency with which a retroversion of the uterus is encountered in patients with endometriosis does not mean that it is necessarily a factor in the production of endometriosis. The retroversion

(Continued on Page 1093)

SURGICAL ASPECTS OF THE MANAGEMENT OF ENDOMETRIOSIS

RALPH E. CAMPBELL, B.S., M.D., F.A.C.S.
Madison, Wisconsin

THE TREATMENT of endometriosis is a real challenge to surgical judgment. Years ago, radical operations were performed in essentially all cases of adenomyosis and endometriosis, including frequent bowel resections. Finally it was observed that these lesions were influenced by an ovarian hormonal stimulus. What was the result of this endocrine observation? Treatment was then directed toward ablation of ovarian function, either by surgical removal of the ovaries or by irradiation.

For several years there has been no real contribution to the treatment of endometriosis. It has been known for years that ablation of ovarian function, either by surgical removal of the ovaries or radiation therapy to the ovaries, affects endometrial growth. However, I wish to emphasize that we are now in an era in which conservative treatment is being emphasized, and justly so, as the guiding principle in the treatment of this complication.

The radical operation should mean, primarily, the removal of both ovaries, with or without hysterectomy, but including any other surgical procedures that may be necessary. The permanent ablation of ovarian function by irradiation in the treatment of endometriosis is radical.

The conservative operation means the preservation of ovarian tissue, associated with such other surgical procedures as deemed necessary.

Treatment will depend upon the age of the patient, social and marital status, type and severity of symptoms, patient's desire for children and the extent of the lesions relative to both genital and associated pelvic organs. It is of prime importance that resection of one or both ovaries may be indicated and that the reduction in ovarian secretion and endometrial stimulation produces a favorable therapeutic response in the endometriosis and symptomatic relief. The removal of one ovary with the resection of the remaining ovary may produce comparable results.

In addition, it is significant that one-half or even one-third of an ovary maintained by a good blood supply is adequate to preserve the reproductive function as well as have a favorable effect upon the endometriosis. Then, too, partial ovariectomy may improve fertility.

A substantial statement to remember in the treatment of endometriosis would be: "The younger the patient, the more rigidly should conservatism in treatment be carried out." Women over forty years of age are best treated by either radical operation or radiation therapy. In this group it is probably better to err on the radical side. Under forty years of age, conservative treatment becomes a paramount consideration.

Now let us take another aspect of the situation, and recognize that this disease is unfortunately most common during the third and fourth decades of life when it is not desirable to do either a radical operation or irradiation on account of the interruption of ovarian activity, with its artificial menopause and the loss of child-bearing ability.

The treatment of endometriosis is simple when the indications are clear for arresting the secretory function of the ovary, either by surgical removal of the ovaries or by the use of x-ray or radium. It must be admitted that uniformly good results are obtained when patients are submitted to radical treatment. However, in repetition, objections to this treatment are certainly found in the loss of menstrual function and child-bearing ability, and the psychic effect in a young woman may be catastrophic.

Stevenson states so aptly, "Treatment of primary endometriosis involves a contradiction between what the surgeon would wish to do and what for various reasons he must do. His chief object is to relieve the patient of symptoms, chiefly pain and abnormal bleeding. In a smaller number of cases correction of sterility may be his chief object. In any event, he wishes to preserve her sex life. Yet the only certain cure, in light of present knowledge is the removal of ovarian tissue, which provides the impetus to menstruation and is the fundamental cause of the symptom complex." I feel that the foregoing

From the Department of Obstetrics and Gynecology, University of Wisconsin Medical School.
Read at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 11, 1949.

quotation certainly summarizes, in part, the surgeon's dilemma when faced by the lesions of endometriosis.

The previous statement as to treatment is contingent upon widespread involvement of the endometriosis, including all or any one of the following: the cul de sac, rectovaginal septum, regional pelvic organs, intestines, and peritoneum. Otherwise in widespread involvement, even though the patient may be young, ovarian resection cannot always be done because ovarian identification is impossible.

Pregnancy is definitely reduced when this disease is present, but is sufficiently high to warrant conservatism in treatment, which includes surgery. Payne reported that 25 per cent of his married patients subsequently became pregnant following conservative operation. Counsellor reported 13 per cent, and Holmes, 12 per cent. Patients desirous of becoming pregnant should have conserative treatment because they can and do become pregnant.

An emphatic warning may be given at this point, that the diagnosis may be difficult, both by digital examination and co-ordination of signs and symptoms, and frequently malignancy must be ruled out. Patients should not be treated blindly with irradiation or hormonal therapy or by any other treatment until a correct diagnosis is made. Certainly surgical exploration is preferable when there is any question as to diagnosis. A correct diagnosis can be established at the operating table, which certainly benefits both the patient and the surgeon and results in appropriate treatment. The peritonescope and culdoscopy may be useful adjuncts in diagnosis.

Frequently, endometriosis is extensive, producing what is commonly spoken of as a "frozen pelvis," involving the rectal wall and other pelvic structures. In these cases, radical operation and bowel excision were formerly practiced. The mortality was high in this type of surgery, and rectovaginal fistula frequently occurred. In present-day treatment, surgical castration with hysterectomy is the procedure of choice, resulting in atrophy of the remaining endometriosis, even though it may involve bowel and bladder. If such a surgical procedure is not applicable or advisable, then the patient's abdomen may be closed and irradiation used. Surgical treatment in the massive endometrial involvement may be difficult because of adhesions and parietal and visceral peritoneal involvement, and there is danger of injury to the bowel, bladder and ureters. It is in these cases that considerate surgical judgment and limitations must be exercised.

When both ovaries are extensively involved, an ovarian resection is impractical, and then it is imperative to remove all ovarian tissue, including the tubes and ovaries. To the contrary, if a normal ovary is present and the patient is under forty, then it is justifiable to remove or resect the diseased ovary and leave the good ovary and tube and preserve the uterus.

Constricting lesions of the rectosigmoid and intestinal obstruction are frequent in this complication, and excellent results can be obtained by castration.

McGuff, Dockerty, Waugh and Randall of the Mayo Clinic feel that in an obstruction of the ileum the procedure of choice is a resection of the ilium with or without preliminary enterostomy and with or without panhysterectomy. E. L. Zander and his associates report three cases of endometriosis which caused small bowel obstruction. Personally, I have had no experience with this type of small bowel obstruction.

We should all be in agreement with the fact that biopsy, frozen sections, and confirmation of the clinical diagnosis in all cases of endometriosis obstructing the bowel are the important procedures in excluding both carcinoma and inflammatory lesions.

Recently in the Wisconsin General Hospital, a patient was operated upon, and a frozen section was diagnosed as carcinoma, but later by permanent section a diagnosis of endometriosis was made. This patient, unfortunately, had a resection of the bowel, and she was subsequently treated by x-ray. The importance of this mistake is that frozen sections at times may be difficult to diagnose and may be misleading, but this does not in any way detract from the importance of carrying out this procedure.

Endometriosis during pregnancy, though rare, has been reported in recent literature and may demand appropriate surgical treatment.

Frank and Geist report that postmenopausal endometriosis is insufficiently emphasized in the literature and that typical lesions are frequently found in women past the menopause. It is suggested that extra-gonadal, possibly adrenal,

sources of estrogenic steroids supply a stimulus permitting decelerated growth. They suggest that the menopausal state is not invariably one of complete estrin deprivation. I would like to call attention to the fact that endometrial hyperplasia associated with estrin activity is often found in menopausal women. There is no evidence in these studies or in the literature to indicate that this process can originate *de novo* after the climacteric or even persist in active symptom-producing growth. However, this process may not be a primary surgical problem except in association with prolapse, fibroids, et cetera.

Resection of the superior hypograstic plexus or presacral nerve of Cotte has been advocated in endometriosis. This procedure should be used only in cases of adenomyosis because the endometriosis involving the pelvic ligaments and parietal peritoneum is not innervated by the superior hypogastric plexus or presacral nerve. Willard Cooke has recognized this and carries out ovarian neurectomy to relieve ovarian pain, by cutting the infundibulo pelvic ligament—the best way to section the sympathetic nerves to the ovary. Interference of the blood supply to the ovary should be avoided. It is certainly much more reasonable to expect relief from this method than by removal of the superior hypogastric ganglion.

Endometrial lesions in the umbilical region, in abdominal scars and inguinal regions are infiltrating lesions and should be widely excised.

Hormonal treatment of endometriosis must be considered in its relation to surgery. Such treatment inhibits pituitary ovarian function and produces temporary changes with occasional permanent changes.

Miller reports that the androgens (testosterone propionate) reduce the activity, vascularity and size of the lesion, and as a result operation can be performed with less danger.

Hirst feels that large amounts of testosterone propionate for the conservative treatment of endometriosis have a rational basis where radical measures are contraindicated or refused.

Schmitz feels that androgens can be used in younger people with minimal lesions to carry these patients as long as possible before instituting more severe procedures.

I have been hesitant in using the androgens because of the fear of producing irreversible masculinizing changes in the patient. Such changes have resulted from even extremely small doses, as others have reported.

Massive doses of stilbestrol have been given by Karnaky and others in the treatment and cure of endometriosis, thereby avoiding operation.

My experience with hormonal therapy has been so limited in this complication that any expression on my part would be worthless.

In conclusion, I wish to emphasize I have not hesitated to give deep x-ray therapy in cases of endometriosis with or without massive involvement, and even in those cases with bowel and bladder involvement, when indicated over operation.

This presentation has been worthwhile if my plea for conservatism in the treatment of endometriosis is heeded. The factual information presented has been based mainly upon my own experience, over a period of twenty years, in the treatment of endometriosis.

TRAUMA TO THE NERVOUS SYSTEM

E. M. HAMMES, JR., M.D.
Saint Paul, Minnesota

THE history of the development of our knowledge of the care and treatment of individuals whose nervous systems, central or peripheral, have been injured, parallels very closely the history of war. During and following each conflict the mass of clinical material furnished by weapons ranging from the naked fist to the atom bomb has stimulated rapid strides forward in our knowledge of this subject. The more global the conflict and the more numerous the injuries, the greater will be the co-ordinated progress in their treatment. As long as man fights he will cause and receive injuries—not instantaneously fatal—to his nervous system. As long as such injuries are received there will be interested men available and stimulated to convert an otherwise hopeless loss into a means of furthering our knowledge and perfecting new skills in the management of these injuries.

It is not a coincidence that our three speakers today were all in military service and that two of them are at present primarily active in veteran's medical care.

Between wars, progress in the field of nervous system trauma is, by comparison, slow and erratic. And yet, there is no lack of clinical material in peacetime. The drunken driver, the motorcycle and airplane, the shallow diving pool, the step-ladder and, in the midwest, a great variety of farm equipment—as well as many other natural forces and human gadgets—assure us a constant and all too massive volume of injuries. If it is not the greater number of cases, what then accounts for the more rapid evolution of our knowledge of the effects of nervous system trauma in war as compared to peace? I think the answer lies in the concentration of this clinical material into centers in a way that can never be done in peacetime. A relatively small number of doctors receive the opportunity of treating enormous numbers of cases and thus accumulate a concentrated experience which would not be possible in any except a wartime setting. Military necessity and convenience demand the grouping of patients with similar disabilities into centers under the care of a rather limited group of men—the resulting benefit to medical progress is a by-product which is no less welcome for being unplanned. It has been estimated that 65 per cent of patients with craniocerebral trauma are treated in localities where no neurosurgeon or neurologist is available. Rare indeed, in contrast, was the military casualty with an injury to his brain, cord or peripheral nervous system, who did not eventually spend considerable time in a neurological-neurosurgical center. It would be impossible in civilian life to carry out a program of study for the control of traumatic convulsive disorders as was done at Cushing General Hospital in Massachusetts, or to collect for treatment on a single service a group of 100 to 200 paraplegias, as was done in several centers. The Peripheral Nerve Registry, established by the Surgeon General in 1944, is affording a means of following nerve injuries in large numbers to their final result in a way that would be totally impossible with a comparable group of civilian injuries widely scattered over the country. I think it is a safe assumption that the majority of the personal experience of each of our speakers in his respective subject has been gained in military service and a lesser part in the study of civilian injuries. I feel quite sure that during my own comparatively limited tour of duty, I had an opportunity of examining more patients with craniocerebral trauma than I will see in the remainder of my practice, barring another war.

Speaking in very general terms it seems to me that the outstanding contributions of the second World War to the subject of nervous system trauma are three: The first is the development of factual knowledge in neurophysiology and the availability of new antibiotic and bacteriostatic agents, which have in turn made possible the tremendous strides in new surgical techniques and skills about which we are to hear this afternoon.

The second contribution is a rather subtle change in our entire philosophy concerning the subject. This is most simply exemplified by the designation of a recent series of papers by Dr. John Aita of Omaha bearing the significant title, "Men with Brain Damage." It is a realization of

Introductory remarks in Symposium on Trauma to the Nervous System presented at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

the fact that our responsibility to the patient does not cease with a successful cranioplasty or laminectomy or peripheral nerve repair. It is not only the attempt to restore function to as nearly a normal state as possible but also to develop the use of unaffected muscles or nerves or skills to substitute or compensate for permanent defects; to learn new vocations when a disability makes the previous one impractical; and to develop as complete a physical and mental adjustment as possible within the limitations imposed by the effects of the injury. It is everything that is implied by the word "rehabilitation" in its broadest sense.

The third contribution of World War II is the realization of the fact that the state of our knowledge, or lack of it, today is such that one physician alone is unable adequately to meet the requirements for the total management of a patient with an injury to his nervous system. As a result, we have seen the development in large centers of coordinated teamwork between doctors concentrating in one particular phase of the total problem. The neurologist and neurosurgeon have been greatly aided by the speech therapist in head injuries; the genitourinary surgeon in paraplegia and the neurophysiologist in dealing with peripheral nerve injuries, to mention only a few. In all three types of trauma the growing specialty of physical medicine and, of course, the ubiquitous psychiatrist are making important contributions.

It may seem paradoxical in view of these present attitudes of considering the total assets and liabilities of a man with an injury to his nervous system and of the special fields involved in their proper management to divide this discussion of trauma along traditional anatomical lines: the brain, the spinal cord and the peripheral nerves. One might instead have had a neurosurgeon, a psychiatrist and a physiotherapist discuss the entire field of nervous system trauma, each from the standpoint of his own particular contribution. In defense of the anatomical arrangement of presenting the subject today, it must be pointed out that the prolonged process of re-education and rehabilitation cannot be most effective or efficient unless every possible effort has first been made to restore disturbed function to as nearly normal a state as possible. Furthermore, both the immediate and later management of injuries to the three divisions of the nervous system are so entirely different, one from the other, that to consider them in any manner other than as separate anatomical groups could serve only to confuse further an already difficult problem.

MANAGEMENT OF ENDOMETRIOSIS

(Continued from Page 1088)

may just as well be a result of the development of endometriosis. It may also be an incidental finding. The presence of a uterus in normal position does not prevent the development of endometriosis and should not be considered as a factor in the diagnosis.

In many instances, endometriosis is diagnosed at the time of laparotomy, and the frequency with which such diagnoses are made depends upon how carefully the pelvis is inspected and how frequently suspected islands are removed and preserved for microscopic examination. Many of these are early endometriosis and are without clinical symptoms. They represent instances of endometriosis beyond the scope of the present discussion. When recognized, such nodules should be removed and in this way potential future difficulty prevented.

The proper management of endometriosis remains a difficult problem just as does its initial diagnosis. The physician who looks for it, who considers it as a possibility in every gynecologic examination and who treats it conservatively, once the diagnosis has been made, is to be commended.

SPINAL CORD INJURIES

GEORGE S. BAKER, M.D.
Rochester, Minnesota

THE PROBLEM which confronts the neurosurgeon and the orthopedist in any acute injury of the spinal cord is but a small one compared to the over-all responsibility of returning this patient to his former position in society. Close teamwork among many specialized groups is necessary for medical, vocational, social and economic rehabilitation. It is true that many patients who have received permanent injury to the spinal cord must rely on the care and treatment of one doctor, or one limited group, but to these patients must be applied the principles of the treatment through many therapeutic fields before the end result is reached. The work of urologists, dietitians, physical therapists, occupational therapists, social welfare workers and nurses, the matter of vocational training, and finally the program for economic adjustments for living must be organized in such a way that the individual patient is rehabilitated to the maximal extent permitted by his disability.

The average medical practitioner does not have the time, nor will many take the time, to read a lengthy treatise on a subject of this magnitude. It is therefore fitting for me to refer to the best clinical review of the problem that I know of and hope that this will cover the major material, leaving a few important items for me to emphasize at this time. I refer to Technical Bulletin 503 of the Veterans Administration on "Spinal Cord Injuries,"[2] compiled by Dr. Ernest Bors, which is an over-all review of the situation, with references to the important contributions of, and the end results following, World War II. It is up to date, concise and presents the problem as I see it today.

The fact that 80 per cent of the patients with spinal cord injuries sustained in World War II survived and returned to the United States, with a mortality rate of only 2 to 8 per cent reported since hospitalization in this country, speaks well for (1) the teachings and training of the medical profession up to the time of the war, (2) the improved techniques in treatment and transportation and (3) the major role of antibiotics. The military training of a large group of young medical men will be strongly felt in every community when the care of any given spinal cord injury is needed. The general principles of therapy are put to work on a large scale in any major military conflict, and the tried and proved methods are available until another war comes along, when better methods may be used.

As in all types of injury, the treatment of injuries of the spinal cord should perhaps start with means of prevention of injury. Under this should be considered educational motion pictures in the schools, colleges and community theaters, displaying what can happen by careless driving of automobiles and airplanes, by diving in shallow water or in the surf, by unprotected participation in strenuous athletic events, by improper use of firearms, and lastly, by failure to practice moderation in the daily routine. In spite of all these measures, many patients with irreparable damage to the spinal cord are seen in every hospital in the United States, and the knowledge of their care should be of the best pattern. Doctors should realize that diagnostic spinal punctures on patients with cervical cord tumors or increased intracranial pressure are often performed at a risk of further damaging the functioning nerve fibers. Also, induced convulsive seizures as used in treating many mental disorders demand the respect of a supposedly strong spinal column. To no part of one's anatomic structure is the adage "an ounce of prevention is worth a pound of cure" more applicable than to the spinal cord.

The doctor should consider it his responsibility to visit the local boy scout troops and instruct these young boys in the transportation of a person who has sustained a broken neck or a broken back. The scout manual is an excellent guide and should be supplemented by proper demonstrations. The use of a simple head sling for traction can also be demonstrated.[9] A real problem arises in the careful transportation of any person with a spinal injury, whether it is compound or simple, or whether it is associated with partial or complete paralysis. As a general rule, the deformity will be one of flexion, and any position to prevent

From the Section on Neurosurgery, Mayo Clinic, Rochester, Minnesota.
Presented at the ninety-sixth annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

further flexion, such as gentle extension, may be considered important.

At the hospital, permanent traction by use of Crutchfield's tongs[4-6] or any of the other means of traction[1,3,7,10,13-15] will probably be necessary for cervical fractures. The problems of shock and other concurrent injuries of serious magnitude are faced at once. If the general condition of the patient is good, and neurologic and roentgenologic studies indicate that a progressive compression of the thoracic or lumbar parts of the spinal column can be relieved by laminectomy, this should be done. The cervical injuries are best treated by traction for at least a week and operation delayed until after this time, as a greatly increased mortality rate is known to be associated with early cervical exploration. Although many patients have been treated in the early phase of the injury, Munro[12] has shown 30 per cent better results by waiting, as far as mortality is concerned. Late operations for arachnoidal adhesions or block[11] and for various types of pain, either root, sympathetic, splanchnic or psychic, can be considered.[2] The problems of using braces and of spinal fusion by orthopedists to prevent collapse and absorption of the vertebrae can be weighed at time of operation (Figs. 1 and 2), or if an operation is not performed, the use of braces can be considered after evidence of callus formation and partial healing (four to six weeks) is observed. All the sequelae such as decubitus ulcers, neurogenic bladders and nutritional deficiencies must be controlled.[8] The rehabilitation is a slow but steady one in the hands of the best therapists and demands the utmost co-operation between patient, relatives and social forces at work in the community. It is possible to accomplish a great deal in most of the spinal cord injuries seen today; however, even though the individual will live perhaps a normal life span with excellent care, the fact must not be lost sight of that a person with permanent damage to the spinal cord will be handicapped for life and that an uphill fight to overcome the disabilities is always present as adjustments are made in the community so that an independent social and economic existence is assured.

TECHNIQUE OF PERIPHERAL NERVE SURGERY

R. GLEN SPURLING, M.D.

Louisville, Kentucky

THE EXPERIENCES with peripheral nerve surgery in World War II have logically laid the groundwork for all future civilian practices—*until the next war.* These lesions are so relatively infrequent in civilian life that no single individual can hope to accumulate enough data to change radically the present concepts which have been tested upon many thousands of cases. Not that the present treatment policies are perfect—far from it—yet the results of treatment of some 20,000 peripheral nerve casualties by several hundred neurosurgeons have been better, from the standpoint of functional recovery, than any heretofore known.

It is extraordinary how frequently nerve lesions are overlooked, even by physicians who are otherwise highly trained in the management of trauma. No doubt this is due to the surgeon focusing his primary interest upon the fractured bone, the mutilating soft tissue wound or the emergency accompanying major vascular injuries. Once the damaged extremity is encased in a plaster cast, the associated nerve injury may go unrecognized for weeks or even months. It has been established beyond reasonable doubt that the early repair of severed nerves yields the best functional results. Therefore, it becomes mandatory that the nerve injury be recognized by the surgeon who first treats the patient.

Complicated clinical and laboratory examinations are not necessary in recognizing the more common nerve injuries. As an example, the integrity of the main nerve trunks of the upper and lower extremities can be evaluated with considerable accuracy by studying the movements of the thumb and great toe.*

Upper Extremity

Median Nerve.—A certain position of the thumb cannot be reproduced when the median nerve is interrupted proximal to the wrist. The first metacarpal is flexed at the wrist, a motion primarily accomplished by contraction of the opponens pollicis. In addition, the distal phalanx of the thumb is extended on the proximal and the whole thumb is rotated inward so that the palmar surface of the distal phalanx opposes the palmar surface of the other digits. This position can be reproduced only with good contraction of the abductor pollicis brevis and the outer head of the flexor pollicis brevis. These three muscles are supplied through a muscular branch of the median nerve which arises just distal to the annular ligament. If the thumb can be maintained in this position, no other examination is necessary to establish the functional integrity of the median nerve.

Ulnar Nerve.—Likewise a certain position of the thumb cannot be maintained when the ulnar nerve is interrupted proximal to the wrist. The first metacarpal is held in the plane of the other four. The proximal phalanx of the thumb is slightly flexed and is pulled toward the metacarpal and metacarpophalangeal joint of the index finger. This function can be tested readily by the patient's ability to hold a stiff piece of paper when an attempt is made by the examiner to withdraw it.

The muscles which produce this action are the adductor pollicis and the inner head of the flexor pollicis brevis. These two muscles are supplied by the terminal muscular branches of the ulnar nerve within the palm. If this position of the thumb cannot be held in the absence of local injury, further examination is unnecessary to establish functional impairment of the ulnar nerve.

Radial Nerve.—The following position of the thumb cannot be maintained if the function of the radial nerve is interrupted proximal to the wrist: The first metacarpal is directly abducted at the carpometacarpal joint in the plane of the palm. The proximal and distal phalanges of the thumb are both held in extension. This position is made possible by contraction of the extensor pollicis brevis aided by the weaker abductor pollicis longus. These two muscles are supplied in the hand by the terminal muscular branch of the posterior interosseous division of the radial nerve. If this position of the thumb cannot be maintained

Presented at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

*The monograph of Haymaker and Woodhall, "Peripheral Nerve Injuries, Principles of Diagnosis," is an indispensable volume for those dealing with peripheral nerve injuries. All of the most useful clinical tests are meticulously described and explained by anatomical descriptions, photographs and drawings.

in the absence of local injury, further examination is unnecessary to establish functional impairment of the radial nerve.

The radial nerve is most likely to be injured in the upper arm, and when this is true, confirmatory evidence is found in the hand by inability to extend both the proximal and distal phalanges of the thumb, a function accomplished by contraction of the extensor pollicis longus. Also, inability to extend the first phalanges of the other digits on the metacarpals results from paralysis of the extensor digitorum communis. Both of these muscles are innervated by muscular branches of the radial nerve in the proximal third of the forearm. Care must be taken not to confuse extension at the metacarpophalangeal joints with extension at the interphalangeal joints since the latter is a function of the lumbricales and interossei.

Lower Extremity

The intrinsic musculature in the foot is not developed to the same extent as in the hand so that reliable observations must be limited to simple contractions of the long flexors and extensors of the toes or else include movements of the entire foot. Fortunately, injuries of the lower extremity which involve peripheral nerves are commonest high in the thigh and about the knee. In the former location either or both divisions of the sciatic nerve may be involved. In the latter the common peroneal nerve is damaged most frequently. Because of this, examination of the toes will give valuable information in the majority of lower extremity wounds. The only common nerve injury apt to be missed if careful study of toe motions is made is the posterior tibial nerve in fractures and shrapnel wounds of the lower third of the leg. In this lesion only the intrinsic musculature of the foot is paralyzed, and very little disability results except that which may follow anesthesia of the sole of the foot.

Common Peroneal Nerve.—The following described position of the great toe cannot be reproduced if there is interruption of the common peroneal nerve or its deep branch proximal to the middle of the lower leg: The terminal phalanx is extended on the proximal and the latter is extended on the first metatarsal. This action can be produced only with good contraction of the extensor hallucis longus whose tendon can readily be palpated over the dorsum of the first metatarsophalangeal joint. It is supplied by the deep branch of the common peroneal nerve in the proximal third of the lower leg. If this position of the toe cannot be maintained in the absence of local injury to the tendon or the toe, further examination is unnecessary to establish functional impairment of the peroneal nerve.

If the entire foot can be examined satisfactorily, further evidence may be obtained by inability to dorsiflex the foot at the ankle (foot-drop). These functions are accomplished, respectively, by the tibialis anticus and the peroneus longus and peroneus brevis which are innervated by branches of the common peroneal nerve arising in the proximal third of the lower leg.

Tibial Nerve.—The following position of the great toe cannot be reproduced if there is interruption of tibial nerve function proximal to the middle of the lower leg: The terminal phalanx of the toe is flexed on the proximal and the latter is flexed on the first metatarsal. This action can be produced only with good contraction of the flexor hallucis longus and flexor hallucis brevis. These muscles are supplied by the tibial nerve in the proximal third of the lower leg. If this position of the toe cannot be maintained, in the absence of local injury to the tendon or the toe, further examination is unnecessary to establish functional impairment of the tibial nerve.

If the entire foot can be examined satisfactorily, further evidence may be obtained by inability to plantar-flex or adduct the foot at the ankle. These functions are accomplished, respectively, by the gastrocnemius group and the tibialis posticus which are innervated by branches of the tibial nerve arising in the proximal third of the lower leg.

Indications for Operation

Preoperative clinical and laboratory studies of motor, sensory and vasomotor functions will indicate usually the degree of physiological disruption of a peripheral nerve. However, there can be complete physiological loss of function without anatomical severance of the nerve. This fact explains the frequency with which injured peripheral nerves regenerate spontaneously. Because of the likelihood of spontaneous regeneration, the surgeons in World War I recommended a waiting period of from six to nine months before advising exploratory operations. However, more recent in-

vestigators believe that the degenerative changes which inevitably occur in nerve ends and in the denervated muscles are progressive, and that the best results are obtained in those cases where repair is accomplished early. Therefore, waiting for spontaneous regeneration is unjustifiable.

The policy presently followed in our clinic is to explore all cases of peripheral nerve palsies, complete or incomplete, unless there has been rapid, progressive improvement of symptoms. If the nerve has been severed, valuable time has been saved by early repair. If the nerve is anatomically intact, freeing it from the surrounding scar tissue will usually hasten recovery, and seldom retard it. It is believed that exploration of any major nerve trunk under proper conditions can be accomplished without risk to life or to function.

The policy of radical exploration, however, should always be combined with one of conservative treatment once the nerve is exposed. Unless actual anatomical division can be demonstrated, or unless the intrinsic scar is so dense that no motor or sensory impulses can be demonstrated to pass through the scar, only complete neurolysis should be done. If a nerve thus treated fails to show evidence of regeneration within two months, re-exploration is done, and if there are still no sensory impulses passing through the scarred area, resection with end-to-end suture is undertaken.

All cases of suture—or neurolysis for that matter—should be observed carefully week by week for evidence of new functional activity. If at any time satisfactory progress seems to have stopped, re-exploration should be recommended.

The value of the Tinel's sign in diagnosis has been discredited by many observers because of the frequency with which percussion impulses can be transmitted through scarred soft tissue to a distant neuroma. If the percussing stroke is heavy, no doubt the jarring will invalidate it. The sign should be elicited by very gentle tapping with the finger tips along the course of the nerve, always working from below the lesion upward. At the point where tingling in the peripheral distribution is produced, functioning sensory fibers are believed to be present. The Tinel's sign when performed properly is a valuable one, especially in following the progress of regeneration after suture.

Much valuable information can be obtained by electrical stimulation of the exposed nerve trunks at operation, and therefore all operations upon peripheral nerves should be started at least under local anesthesia. Once the direct stimulation data have been obtained, a shift to general anesthesia may be desirable, particularly if the procedure is prolonged by the necessity for wide dissection and extensive mobilization of contiguous joints.

Electrical stimulation of the exposed nerve trunk is valuable in determining its anatomical continuity. Galvanic, faradic or sinusoidal current provided a satisfactory stimulus. The minimal current is that which will produce a visible contracture of muscle fibers when the electrodes are applied directly to them. The current should be increased four or five times above this minimal level before deciding that there are no functioning fibers passing through the involved segment.

If stimulation proximal to the scarred area causes contraction of muscles normally innervated by the nerve distal to the scar, it may be assumed that there is still anatomical and physiological continuity of the motor fibers.

If stimulation of the nerve proximal to the scar fails to elicit motor responses even with five times the minimal stimulus, it may be assumed that anatomical continuity is lost, providing the nerve has been liberated from its extrinsic scar prior to the test.

If the operation is conducted under local anesthesia and no procaine has been infiltrated into the proximal segment of nerve, information of great value can be obtained from the sensory responses. Stimulation of the scar or neuroma is always painful, more so than stimulation of normal nerve above the scar. Stimulation distal to the scar without sensory response indicates disruption of the afferent fibers unless the amount of current is excessive and overflows into the neuroma.

Sensory responses to electrical stimulation are valuable in cases of re-exploration after suture. Not infrequently, physiologically active sensory fibers can be demonstrated traversing the suture line before any motor fibers have reached their appropriate end-plates.

Selection of the Time for Definitive Nerve Surgery

In contrast to the progressive intraneural pathological changes which dictate in large part the upper level of the optimum time for nerve repair, the factors which contraindicate primary

nerve surgery in an injured extremity are entirely technical and mechanical.

1. The suture of a divided peripheral nerve at the time of wound debridement is not feasible by any technical standards, nor is it compatible with the surgical principles of preservation of life or the extremity, or of the prevention of infection, which must be dominant at this time.

2. It is often not possible for the surgeon to estimate the intraneural damage to nerve segments adjacent to the point of severance.

3. Selective section of nerve ends prior to suture is impossible unless a large nerve gap is arbitrarily established.

4. Mobilization and transplantation procedures essential for restoring the nerve gap and delimiting suture line tension are surgically unsound for fear of infection.

5. While in cleanly lacerated or in small penetrating wounds, immediate nerve suture might be carried out by flexion of contiguous joints, the results in cases in which nerve gap has been overcome by flexion alone are likely to be prejudiced both by joint contractures and by the adverse effect of postoperative stretch upon the suture line. Moreover, this method may not be applicable if the point of suture is distant from an articulating surface.

6. Finally, the epineurium of a freshly divided nerve is thin and friable and lacks the tensile strength to hold sutures.

In spite of this array of arguments, surgical opinion is by no means unanimously in favor of delayed nerve suture. On the other hand, the case for this plan has been well stated by Seddon: ". . . the delayed operation (in war wounds of peripheral nerves) converts the suture from a procedure carried out under restriction into one in which the surgeon is free to do as he wishes. At Oxford, all the primary sutures compare unfavorably with early secondary sutures, and if I had the misfortune to suffer a nerve injury myself I would prefer the secondary operation."

The practice of delaying operation to wait for evidence of spontaneous regeneration is indefensible. In the interim irreversible pathologic changes occur in the form of progressive degenerative changes in the distal nerve trunk, nerve endings and distal articulations, which impair and eventually invalidate the functional results of axonal regeneration. Furthermore, there is considerable evidence that these alterations impair nerve regeneration adversely in direct ratio to the length of time between the injury and the attempt at definitive suture.

A description of the entire gamut of changes in all the tissues of a denervated extremity is too complex a task to undertake here, and the emphasis will be directed to the most important alteration which occurs in the distal nerve segment.

The first evidence of changes leading eventually to deterioration of the distal nerve trunk throughout its entire extent is a slight fibrotic thickening of the epineurium, which occurs between fifteen and twenty-five days after severance of the nerve. Within this period the epineurium first attains the tensile strength which facilitates nerve suture. As time passes, the distal trunk exhibits two types of tissue reaction. The first type may be summed up in a single word—fibrosis. The epineurium becomes thicker and more dense. Collagenous tissue spreads diffusely in the interfascicular spaces. The normal cross-section area of the fascicles is diminished as the result of an enveloping perineural fibrosis which may progress to practical obliteration of the fascicular masses. Although the entire cross-area of the distal nerve trunk diminishes in size, the atrophy of fascicles is compensated for by a relatively greater ratio of interfascicular fibrosis. Simultaneously, with the fibrotic changes described, there may be seen an endoneural fibrosis, which at times almost replaces the attenuated groups of atrophic tubules.

The second major change in the distal trunk, which takes the form of tubule atrophy, can with some qualifications be readily associated with the lapse of time after wounding, although it is difficult to correlate exactly the fibrotic changes first described with the passage of time. Progressive tubule atrophy in uncomplicated nerve injuries may vary in severity from case to case, but it remains a stable measure of the duration of distal segment deterioration unless it is even more adversely influenced by the factors of ischemia or traction. The normal maturation of regenerating nerve fibers depends to a large extent upon the number and volume of these tubular spaces. Although the upper limit of potential functional regeneration cannot be fixed with certainty, it is a warrantable assumption, on the basis of this evidence, that it is within the three-month period following injury.

After Care

The operation is but a single phase of the treatment of an extremity paralyzed as the result of a peripheral nerve injury. Obviously, an extremity will be functionally useless, however satisfactory the nerve repair and subsequent regeneration may be, if temporarily denervated muscles are permitted to become irreversibly atrophied or fibrosed, or if the joints of the wrist, hand, ankle or toes are "frozen" beyond repair. For the best results it is, therefore, essential that physical therapy be employed both before and after operation.

Recent experiments and clinical studies have indicated that daily galvanic stimulation of denervated muscles will prevent atrophy and retard fibrosis, and this measure was, therefore, employed as a routine in all cases, beginning with fifteen brisk contractions daily and progressing gradually to thirty contractions. When casts were used for postoperative immobilization, windows were cut over the bellies of the paralyzed muscle groups and galvanic stimulation was begun the day after operation. Other measures included massage, active and passive motion, and the use of dry and moist heat as indicated. Particularly careful attention was given to the active and passive motion of small joints. Fixation by splints was kept at a minimum, detailed instruction of the patients in respect to the care of their own joints being considered more important than mechanical methods of fixation.

Results

Some 8,000 cases of nerve suture have been listed in the Army's Peripheral Nerve Registry. Most of these cases have had careful follow-up studies for periods ranging from six months to two years. A recent primary analysis of data indicates that in 85 per cent of cases there is unmistakable evidence of regeneration. Just how complete the ultimate functional recovery will be cannot yet be determined. Eventually, the answer will be forthcoming from the Registry, but fully two years must elapse before final evaluations can be made.

Apparently all peripheral nerves, regardless of their location, possess the same ability to regenerate, providing the surgical treatment is adequate and the operation performed during the optimal post-injury period. However, there is inevitable mixing of fibers at the suture line no matter how meticulous the repair. In nerves, predominantly motor, which supply muscles concerned with gross movements (radial and musculocutaneous) functional recovery is more perfect than in nerves supplying muscles concerned with fine precision movements (ulnar and median). In the latter group there may be excellent regeneration, yet the extremity remains functionally poor. Great improvement can be expected in patients who will co-operate fully in a re-educational program. The patient must learn to make use of muscles whose motor connections with the brain have been mixed up—just as the patient whose facial nerve has been anastomosed with the hypoglossal must learn to move his facial musculature through the hypoglossal pathways in the brain stem and cerebrum.

Sensory regeneration in a mixed nerve is less of a problem, for the anesthetized areas may function usefully although the central connections are bizarre.

THE SURGEON AND THE CANCER PROBLEM

OWEN H. WANGENSTEEN, M.D.
Professor of Surgery
University of Minnesota Medical School
Minneapolis, Minnesota

THE SUBJECT I have chosen is not an easy one to discuss. There is so much to say and yet so little that we know about cancer. Cancer does constitute, however, a very challenging problem, as I believe everyone will admit. Our families know it. There probably is not a family in this city, in this state, that will not perhaps be touched in some manner by cancer: This is a rather serious thing to contemplate. Cancer strikes frequently and in all areas of the population; it takes its largest toll, however, among people over forty-five years of age.

What are we going to do about the problem of cancer? We know that we shall have the full endorsement of the public in any program which we undertake. Witness the generous response of the citizens of this and other states to the public subscription program of the American Cancer Society; the response of Congress in its liberal support of research is a reflection in turn of the intense interest of the public that preventative or curative measures for cancer will be found. Witness also the great interest of the public in cancer detection. On this score, it is only fair to say that the attitude of the public on detecting the presence of cancer early by attendance at cancer detection centers has been more optimistic than that entertained generally by physicians in reference to this agency.

Cancer Detection Centers

A pilot Cancer Detection Center has been set up at the University Hospitals, sponsored by the Minnesota State Medical Society and supported by the Minnesota Division of the American Cancer Society and the National Cancer Institute of the United States Public Health Service. Dr. David State, the director of the Center, finds that approximately 1.2 per cent of patients over forty-five years of age presenting themselves for examination without symptoms have cancer. The most frequent site has been the alimentary tract, especially the colon and rectum. Moreover, it would appear from the findings of Dr. State and his associates that about 10 per cent of these patients have silent polyps or adenomas in the rectum or colon. Inasmuch as the majority of these lesions are probably precursors of cancer, it would appear that these findings alone fully justify all the effort involved.

Screening Tests.—The lamentable circumstance is that so much labor is involved in the detection of a single cancer. But who counts the cost of labor when life is at stake? A 1 per cent return does seem to be small remuneration, but is that not the current rate of interest on money deposited in our banks? Yes, there are those who have conclusively shown how impossible it would be to subject all persons over forty-five years of age to annual x-ray scrutiny of their stomachs. Our studies have shown that approximately 90 per cent of gastric cancers develop in patients who are achlorhydric or hypochlorhydric (less than 30 degrees free HCl) to histamine. This is a test which can be done in the physician's office. Annual routine application of gastric aspiration under histamine stimulation to patients over forty-five years of age would determine which 25 per cent (approximate number) should be submitted to x-ray examinations of the stomach.

Similarly, the demonstration of occult blood in the stool on application of the Guaiac test has proved a useful tool in indicating which patients should be submitted to x-ray examination of the colon. And the finding of polyps and/or adenomas in the rectum and lower reaches of the colon on proctoscopic examination has been so rewarding an undertaking as to suggest that every person should submit annually to this test. Moreover, patients exhibiting this finding should also be submitted to x-ray examination of the colon.

What is the alternative?—Those who decry the efforts of the Cancer Detection Center as not justifying the outlay of all the cost and labor suggest that we continue to examine only those patients who have symptoms. Do they not know that, in

The work on which this presentation is based was supported by the following funds for cancer research:
1. The Flora L. Rosenblatt Fund
2. The Malignant Disease Fund
3. The Tillie A. Nelson Fund
4. The Donald P. and Marion S. Ordway Fund
5. The Leo and Frances Pritzker Fund

Presented at the thirteenth annual banquet meeting of the Saint Paul Surgical Society, April 28, 1949.

the alimentary tract, in any case, that cancer is a silent disease until approximately twenty months have passed? The evidence on this score seems quite satisfactory. The public looks to us as guardians of its health. Does the attitude of "wait until symptoms develop" suggest that we are mindful of our great public trust? To any of you who might feel inclined to hesitate and listen to the discouraging platitudes of the doubting Thomases, I say: Let us go forward; faith will follow.

Research

Research, to be certain, is the promise of the future. But what of the present? Are our fellow citizens placing so much money at our disposal for the formulation of a cancer program solely in the hope that the riddle of the cancer enigma will be solved? No, I do not believe that. There may be a few isolated persons who believe that money alone will amass brains, hands and ideas and dispel quickly the scourge of cancer. Most of us are not that sanguine. We know how slow and prodding is the process of new-fact finding. Yes, progress is being made, but I do believe that any program which places its emphasis solely on research with the suggestion that we continue as we have been doing until the nature of cancer is resolved is not in the public interest. Moreover, affecting not even the role of a minor prophet, I believe it is safe to say that it takes little imagination to anticipate such a program boomeranging upon its supporters. We must abstract out of what knowledge we have of cancer today every grain of useful information and use it to the best possible advantage in our wrestle with the problem.

It will be a great day in medicine when we know the nature of cancer and what factors bring it about. And if and when we learn how to prevent cancer, it will be an occasion for universal rejoicing. In the meantime, we have to content ourselves with lesser flights of hope. A biologic test for cancer would lessen enormously the labors of individual organ scrutiny which is at present the technique of the Cancer Detection Center. It is easy, even for a child, to ask questions which no one can answer. It is the mark of genius to ask a question which can be answered. It is such a succession of intelligent questions put to nature, for which answers can be found, that leads to the solution of a problem.

Cancer Is Curable

Figures are accumulating on every hand to suggest that cancer is curable. The problem is to recognize cancer while it is still a local disease. It is spread of cancer from the initial site of origin to the regional lymph nodes that is synonymous with a poor prognosis. Fifty per cent of patients who have gastric cancer and no lymph node involvement are cured by gastric resection. Yet how few those cases are! And why? Because we are dealing largely with patients who come following the development of symptoms. It is well that we deplore the circumstance that patients as a group neglect the onset of symptoms for a period of approximately six months before reporting for medical help. The more important consideration, however, is that most alimentary tract cancers are silent for approximately twenty months before symptoms develop. In other words, neglect of the knowledge of this circumstance is largely accountable for the delay. One can go through the list of common cancers, such as breast, uterus, colon and rectum, and the stomach; it is a uniform finding that cancer is curable when it is still local, but the cures drop sharply with the presence of demonstrable lymph node involvement.

Information compiled by various agencies suggests definitely that cancer is curable. The reporting of cancer cures has long been an activity of the American College of Surgeons. The labor involved in cancer registries is beginning to bear fruit, and at long last, we have one in Minnesota. Those of New York and Connecticut, which have long been active, are begining to give us useful information on cancer incidence and prevalence, as well as mortality. Just recently, Dublin (March, 1949) reported that of patients treated for cancer in the State of Connecticut in 1941, the five-year survivors number 33.5 per cent. When surgeons come to deal with a larger number of Group I or A cases (patients without lymph node involvement), obviously our accomplishment will be correspondingly greater.

Surgery Still the Mainstay of Treatment

There was a time when it was believed that irradiation would supersede surgery as the most reliable remedy with which to combat cancer. Gradually, however, we have awakened to the realization that it is only in certain restricted fields that irradiation holds out promise of relief to patients suffering from cancer. These are essentially: the

skin, certain intraoral cancers and the cervix. The Memorial Hospital in New York was at one time the keenest exponent of the employment of irradiation in the management of cancer. When one goes there now, he finds that this agent enjoys wide usage only in the treatment of intraoral cancer. Those who have some familiarity with papers emanating from that institution ten to twenty-five years ago, or those who had the opportunity of hearing their lamented nestor, James Ewing, extol the virtues of irradiation in the management of malignancy, know what a change in attitude has occurred at the Memorial Hospital with reference to the relative merits of surgery and irradiation in the management of cancer. Obviously, not everyone shares the sharp veering-about in attitude of the Memorial group. In most institutions, irradiation is still the therapeutic agent of choice in the management of cancer of the cervix uteri. It is only fair to say, however, that, more and more, it is becoming recognized that surgery is still the mainstay of present-day therapy in cancer.

In addition to irradiation, there are other helpful adjuncts. In certain malignancies hormonal treatment (estrogens for prostatic and breast cancer and/or androgens for breast cancer) and chemotherapy afford definite palliation. I have seen supraclavicular metastases disappear from a late cancer of the breast under estrogen therapy. Its administration deserves to be probed for the treatment of extensive lymph node metastases from other cancers. Timely, aggressive supplemental surgery may in some such instances convert palliative estrogen therapy into a more hopeful prospect for the patient.

Exploration of the value of chemotherapeutic agents in arresting cancer is being prosecuted in many quarters. Radioactive iodine in the control of cancer of the thyroid, nitrogen mustards in Hodgkin's disease and multiple myeloma, and radioactive phosphorus for certain leukemias—these and other chemotherapeutic agents will undoubtedly bring relief, temporary in most instances, to some cancer sufferers.

Replacement of the scalpel by intravenous injection would indeed be a great step forward in checking the cancer scourge. However, we must be realistic. For most cancers, the only reliable therapeutic agent is still the surgeon's scalpel. There was a time when the mortality of operation for cancer was an item of great concern to surgeons as well as patients. On this score, surgery has made great advances. Today, most standard operations for visceral cancer can be done at risks under 5 per cent.

Need of More Aggressive Surgery

It would be nice indeed if every cancer operated upon by the surgeon were a local lesion. Alas, if it only were so! Yet, if organ screening tests, of which we have some knowledge, were implemented to uncover patients who should be submitted to more detailed and precise organ scrutiny, the mere adoption of this policy of annual organ scrutiny for all patients over forty-five years of age would obviously bring a far larger number of patients with early local cancer for treatment. But who knows better than surgeons that merely wishing it so does not make it so? The proponents of inertia can only be overcome by the slow attrition of fact gathering.

In the meantime, the only manner in which the poor record of accomplishment can be improved is to deal more radically with the cancers as we encounter them.

Re-entry of Abdomen of Patients Presenting Lymph Node Involvement.—Some months ago, I proposed to my colleagues that we re-enter the abdomens of some of our patients after an interval of four to six months when the lymph nodes at the initial operation contained gross evidence of cancer. This procedure has been carried out on a few patients with Dukes' Group C colic cancer. I have the impression that by having a "second look" into the abdomens of such patients, to do a wiping-up procedure on cancer sprouts in lymph nodes not detectable at the first operation, we may improve our accomplishment in the large group of cases with lymph node involvement. From only a few preliminary skirmishes with this problem, I believe it is safe to say that, for certain cancers, this procedure may become standard practice. And if it does, the role of the surgeon in combatting cancer will become even more important than it is today. The more immediate concern for us to cogitate on now, however, with reference to that item is: how many more hospital beds will have to be devoted to cancer surgery? In the light of the circumstance that approximately 65 per cent of patients coming for cancer therapy exhibit lymph node involvement, it is obvious that if a "second look" becomes standard practice for

certain cancers, the need for more hospital beds for the surgical treatment of cancer is obvious.

Primary Subtotal Colectomy for Cancer of the Left Colon.—That polyps are a frequent precursor of colic and rectal cancer is well known; that patients may develop a second lesion also is well known. Because of the potential polyp-bearing nature of the mucosa in colic cancer, I have come to feel that a primary subtotal colectomy is indicated in patients with a cancer of the colon lying between the hepatic flexure and the terminal portion of the sigmoid colon. In any such circumstance, it is possible to excise the lesion together with the entire lymphatic drainage area, without provoking persistent diarrhea. For a carcinoma of the cecum, on the contrary, it is mandatory to excise a fairly long segment of the terminal ileum simultaneously, in order to get the entire lymphatic drainage area, a circumstance which would make primary subtotal colectomy for right-sided lesions undesirable, inasmuch as complete loss of the water-wringer of the gut (terminal ileum and right colon) together with excision of the left colon would be followed by persistent diarrhea. In the patients with primary cancer of the left colon, for which primary subtotal colectomy has been done, an end-to-end anastomosis has been effected between the terminal ileum and the ileac colon at or just below the sacral promontory.

A More Radical Attack upon Fixed Intraperitoneal Lesions.—In this clinic over a period of several years, determined efforts have been made to attempt to extirpate fixed lesions. In the colon and the stomach, for that matter, the procedure is not too formidable. In colic lesions, the simultaneous sacrifice of an adherent loop of gut or the removal of a kidney because of fixation of the ureter or sacrifice of a portion of the abdominal wall may be necessary. In fixed gastric lesions, the simultaneous sacrifice of the mid-transverse colon or a good portion of the pancreas may be necessary. In superficial spreading gastric lesions (Borrmann Type IV), total gastrectomy for juxta cardial lesions with simultaneous excision of several centimeters of the lower reaches of the esophagus is in order—a maneuver which is made easier by dividing the crura of the diaphragmatic canal. The developments in thoracic surgery of the last decade have made excision of esophageal cancer a reality. The only portion of the operation which remains to be standardized is the operation for cancer of the cervical esophagus. Excision of fixed pelvic cancers, whether of the rectum or the pelvic viscera, also must be undertaken by the surgeon. Disposition of the urinary outflow has deterred the surgeon in a frontal attack on fixed cancers of the rectum, cervix or bladder. However, preliminary skirmishes with such patients in this and other clinics have shown that it is feasible to remove such lesions and deviate the urinary stream either to the skin or to the bowel. When refinements of surgical technique in dealing with the problem of deviation of urine make the excision of such lesions possible, these cancers will cease to be labeled "inoperable."

Reoperation for patients with evidences of recurrent cancer has long been regular practice among bold cancer surgeons. Such procedures are ordinarily unusually radical, unless the surgeon becomes dismayed by the magnitude of the undertaking and terminates the procedure by mere exploration, a not infrequent occurrence. Such secondary reoperations for cancer test the fortitude of the patients too in many ways, demanding frequently multiple organ sacrifice and occasionally the acceptance of external fecal or urinary stomas. I have the feeling, as indicated above, that early reentry into the abdomen of Group C cases (those with lymph node involvement) before the termination of the latent interval and the reassertion of symptoms (approximately twenty months), that general adoption of the policy of a "second look" in such cases, will not alone result in a larger number of cures in Group C cases but will make less necessary the very formidable procedures of the present occasional secondary operation.

In other words, the lode-star of the cancer surgeon must come to be: *extension of the possible.* A number of years ago, I advocated and practiced excision of isolated hepatic metastases in suitable cases. Inasmuch as the liver regenerates rapidly, probably faster than cancer grows, I am sanguine enough to believe that by employment of a secondary wiping-up operation, it may actually be feasible to remove extensive hepatic metastases if a portion of either hepatic lobe is relatively free from cancer.

More Extensive Operation for Cancer of the Breast with Axillary Metastases.—The disparity in accomplishment by the surgeon in patients with and without axillary lymph node involvement in cancer of the breast is only too well known. Yet surgeons have continued to perform the conventional Halsted operation which obviously is incomplete and inadequate for the patient exhibiting lymph node involvement. For a period of several months, I have been carrying out in such patients a super-radical Halsted operation. The clavicle is divided and the first rib is removed, permitting a much more complete dissection. The site of the juncture of the internal jugular and subclavian veins to form the innominate is uncovered and freed from all lymphatic-bearing tissue. The axillary vein and artery are laid bare for a distance of 12 to 15 cm., and the component parts of the brachial plexus are stripped of lymphatic-bearing tissue. A supraclavicular lymph node dissection of the lower half of the neck is permitted. Extrapleural incisions are made in the intercostal spaces, permitting removal of the intercostal lymph nodes and the internal mammary vessels. More than half the patients with axillary lymph node involvement upon whom this operation has been done have exhibited evidences of cancer beyond the reach of the conventional Halsted operation. Moreover, the surgeon leaves the operation with the feeling that he has enhanced the chances of curing his patient. Only time will tell.

Summary

Man dreads cancer, and well he might when one contemplates the frequency with which it strikes and the large toll it takes. Approximately one out of every eight deaths is due to cancer. And between the ages of forty-five and sixty in women, approximately one out of every four deaths is due to cancer. Cancer of the colon and rectum, considered as one organ, takes the largest toll in cancer deaths. In the male, cancer of the stomach, the colon and rectum, the prostate and the lung are the most frequent causes of cancer mortality; in the female, these are cancer of the breast, uterus, colon and rectum, and the stomach.

In men past seventy-five, cancer of the prostate is the most frequent cancer. Yet, up to the present time only palliative treatment has been advised for this cancer. The development of satisfactory means of achieving urinary deviation may result in a more energetic attack upon this cancer.

Whereas research is the promise and the hope of the future, the formulation of a realistic cancer program demands that more interest be focused by the medical profession upon the difficult task of earlier recognition. Until a biologic test for the detection of cancer becomes available, only careful organ scrutiny, employing screening tests and detailed and precise techniques of organ survey, can bring about the more regular detection of cancer in its earlier phases. Much as we lament the enormous labor of the Cancer Detection Center, what substitute for it is there today? In the light of the circumstance that the silent interval of cancer is in the area of twenty months, in our role as guardians of the health of the people, we cannot continue to await the development of symptoms. We must seek out the patient who harbors the silent cancer. "The price of liberty is eternal vigilance"; the cost of finding a single, symptomless cancer is much labor. Is it worth it? Well, if life has any value, what would it be worth to any of us to have a cancer detected while it was still local? Yes, I believe the salvage of life by the tedious methods of the Cancer Detection Center will justify in superior accomplishment all the cost in labor and money.

While striving to effect earlier diagnoses, which accomplishment will assure a high percentage of cancer cures, we must nevertheless struggle to deal more effectively with the late cancer. Re-entry of the abdomen of patients exhibiting lymph node involvement four to six months after the initial operation, with a view to a "second look" and excision of cancer sprouts, previously undetected, should result in a better accomplishment in such patients. We have been exploring this thesis on patients with colic cancer and are extending its employment to rectal and gastric cancer. In primary cancer of the left colon, a primary subtotal colectomy is indicated. The surgeon should give more considered thought to the extirpation of fixed intraperitoneal lesions, whether of the colon, stomach, rectum or other pelvic viscera. In patients with cancer of the breast, exhibiting axillary lymph node involvement, an extension of the operation to include an additional centrifugal group of lymph nodes in every direction appears justified.

The increasing frequency with which cancer is

REVERSIBLE FORMS OF HEART DISEASE

JOHN F. BRIGGS, M.D.
Saint Paul, Minnesota

FOR MANY years the diagnosis of heart disease connoted a life of invalidism with probable death by virtue of the affliction. In recent years, however, the marked advances in medical science have not only enabled the heart patient to live a more useful life but also have shown that many forms of heart disease are entirely curable. It is important to remember that a normal heart or a heart that is only slightly diseased may show symptoms that are solely the expression of some extracardiac disease, and that this extracardiac condition may manifest itself entirely or largely in the cardiovascular system. As a result, the cardiac symptoms may be so marked that they completely overshadow the underlying extracardiac disease. As a result the patient is often considered a cardiac invalid, whereas recognition of the effect of the extracardiac disease with treatment directed to the extracardiac condition usually brings about a reversibility in the cardiovascular symptoms. Failure on our part to recognize that many extracardiac diseases are expressed clinically through the cardiovascular system has led to unnecessary invalidism and even death. In every cardiac patient we must constantly be aware of the possibility that the heart itself may not be actually diseased but that rather it is acting secondarily to other conditions in the body. It is only by recognizing these extracardiac factors before they produce structural changes in the heart muscle that treatment of the extracardiac disease may be instituted sufficiently early for the patient to be cured. It is the purpose of this paper to point out in a general way some conditions that are manifested entirely or largely through the cardiovascular system, with the result that a normal or a previously damaged heart may be precipitated into actual cardiac failure. It is apparent that all of the diseases that may produce such changes cannot be listed in the space permitted, and under these circumstances only a brief mention will be made of the various illnesses that can affect the cardiovascular system.

We are familiar with the symptoms presented by the markedly obese patient. He frequently complains of dyspnea, palpitation and precordial distress. Physical examination may often reveal an elevated blood pressure, and pretibial edema is not uncommon. The electrocardiogram may show an inverted QRS_3, the "T" wave in lead III may be inverted, and the presence of a "Q" wave in lead III may be significant. The x-ray of the heart may also show that the heart is pushed up and apparently enlarged. All of the signs and symptoms presented by the patient are the result of the excess weight he carries, as well as the increased work placed on the heart by the larger blood volume associated with the obesity. Loss of weight through a reducing regime brings about a disappearance of the signs and symptoms enumerated above. In some types of obesity, the heart itself may actually play a role in the increased deposit of fat. Normally there is more adipose tissue on the right side of the heart than on the left. If the adipose tissue in the heart follows the course of the increase of adipose tissue throughout the body, then there will be a marked infiltration of fat on the right side of the heart. This infiltration may progress to the point of producing right heart strain and right heart failure. Here again, weight loss brings about a return of the cardiac function to normal, for just as the adipose tissue throughout the body decreases, so does the adipose tissue in the heart decrease. In very severe toxic, anemic or infectious states, fatty metamorphosis may occur within the heart muscle. These lipids may accumulate within the cell to such an extent as to interfere with the function of the cell, and thus cardiac failure may ensue. If the etiologic agent producing the fatty metamorphosis is a treatable lesion, then as the extracardiac lesion is cured, the secondary fatty metamorphosis within the heart is cured and the heart regains its function.

Acute blood loss produces very marked cardiovascular symptoms in the form of shock. In addition, a precordial systolic murmur associated with the acute anemic state is not uncommon. With restoration of the blood volume both the symptoms of shock and the murmur disappear. In the chronic types of anemia not only may there be a systolic murmur over the precordium, but upon

Read at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

occasion a diastolic murmur may be heard over the pulmonary artery area. There is frequently an enlargement of the heart, and at times this hypertrophy may be very marked. The electrocardiographic tracings usually reveal nothing significant. Here again treatment of the underlying cause of the anemia usually restores the cardiac function to normal. It is also important to recognize the effect of even mild degrees of anemia upon patients with degenerative forms of heart disease, such as coronary sclerosis. Disease of the coronary arteries may not be sufficient to produce either signs or symptoms, as sufficient blood is still being supplied to the myocardium. However, when these patients develop anemia, the reduced oxygen-carrying power of the blood plus the mechanical interference with the circulation incidental to the coronary sclerosis may be sufficient to produce marked anginal symptoms and even myocardial infarction may result. Here again, recognition of the effect of the underlying anemia upon the previously diseased heart and the successful treatment of the anemia invariably lead to clinical improvement.

Avitaminosis, particularly a deficiency in vitamin B, sometimes produces reversible changes in the cardiovascular system. This is particularly true in those individuals who are malnourished as a result of either chronic wasting diseases, self-inflicted starvation, or in the malnutrition secondary to chronic alcoholism. The diagnosis of beriberi is made by having a high index of suspicion that such a condition may be present in malnourished cachectic patients. The diagnosis is frequently recognized when a patient with obvious heart disease fails to respond to the usual treatment of heart failure and then consequently responds when his diet is adequate and supplemented by vitamins. The symptoms of beriberi heart disease may vary from simple tachycardia to very marked congestive heart failure. It is the failure of the patient to respond to the ordinary cardiac regime and his response to a high caloric, high vitamin regime that establishes the diagnosis of beriberi.

Some types of congenital heart disease are now cured by surgical intervention. The diagnosis of congenital heart disease can therefore no longer be considered of academic interest only. Patent ductus arteriosus, which is essentially an arteriovenous fistula between the aorta and the pulmonary artery, is readily cured by surgery. This fistula, serving a useful purpose in intrauterine life, may persist after the first year of life and produce symptoms and cardiovascular distress. The diagnosis is apparent because of the machinery hum murmur over the base of the heart, a high pulse pressure, absence of cyanosis, and usually the presence of a normal electrocardiogram. Surgical closure of the ductus brings about a complete relief of the cardiovascular symptoms. Should bacterial endarteritis be present, the combination of operation with antibiotics and chemotherapy also cures the condition. Coarctation of the aorta is an easily diagnosed condition when it is recalled that in this disease there is hypertension in the upper extremities and hypotension in the lower extremities. Various murmurs may be heard, but the diagnosis depends upon determining the presence of the hypertension in the upper extremities and the hypotension in the lower extremities. This is easily accomplished by simultaneously palpating the radial and femoral arteries during every routine examination. The removal of the coarctation with the end-to-end anastomosis of the aorta effects a cure in these patients. Cyanotic heart disease is omitted in this discussion, for the procedures are palliative rather than curative. Anomalous vessels occurring about structures in the neck are also easily diagnosed and easily cured by the surgeon.

Arteriovenous fistulas may be either acquired or congenital. In either event, they may produce very marked disturbances in the cardiovascular system. The diagnosis of the arteriovenous fistula and then the surgical correction of the lesion results in the disappearance of the cardiovascular symptoms.

Endocrine disturbances are frequently associated with marked changes in the cardiovascular system. Addison's disease with associated hypotension, small heart, and signs of peripheral collapse is familiar to all of us. With the use of proper cortical extracts, saline solutions and the like, the cardiovascular symptoms promptly disappear, blood pressure returns to normal and the heart to normal size. Hyperfunction of the adrenal gland in the form of a pheochromocytoma causes vascular crises, paroxysmal or prolonged hypertension, headaches, collapse, et cetera. Here again, recognition of the tumor and its surgical removal brings about relief to the patient. Hyperthyroidism may express itself through the cardiovascular system in the form of simple tachycardia, par-

oxysmal tachycardia, paroxysms of auricular fibrillation or even persistent auricular fibrillation. It is not uncommon to have a slight elevation in the systolic blood pressure, and the patient may be dyspneic as a result of the increased demand for oxygen. Proper preparation of the patient and surgical removal of the diseased gland relieves the symptoms. At times, a mild hyperthyroidism may be sufficient to precipitate severe heart failure in the middle-aged or aged person with degenerative heart disease. Here again, relief of the hyperthyroidism aids in the return of the cardiac function to its previous state. Myxedema is not an uncommon disease. The symptoms and signs of myxedema are manifold and often involve the cardiovascular system. These patients frequently have a very characteristic type of electrocardiographic tracings with low voltage and low voltage "T" waves or even inversion of the "T" waves. Treatment with thyroid gland invariably relieves the cardiovascular symptoms.

We can no longer consider that hypertension is incurable. Hypertension associated with coarctation of the aorta, with arteriovenous fistulas, with hyperthyroidism, with pheochromocytomas, with unilateral renal disease and certain types of kidney tumors can be cured by appropriate surgical treatment.

Formerly, acute bacterial endocarditis, subacute bacterial endocarditis and the acute and subacute forms of endarteritis, were almost always fatal. With the advent of antibiotics and chemotherapy, many of these patients are promptly cured and are returned to an active normal life and the heart and the cardiovascular system may be returned to its previously normal or inactive involvement.

Pericarditis is not an uncommon disease, and the acute forms are easily recognized and usually heal spontaneously. There is one form, the idiopathic relapsing type of pericarditis, which simulates coronary thrombosis with myocardial infarction. Failure to recognize that the lesion is pericardial rather than myocardial may lead to invalidism. The disease is readily diagnosed by the history, by the physical findings and by the electrocardiographic tracings which reveal the signs associated with pericarditis. This condition also leaves no residue, and the patient, after the acute illness has subsided, may have a normal cardiovascular system. It is possible for a chronic type of pericarditis to develop and over a period of years the increase in fibrous tissue compresses and constricts the heart. This constriction may develop to such an extent that it interferes with cardiac function. When it does so, the venous pressure becomes elevated, the peripheral pulse becomes small and systemic blood pressure falls. There is an increasing amount of edema, the liver enlarges, and the symptoms resemble those of cirrhosis of the liver. The triad of the increased venous pressure, the small peripheral pulse and the decreased systemic blood pressure suggests the diagnosis. On physical examination, the heart is usually small, murmurs are seldom heard and the heart is frequently silent. On fluoroscopic examination the heart seems to pulsate but little. An electrocardiogram has a characteristic pattern. Recognition of the syndrome, surgical removal of the constricting pericardium relieves the condition. Acute cardiac tamponade may occur either as the result of infections or injury to the pericardium and the like. Here, as a result of the rapid accumulation of fluid within the pericardial sac, the heart is compressed and we have a rapid rise in the venous pressure, a fall in the systemic blood pressure and a very weak and rapid pulse. The cardiac silhouette is enlarged on x-ray and physical examination. Removal of the fluid, either by paracentesis or by surgical means, relieves the condition.

Pulmonary heart disease in the acute form is best recognized in the form of pulmonary infarctions. Here acute right heart strain results from the pulmonary embolic phenomena. The diagnosis is frequently made from the history of a recent surgical procedure or long confinement to bed from one cause or another; the patient suddenly experiences a severe chest pain, goes into collapse, becomes cyanotic and even moribund. The symptoms are quite distinct from those of a coronary thrombosis. Here the electrocardiogram has also a characteristic pattern, and treatment directed to support the cardiovascular system usually results in recovery. Some forms of chronic cor pulmonale are reversible. The accompanying right heart strain is secondary to some chronic disease of the lung or thoracic cage. It is possible that antibiotics, chemotherapy, or surgical procedures administered for the lesions of the lungs or the thoracic cage may bring about a relief of the right heart strain. Many mechanical disturbances of the thoracic cage may produce profound alterations in the cardiovascular function. These are best seen in individuals with kyphoscoliosis, or in

those who suffer from acute compression of the mediastinum and heart as a result of injury or displacement of the heart from any cause. Here again, treatment directed toward the offending mechanical agent will usually relieve the cardiovascular symptoms.

In conclusion, some examples of cardiovascular disease have been listed wherein the heart itself may be normal or only slightly diseased, but by virtue of extrinsic factors acting upon the heart or through the cardiovascular system, the heart is precipitated into severe congestive heart failure. As a result, the patient may become invalided and even may die as a result of this disturbed cardiovascular function. If recognition of the extracardiac disease is made early before structural changes in the heart become irreversible, treatment of the extracardiac disease will usually result in cure. Failure to recognize extrinsic factors as they express themselves in the cardiovascular system usually leads to irreversible changes in the cardiovascular system with ultimate cardiac death. The saying is applicable to the heart that it is more often sinned against than sinning.

Discussion

Dr. Joseph Borg, Saint Paul: Dr. Briggs has called our attention to certain heart conditions which are amenable to treatment because the factors which damage the heart, or which lead to heart failure secondary to heart strain, can be removed or their effects materially lessened. This emphasizes the need for accurate diagnoses in all cases of heart strain and heart failure in order that proper measures for their correction may be instituted.

Properly speaking, there are few chronic or acute infectious diseases which may not in some way cause interference with proper heart function, but in most of these it is not necessary for us to particularly direct our attack on the cardiac manifestations since these will subside with satisfactory response of the underlying disease. It is not to these conditions that our attention is being drawn, but rather to conditions in which the cardiac manifestations are paramount at some time or other and therefore must be distinguished from the heart diseases which may produce similar clinical pictures, but in which organic changes are irreversible, such as the valve deformities of rheumatic disease, the vascular changes of arteriosclerosis, and the hypertrophy of hypertension arteriovenous aneurysm or other cause.

The so-called reversible heart conditions then may be divided into (1) conditions in which structural heart change leads to disability, such as the congenital defects and the results of inflammation which lead to constrictive pericarditis, and (2) conditions in which extracardiac etiologic factors lead to syndromes in which the cardiac manifestations are of major importance. Dr. Briggs has discussed conditions in which dramatic recovery from disabling heart disease can be obtained by proper treatment. Other conditions, while relatively infrequent, are sufficiently numerous in the aggregate to form a sizable important group which is frequently overlooked because consideration is not given to the possibilities and sufficient attention has not been called to them.

The dramatic accomplishments of the surgeon in alleviation of the disability due to traumatic injury and to congenital defects speak for themselves. I should like, however, to call attention to the difficulties of accurate diagnosis in some of these and to emphasize the need for the most exhaustive study possible of these cases. This may not be possible by even the most experienced cardiologist practicing alone, and the development of group study by competent investigating teams will probably be the answer. Too few cases of this type are seen by the individual doctor, and mistakes in diagnosis can be averted only by most careful study.

Disturbances of function, such as neurocirculatory asthenia and paroxysmal disturbances of rhythm, may not be easy to diagnose at times, but when recognized their response to treatment is often gratifying. Severe nutritional disturbances in obesity, scurvy, beriberi, and rickets, produce myocardial insufficiency. Severe anemia, especially pernicious, may be responsible for angina pectoris.

Endocrine diseases also may account for heart disability, as seen in adrenal tumors and the thyroid conditions which have been discussed. And finally, the cardiac failure secondary to hypertension has been demonstrated to be reversible in certain patients who have satisfactorily responded to sympathectomy.

Dr. Briggs, therefore, has done us a distinct service in calling our attention to these conditions. To recognize them, our index of suspicion must always be high, and the reward will be gratifying to both the patient and physician.

BABIES AND POLITICAL STRATEGY

From Tel Aviv, Palestine, comes the report that the Israeli Government has recently decided to provide a baby bonus of $300 to each mother who bears her tenth child. This is the opposite of the Canadian baby bonus plan where the payment decreases after the birth of the fourth child. No doubt the Israeli bonus will inspire some mothers to raise large families—despite the fact that most Oriental countries consider the high birth rate a problem.

—*Briefs*, October, 1949.

SLIPPING OF THE CAPITAL FEMORAL EPIPHYSIS

S. W. SHIMONEK, M.D.

Saint Paul, Minnesota

EPIPHYSEAL or adolescent coxavara is a condition in which the femoral neck or metaphysis rides or slips out of its normal position beneath the head, rotates externally and rides up in relation to the head. This usually occurs gradually but may slip acutely. Varying degrees of displacement are observed when the patient is first seen. Upon the degree of slipping depend, in large measure, the results which are obtained by treatment. Early diagnosis before gross deformity has already developed is paramount for the best results. Untreated persons at an early age develop severe symptoms of hypertrophic arthritis or, as it is often termed, malum coxae senilis.

In 287 cases of hip joint disease observed in adolescents under twenty, this condition was noted in twenty-six by Brailsford. Eighteen were male and eight female.

The etiology is obscure. Rickets is probably a factor in some cases. It is often seen in the Froehlich type of obese patient, but this may be due to the added stress and strain of excessive weight rather than directly resulting from glandular dysfunction. Acute displacement may be the direct result of trauma. We do not know the cause in the majority of cases.

The typical case will be an adolescent between ten and eighteen, complaining of pain in the region of the hip joint, often about the knee, and vague subacute pain in the thigh. One should be suspicious of hip joint disease when discomfort is localized only to the knee or thigh. Limp will often be noted, particularly by the parents. Symptoms will have been present for a varying time. It will be stated that rest relieves symptoms. On examination some limitation of hip motion will be demonstrated, varying greatly with the degree of slipping which has occurred when the patient seeks aid and with the severity of the symptoms. Limitation of internal rotation should be particulary noted. In early cases a mere sense of resistance to internal rotation when rolling the extremity with the palms of the examiner's hands may be the only positive diagnostic sign. Fixed external rotation will be present in the cases with marked separation. It will be noted even in some early cases that when the hip is flexed, it tends to rotate externally. It will not be possible to rotate the flexed hip internally in the advanced cases, and fixed external rotation will be present. Shortening will not be noted unless marked deformity is present. A limp favoring the affected side and toeing out may be noted. Hyperextension will be limited. The hip will be adducted, and abduction, therefore, will be limited even in some early cases.

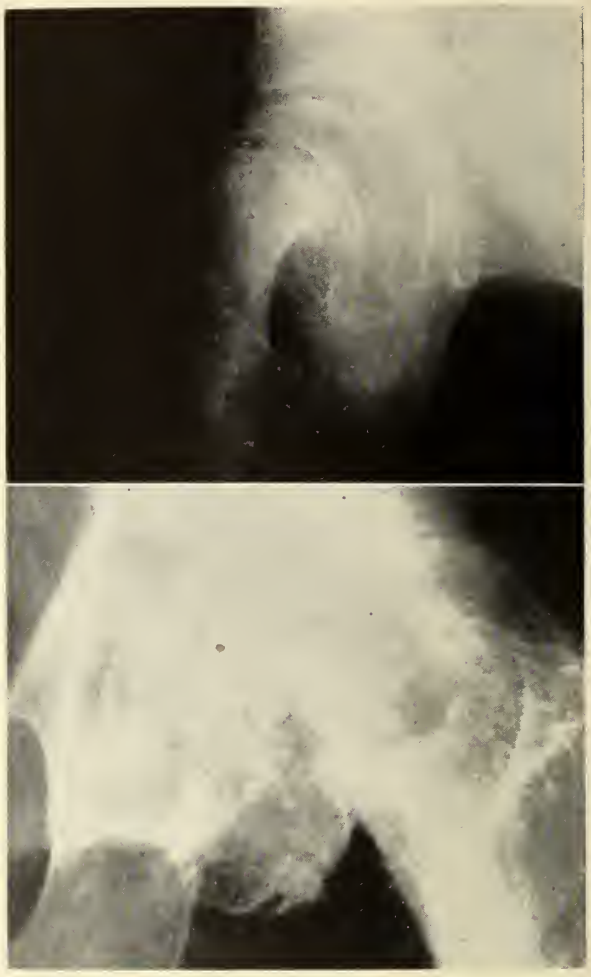

Fig. 1. *(above)* Extreme slipping of the upper femoral epiphysis. This case would require reduction or osteotomy of the neck.

Fig. 2. *(below)* Case of degenerative changes developing in a previously slipped epiphysis which was untreated.

Read at the annual meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9, 1949.

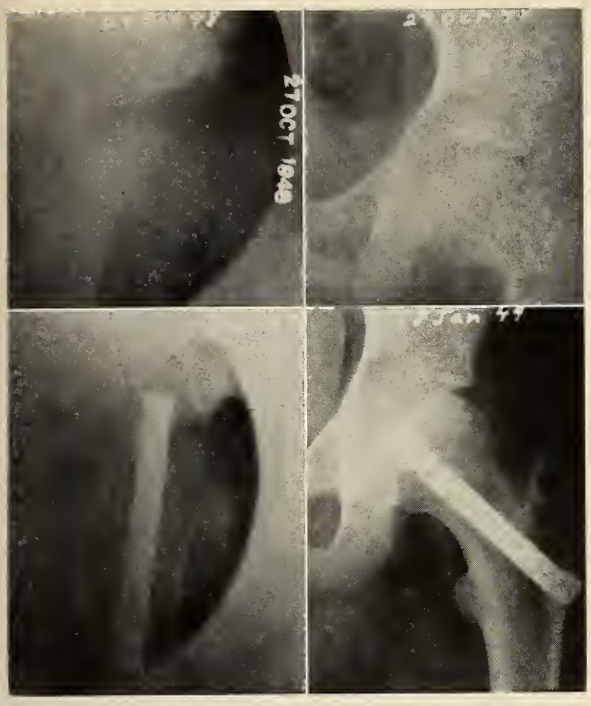

Fig. 3. *(above)* and Fig. 4 *(below)*. Minimal slipping nailed without reduction. The epiphysis closed six months after nailing. No apparent residual disability.

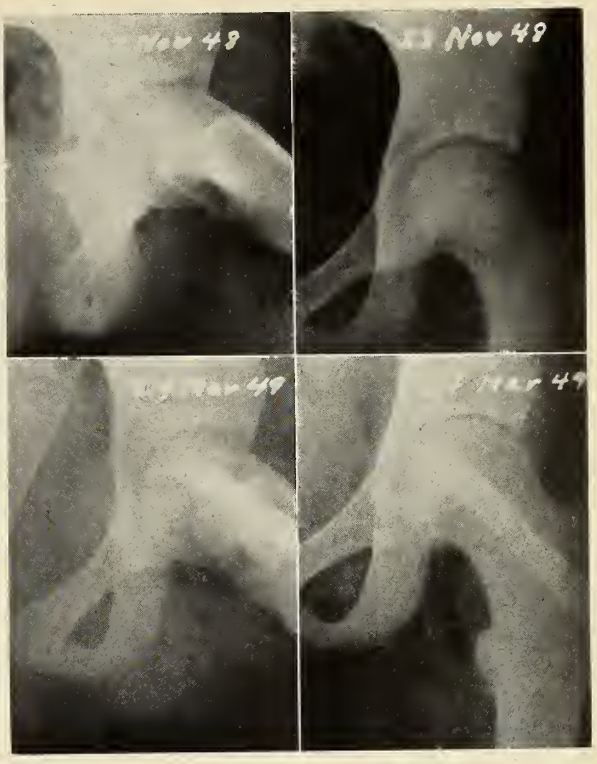

Fig. 5 *(above)* and Fig. 6 *(below)*. Minimal slipping nailed *in situ*. Apparently cured without disability.

Similar physical findings are noted in tuberculosis of the hip and in Perthes' disease. The x-ray picture is diagnostic. The x-ray findings will vary with the degree of malposition of the head in relation to the neck. In early cases, termed the pre-slipping stage, it is stated by some observers that thickening of the neck or metaphysis and accentuation of the space between head and neck may be the only sign. However, this pencil line distinctness of the epiphyseal shadow is due to rotation of the neck on the head, and, in my experience, these cases will also show a narrowed shadow of the head in the anteroposterior view and some distortion of the normal relationship of the head and neck in the lateral view. The metaphyseal thickening is found constantly, and, where observed, this condition should be suspected. As the condition advances, the neck rides up so that its superior border lies in the same plane with the top of the head in the anteroposterior view, and the lower border of the head may be in line with the lesser trochanter. In the lateral view, almost complete rolling out of the neck from under the head may be observed. In the final stage of the process the typical picture of the hypertrophic hip is demonstrated. When the diagnosis is made, weight bearing should be rigidly prohibited until treatment can be instituted. Cases have been observed in which there is sudden and complete separation. In cases with minimal slipping, internal fixation without altering the position gives excellent results. Light traction followed by gentle manipulation and internal fixation is sometimes successful. Open reduction is favored over forceful manipulation. The latter seems to further limitation of motion. Removal of a bone wedge may be necessary to obtain normal head and neck relationship.

In conclusion, I would stress the importance of early diagnosis. Where marked deformity is allowed to occur, the patient's activities are severely limited. Early in life, the typical hip of old age develops, necessitating reconstructive procedures and acceptance of a sedentary existence, deprived of the pleasures of even noncompetitive sports and slightly rigorous occupations.

THE PRESENCE OF SODIUM IN NATURAL WATER AND SOFTENED HARD WATER IN RELATION TO LOW SODIUM DIETS

C. B. NELSON, M.D., M.P.H., H. R. SHIPMAN, M.S., and DEAN TAYLOR, B.Ch.Eng.

Minneapolis, Minnesota

INTEREST in the use of low salt diets for treatment of hypertension has recently been stimulated by reports in which the intake of sodium chloride is rigidly controlled. In the "rice-fruit-sugar" diet for treatment of hypertensive vascular disease, Kempner[4] states that this diet contains not more than 200 mg. of chloride and 150 mg. of sodium. Grollman[3] reported the use of a 2,000 calorie diet containing less than 1.0 gm. of sodium chloride. Schroeder,[6] summarizing the literature, reported the use of diets in which the sodium content ranged from 200 to 400 mg. of sodium per day. At the University of Minnesota Hospitals,[1] the daily intake of sodium in such diets is limited to 200 mg. of sodium or approximately 0.5 gm. of sodium chloride.

Gorham[2] has reported beneficial results with the restriction of sodium chloride to less than 1.0 gm. in treatment of cardiac failure with edema.

In view of this drastic reduction of sodium in these diets, it can readily be seen that any extraneous addition of sodium to the diet, such as from the water supply, even in small amounts, would offset the restrictions of the diet. With this in mind and considering that sodium chloride restriction may be of importance in other conditions such as kidney disease and pregnancy, it was decided to make a study of natural waters as they occur in Minnesota to determine the presence of sodium, and to show in other instances the effect of water softeners on the presence of sodium in the softened water supply.

Water samples were collected during April and May, 1949, from a number of municipal systems in those parts of Minnesota where previous analytical determinations indicated that sodium might be present in the ground water. Since surface water supplies such as are obtained from lakes and rivers are normally low in sodium, no waters of this type were examined during this study. Sodium concentrations were determined gravimetrically in the water laboratory of the Minnesota Department of Health by the method of Kolthoff and Sandell,[5] and ranged from 17 to 568 parts per million.

TABLE I

Municipality	County	Sodium Concentration (p.p.m.) in Municipal Water Supply
Bricelyn	Faribault	92
Stewart	McLeod	84
Hector	Renville	131
Olivia	Renville	104 (East well)
Olivia	Renville	105 (West well)
Barry	B'g Stone	568
Danube	Renville	103
Bird Island	Renville	70
Brooten	Stearns	17

The results of this spot check of municipal supplies are shown in Table I.

Concentrations expressed as parts per million are the same when expressed as milligrams per liter, that is, 568 parts per million is 568 mg./liter of water. From these results, it is reasonable to believe that other municipal wells and many private farm and home wells contain significant amounts of sodium.

Where hard waters occur, water softeners of the zeolite base exchange type are in use throughout this and most other states in homes and municipalities. The home softening units may be either of the type which is replaced at periodic intervals by a service company or of the type which is recharged by the home owner through introduction of salt or salt brine.

The exchange process takes place in a manner similar to the following equation:

$$\begin{matrix} MgSO_4 \\ CaSO_4 \\ CaCl_2 \\ MgCl_2 \end{matrix} + \text{Na zeolite} \rightarrow \begin{matrix} \text{Mg zeolite} \\ \text{Ca zeolite} \end{matrix} + Na_2SO_4$$

$$Na_2SO_4 \rightleftarrows 2Na^+ + SO_4^{--}.$$

In this equation the calcium, magnesium and a few other ions tied up with such anions as sulfates, carbonates, bicarbonates, chlorides, et cetera, are replaced by sodium. This means that the harder the water, the greater the concentration of sodium found in the softened water. In order to demonstrate what such hardness will yield in terms of sodium after softening by the zeolite process, a few of the municipal waters are listed

Dr. Nelson is associated with the Section of Preventable Diseases and Mr. Shipman and Mr. Taylor with the Section of Environmental Sanitation, Minnesota Department of Health, University Campus, Minneapolis, Minnesota.

TABLE II

Municipality	County	Hardness in Terms of p.p.m. Calcium Carbonate	Resulting Sodium Concentration in Terms of p.p.m. Sodium
Alberta	Stevens	830	380
Alvarado	Marshall (South well)	1160	530
Canby	Yellow Medicine	920	420
Currie	Murray	1200	550
Fairfax	Renville	720	330
Hills	Rock	1050	480
Jeffers	Cottonwood	1700	780
Lewisville	Watonwan	1200	550
Ortonville	Big Stone	830	380
Round Lake	Nobles	1100	500
Slayton	Murray	1100	500
Wilmont	Nobles	1800	825

in Table II, together with the sodium concentration that would result if the water were completely softened.

For those water supplies for which the hardness is known, the sodium concentration can be readily obtained by multiplying the hardness concentration expressed as $CaCO_3$ by a conversion factor of .46. Thus, a water supply which has a hardness of 1,000 parts per million as $CaCO_3$ would have a sodium concentration of about 460 parts per million if it were completely softened by being passed through a zeolite unit.

It becomes evident that zeolite-softened water and natural waters high in sodium have a definite significance wherever sodium-free diets are prescribed if this water is used for drinking purposes. As a matter of policy, it seems advisable for physicians to check on all waters used by patients on such diets, to determine (1) that the natural water is low in sodium and (2) that no water is consumed which has been passed through a zeolite softener.

Summary

Analytical data are presented to show that a number of natural ground waters in Minnesota contain significant concentrations of sodium and that all hard waters passed through zeolite softeners will be high in sodium.

These data are presented in order that physicians who may prescribe low sodium diets may know that significant amounts of sodium may be introduced through the water intake.

THE SURGEON AND THE CANCER PROBLEM

(Continued from Page 1105)

being cured brings the comfort of hope to potential and actual cancer sufferers. The consideration of a large initial operative mortality is no longer an important deterrent. The only dread should be the *fear of neglect.*

A series of intelligent questions will have to be directed by the cancer investigator at the cancer diathesis. Each question answered enhances the likelihood that we may ultimately have a satisfactory answer to these questions which occupy the minds of all of us.

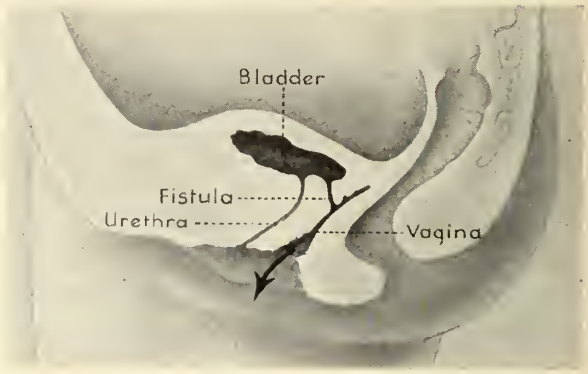
Case Report

VESICOVAGINAL FISTULA CURED WITHOUT MAJOR SURGERY

R. C. RADABAUGH, M.D., F.A.C.S.
Hastings, Minnesota

THE CASE I am presenting is that of a vesicovaginal fistula, which appeared ten days after I had performed a complete abdominal hysterectomy on October 3, 1935. Confirmation of the suspected vesicovaginal fistula was obtained by instillation of methylene blue solution into the bladder and its subsequent detection in the vagina. About three weeks later, upon a more thorough examination of the vaginal field, the fistula was found to be in the two to three o'clock position in the vaginal wall two-thirds of the distance posterior to the internal labia on the left side of the vagina.



Two months after the operation, when the chances of injury to the operative field were minimized, a cystoscopic examination was performed; the site of the fistula in the bladder was located, and it was determined that the ureters and trigonum vesicae were intact.

The fistula was about the diameter of a small darning needle and through it about one-third of the total urinary excretion drained off from the bladder. This necessitated the wearing of a napkin to catch the drainage of urine from the vagina. When a snake-eye catheter was inserted in the bladder so that no back pressure of urine existed, only a small amount of urine drained through the fistula.

The operative method of treating the fistula was discussed with the patient, but she was very much opposed to further surgical treatment. We then considered the chance of treating the fistula by injection of sclerosing solution about the fistulous opening. Although a cure could not be foretold with any certainty, the patient readily consented to this procedure.

The patient was hospitalized for four days and a self-retaining catheter was maintained in the bladder during that time. On April 29, 1936, the fourth day in the hospital, the catheter was removed at 5:00 a.m. to allow the bladder to fill, and at 8:00 a.m. the patient was taken to the operating room and a general anesthetic administered. The patient was placed in the dorsal recumbent, moderate Trendelenburg position.

Vaginal retraction was accomplished by a self-retaining weighted vaginal retractor inferiorly and a Sims' vaginal retractor anteriorly and somewhat to the left, held by the assistant, thus bringing the fistula into the field of vision. A 5 c.c. glass tonsil syringe containing 5 per cent sodium morrhuate sclerosing solution, with an angular tip tonsil needle, was held in the right hand. The tip of the angular tonsil needle was carefully placed in the posterior portion of the fistulous tract,

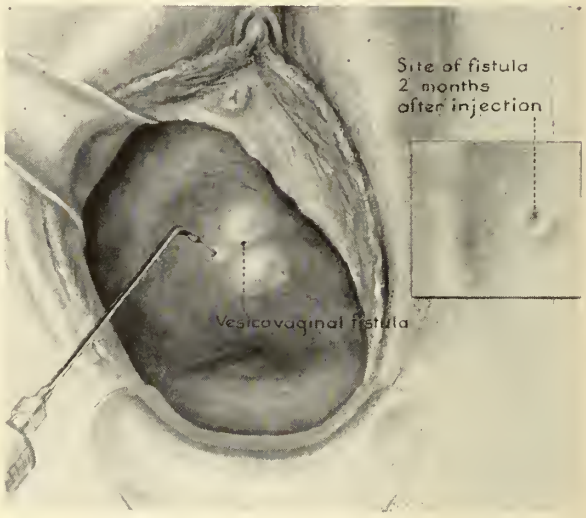


Fig. 1. *(above)* Site of vesicovaginal fistula.
Fig. 2. *(below)* Obliteration of vesicovaginal fistula by injection.

about ¼ inch from the tract in the vaginal mucosa, and a bleb of about 5 or 6 minims was injected. This was in the twelve o'clock position to the fistulous opening. The same procedure was carried out in the four o'clock and the eight o'clock position of the fistulous opening. There was a distinct difference noted in the resistance to the needle of the vaginal mucosa and the bladder wall. This made it possible to inject into the vaginal mucosa and the outer muscular coat of the bladder wall and not into the bladder lining. We then tested and found we had closed the fistulous opening. This was determined by instilling into the bladder, 50 c.c. of methylene

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY

Rochester, Minnesota

(Continued from the October issue.)

When in June, 1867, an appointee was named to finish the term for which Dr. Galloway had been elected in 1865, the *Rochester City Post* stated: "We have a coroner in Olmsted County, a much needed officer. The vacancy which has so long existed in this important office has been filled by Mr. L. L. Benjamin who will fill it faithfully and well." In the following November Mr. Benjamin was elected coroner. He served his full term, and subsequently from time to time acted as deputy coroner.

The remainder of the record is clearer. Dr. W. W. Mayo, elected coroner in 1869, served one term. He was succeeded by Alfred Blanchard, a layman, who served one term. Dr. Galloway was re-elected in the autumn of 1873; evidently part of this term was filled by N. E. Gaskill. Dr. G. W. Nichols was coroner in the period of 1874-1877, and Dr. F. R. Mosse in 1878-1879. Dr. Nichols, re-elected in November, 1879, moved to Dakota Territory in June, 1880, and Dr. E. T. Sedgwick was appointed to fill the vacancy. Dr. Mosse again was elected in November, 1880, and served through 1894. Dr. A. S. Adams held the office in 1895-1896, Dr. Mosse in 1897-1910, and Dr. J. E. Crewe from January, 1911, well into 1946.

The Sick Poor and County Physicians.—One of the early acts of the first territorial legislature of Minnesota was to pass a law providing for relief of the indigent, whereby relatives of the poor were primarily responsible for their support. When solvent relatives were lacking, each township was required to provide financially for the resident poor, the actual care being under supervision of the county board of commissioners. In the records of Olmsted County the first mention of paupers and foundlings occurs in the commissioners' proceedings for January 5, 1857. The commissioners were authorized to build or provide a workhouse for the accommodation and employment of public charges, and accordingly the Olmsted County Poor Farm was established in 1868; three changes of location of this home were made before 1900. After the Civil War the large number of soldiers' orphans left destitute in this county and throughout the state required frequent state legislation, between 1865 and 1879 for their relief. Laws providing for improvement in the care of the poor, including foundlings, orphans and the aged, are a matter of record.

In Olmsted County the commissioners, in addition to providing suitable support for the poor, supplied also, if necessary, *medical care* to all indigent persons who had resided in the county for one year prior to application for aid. In 1864 the office of county physician was established by the legislature, for the purpose of furnishing medical aid to the sick poor. These physicians were appointed by the

county board to serve at its pleasure. After answering a first call from a sick person, a county physician made additional calls only on order from the commissioners. In some counties, as in Olmsted, the position of county physician rotated among the physicians in the various districts; in an occasional district the position was held by one man in what amounted to almost a life tenure. For a time at least, in Olmsted County, physicians submitted sealed bids for appointment. All county physicians furnished medicines and other therapeutic supplies.

In an occasional year some of the townships of Olmsted County did not have official county physicians, in which case the local physicians attended the sick poor and in due course presented their bills to the county commissioners for payment. Compensation of county physicians in Olmsted County was about 60 per cent of the usual professional rates and ranged from $48 to $250 annually depending on the size of the territory served and on the variety of duties, as will appear.

Although the records consulted are not complete, there is evidence that at one time or another many physicians of Olmsted County, and among them some of the most able, administered officially to the poor. A few names taken at random from different years are given here:

The first comment noted about a city physician (appointed by the county commissioners) for Rochester concerned the appointment of Dr. W. A. Hyde in 1864. In January, 1870, Dr. B. J. Kendall, of Marion, was named physician for the Olmsted County Poor Farm, and Dr. Hector Galloway, county physician. In March, 1872, five county physicians were appointed, one for each commissioner district. From March, 1873, to March, 1876, the county had three such physicians: during this period, in March, 1874, there were appointed Dr. E. C. Cross, for the city of Rochester and ten townships including Rochester Township, Dr. C. E. Teel, of Eyota, and Dr. J. F. Slocum, of Marion, at annual salaries of $110, $48 and $150, respectively.

Beginning in 1876 and continuing through 1913, one county physician was appointed periodically to serve the city of Rochester and to attend the inmates at the poor farm; in the nineties this service was extended to include attendance at all examinations of insane persons before the judge of probate. This multiple office commanded $250 a year.

From 1876 to 1881, inclusive, there were five county physicians: In 1878, for example, Drs. H. Galloway and F. A. Sanborn jointly for the city of Rochester and six townships and the poor farm; Dr. I. M. Westfall, of Eyota, for the village of Eyota and six townships; Dr. I. H. Orcutt, of Byron, for the village of Byron and three townships. In 1880 Dr. G. W. Nichols served the Rochester district; Dr. J. N. Farrand, of Oronoco, his village and three townships; Dr. I. H. Orcutt, Byron and three townships; Dr. A. W. Stinchfield, Eyota and four townships; and Dr. M. A. Trow, of Chatfield, the townships of Elmira and Orion. As stated previously, Chatfield lies partly in Elmira Township, Olmsted County, and partly in Fillmore County. From 1881 to 1890, inclusive, seven county physicians were appointed; in 1891, eight; and in 1898, five.

Vital Statistics.—In accordance with the state law passed in 1869 the official registration of births and deaths in Olmsted County began in 1870. Issues of Rochester newspapers from that year forward give condensations of annual reports on these statistics, and also indicate that for several decades considerable difficulty was encountered by the authorities of the county in enforcing the law of registration, especially the recording of births. On May 6, 1871, the *Rochester Post* stated: "All births taking place in this city must be reported promptly to the city recorder. The law requires this under severe penalty. New parents will take

notice." The same paper on January 9, 1891, said: *"Reports of births.* The law requires that all births shall be reported every year to the city health officer. This law has not been complied with in this city the past year and unless those interested report to Health Officer Mosse immediately, the penalty, a fine of $10, will be inflicted."

Olmsted County and Rochester were not the only delinquents. Dr. H. M. Bracken, secretary of the State Board of Health and Vital Statistics, in presenting to Governor Lind, on December 30, 1900, the report on vital statistics in the state for the period of 1894-1897, wrote: "It would seem that the laity should recognize the importance of records of births and deaths as bearing upon such legal documents as wills, et cetera, and that physicians and midwives would comply with the law demanding reports of births and deaths. In spite of all efforts of this board, returns are very imperfectly made, and many local officers fail to enforce the law requiring reports. As a result of this negligence Minnesota is still c'assed with the 'nonregistration states' by the census bureau at Washington." He expressed the hope that before another decade had passed, the reports of births and deaths from Minnesota might be in such form as to insure proper recognition by the federal government.

The death rate in Olmsted County for many decades hovered around 1 per cent. In 1891 the death rate in Rochester was 11.6 per thousand, less than in any other city in the state. The computation in that year, as in every other year subsequent to 1879, excluded the deaths among patients at the state hospital, those patients being considered nonresidents of Rochester.

Public Health.—In the pioneer years, living conditions in Olmsted County and other counties of Minnesota were crude, and measures for sanitation were primitive or lacking. That was the period, long continued in isolated communities, of individualism in matters of health. The early physicians met problems of public nuisance, endemic disease and epidemic disease as best they could, but their knowledge and experience were inadequate, and the laity were uninformed or indifferent, many of them ignorant and superstitious. Disregard of cleanliness produced much nuisance and illness, and mistaken personal independence of conduct, in the presence of contagious disease, multiplied hazards in communities. Certain residents of foreign extraction, for instance, declared that smallpox and diphtheria were acts of God and, even when members of their households were ill with one of these diseases or other communicable disease, went deliberately from home to home among their friends and into churches, stores and other public places.

With increasing population and livestock and with unclean sties, stables and latrines close to dwellings, came myriads of houseflies. The late Charles N. Ainslie (as stated earlier, Mr. Ainslie from 1906 to 1930 was a member of the Federal Bureau of Entomology in Washington, D. C.), who came to Rochester in 1862 as a child, said in his memoirs (1938), in discussing early conditions of living in Olmsted County:

> The slogan, "Swat the Fly," originated by Dr. L. O. Howard,* . . . had never been heard during my younger days, and flies were considered a necessary though, of course, unpleasant nuisance. They swarmed in the houses, for screen had not been then invented, and mosquito netting had not come into use. We used to have a lively time driving the flies from our house when they had become too numerous. We darkened all the windows but one, then, with brushes made of strips of tough paper fastened to the end of a short handle, we

*Dr. Leland Ossian Howard (1857-), Washington, D. C., became assistant entomologist of the United States Department of Agriculture in 1878; from 1894 to 1927, inclusive, he was chief of the Bureau of Entomology.

would keep the flies in motion, until in desperation they would move out through the open lighted window as fast as they could. In a short time they would all be back again and the same drive would have to be repeated. It was common for bushy tops of asparagus to be hung from supports of the ceiling for the flies to perch on, to keep them from the walls and the furniture, on which they might leave fly specks. In the fall, when the nights grew cool, we would leave a window open all night, then in the morning, the flies, torpid from the chill air, could be swept down, gathered and burned. Another method was to sprinkle a little sugar on live coals on an ash shovel and the smoke from the sugar stupified the flies so that they would be easily disposed of. Even in my boyhood a few smart people would fasten thin cloth across the outside of windows that were especially exposed, but this device was seldom seen in use. For many years we used fly covers on our dining table, wire-woven hemispheres of various sizes, adapted to fit vegetable dishes, butter and meat, bread and cake. These covers were fitted with a small knob at the apex by which they could be lifted from the protected dish when necessary.. These devices were far ahead of nothing, but were a perpetual nuisance at meal time.

Even scientists of that day, and for many years afterward, did not know the habits of the common house fly, nor where they bred, and careful study and observation were required to learn these elementary facts. Of course, the proximity of stables and farm yards was responsible for the swarms of flies that invaded houses at that time. Even in the smaller cities nearly every family had a cow or a horse on the premises. In these days it is not easy to imagine the conditions that prevailed sixty or seventy years ago, when flies were insisting on a place in even the best families.

Until 1901, when the Olmsted County Board of Health was established, the county supervisors, village trustees and city council were responsible for measures of public health and sanitation. The nuisance of straying domestic animals was first to receive attention in Rochester and in the villages. At a town meeting in Rochester in May, 1858, a law was passed unanimously by the city officers requiring owners of hogs to keep those animals from running loose about town, and imposing a fine of one dollar on the owner every time his hogs were found in the streets. Additional orders of the sort were issued annually in Rochester well into the sixties, and there were discussions of whether to "fence in or fence out." Editors wrote dramatically about many swine running at large, to the disgust, damage and annoyance of the orderly public; about cattle ranging the streets, stealing hay from wagons, tearing open bags of grain, and damaging coats, cushions and other articles left in vehicles; and about sheep: "Aside from the noxious effluvia arising from the herding of droves of diseased sheep about our residences, they are quite likely to monopolize the fresh pastures that environ our city and have hitherto afforded free grazing to the poor man's only cow."

The Rochester newspapers protested, in May, 1864, about the stench from twenty dead horses lying "without burial" on the banks of the Zumbro in midtown. The editors deplored the condition of the city's cemeteries, and they described then and for many subsequent years, muddy streets, stagnant pools on Broadway, filthy stables, outhouses and garbage reservoirs, and heaps of organic refuse in alleys and beside kitchen doors, all of which breaches of sanitation menaced the purity of wells. There were piles of ashes in the main streets, obstructing gutters and sidewalks and, in winter, interfering with the sleighing. Throughout the city, cellars were dirty and littered, even foul, and some of them in the business section served as places for butchering poultry and calves. In fact, one gains the impression that noxious effluvia constantly rose from and hovered over the community and that sanitation in villages of the county was comparable to that in the county's only city.

The first city board of health in Rochester, in 1858, apparently was not active. In June, 1864, when conditions of sanitation had become objectionable, the city fathers appointed a board of health of three lay members. In 1865 this board

was succeeded by a board of three physicians, Drs. W. W. Mayo, J. S. Allen and H. Galloway. In the next several years open letters on public health and sanitation were issued from time to time by the board and published in the newspapers. In 1866 City Ordinance No. 20 made new provisions for creation of a board of health of three persons, two of whom should be physicians, and defined the duties and powers of the board in "cleaning and cleansing" the city. From then through the next six years, it is evident that the Drs. E. C. and E. W. Cross, Mayo, Galloway and certain other representative physicians were, two at a time, on the the city board of health and active in a campaign for better conditions of health and sanitation. Their notices to the public and their reports to the city council evince their thoroughness. In 1874 conditions had so changed that a local editor, embittered by such zeal, inquired because the board of health had insisted that no more manure, garbage or other filth be thrown in the alleys, "What are the alleys for? Are they for traveling, parks, or boulevards?"

From 1872, the year in which the Minnesota State Board of Health was established, the following physicians were among the officials of public health and sanitation in Rochester: in 1872-1879, Drs. G. W. Nichols, E. C. Cross and E. W. Cross; in 1880-1881, Drs. E. C. Cross, W. W. Mayo and S. W. Gould. Dr. E. W. Cross next served with others until 1883, when Dr. F. R. Mosse and Dr. W. J. Mayo became health officer and secretary, respectively; in the succeeding term Dr. Mayo was health officer and Dr. Mosse, secretary. Dr. Mosse continued to serve most of the time as health officer into 1896. He was followed by Dr. A. S. Adams, who was health officer into May, 1912, when he was succeeded by Dr. C. H. Mayo, who continued as chief of the public health department of the city until shortly before his death, twenty-seven years later.

Dr. W. J. Mayo in 1892 was appointed a member of the Minnesota State Board of Health, and he so served until he resigned in January, 1900, when Governor John Lind appointed Dr. C. H. Mayo to the vacancy.

In the villages of the county, prior to 1872, the program of public health and sanitation was in degree like that in Rochester, and after 1872 showed comparable improvement. Record of village health officers has not been available; in the later decades of the period the names of physician health officers in the different communities appeared occasionally in the local newspapers.

With the organization of the Minnesota State Board of Health there began more effective control of public health in all counties, control that was strengthened by subsequent legislation and by "sanitary conferences" of boards of health, city, township, county and state, for the purpose of awakening public conscience and satisfying public curiosity regarding sanitary matters. The programs consisted of addresses, illustrations and scientific demonstrations bearing upon the duties of the citizen in the work of public health. One such conference was held in Rochester on May 29, 30 and 31, 1888, at which the speakers were Professor W. W. Folwell, Dr. Franklin Staples, Dr. A. T. Conley, Dr. C. N. Hewitt, and Dr. W. W. Mayo, all of Minnesota, and Professor G. Armauer, of Bergen, Norway, surgeon of the Leper Hospital of Bergen. Professor Armauer lectured on the bacteria of spedalsked (Norwegian leprosy) and gave a microscopic demonstration.

From the beginning a difficulty in enforcing measures of health and sanitation in Minnesota lay in the fact that the majority of health officers worked for little or no salary. As late as 1898 more than half were not paid, and most of the others received not more than $20 a year. Complicating the situation further, the duties of health officers in abating nuisances, maintaining public sanitation and dealing

with epidemic diseases were obligatory, but means for performance of these duties were at fault or in dispute. Through the nineties special effort was made to secure not only suitable compensation for health officers but also special funds for dealing with emergencies of sudden infectious diseases and, particularly, adequate executive machinery to enable health officers to act effectively.

Judging from local records of its earlier decades and from reports to the state board of health, Olmsted County was not afflicted with epidemics prior to 1900, although in the early period it had its share of almost annual sporadic outbreaks, some of them severe, of measles, scarlet fever, diphtheria and smallpox. Much of the difficulty in controlling smallpox in those years was due to diagnosis of the disease by irregular practitioners as French measles, or measles, or chickenpox, as well as to the lack of authority, already mentioned, vested in health officers, and to indifference on the part of the laity.

The experience of Olmsted County in dealing with epidemic diseases, especially smallpox, was similar to that of other counties. In 1860 vaccination against smallpox was recommended by physicians, but it was long before consistent attempt was made to influence public opinion. In times of emergency, then and decades later, some of the people would respond to the urging of private physicians and health officers and would accept vaccination, but the majority were indifferent or antagonistic. In the late nineties, when again smallpox was prevalent and was increasing, the Minnesota State Board of Health adopted a resolution, on July 11, 1899, that "in all schools a certificate of vaccination must be required from each pupil before admittance to the fall term." And in the autumn, health officers, teachers and school officials in Olmsted County and other counties were trying to enforce that resolution as a ruling.

In Rochester a city hospital or pest house was built in 1869, of which it appears that the caretaker was the chief occupant. In 1889 Health Officer F. R. Mosse was urging the need for a pest house. In reporting to the state board, he said, "Our city pest house was blown away in the cyclone of 1883 and we have had no need for one since, but we should be ready to care for cases of contagious diseases. St. Mary's Hospital has no convenience for the care of such cases, and we are informed that the hospital authorities will make no extensions this year, and it is doubtful if they ever decide to place a pest house on their grounds." Finally, however, the lack was filled by St. Mary's Isolation Hospital, which was opened by the Sisters of St. Francis on June 14, 1918.

The first city water system of Rochester was acquired in 1886; until then private wells supplied homes and business buildings. In the new system a series of large wells near Bear Creek, in East Rochester, supplied the water, which was forced to a standpipe on College Hill, on the then western edge of Rochester, and thence distributed in mains. Two years later fountains and drinking troughs "for man and beast" were erected, on standards of Mantorville stone, in Central Park, at the head of Broadway, and on street corners. This water system supplied the city until after the turn of the century.

Slaughter houses for decades were a nuisance in the city of Rochester. One such place was condemned in 1886 and another, on Bear Creek, in 1890, at which time the State Board of Health recommended the construction of a municipal abbatoir. In the summer of 1891 the secretary of the state board responded to an appeal from the city health officer by saying that although the city officer could not control the operation of the local slaughter house, he could condemn the meat after it had been brought inside the city and offered for sale. Ultimately the problem was solved.

The paving of Broadway, the chief business district, came toward the close of the century. This street, on which were hitched thousands of teams of horses in the course of a year, long was described as a veritable barnyard.

Rochester was thirty-seven years in achieving a sewerage system. The first sewer in the city was a private one, built in 1869, extending from the new and, for time and place, magnificent Cook House, to the Zumbro River. Thereafter, at intervals for many years, the city board of health campaigned for a city sewerage system. In 1888 sewage from the state hospital, emptying into Silver Creek, in East Rochester, created an emergency, which Dr. C. N. Hewitt, of the state board of health, solved on the appeal of the Rochester board by ordering a special method of disposal for the state hospital, which promptly was carried out; it was not until after 1900 that the sewers of the hospital were connected with the city sewers. The first city sewer ran the length of Broadway and empied into the Zumbro River. Before the sewer was built, in 1895, there was much conferring to gain permission from the state board of health to empty the sewer into the Zumbro near the bridge at the north end of Broadway. The following interesting item appeared in the *Record and Union* of July 20, 1894:

> *The Sewerage Matter:* Dr. W. J. Mayo who came down from Waseca [from his summer cottage] this morning reports that he was at the State Board of Health when they discussed the matter of allowing Rochester the privilege of connecting its proposed sewerage system with the river.
>
> There was no permission to do this, but at the same time permission is not denied. This river does not run through any towns below except Hammond's Ford, and by the time it reaches there has been joined by the waters of two other rivers and is supposed to have run far enough to purify itself. The upper line of the river is through badlands and ravines, and therefore our sewerage system will not materially affect those below us. At the same time, if the State Board of Health gives permission to Rochester to connect a sewerage system with the river, other cities will demand the same right. The course which will be pursued will be to put in the sewerage system and allow it to run into the river, and then the State Board of Health cannot consistently order it out without doing the same by Saint Paul, Minneapolis and many other cities of the state, which all have systems emptying into rivers. The Board has indeed, given intimation that our system will be unmolested if put in here. Mayor Witherstine expects to make one more effort to gain formal permission, but if the same is not gained, it will have no material effect on the enterprise.

Rest Room for Women and Children.—In 1896 the Woman's Club of Rochester, at the suggestion of Miss Evans, of Carleton College, Northfield, made an important contribution to public welfare. From earliest days Rochester was the trading center of the county and attracted farmers and their families from all parts of the region. A few of the women and children went to hotels after shopping was done and while the heads of households were transacting business, but most of them waited wearily wherever they could, on the streets and in stores. At the instance of the Woman's Club, merchants pledged monthly contributions, as did the city, toward the maintenance of a rest room for women and children from the country. The rest room, the first of the sort in the state, under the superintendence of the club duly was opened in a small room in the business section of town, and a few years later was established in larger, suitably furnished quarters under the immediate supervision of a matron. The room continued in use until changing conditions obviated the need for it.

The Red Cross Society.—In May, 1898, the Red Cross Society came to Olmsted County, first in Rochester, through the agency of Dr. H. H. Witherstine, in response to the urgent request of Miss Kate B. McKenzie, of Minneapolis, assistant

corresponding secretary of the Red Cross Society. Miss McKenzie wished the ladies "to unite in the work of furnishing bandages, pillow cases, night shirts, et cetera, for the soldiers who may be wounded" (during the Spanish-American War). The original idea was that the work in Rochester should be subsidiary to that in Minneapolis, but Rochester chose to establish its own society, with headquarters at the Woman's Club rooms, and the organization soon looked forward to membership in the National Red Cross Society. Contributions of money, material, sewing machines and work were asked, and shortly there were published in the local papers accounts of cash and material sent by the local society to various military hospitals. Soon after the society was organized in Rochester, auxiliary branches were formed, in Eyota and elsewhere in the county, and in neighboring counties.

Civic Improvements Advancing Public Welfare.—In January, 1897, Rochester then a city of 6,000, had obtained all that she asked for and other improvements were in a fair way to consummation; these improvements were of advantage to the county as a whole. There were stone pavements and broad plank walks, a complete telephone system with 165 subscribers. There were gas and electricity, pure city water, miles of tile sewers, free U. S. mail delivery, six well-located and well-equipped public school buildings, besides St. John's and the Academy of Lourdes, two private schools and a kindergarten coming, as well as a promised library building. There were twelve churches, St. Mary's Hospital, the Second Minnesota Hospital for Insane, the Conley Camera Factory, a courthouse and a jail. Predicted were a three-set woolen mill, a board of trade, a new opera house, a new Masonic temple, street cars, an additional railroad from Duluth, and possibly the Chicago Great Western Railroad from Mantorville and the Winona and Western from Simpson. Many of these advances were realized before 1900.

Organization of Medicine

To the advance of public welfare in Minnesota nothing contributed more than increasing awareness on the part of regular physicians of, first, the menace of quackery and, second, the need for improved medical education, awareness that led to medical legislation and medical organization. The move toward improvement received early impetus in the middle sixties when physicians and surgeons returned from the Civil War to find that innumerable quack practitioners, some of them professing to have been army surgeons, were invading the home fields.

Medical Legislation.—A territorial law of Minnesota in 1851† provided for the examination by medical societies of applicants for license to practice and for the issuance of diplomas by the presidents of such medical societies. The law specified that an applicant for license to practice must be twenty-one years of age, have had a good English education, and have studied medicine at least three years with some respectable practitioner. In March, 1869, owing to the efforts of the Minnesota State Medical Society, aroused by the increasing influx of irregular practitioners, the legislature of Minnesota enacted a medical law that made it unlawful for a person to practice medicine in Minnesota who had not attended at least two full courses of instruction, who had not been graduated in some school of medicine either in the United States or in some foreign country, and who did not possess a cer-

†The Public Statutes of the State of Minnesota. (1849-1853.) Compiled by Moses Sherburne and William Hollinshead, Esqs., Commissioners. Saint Paul: Pioneer Printing Company, 1859. Pp. 277-279. Also, the Revised Statutes of the Territory of Minnesota, passed at the session of the legislative assembly commencing January 1, 1851, pp. 29 and 126. References through the courtesy of Dr. James Eckman, Division of Publications, Mayo Clinic, Rochester, Minnesota.

tificate of qualification from some state, district, or county medical society. The law stated further that the failure of a practitioner to file a sworn copy of his diploma or certificate, before October 1, 1869, in the office of the clerk of the district court of the county in which he resided or kept his office, should constitute prima facie evidence that he had not attended lectures or been graduated from any school of medicine. It is noteworthy that the provision referred to a diploma or a certificate and not to a license to practice medicine. The phrasing of the law inadvertently left loopholes which enabled irregular practitioners to organize and to gain recognition. Because of this defect the bill was a failure and was repealed in 1870.

The first medical legislation of merit in the state, the Minnesota Medical Act or "Diploma Law," was enacted on March 15, 1883, and was designed to protect the people of the state from "the manifest dangers of quackery and the less obvious perils of incompetency and ignorance." Under this law licenses to practice medicine were issued to physicians who held diplomas from recognized medical colleges and to physicians lacking such diplomas who passed the examination of the newly established Minnesota State Medical Examining Board. Exemption certificates were given practitioners who finished evidence of having practiced medicine in Minnesota for five years prior to the passage of the act.

In 1887 the law of 1883 was repealed and a new act, designed to regulate the practice of medicine, to license physicians and surgeons and to punish violations of the law, was passed. This act, in due time, was followed by other legislation as new problems arose. When, in 1927, the Basic Science Law in Minnesota was passed, it required that all practicing physicians should file their original Minnesota licenses with the clerk of district court in their respective counties. Those older physicians who had been licensed under the law of 1883 and duly had filed their licenses were fortunate. Those who had neglected to file and who had lost the early licenses, and in this group were some of the most able and eminent, found themselves under the necessity of appealing to the State Board of Medical Examiners for certified copies of the original documents in order to place themselves on record as in good standing.

Medical Societies.—An early evidence of the changing attitude of physicians toward the art, science and ethics of medicine was effort toward the organization of county medical societies, long urged by the American Medical Association and by state medical societies. In 1872 there were in Minnesota six county medical societies, all of which were affiliated with the state society. Of these the groups in Winona and Fillmore Counties were organized in 1866; in Olmsted and Wabasha Counties, in 1868; and in Ramsey and Hennepin Counties, it is believed, in 1870. During 1872 the Dakota County Medical Society and the St. Croix Medical Society became auxiliary to the state society. The county societies gave impetus to professional advance and helped to establish a pattern of progress. Physicians of one county not only fostered their own local society, presenting reports and papers before the group, but also encouraged the formation of societies in neighboring counties and contributed to their meetings. Individually these physicians more and more were stimulated to exchange visits with other physicians throughout their region for consultation and for observation of surgical operations of special interest, to join in organizing district groups, to attend sessions of state and national medical societies, to travel far to observe work in hospitals of large cities and to take postgraduate study at accredited medical schools.

(To be continued in December issue.)

President's Letter

DOCTORS ON THE ALERT

Unlike the political "organizers" who can devote their full time to the promotion of schemes embellished with such phrases as "attaining the highest level of health," "free medical care for everyone, everywhere," the men and women of medicine are confronting a scientific challenge today that supersedes in importance even the economic and sociologic threats devised by these organizers.

Doctors today are in a dual race. Fighting to outdistance with facts the ethereal promises of those who are trying to socialize medicine, the doctor cannot pause, even momentarily, in his constant striving to keep abreast of medical progress.

So fast are these cures and hopes for cure being developed and so intense is the public's interest in them, that often we read newspaper and magazine accounts of the latest discoveries in drugs, serums and operating techniques before the profession itself is informed about them.

An informed and ever-curious public speaks intelligibly these days of the effects of penicillin and aureomycin and the newest techniques in surgery.

Research centers are co-operating with this interest and helping to inform the public. Newspapers and magazines devote special sections to medical news and assign qualified reporters and feature writers to translate the scientist's reports into lay language.

With revolutionary developments emerging every day from the medical laboratories of the nation and with informed and, therefore, more co-operative patients to work with, the doctor of today cannot fail to meet both the scientific and economic challenges which have been offered to him.

Equipped with the knowledge he gains from reading the medical literature, visiting clinics and hospitals and continuing his postgraduate work by means of short courses, the modern physician can counter, with the reality of medical care, the unfounded promises of government control.

MEDICAL PROFESSION INVESTIGATED

IS IT POSSIBLE that we have come to such a state of affairs in our beloved free country that the government we have set up to operate for the general welfare is now going to use its invested power to interfere unjustifiably with our freedom of speech and action? Certain groups of our citizens have been investigated by the Antitrust Division of the Department of Justice of our federal government in recent years and have been brought into court accused of infringement of antitrust laws. Rather than go to the expense of costly litigation, these groups have entered pleas of *nole contendere* and have paid fines even, though they have felt a reasonable certainty of their innocence.

Is the medical profession about to take its turn in an investigation suit?

We, as American citizens, elect representatives to pass certain laws which are enacted by majority action and also elect an executive, the President, to enforce the laws. This is legislation by representation. But what has happened? Officials in the Executive Department, for the most part appointees, propose laws for the socialization of our economy, the practice of medicine in particular. The physicians of the country, as represented by the American Medical Association, opposed such a proposal and in November, 1948, voted to assess themselves to provide funds to present their viewpoint to the public. A month later the Department of Justice called on the Chicago Medical Society secretary to check the Society's records in connection with an alleged antitrust investigation. In the early hours of February 10, 1949, the room of the Board of Trustees of the AMA was broken into and records searched by persons unknown. A few weeks later Administration leaders began threatening medical societies and medical men with investigation as part of their campaign to discredit and intimidate the medical profession. On February 28, 1949, one of the National Press Associations carried a dispatch from Washington quoting Government officials as stating that antitrust actions would be started against several medical societies soon after the Compulsory Health Insurance drive was started in Congress.

This threat has now materialized. During the past few weeks some twenty-two medical societies, including the AMA headquarters, state medical associations and allied groups, have been or are being investigated by the Antitrust Division of the Department of Justice. More investigations are said to be in the offing.

Are we just using our imagination when we see in this train of events an attempt to discredit the medical profession because of its opposition to certain socialistic elements in Washington?

If any of the organizations of the profession or any of those sponsored by the profession are knowingly or unknowingly infringing on any antitrust laws, we want to know in what way and we shall be only too willing to make the needed correction. But if the present widespread investigation by a branch of the federal government is being conducted in an effort to intimidate and discredit the profession for political purposes, we venture to predict that it will not be successful.

Whatever monopoly in the care of the sick is possessed by the medical profession has been given by law. It should be more of a monopoly than it is. The Blue Cross and Blue Shield cannot with any justice be accused of possessing or seeking a monopoly in their respective fields. We shall await with interest the results of the various investigations being presently conducted. In the meantime, we as a profession will continue to exert our right of free speech to oppose the socialists in Washington and elsewhere who would give the government a monopoly in the medical care of our citizens. Is it possible that the Department of Justice of the government is about to accuse the medical profession of monopoly in order to further governmental monopoly in the realm of medical care?

HOSPITAL CARE OF VETERANS

THE SUBJECT of the medical care provided for veterans by the federal government has been touched upon editorially in MINNESOTA MEDICINE on numerous occasions. We have recently received a report on the Hospitalization of Veterans by the Committee on Public Health Relations of the New York Academy of Medicine* which is most complete. Its recommendations merit serious consideration.

We have always taken the stand that nothing was too good in the way of medical care and compensation for the veteran for any disability sustained in the service of his country. But we have been equally vocal in maintaining that the government is not obligated to provide hospital or medical care for veterans for non-service-connected disabilities.

After World War I the Veterans Administration initially provided hospital care only for veterans with service-connected disabilites. As early as 1924 the present policy of hospitalizing veterans for non-service-connected disabilities began, and veterans unable to pay the cost of hospitalization were admitted, providing beds were available. In 1934 a law was passed requiring the veteran to affirm under oath, under penalty of $1,000 fine or a year in jail, that he was unable financially to provide hospital care for himself. No provision was made for checking his statement, and it is said no veteran has ever been prosecuted, although it is known that many false declarations have been made.

There are at present 18,733,000 veterans—a sizable portion of the population. To provide total hospital care at government expense for this large section of our population would entail the construction and staffing of many new hospitals at the cost of billions to the taxpayers. To any fair-minded citizen such a program is unjustified. And yet this was apparently the program initiated when Congress, in 1947, appropriated three-quarters of a billion dollars for the construction of eighty-nine new institutions plus additions to existing hospitals which would add 54,000 new beds. The veterans organizations want to have 300,000 beds available in twenty years, which would mean 20 beds per 1,000 veterans, over four times the 4.5 beds per 1,000 now available for the civilian population. Such an objective is obviously absurd. The Medical Director of the Veterans Administration has estimated that 120,000 beds are about all that can be staffed at present.

With the appearance of the Voorhees report of the Hoover Commission, which showed the gross extravagance of the plans for hospital construction and the great economy that could be effected by combining the hospitals of the Veterans Administration, Public Health Service, general hospitals of the armed forces and others under a National Health Department, be it said to the credit of President Truman that he cancelled the plans for the construction of twenty-four of the proposed hospitals and a reduction in the size of fourteen others at a saving of $280,000,000 and a reduction of 16,000 in the number of beds authorized.

The report of the New York Academy of Medicine states that on January 31, 1949, there were 104,414 available beds in veterans hospitals occupied by 97,079 patients. In addition to this there were 13,474 veterans in army, navy, state and county hospitals—a total of 110,553. Approximately two-thirds of these were non-service-connected cases. Of the 36,732 service-connected cases only 5,734 were general medical and surgical cases, the rest being psychiatric and tuberculous. Of the 73,721 non-service-connected, 34,283 were general medical and surgical cases, the rest being psychiatric and tuberculous. There were therefore about six times as many general medical and surgical cases that were non-service-connected as there were service-connected.

The 39,538 patients with non-service-connected psychiatric and tuberculous disease now being cared for in veterans hospitals have disabilities which generally require tax-supported care. Doubtless state and other institutions for psychiatric and tuberculous patients could not accommodate this large number of additional patients.

The recommendations of the committee of the New York Academy of Medicine are in brief:

> That federal responsibility for hospital care should be limited to those veterans with service-connected disabilities except that all tuberculous and mentally ill veterans should be included irrespective of service connection and that the medically indigent and veterans with service-connected disabilities who develop general medical and surgical conditions unrelated to service should also be included.
>
> That Congress amend the law making it possible for the Veterans Administration to investigate claims by

*Bulletin, New York Academy of Medicine, 25:567, (Sept.) 1949.

veterans of inability to pay for non-service-connected disabilities.

That Congress place a limit on the number of beds available for veterans and that that limit not exceed 120,000.

That the 46,000 beds in various governmental hospitals, which according to the Voorhees report of the Hoover Commission are at present unoccupied, be used before new hospitals are built.

That veterans' hospital services be coordinated with voluntary hospitals in order to prevent further costly duplication of facilities.

That needlessly long stays in hospital be shortened and a strict admission policy be based on necessity.

That veterans use their voluntary insurance covering medical and hospital care and that the recommendation of the Voorhees Committee that the Government provide insurance for those veterans unable to afford it be considered.

It is evident from this report that the 104,414 available beds in the veterans hospitals are more than sufficient to care for the 36,732 service-connected cases and the 39,538 non-service-connected psychiatric and tuberculous cases. It is true that the available beds are not sufficient to accommodate the additional 34,283 non-service-connected general medical and surgical cases now being cared for by the VA, but it is difficult to believe that this number are bona fide medically indigent.

The Veterans Administration claims that more than the approximate 6,000 service-connected general medical and surgical cases are required to provide a sufficient variety of clinical material of interest and educational value to the medical staffs. The report contends that another 6,000 general medical and surgical cases of non-service origin from among the medically indigent veterans rather than the 34,283 presumably indigent veterans now being cared for should be sufficient to provide the needed variety. Even if it should prove that all the 34,283 presumably indigent veterans with non-service-connected disabilities are indigent, the 46,000 vacant beds in other government hospitals would obviate the need for the present hospital construction being carried on by the Veterans Administration.

The Committee of the New York Academy of Medicine has done a real service in clarifying the present status of the veterans hospitals. Even with the building program already somewhat curtailed, the total number of hospital beds should be limited to 120,000 at most. This figure is apparently going to be exceeded if present plans are continued.

MISS ELIZABETH McGREGOR AND THE GILLETTE HOSPITAL

MISS ELIZABETH McGREGOR, for thirty-five years the superintendent of Gillette Hospital for Crippled Children in Saint Paul, retired on October 15, 1949, having supervised the institution during its growth from a convalescent home to its present outstanding position.

The Gillette Hospital, which was the brain child of the late Dr. Arthur J. Gillette, was first opened in January, 1911, for the care of crippled children awaiting operation at the City and County Hospital (now Ancker Hospital) in Saint Paul or for convalescents from that hospital. At that time the hospital consisted of just two connecting wards. On October 1, 1914, when Miss McGregor arrived to take charge, the hospital consisted of these two wards and two two-storied additions in the process of construction. These additions, as a matter of fact, were not completed when all the children were transferred from the City and County Hospital in December, 1914. Dr. Gillette and his assistant, Dr. Carl C. Chatterton, were joined by Dr. Wallace H. Cole upon his return from Europe in May, 1914, and all three gave their services without financial remuneration for many years.

Upon the death of Dr. Gillette in March, 1921, the name of the hospital was changed by an Act of the Legislature from the Minnesota State Hospital for Crippled Children to the Gillette Hospital, and Dr. Chatterton was appointed Chief of Staff, he supervising the care of the boys and Dr. Cole the girls. These members of the staff received no remuneration until 1938. Since then stipends have been paid all members of the orthopedic staff which now consists of five additional Twin City orthopedists. The fine spirit of cooperation which has always prevailed at the Gillette Hospital, and which is so necessary for successful operation of a hospital, accounts, according to Miss McGregor, for the high standing achieved and maintained by the hospital. It should be stated, however, that it is well recognized that staff cooperation depends much on the diplomacy and executive ability displayed by the superintendent of the hospital.

Miss Elizabeth McGregor's academic education and early experience specially prepared her for the responsibilities she so well assumed at the Gillette Hospital. She graduated from the University of Minnesota in 1901 with a degree of

Ph.B., one of but ten such degrees ever conferred at the University. This degree was awarded for majors in mathematics, psychology and sociology with a large sprinkling of the arts. After graduating, Miss McGregor taught in the public schools in Saint Paul for six years and then obtained a position with the State Public School at Owatonna (now defunct) for six years, in connection with which she visited all parts of the state in her investigation of dependent children who were candidates for the school. She served as superintendent of the school the last three years at Owatonna.

The onset of World War I cut short the continuation of a trip on the Continent, and Miss McGregor was forced to return to England from Belgium just before the shooting began. During the war, however, she spent a year and a half in the service of the organization known as the American Fund for the French Wounded and later with the French Red Cross stationed at Neuf Maison, some ten miles south of Nancy in France.

It was at Miss McGregor's instigation that the Gillette Hospital was one of the first in the country to be investigated and approved by the American College of Surgeons. This took place in 1922, and it is a source of considerable pride to the former superintendent that it has been approved each year since then.

In 1933, the American College of Hospital Administrators was organized with 100 men and thirteen women charter members. One of the thirteen women was Miss McGregor. Only individuals trained in hospital administration are approved by this organization.

Miss McGregor can take credit for a large share of the accomplishments and the high standing of the Gillette Hospital to which such a great portion of her life has been devoted. She has moved into her own home at 509 South Cretin Avenue, Saint Paul, which she purchased a year ago. Her responsibilities now will be her garden, books and housekeeping, and she is leaving the administration of the hospital to Miss Jean Conklin, whose services in the various departments of the hospital have specially prepared her for her new responsibilities.

KETTLE AND POT

Those government officials who look down their noses at the American Medical Association's efforts to combat compulsory health insurance display the typical bureaucratic approach to all controversial topics.

The administration says its program will not lead to socialized medicine. We may never know just how many dollars of everybody's money has been spent to propagate that bit of nonsense, but we can be sure the sum will run to many more millions than the AMA has collected from its members. The money spent by organized medicine will come from the pockets of the contributors and not from the public kitty into which everyone who buys so much as a loaf of bread must pay regardless of his views on the welfare state.

Few opponents of compulsory health insurance are so dimwitted as to suggest that the AMA is a body of supermen who can't be wrong about anything, many doctors are unhappily aware of the fact that their organization's policies have sometimes tended to be unnecessarily restrictive.

But if the AMA is several giant strides away from omniscience, the same can be said of the bigwig bureaucrats who keep the government mimeographs and presses turning twenty-four hours a day on behalf of their pet panaceas.

Propaganda money is "slush" when the AMA spends it and a perfectly legitimate federal function when government lays it out. A neater case of the pot sneering at the kettle would be hard to find.—Editorial, *Chicago Journal of Commerce,* May 14, 1949.

VESICOVAGINAL FISTULA CURED WITHOUT MAJOR SURGERY

(Continued from Page 1114)

blue solution. No further dripping of the blue colored solution came from the site of the vaginal opening, proving that the tract was closed. A self-retaining catheter was again placed in the bladder. The surface of the fistulous opening in the vagina was wiped off with an alcohol sponge, and a pack of vaseline iodoform gauze was placed in the vagina. The retractors were then removed. When the patient was back in bed, a rubber tube was attached to the self-retaining catheter leading to a bottle and the catheter was left open, allowing continuous drainage of urine. The vaginal pack was changed several times in dressings at the bedside, and on the tenth day the patient was allowed to be up and around with the catheter draining into a bottle strapped to the patient's thigh.

At the time of the injection the patient did not have cystitis, and special care was taken to be sure that the patient did not develop cystitis afterward.

At the end of three weeks the patient was very carefully examined, and the fistula's tract was found to be healed. The continuous open drainage was allowed to proceed for one more week and then was removed. A final cystoscopic examination was made about two months later and the vesicovaginal fistula in the bladder had healed and appeared like a dimple-like depression. The site of the vesicovaginal fistula in the vagina appeared healed and only a slight depression was visible.

Thirteen years have now elapsed since this sclerosing injection treatment of the fistula was carried out, and we believe that a permanent cure can reasonably be presumed to exist.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

HUMPHREY NOW OPPOSES GOVERNMENT MEDICINE

Senator Hubert H. Humphrey, one of the sponsors of the Administration's compulsory health insurance bill, has withdrawn his support from the measure, at least for the present.

After many conferences and communications with Minnesotans, and much careful thought and analysis of the proposals for tax-supported medical and hospital care, Senator Humphrey declared October 20 that voluntary prepayment plans should be given a chance to do the job.

"I think it (the Truman plan) is premature," he said. "If it were presented for a vote on the floor of the senate, I would not support it."

Like Auto Policy

"What we need is possibly something similar to auto insurance, where you have what is called a deductible policy. . . . I feel this can be handled on a voluntary basis if there is a will to do it."

Humphrey said that he was giving thought now to plans for prepaying hospital and surgical care for the chronically ill.

"The medical profession ought to be given plenty of opportunity to lend its efforts to a more constructive program."

News of this shift in Humphrey's thinking is gratifying to Minnesota doctors and may be regarded as a constructive move by the Senator, along the lines of American governmental philosophy.

Humphrey added that present voluntary plans are inadequate and that the medical association should spend more time and money in promoting better health coverage.

Doctors of Minnesota are in accord with this statement, urging further extension of voluntary medical care insurance and agree with the senator that more answers must be sought to the problem of chronic illness.

The co-operation of the medical profession will always be pledged to forward-looking programs, developed with careful regard for the tested and proved procedures of the past.

Three Against It

Senator Humphrey brought to three the number of Democrats who expressed, within one week, their opposition to the President's plan for health insurance.

Senator Paul H. Douglas, Illinois, addressed a meeting of the St. Paul Jewish Community Center October 19 and declared:

"I think doctors have some reason to be afraid of too many forms and too much red tape, and I think there will be some patients who would enjoy ill health if they never had to pay at all."

To Oscar Ewing, federal security administrator, he attributed the creation of the Truman-plan bill.

"I say, let the general practice of medicine go on just as it does today. But recognize the catastrophic illness, which peculiarly lends itself to the insurance principle, the principle that it is better that many make small payments than that a few should take large losses.

"In short, if we could cut out some of the foolishness of Mr. Ewing, why couldn't we all get together?"

Herbert H. Lehman, New York candidate for the Senate, has flatly stated his aversion to the Truman plan. These three repudiations of a Truman "must" have led political writers to believe that there is a definite split among Democratic liberals on this issue.

NEW STATE LAWS OF INTEREST TO DOCTORS

"Among the new (state) laws and regulations are many of immediate interest," points out Dr. Dean S. Fleming, chief of the Section of Preventable Diseases at the Minnesota Department of Health. "These include the county board of health act, cancer statistical research service act, tuberculosis control act, mosquito abatement act, milk pasteurization act and the boat safety act."

"New regulations applicable to scarlet fever, scarlatina and epidemic sore throat now require that persons with these diseases must be isolated until complete recovery with a minimum isolation of seven days. A warning sign replaces the old quarantine placard, and restrictions of other members of the household have been liberalized."

The regulations on these ailments now read:

Regulation 1200. The local health officer shall post in a conspicuous place upon the entrance to premises where scarlet fever, scarlatina, or epidemic sore throat exists, a notice in words and form as follows, inserting the name of the disease in the proper blank: Warning. The public is hereby warned that there is ——— in this household. Removal of this placard without the authority of the health officer is a misdemeanor punishable by law.

_____ _____.
Health Officer Date

Regulation 1201. (repealed).

Regulation 1202. A person with scarlet fever, scarlatina, or epidemic sore throat shall be isolated until complete clinical recovery and until all abnormal discharges from the nose, throat and ears have ceased, and the mucous membranes have returned to normal appearance, and the swollen and suppurating glands have subsided, provided that such isolation shall not be terminated until at least seven days from onset of the disease.

Regulation 1204. All children of the household where scarlet fever, scarlatina, or epidemic sore throat exists, shall be restricted to the household premises for the duration of the isolation period of the patient. Adult members of the household, except those caring for the patient and those engaged in teaching or other work bringing them into contact with children, may be released from restrictions at the discretion of the health officer, provided they are free from symptoms of the disease.

Regulation 1205. (repealed).

The Department of Health has mailed copies of *Minnesota Supplement No. 1 to State Health Laws and Regulations* to health officers of Minnesota counties, cities, villages and townships. This supplement contains the laws pertaining to public health enacted by the 1949 Legislature and regulations adopted by the State Board of Health since the issuance of January 1, 1948, edition of *State Health Laws and Regulations.*

YOUNGDAHL DEFENDS PRIVATE ENTERPRISE

Governor Luther Youngdahl, in his column released to community newspapers throughout the state, came to the defense of private enterprise recently.

"In these days when there are so many distractions, we lose sight sometimes of its importance, and designing men make progress in their effort to tear down this heritage which has contributed so much to the greatness of our country," he wrote.

"The private enterprise system and the opportunity for individual initiative it offers have been a major factor in the growth of our state and nation. It rewards the farmer for his work, reaches out a helping hand to the businessman and brings to all of us more of the good things of life than any other plan ever devised."

Concluding the column, he cited the progress made in Minnesota under the system of private enterprise and added:

"Minnesota has not neglected the needs of its people while making its material progress. Money paid out in state aid to local schools, for instance, has tripled in the past eleven years. Allowances for old age assistance and aid to dependent children have been raised more than 130 per cent in this period. Far-reaching programs to improve health have been initiated. But main reliance, if we are to have any real social welfare, must be on maintenance of an economic and social system which will encourage production."

SOCIALISTS TEACH BRITONS TEA-MAKING

The Socialist government in Britain has a special section of experts in its vast bureaucracy, devoted to teaching restaurant staffs how to make tea! The proper method of roasting beef is bound to be next, if the socialists are determined to invade even the culinary traditions of that country.

As it stands now, the British government tells its people what to eat, how much to spend for clothing, whether they can drive cars and where, as well as alloting them some four minutes of medical time with an assigned doctor.

25,000 Rules

There are, in fact, 25,000 rules covering personal affairs in Britain under the Socialistic government and the number of government employes has been trebled since before the war.

"You find it difficult to comprehend that little men are trying to destroy a great people," wrote Cecil Palmer, British journalist, as he left the United States to return home after a summer of lecturing. "We, in Britain, experienced a similar difficulty and because large sections of our people temporarily lost their sense of perspective we have marched a long way down the road to serfdom."

"I cannot believe that you are insensible of your great inheritance. I will not believe that you are capable of throwing it away. I do not believe that politics has the power to send you chasing helter-skelter after the shadow of state help when the substance of self-help and all its monuments are a constant reminder of solid achievement under liberty and free competitive enterprise."

Three Minneapolis Persons Sentenced in Abortion Case

Re. State of Minnesota vs. Ida Peterson Chilson, Robert Charles McGowan and Irving Kaplan.

On September 19, 1949, Mrs. Ida Peterson Chilson, seventy-six years of age, 1800 Third Avenue South, Minneapolis, and Robert Charles McGowan, forty-five years of age, Maryland Hotel, Minneapolis, were sentenced to terms not to exceed four years each, in a state penal institution following their pleas of guilty on August 16, 1949, in the District Court of Hennepin County, to an information charging them with the crime of abortion. The sentences were stayed in each case by Judge Harold N. Rogers, and the defendants placed on probation for two years.

On September 29, 1949, the defendant Kaplan, thirty-eight years of age, was permitted to plead guilty, in the same case, to the charge of practicing healing without a basic science certificate. Kaplan, a registered pharmacist and the owner of the Kenesaw Drug Store at 14th and Nicollet, Minneapolis, was sentenced by Judge Rogers to pay a fine of $1,000 or serve one year in the Minneapolis workhouse. Kaplan paid the fine.

Mrs. Chilson, McGowan and Kaplan were arrested following a joint investigation by Minneapolis police officers and representatives of the Minnesota State Board of Medical Examiners into the facts surrounding the abortion on a married woman living in rural Hennepin County. That investigation disclosed that $200 was paid to the defendant Chilson on or about July 13, 1949, for the purpose of having an abortion performed. $100 of the fee was retained by the defendant Chilson, who actually performed the abortion, and the other $100 was divided equally between the defendants McGowan and Kaplan. Kaplan was first contacted about the abortion, and he in turn put the defendant McGowan in touch with the patient. McGowan took the patient to Mrs. Chilson and the abortion was performed in Mrs. Chilson's home. Evidence was also obtained that several other abortions had been performed in the same manner and with a similar division in the fees. Neither Mrs. Chilson nor the defendant McGowan are licensed to practice any form of healing in the State of Minnesota.

WELFARE STATE

Congress passed in June a record annual budget for public health service that provided increases for mental health, cancer and heart research and aid to the various states. In addition, a bill was introduced in the House, to which the medical profession certainly will not object, to raise the pay of all physicians, dentists and nurses in the Veterans Administration.

According to the terms of the Federal Security Agency's appropriations bill, forty medical and sixteen dental schools will receive $872,477 for training in cancer; thirty-one institutions, including the American Cancer Society and the American College of Surgeons will share $550,802 in special cancer-control-project grants; and ninety-nine cancer research projects will receive a total of $1,026,294.

Congress has further voted $100,000 for blue prints and specifications for the National Dental Research Institute to be built in Bethesda. (The American Dental Association favored $2,000,000 to start immediate construction.)

According to the details published in *Washington Report on the Medical Sciences* for June 27;

> National Heart Institute received a sizable $10,725,000 plus contractual authority of $5,350,000 for research and training grants. To National Cancer Institute went the record sum of $18,900,000 and, in addition, $6,000,000 in contractual authority. Another record figure of $11,612,000 was voted for mental health. And still another, $12,075,000 to National Institutes of Health, a large part of which will go for research, training, control and fellowship grants in noncategorized fields. Venereal disease activities get $16,000,000; for general assistance to the states, $16,600,000 is provided; communicable disease control functions receive $7,350,000; $167,000 is allocated for administering the Federal employe health program. For administration of the Hill-Burton hospital program, $1,200,000 was approved, obviating a drastic reduction in force which would have resulted if the Senate had yielded to the House figure of $1,000,000.

Without the aid of an adding machine, the figures mentioned seem to total $108,528,573. For no particular reason at all, snatches of a conversation at the Mad Hatter's tea party come to mind:

"'And so these three little sisters'—(said the Dormouse) '—they were learning to draw, you know—'

"'What did they draw?' said Alice. . . .

"'Treacle,*' said the Dormouse. . . .

"'But I don't understand' (said Alice), 'Where did they draw the treacle from?'

"'You can draw water out of a water well,' said the Hatter; 'so I should think you could draw treacle out of a treacle-well—eh, stupid?'"—Editorial, *New England Journal of Medicine,* Aug. 4, 1949.

*Molasses.

HEALTH AND SAFETY LAWS

Narcotic Drugs. Amidone, isobemidone, and ketobemidone are added to the controlled list of narcotic drugs (Chap. 360).

Abatement of Nuisances. In cases where a health officer abates a nuisance because the property owner has failed to act, the maximum claim of the municipality has been increased from $25 to $50. (Chap. 80.)

Indians. A commission is authorized to investigate the needs of Minnesota Indians.

Mosquitoes. If 5 per cent of the voters in a district petition for mosquito abatement, a referendum may be taken. If the referendum is favorable, a property tax of one mill may be levied to finance a mosquito control program, which must have the approval of the Departments of Conservation and Agriculture. (Chap. 404.)

Boat Safety. Boats are to be equipped with detachable anchor lines. The annual issuance of metal boat tags is eliminated. Instead a tag will be required to remain on each boat until the boat is sold, taken out of service, or otherwise removed. (Chap. 655.)—*Minnesota Health,* May, 1949.

Minnesota Academy of Medicine

Meeting of May 11, 1949

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town & Country Club on Wednesday evening, May 11, 1949. Dinner was served at 7:00 p.m. and the meeting was called to order at 8:25 p.m. by the president, Dr. J. A. Lepak.

There were forty-two members and one guest present.

There was no business to come before the Academy, so the scientific program followed.

Dr. Carl W. Laymon of Minneapolis presented a case report, and Dr. J. Richards Aurelius of Saint Paul presented his inaugural thesis.

MASSIVE METASTASIZING MENINGIOMA INVOLVING THE SCALP

Report of a Case

CARL W. LAYMON, M.D.
Minneapolis, Minnesota

Meningiomas are tumors of the meninges of the brain or spinal cord. There are several types, distinction of which depends primarily upon the morphology and architecture of the tumor cells. Most writers believe that meningiomas almost never metastasize. This is the report of a most unusual example of a meningioma which eroded the skull, invaded the scalp and metastasized to the cervical nodes. Although many sources were carefully studied, no lesion has been described which resembled this one.

From the Division of Dermatology, University of Minnesota, H. E. Michelson, M.D., Director; the Department of Dermatology, Minneapolis General Hospital, Carl W. Laymon, M.D., Director, and the Duluth Clinic.

Report of a Case

(Courtesy of Dr. Frederic T. Becker, Duluth)

V.T., a white man, aged seventy-two, developed a swelling in the right frontal portion of his scalp in 1941. The tumor gradually grew until it attained a size approximately that of the head by April, 1947. At that time the patient noticed weakness of the left arm and leg, and early in May, 1947, fell unconscious. He was admitted to the hospital on July 1, 1947, and stated that he had experienced periods of unconsciousness for several months. His friends said that there had been a loss of mental faculties for five years. There was nothing important in the past history.

Examination.—There was compressible bluish-red tumor about the size of two grapefruits in the right frontal and parietal regions of the scalp. There were

Fig. 1. Massive meningioma invading the scalp.

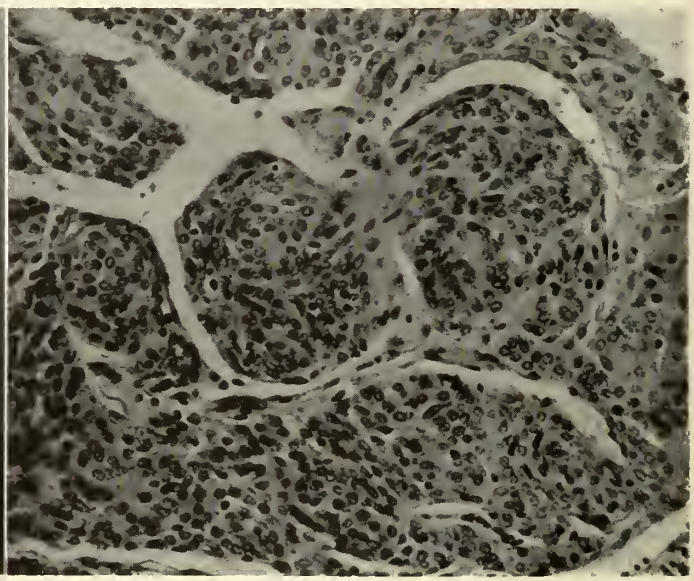

Fig. 2. Histologic section of primary tumor showing units of polyhedral and spindle formed cells. In most cases whorling of the cells is an outstanding feature.

numerous large blood vessels coursing over the surface and the hair was extremely sparse over the growth. There was a definite bruit on auscultation with a stethoscope. There were several enlarged posterior cervical nodes, one of which was about the size of an egg.

Course.—During the period of hospitalization the surgeons were reluctant to perform a biopsy of the tumor because of the possibility that the patient might die of hemorrhage. One of the enlarged cervical nodes was removed and studied histologically. Drs. E. T. Bell, A. C. Broders, H. Montgomery and others agreed on a diagnosis of malignant non-cornifying epithelioma. The patient died on January 10, 1948. The final diagnosis was made after study of tissues from the primary tumor. At autopsy it was found that the mass which infiltrated the scalp came from within the cranium through an irregular circular defect of the skull, 9 cm. in diameter. The tumor, including that part which had infiltrated the scalp, weighed 2300 grams. Except for the aforementioned metastases there were none throughout the entire body. The final diagnosis was meningioma of the meningiothelial type.

Discussion

Dr. H. E. Michelson, Minneapolis: In many of these iconographic cases there is not much to state except that the condition is so unusual that it is literally a museum piece. However, there is one thing that should be emphasized: that most patients who allow tumors to attain an unusual size before seeking advice are of a peculiar mental make-up. This patient was a recluse. We have seen this often, especially in long cutaneous horns. Patients wait often until the horn is 6 to 8 inches long before anything is done.

It was a pleasure to see this patient and it speaks well for Dr. Laymon's versatility in his illuminating report.

Dr. W. H. Hengstler, Saint Paul: I have never seen a meningioma outside the skull. From a neurological standpoint they are hard to diagnose. Some diagnose them from calcium deposits found in x-rays of the skull. Apropos of what Dr. Michelson said about this patient delaying going to the doctor, I can only say that the man might have had a fear of doctors or thought that it might cost too much. I have known of people who did not go to doctors because they thought it would cost too much.

PROBLEMS IN THE X-RAY DIAGNOSIS OF PULMONARY TUBERCULOSIS

J. RICHARDS AURELIUS, M.D.

Saint Paul, Minnesota

Pulmonary tuberculosis, long the scourge of man, is fast losing ground to medical advancement, but its threat still remains very real. To further reduce this danger and eventually eliminate it, we believe it becomes necessary, more than ever, to appreciate its protean manifestations and endless variety of findings. Therefore, even in danger of being trite and emphasizing well known facts, we shall relate some of the pitfalls in the diagnosis of pulmonary tuberculosis as seen through the eyes of a radiologist.

Although the x-ray examination is of highest importance in the discovery and diagnosis of pulmonary tuberculosis, the fact still remains that an unequivocal diagnosis of pulmonary tuberculosis cannot be made from an x-ray film. The more we study the appearance of tuberculosis on the film, the more definitely we become convinced that any nontuberculous lesion that we have seen on an x-ray film of the chest at some time or another will have its counterpart in tuberculosis. It is because of this fact that a differential diagnosis can never be definitely made from a given film. In spite of this lack of a definitely diagnostic pathognomonic picture for pulmonary tuberculosis the x-ray still remains the one greatest aid in its diagnosis outside of the laboratory finding of the tubercle bacillus.

A well-taken history can be extremely helpful in reducing the differential diagnostic considerations on a chest film and is much more important than the physical examination. It is very common experience in chest radiography to find a strongly positive clinical history for tuberculosis when the x-ray film shows extensive infiltration in the lungs but with the physical examination of the chest completely negative. Occasionally the clinical history will be negative with definite findings of tuberculosis in the chest film, but these instances are rarely encountered.

E-21, M.M., F. (nurse), eighteen years old. Lesion picked up on routine chest films on leaving training school (graduation). Previous films always negative. Always good health. No complaints or symptoms. Surprised to hear of x-ray findings. Temperature, 99°. Sedimentation rate, 18 mm. in one hour. Physical examination showed no abnormal physical findings. Lesion proved to be tuberculosis. Films showed an irregularly outlined exudative infiltration in the middle third of the right lung and increased prominence of the right root, particularly suggestive of a pneumonitis which proved to be tuberculosis.

The failure of the physical examination of the chest to detect the presence of tuberculosis, even in advanced stages is not uncommon. Undoubtedly it has been the experience of all of us that a chest that gives no stethoscopic findings can still be very extensively infiltrated with tuberculosis. It is this failure of the physical examination that has lead to such joking statements as "I use the stethoscope merely to impress the patient rather than to rely on its detection of tuberculosis," or as I heard a Detroit thoracic surgeon tell an assembled group of physicians, in effect, that if they would only throw away their stethoscopes rather than to rely on them to rule out tuberculosis, he would not be doing so many thoracoplastic operations for advanced tuberculosis. This failure of the physical examination to elicit signs of tuberculosis is a shortcoming of the method and not necessarily of the physician, because we have all seen physicians of unquestioned ability fail at times to pick up any physical findings in the chest in the presence of disease in the chest. This experience is not unusual in a

radiological department of any size and it forcibly teaches the lesson that tuberculosis is never ruled out of the chest simply because the physical examination is negative.

A-85203, Mrs. B. C. N., fifty-four years old. Controlled diabetic, nine years, well until January, 1937, when she developed nonproductive cough, nervousness, night sweats, loss of weight. The diabetes became worse and she then was hospitalized. Routine chest x-ray film showed extensive bilateral tuberculosis. She was admitted to the Ancker Hospital pavilion. The chest was negative on physical examination. Film at this time (10-4-37) showed extensive tuberculosis in upper two-thirds of both lungs with cavitation.

A-22656, M.B., F, twenty years old. Always well. Kept company with a boy who died of tuberculosis in 1931. Finished high school under observation. Mantoux became positive in 1932, and suggestive findings were present on the chest film, but no findings though important until June, 1934, when the right upper lobe lesion definitely increased and patient was hospitalized. Had no cough or sputum and felt well. Sedimentation rate, 57 mm. in one hour. On admission to Ancker pavilion (6-29-34) there were no abnormal physical findings. The chest films showed a right apical infiltration extending to the second anterior rib level, with a cavity present.

A-123472, Mrs. R. J. D., twenty-four years old. Well until March, 1942, when she noticed a weight loss. Chill on 4-1-42, and then rapidly went down hill, losing 30 pounds of weight; many chills, drenching sweats, very weak, fever up to 105°. Sedimentation rate, 45 mm. in one hour. Died 6-15-42, of fulminating pulmonary tuberculosis. There were no abnormal physical findings in the chest examination. The film on 5-18-42, showed an extensive bilateral generalized nodular coalescing exudative tuberculous infiltration.

A-88559, Miss P. M. D., twenty-two years old, stenographer. Father a patient in Ancker Hospital pavilion. Patient had negative x-ray of chest in May, 1937. Developed a cold in November, 1937, which did not clear, and saw her physician, February 3, 1938. He found chest film and sputum positive for tuberculosis and had her admitted to Ancker Hospital. Admission film at Ancker Hospital showed extensive infiltration in the left lung root and a large cavity. At this time there were no abnormal physical findings in the chest. Improved with pneumothorax, but a check-up fluoroscopy for pneumothorax on 3-8-38 showed marked extension into the right lung, which was confirmed with chest film. The right lung showed no abnormal physical findings.

The cause of pulmonary hemorrhage can be as elusive as the cause of gastro-intestinal hemorrhage. Careful bronchoscopic and x-ray studies will frequently disclose no explanation for the hemoptysis. In these instances it is well not to dismiss the search at the time of the hemorrhage but to reëxamine the patient from time to time to catch what is often a delayed appearance of a lesion. This alertness will frequently be rewarded by the finding of an early tuberculosis.

A-5984, J. A. G., M, forty years old. Slight hemoptysis in January, 1935. Chest film then was negative and no cause was found for the bleeding. A chronic alcoholic, he was seen in the dispensary, from time to time, for a cough and given cough mixture. Had chills and fever, August 25, 1938, was admitted to Ancker Hospital and film of the chest showed advanced tuberculosis. The sputum was positive for tuberculosis. A chest film, (1-22-35) was negative. Chest film (8-27-38) showed extensive infiltration in the left lung and moderately in the right lung, with cavities in the left upper lobe.

A-18589, V. F. J., M., twenty-three years old. Frequent hemorrhages over a period of six years; coughed up one ounce of blood, 8-27-33. A chest film on 8-31-33, was negative. Infiltration appeared on film, 3-23-34. Course was benign and was quiescent, and dismissed on 12-1-34. Was well when last seen, 8-18-37. Chest film, 8-31-33, was negative except for small calcification in right apex. Chest film, 3-23-34, showed small area of infiltration in right upper lobe, suggesting tuberculosis.

A-30578, A. B., M, twenty-one years old. Well until September, 1932, when he had sudden hemoptysis. Chest x-ray suggested tuberculosis, but it could not be proved. Returned to work in eight months. In December, 1933, had pleuritic pain and hemoptysis and entered Ancker pavilion but again tuberculosis could not be proved. Mantoux was positive. Dismissed August, 1934, as probably not tuberculosis but returned in September of 1935 because of fatigue, weight loss and progression of lung infiltration. Sputum contained tubercle bacilli. Chest film, 2-7-34, showed considerable infiltration in the right upper and lower lobes and slightly in left upper lobe, suggestive of tuberculosis. Chest film, 9-19-35, showed extensive exudative infiltration in the right upper lobe with cavitation and moderate left apical infiltration, suggestive of tuberculosis.

In the directed or in the routine x-ray examination of the chest, pleural effusion on one side without any demonstrable lung infiltration occasionally is demonstrated. A casual attitude by some clinicians to this finding is not infrequently noted by the radiologist, only to find that the same patient who was allowed to return to normal activity in two or three weeks, returns in six months or a year with definite pulmonary tuberculosis. He not only was not treated sufficiently for his pleurisy, but also was not followed after this treatment to be sure that a parenchymal lesion had not appeared. It is this type of experience that teaches us to be extremely concerned about pleurisy and makes us feel that it should be treated as continuously as if a parenchymal lesion also were present at the same time. The failure to prove a tuberculous etiology for a unilateral pleural effusion does not permit the assumption that the tubercle bacillus is not the cause.

A-26335, R. K., F, seventeen years old. Admitted to Ancker Hospital, 12-1-33, with cough, fever, pain in the left chest. Chest film showed effusion in left pleural cavity. Mantoux test positive on 12-20-33. Discharged 2-7-34, and was to be watched in outpatient department. Returned 8-5-35, with nodes in right side of neck going on to suppuration. X-ray treatment was given and nodes became normal in size. Returned 9-14-36, because chest film showed tuberculosis, not present before. Guinea pig showed tubercle bacilli. Chest film, 12-16-33, showed extensive effusion in left pleural cavity. Chest film, 8-7-35, was negative. Chest film, 8-27-36, showed infiltration in left first interspace, suggestive of tuberculosis.

A-56008, M. C., M, fourteen years old. Had pleurisy with effusion, 10-28-38, being sick ten days before admission to hospital and remained for two weeks. Fluid

had left and Mantoux test was negative. Discharged to out-patient department, was followed one month and then dismissed by house doctor with advice to return if and when necessary. Stayed well up to November, 1939, when he complained of pain in right chest. Mantoux now was positive and chest film showed infiltration in the left lung. Tubercle bacilli recovered from guinea pig. Chest film, 11-3-38, showed effusion on the right, and slight left apical infiltration. Chest film, 11-2-39, showed extensive exudative infiltration in the left upper lobe, suggesting tuberculosis.

In the evaluation of chest films it is often a very great problem to differentiate a non-tuberculous bronchopneumonia from the infiltration of tuberculosis. Also a pneumonia that is resolving when first seen can have the identical appearance of tuberculosis. Tuberculosis not infrequently may be largely or entirely a basal lesion and will very closely simulate a patchy nontuberculous pneumonia. Cavitation in this type of lesion often is a clue to a tuberculous etiology. Innumerable experiences of this kind soon teach one that it is misleading to specifically and definitely name the etiology of a chest lesion from a film study. As has been stated before in this discussion, it is entirely possible for any lesion in the chest to simulate tuberculosis. Therefore, when reading a chest film, one is justified in simply suggesting the etiology as one of two or more possibilities in the differential diagnosis and indicating, when possible, the one that is most likely to be correct. Then, in consultation with the clinician, it may be possible to select the correct diagnosis. It is important that a clinician should not accept a suggested etiology as an unequivocal statement of fact or read that into it. The fallacy of making a dogmatic statement of etiology from a film study is easily illustrated.

5943 (Midway Hospital) Miss E. P. (nurse), twenty-three years old. Became ill with fever and cough. Recent exacerbation of chronic paranasal sinusitis. Mantoux test negative. Raised no sputum. Chest film showed infiltration suggesting tuberculosis. The lung lesion cleared with subsidence of the sinusitis. The chest film showed a right apical infiltration extending to the second rib level, suggesting tuberculosis and questionable cavitation.

26719 (Ancker Hospital) Mrs. R. E. A., thirty-seven years old. Delivered September, 1929. Asthma attack, November, 1929, and in hospital with fever but negative for tuberculosis. Readmitted, January 26, 1930, with productive cough, difficult breathing, weakness, loss of appetite. Worked for woman having tuberculosis (one year previously). Moderate coarse râles and wheezing entire chest, difficult expiration. Had no fever; sputum was negative for tuberculosis. Chest cleared promptly as a nontuberculous pneumonia. Chest film, 1-27-30, showed extensive patchy exudative infiltration in both upper lobes, possibly with cavitation and particularly suggestive of tuberculosis. A chest film, 2-7-30, showed this infiltration absent.

A-107573, O. L., M., fifty years old. A cook, quit work one year before. Collapsed on street and admitted to Ancker Hospital. A chest film, 1-29-40, showed extensive patchy infiltration in the right base and midportion of left lung, suggesting pneumonia except cavitation in right base makes tuberculosis likely. Lesion was due to tuberculosis.

A-39328, Mrs. W. M. C., thirty-seven years old. Cough through pregnancy. Delivered June, 1934. Nursed baby to 10-10-34. First x-ray of chest, 8-30-34, showed a left basal infiltration suggesting pneumonia. Mantoux became positive, 12-13-34. Sputum not positive until January, 1935. A second chest film, 12-7-34, showed left basal lesion still present with cavitation now seen.

A-10843, C. N., M, seventy-five years old. Admitted to Ancker Hospital, 5-8-33, with productive cough, two years; dyspnea, five years; occasional blood streaking. Chest film, 5-8-33, showed infiltration suggesting pneumonia right root and lower lobe. Sputum positive for tuberculosis, July, 1933. Lungs cleared almost completely. Died in 1944 from carcinoma of the prostate, and autopsy showed active tuberculosis in right lung.

26109 (Ancker Hospital). Mrs. M.S.G., seventy years old. Entered hospital, 12-4-29, with cough and weakness. Died, 12-6-29, from right heart failure. Autopsy showed extensive bronchiectasis and fibrosis in right lung, pus in left bronchi and right heart dilatation but no tuberculosis. Chest film, 12-5-29, showed extensive consolidating infiltration of entire right lung with cavities anr was suggestive of tuberculosis.

Those of us who have the privilege of seeing the chest films of tuberculous patients over a long period of time have noted that in some instances the evidence of tuberculosis remains unchanged while the cough continues to be productive and unending. The sputum and gastric specimens remain constantly negative for tubercle bacilli. Iodized oil injection in these patients will show, frequently, the presence of a nontuberculous bronchiectasis which is keeping up the cough after the tuberculosis has long since ceased to be active. This indicates that a cough in a tuberculosis patient does not necessarily mean activity and therefore activity should not be taken for granted.

A-20126, J. K., M., twenty-seven years old. Came to Ancker Hospital in 1930, with hemoptysis, and diagnosis of pulmonary tuberculosis was made but not confirmed. Left hospital in three weeks against advice. Later entered state sanatorium for tuberculosis. Had hemoptysis again in 1933 with bilateral tuberculosis including a clinical picture and positive sputum. Sputum became negative in 1933, and remained so, but cough continued. Iodized oil study showed bronchiectasis present. Chest film, 8-31-33, showed extensive tuberculosis in right upper lobe and minimal tuberculosis in left apex. Chest film, 6-11-35, showed hydropneumothorax on the right and negative right lung. Slight accentuation of basal lung markings on the left. Chest film, 7-20-35 (bronchography) showed extensive left basal bronchiectasis.

Frequently a radiologist is asked whether or not a given lesion of the lungs thought to be tuberculosis is active. It must be remembered that this type of evaluation cannot be made from a single film and often not from a series of films. If one has a series of consecutive films to evaluate and they extend over a reasonable period of time, it often is possible to say that a tuberculosis is active. The sharply defined, discrete, apparently unchanging lesion, however small it may be, still has the possibility of being active. It follows, therefore, that one cannot safely judge the activity status of

a lesion by what one sees on the film. That evaluation comes only by way of a thorough clinical study in which the x-ray examination is a very valuable aid.

A-9806, J. M., M, fifty-four years old. Original chest film showed a slight, evidently old, tuberculous fibrosis which was associated with a slight cough but otherwise apparently was inactive. Returned in two years with advanced tuberculosis and a positive sputum. Cough for four months. Chest film, 5-22-33, showed old fibrotic infiltration in both lungs and appears inactive. Chest film, 3-7-35, showed extensive tuberculosis in both upper lobes.

A-130469, Miss P. M., eighteen years old. December, 1942, had positive Mantoux in school and routine chest film showed slight right apical infiltration. Nodes in neck enlarged in July, 1943. Chest film showed no change in October, 1943. Pus from node was positive for tuberculosis. Sputum became positive in December, 1943. Chest film, 1-17-44, showed right apical lesion that appeared quiescent but is active tuberculosis.

Pulmonary tuberculosis in the aged is often a very atypical disease, showing unusual distribution of the chest lesions or fairly typical lung lesions but associated with a clinical picture that is not that of the ordinary type of tuberculosis. There may be a delayed positive Mantoux test or absence of the tubercle bacillus from the sputum or gastric washings in the presence of extensive pulmonary infiltrations. Case A-10843, described above, shows an atypical tuberculosis in a man seventy-five years old. The following cases also are variations in the old patients.

A-105114, Mrs. H. F., eighty years old. Entered hospital because of progressive weakness, epigastric pain and cough. Son died of tuberculosis one year before. Chest film, 10-6-39, showed a miliary infiltration in both lungs, including sharply defined and fuzzy lesions and a left pleural effusion and rather suggestive of metastatic malignancy. All laboratory tests for tuberculosis were negative. Died on 11-29-39, and autopsy showed generalized miliary tuberculosis. The lung tubercles were both of chronic (sharply demarkated) and acute types accounting for the appeanance on the film.

A-115445, M. G., M, aged eighty years old. Senile, emaciated, fell breaking humerus and admitted to Ancker Hospital, 2-5-41. Previous diagnosis of leukemia by own physician (ten months) but not confirmed in hospital. Sputum positive three days before he died on 3-28-41. Chest film, 2-11-41, showed patchy infiltration throughout right lung and less in left upper lobe, suggesting a pneumonia. Autopsy showed generalized tuberculosis, including bones and bilaterally in the lungs. No cavitation.

Summary

1. Notwithstanding the great importance of the x-ray examination in the diagnosis of pulmonary tuberculosis, it cannot be expected to make an absolute diagnosis.

2. Pulmonary tuberculosis should not be considered ruled out by a negative physical examination of the chest.

3. Hemoptysis is often followed by a late-appearing tuberculous infiltration.

4. Unilateral pleural effusion is often due to tuberculosis and is frequently followed by a late infiltration.

5. There is no strictly characteristic pattern for a tuberculous infiltration seen on the x-ray film.

6. A tuberculous infiltration should not be judged active or inactive from an x-ray film alone.

7. Pulmonary tuberculosis in the aged often is atypical and the diagnosis elusive.

Discussion

Dr. Thomas J. Kinsella, Minneapolis: I do not feel that Dr. Aurelius need make any excuses for this presentation. It contains a lot of meat and many points often overlooked in our interpretation of some x-ray films and reports. The roentgenologist is frequently on the spot because some physicians wish him to make the diagnosis of activity or inactivity of tuberculosis. If he does so and is wrong, some one is seriously harmed. If he happens to be right, his reputation may be enhanced by making a shrewd guess. Tuberculosis is where you find it—in old people, in young people, on the medical services, especially in diabetics, on the surgical floors, and on the obsterical and gynecological services. The more one searches, the more one finds.

One big mistake that is made in handling tuberculosis is in the patient with primary pleural effusion. If no other cause for the process can be found, the patient should be treated for an active, minimal tuberculosis by institutional care for several months; otherwise, many of these patients will break down with tuberculosis later on. Another big mistake that is now being made is in the indiscriminate use of streptomycin. The patient has an x-ray film made which is interpreted as showing tuberculosis. Without any further investigation or any other type of treatment, the patient is immediately placed on streptomycin therapy in the hope of obtaining a quick cure. This is not the miracle drug that the *Readers Digest* and other publications would have one believe. If it cannot be used intelligently, it should not be used at all.

A general rule that upper lobe x-ray lesions should be considered tuberculous unless proved otherwise, and lower lobe lesions considered non-tuberculous unless proven to the contrary, is a good one; but all such lesions must be studied thoroughly in order to reach an accurate diagnosis. One or two negative sputum specimens, particularly as examined in the average hospital laboratory, do not rule out tuberculosis. I have seen patients who have had forty to fifty negative sputum examinations and two or three negative cultures or guinea pig inoculations of sputum and yet had a lung which was riddled with tuberculosis. These patients are far more dangerous to our nurses than the cases which have already been diagnosed.

This has been an excellent presentation and I think it has been very timely.

Dr. D. Greth Gardiner, Saint Paul (by invitation): I have appreciated Dr. Aurelius' presentation tonight particularly in view of the fact that I think many men here do not realize that Dr. Aurelius was a clinician first before he was an x-ray specialist and has seen tuberculosis as a clinician. He can interpret what he sees on the x-ray plate. I think over a period of twenty years we have had our conferences at Ancker Hospital every Friday morning on tuberculosis, and Dr. Aurelius has brought out the cream of the problems that confront us. I agree with Dr. Kinsella that pleural effusions have to be considered tuberculous until proven otherwise. There are two men on our staff at the present time who had massive effusions that were treated as tuberculous but never proven. Nothing active ever showed in either lung. They were treated for about one and a half years for tuberculosis. Dr. Kinsella did not touch on that, but

RESEARCH IN THE SERVICE OF MEDICINE

In Memoriam

NORMAN SCHNEIDMAN

The Minneapolis Society of Internal Medicine in its first year as an organization sadly must record the first death of one of its members.

Norman Schneidman was born June 7, 1907, in the town of Meshbesh in the State of the Ukraine in Russia. He died in Minneapolis, September 6, 1949. Of his early life we know little. He emigrated to this country at the age of twelve. He was somewhat reticent about revealing the experiences of this early period of his life. He entered the first grade at the age of twelve and in a few years' time graduated from high school with the boys of his age. He entered the University of Minnesota as a premedical student in 1926. He received the degree of M.B. in 1934 and that of M.D., after interning at the Minneapolis General Hospital for one year, in 1935. His college and medical work as a student were always of the highest quality. This high quality was maintained in the face of desperate poverty at home. Norman had a lifelong ambition to be a physician. He achieved this ambition in the face of odds that would have felled a lesser man and prevented him from achieving his goal.

In 1933 he married Mildred Roberts. Dr. and Mrs. Schneidman had two daughters, Carole, born in 1941, and Barbara, born in 1944.

After receiving his M.D. degree, he practiced in several small communities in Minnesota, including Pipestone and Kasson. He then spent one year on the White Earth Indian Reservation as a federal physician. He returned to Minneapolis in 1937 and served for a year as city physician in the Minneapolis General Hospital. He then opened his office for the practice of medicine with Dr. Ziskin with whom he was associated from 1938 until 1941. He joined Dr. Moses Barron that year and entered the Navy in 1942. He served with distinction in the Southwest Pacific and was released from service in the summer of 1945. On his return to civilian life, he decided that he would specialize in the field of internal medicine. In his characteristic way he let nothing stand between him and his goal. Although he was older than most of his fellow residents, he took up a residency in the department of medicine in the Minneapolis Veterans Hospital. After serving twelve months and completing his requirements for the Board of Internal Medicine, he returned to private practice opening an office with Dr. Fingerman in the Physicians and Surgeons Building. He retained a service, however, at the Minneapolis Veterans Hospital, taking over a part of the chest work with Dr. Tucker.

In February, 1949, he found himself to be suffering from angina. A coronary thrombosis was discovered during that month and because of the severity of the lesion and a bad family history, he was advised to discontinue the private practice of medicine and to work part time or full time with the Veterans Administration. He continued to work at the Veterans Hospital following his recovery from the coronary thrombosis. At about the time that he was ready to return to full duty at the Veterans Hospital he suffered his second and final attack.

Dr. Schneidman was well known through his work at the University, at the Veterans Hospital, and through professional contact in downtown Minneapolis. His hospital affiliation in addition to the Veterans Hospital was the Asbury Hospital in Minneapolis. Dr. Schneidman had been unable to attend any of the meetings of the Minneapolis Society of Internal Medicine, since his illness predated the first meeting of this organization. Nevertheless, he was keenly interested in the organization and its members and he will be remembered during our lifetimes as a good friend, a keen practitioner of medicine, and a fine gentleman. His loss is our loss. We mourn his passing.

REUBEN BERMAN, M.D.

Plans for the new maternity hospital El Hogar de la Madre in Lima, Peru, call for a unit for the care of a mother's other children while she is in the hospital. This unit is to be called the Children's Hotel. Here it is planned to provide in bright and airy quarters a nursery, kindergarten and hotel under the supervision of pediatricians, nutritionists and child training specialists. This is the first such children's hotel planned in the Americas.—*Briefs,* October, 1949.

WHEN OBESITY IS A PROBLEM

Clinicians have long noted that the forward bulk of the heavy abdomen with its fat-laden wall moves the center of gravity forward. As the patient tries to balance the load, the lumbar and cervical curves of the spine are increased, the head is carried forward and the shoulders become rounded. Often there is associated visceroptosis. Camp Supports have a long history among clinicians for their efficacy in supporting the pendulous abdomen. The highly specialized designs and the unique Camp system of controlled adjustment help steady the pelvis and hold the viscera upward and backward. There is no constriction of the abdomen, and effective support is given to the spine. Physicians may rely on the Camp-trained fitter for precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

✦ Reports and Announcements ✦

THE UNIVERSITY MEDICAL SCHOOL SEMINARS

The first of a series of state-wide seminars on heart disease, cancer, and psychosomatic medicine for professional groups has been successfully inaugurated at Bemidji.

On September 27 the first of eight consecutive weekly classes was held for the physicians of the Bemidji area at the Bemidji Lutheran Hospital. The faculty of the University of Minnesota School of Medicine, augmented by eminent practicing specialists, have provided lecturers for the physicians' meetings.

Sponsored by the Minnesota State Medical Association, the University of Minnesota School of Medicine, and the Minnesota Department of Health, the Bemidji Seminar has been received with great enthusiasm by the physicians of the locality, and it is believed that this will be duplicated at other seminars throughout the state.

Nurses of the Bemidji area have been utilizing the occasion of the physicians' seminar to hold eight meetings of their own the same evening and hour. The nurses' sessions are sponsored by the 11th District Nurses Association, the University of Minnesota School of Nursing, and the Minnesota Department of Health. Faculty members of the University of Minnesota School of Medicine and School of Nursing, provide speakers to address the group. Most of the nurses of the area are taking part in the meetings.

On October 18 dentists of the area joined the other professional seminars for a series of three sessions devoted to cancer and heart as they affect dentistry. The dental meetings are sponsored by the Minnesota State Dental Association, the University of Minnesota School of Dentistry, and the Minnesota Department of Health.

Minnesota's second seminar was held at Fergus Falls, starting October 26. Physicians and nurses held separate meetings during the course. Dentists have tentatively scheduled three sessions, the first to be held the same evening as the physicians' and nurses' meetings. Additional dental sessions will be added if sufficient interest is manifested.

During the 1949-50 season these professional seminars, designed to disseminate postgraduate education throughout the state, are planned for nine Minnesota areas. As presently organized, the 1949-50 schedule marks the beginning of a continuous five-year educational program for professional groups.

AMERICAN ACADEMY OF DERMATOLOGY AND SYPHILOLOGY

The eighth annual meeting of the American Academy of Dermatology and Syphilology will be held in Chicago, December 3 through 8. Special courses in histopathology and mycology will be presented at the medical schools of the University of Illinois and Northwestern University. Teaching clinics will be held at the University of Illinois College of Medicine in Chicago. Other sessions will be conducted at the Palmer House.

Dr. Earl D. Osborne, 71 North Street, Buffalo, New York, is secretary of the Academy.

COUNCIL ON INDUSTRIAL HEALTH

The Council on Industrial Health will hold its tenth annual Congress on Industrial Health at the Roosevelt Hotel in New York, New York, February 20 and 21, 1950.

NATIONAL CONFERENCE ON HEART DISEASE

A National Conference on Cardiovascular Diseases will be held in Washington, D. C., January 18-20, 1950, under the joint sponsorship of the American Heart Association and the National Heart Institute of the U. S. Public Health Service. This will be the first national conference bringing together physicians, scientists, community service leaders, and members of allied professions to formulate a comprehensive program to combat the nation's leading cause of death.

Dr. H. M. Marvin, president of the American Heart Association, and Dr. C. J. Van Slyke, director of the National Heart Institute, will be co-chairmen of the Conference.

The meeting will include representatitives in the fields of nursing, social work, hospital administration, rehabilitation, public health and others concerned with various aspects of the heart disease control program.

The American Heart Association was organized twenty-five years ago as a scientific body and was recently reorganized and expanded to become the only national voluntary health agency concerned exclusively with heart and circulatory disease. The National Heart Institute was created by Act of Congress in 1948 as one of the Public Health Service's National Institutes of Health at Bethesda, Maryland. The Institute, besides conducting its own program of research, supports also both fellowships and research in medical schools, hospitals, and laboratories with funds appropriated by Congress.

HENNEPIN COUNTY SOCIETY

At the annual meeting of the Hennepin County Medical Society in Minneapolis on October 3, Dr. Robert F. McGandy was installed as president, replacing Dr. Edward D. Anderson, who became chairman of the board of directors.

Other officers of the society include Dr. John H. Moe and Dr. Ernest R. Anderson, vice presidents; Dr. Charles A. Aling, secretary-treasurer, and Dr. Thomas Lowry, librarian.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

Dr. Warren E. Wilson, Northfield, was elected president of the Southern Minnesota Medical Association at its annual meeting in Red Wing on September 12.

During Pregnancy...

VITAMIN REQUIREMENTS ARE INCREASED

Vitamin deficiency may occur as a result of increased requirements during pregnancy, febrile conditions, hyperthyroidism, or other conditions in which the metabolism is greatly augmented.

The vitamin deficiencies most commonly seen are those of the B complex. Since deficiency of only a single vitamin of this group rarely occurs, and since many of the metabolic functions of members of the vitamin B complex are closely related, best results are obtained in most cases by administering *all* of the B complex vitamins known to be of importance in human nutrition. This can be done most conveniently by prescribing a sufficiently potent preparation containing these vitamins combined in properly balanced proportion.

MERCK VITAMINS

MERCK & CO., Inc. *Manufacturing Chemists* RAHWAY, N. J.

SOUTHERN MINNESOTA MEDICAL ASSOCIATION

(Continued from Page 1140)

He succeeds Dr. Lewis I. Younger, Winona, in the office.

Other officers elected at the meeting are Dr. R. F. Hedin, Red Wing, first vice president, and Dr. W. A. Merritt, Rochester, secretary-treasurer.

WABASHA COUNTY SOCIETY

The eighty-first annual meeting of the Wabasha County Medical Society was held at Plainview on October 6.

Officers elected at the meeting include Dr. L. M. Ekstrand, Wabasha, president; Dr. William P. Gjerde, Lake City, vice president; Dr. W. F. Wilson, Lake City, secretary-treasurer, and Dr. B. A. Flesche, Lake City, assistant to the secretary.

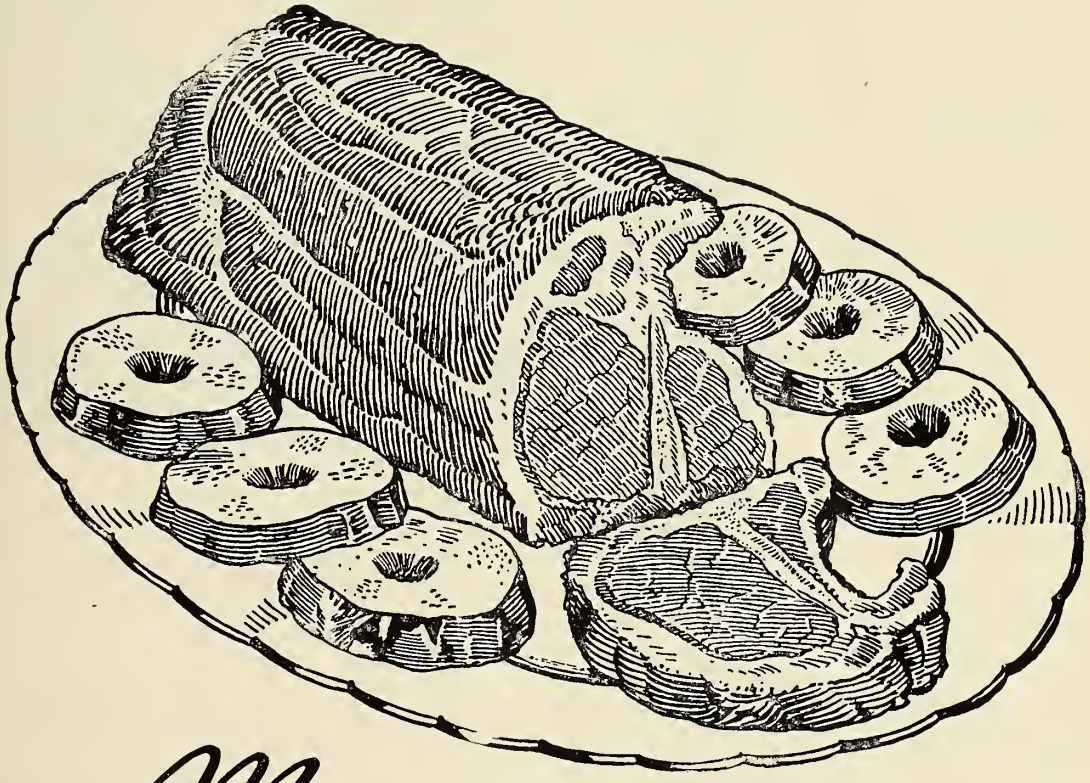
During a scientific session held in the evening, papers were presented by Dr. E. C. Bayley, Lake City; Dr. T. T. Myers, Rochester; Dr. B. A. Flesche, Lake City, and Dr. R. A. Green, Minneapolis.

WASHINGTON COUNTY SOCIETY

Members of the Washington County Medical Society did not hold their regular monthly meeting in October, but instead they accepted an invitation from Dr. Karl H. Pfuetze, superintendent of the Mineral Springs Sanatorium in Cannon Falls, to attend a dinner on October 13. The other seven counties which send patients to the Mineral Springs Sanatorium were also represented by members of their county medical societies. About 100 physicians attended the dinner and afterwards heard illustrated talks by specialists in tuberculosis.

MINNESOTA ACADEMY OF MEDICINE

(Continued from Page 1136)



I am sure in my thoracoplasty work at Ancker Hospital I have refused to operate on the patient with positive gastric washes.

Dr. H. L. Ulrich, Minneapolis: I am a little astonished that the clinicians did not find evidence of parenchymal inflammation in some of these cases presented tonight. We who studied medicine without the aid of the x-ray had to do it. Parenchymal lesions in the lungs can usually be picked up by looking at the neck. Pottenger called attention to the neurotrophic reflexes occurring in the neck when there was parenchymal inflammation present. In the acute stage, there is increased muscle tonus on the side of the lesion; later on, chronic atrophy of the muscles previously stimulated occurs. We also used the malar flush on the side of the lesion as significant. My discussion is not intended to be derogative of x-ray chest examinations, but I think the clinical inspection of the patient's neck will always tell us of pulmonary lesions. I think our dependence on x-ray has made us minimize or lose some of our skill in seeing and feeling.

The meeting was adjourned.

A. E. Cardle, M.D., *Secretary*

Meat...

Outstanding Value...

Outstanding Nutritional Benefits

Whether the pocketbook calls for economy or permits satisfaction of that urge for the fanciest cuts, meat gives your patients full value for their money. Every cut and kind of meat supplies, *in abundance*, these essential nutrients:

1. Biologically complete protein . . . the kind which satisfies the requirements for growth and which is needed daily for tissue maintenance, antibody formation, hemoglobin synthesis, and good physical condition.
2. The essential B complex vitamins, thiamine, riboflavin, and niacin.
3. Essential minerals, including iron in particular.

In addition to these tangible values, meat ranks exceptionally high not only in taste and palate appeal, but also in satiety value.

The instinctive choice of meat as man's favorite protein food has behind it sound nutritional justification.*

Woman's Auxiliary

AUXILIARY MAKES NEW APPOINTMENT

Mrs. George L. Merkert of Minneapolis was named chairman of the Emergency Nursing Committee of the Woman's Auxiliary to the Minnesota State Medical Association at the annual fall board meeting of the organization September 23, at the Hotel Radisson.

Mrs. H. E. Bakkila, president of the State Auxiliary, announced the appointment.

Mrs. Bakkila also presented Mrs. Harold Wahlquist to the group. Mrs. Wahlquist, last year's state auxiliary president, is the new first vice president of the national auxiliary, elected at Atlantic City, New Jersey, last June.

The convention which gave Mrs. Wahlquist this important post was reported in detail by Mrs. Bakkila, Minnesota's delegate.

The Auxiliary Board went on record as again endorsing the cancer essay and poster contests throughout the state, giving to these projects the sum allocated in the Auxiliary's budget for that purpose.

In line with the Auxiliary's public health education work, county presidents were urged to keep alerted to state medical legislation which may be in the formative stage now for introduction when the legislature meets again in 1951. Preparations were begun for the next state-wide public relations conference—the annual Workshop. If the board's tentative plan is followed, all Auxiliary chairmen will receive questionnaires concerning the time, place, program content and general procedure for next year's session.

The Board elected the following women to membership on the Nominating Committee: Mrs. Peter Rudie, chairman; Mrs. Melvin Henderson, Mrs. William Von der Weyer, Mrs. Virgil Schwartz, Mrs. Walter Benjamin. Mrs. M. I. Hauge and Mrs. G. M. Erskine were named alternates.

"AUXILIARY NOT EXCUSE": EDITOR

"I know that the Auxiliary of the Minnesota State Medical Association is more than just a name; more than an excuse for women to get together at a bridge luncheon, a dinner dance, or a picnic with your husbands," declared Max Ninman, editor of the Reedsburg (Wisconsin) *Times-Press,* when he addressed the second annual Woman's Auxiliary Workshop September 22, at the Hotel Radisson.

Mr. Ninman, past president of the Wisconsin Press Association, discussed "Community Responsibilities of the Doctor and His Wife," following the banquet which

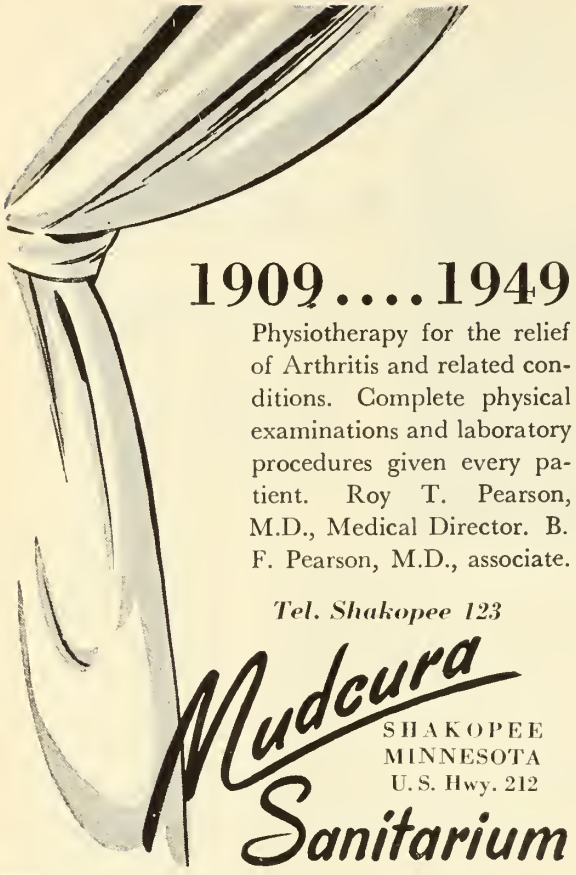
THIS BEAM OF LIGHT Shows What Rexair Can Do

Next time you house-clean, pause a moment by a sunlit window. You will see thousands of dust motes floating in the beam.

Light does not produce this dust. It is everywhere in the air you breathe. Conventional methods of cleaning often fail to eliminate it, by letting dust filter back into the air you breathe.

Wouldn't you like to clean *clean?* Wouldn't you like to know that the dust you remove from floors, carpets and furniture is eliminated from your house forever? You can—with Rexair.



Rexair has no bag. It uses a pan of water to trap dust and dirt. Wet dust cannot fly, and dust cannot escape from Rexair's water bath. You pour the water down the drain, and pour the dirt away with it.

REXAIR DIVISION, MARTIN-PARRY CORP.

AUXILIARY NOT EXCUSE

(Continued from Page 1144)

concluded the all-day conference on public relations and health education.

"Organizations must have a purpose rightfully to exist —to live, yes to be worthy of membership," Mr. Ninman continued. "Your organization must be an active one with constructive goals—this second annual Workshop proves the point. You are here because you are deeply interested in the professions of your husbands, and to gain such information as might aid you in their relationship with the people of your communities."

Keynoting his discussion with "the more personal, intimate and neighborly aspects," Mr. Ninman advised Auxiliary members to encourage their husbands to find interests—"community problems from the civic and governmental level."

"Take Active Part"

Doctors' wives, too, should interest themselves in community affairs, Mr. Ninman believes. "You should, if you are not now doing so, take an active part in community affairs, and not necessarily in relation to health activities."

Mr. Ninman closed his address with the maxim: "Do good to your community, and your community will do good to you."

The Workshop began at 9 a.m. with registration. Mrs. H. E. Bakkila, Auxiliary president, opened the discussion sessions with a welcome to those present. Said Mrs. Bakkila: "This second annual Workshop, sponsored by the Minnesota State Medical Association, is for the purpose of teaching us, as wives of physicians, how we can become more effective leaders in health in our state and better interpret health and health problems to our neighbors."

K. A. Kirkpatrick, of the Minnesota Farm Bureau, discussed the general threat of socialism in the United States in an address titled "Socialism, USA," and added comments on the rural health problems of this state.

Health Departments Good

"Setting up of county health departments, made possible by an enabling act passed by the 1949 state legislature, is a great step forward in the rural health program," he said.

Following Mr. Kirkpatrick, Dr. A. E. Cardle, chairman of the MSMA Public Health Education Committee, discussed "Minnesota's Public Health Education Program."

"In Minnesota we have finished with polite, academic discussions of compulsory health insurance," Dr. Cardle told the Auxiliary. "As members of a free and responsible profession we have definitely assumed the offensive."

State Against CHI

Calling attention to the progress made under this new policy, Dr. Cardle cited *Minnesota Poll* figures which indicate that Minnesotans in increasing numbers have "turned from this program (compulsory health insurance) to a renewed faith in their family doctors." Poll statistics show that 55 per cent of Minnesota's adult

Of General Interest

Fifty-four years in office—fifty-three of them as secretary-treasurer and one as president of the Wabasha County Medical Society—is the record held by Dr. W. F. Wilson of Lake City. In 1896, Dr. Wilson was elected secretary-treasurer of the society for the first time. Since then, he has been re-elected to the post each year, with the exception of one year when he served as president. He began his fifty-fourth term as an officer on October 6, when he was re-elected secretary-treasurer at a meeting of the Wabasha County Medical Society in Plainview.

* * *

At a meeting of the Multiple Sclerosis Society in Duluth on September 13, Dr. Martin O. Wallace presented a talk on "Socialized Medicine." The meeting was open to the public.

* * *

Dr. Harry M. St. Cyr opened offices for the practice of medicine at 2203 West Broadway, Minneapolis, early in October. A graduate of the University of Minnesota Medical School, Dr. St. Cyr spent two years in the Army, serving most of the time in Munich, Germany. He recently completed some postgraduate training at Swedish Hospital, Minneapolis.

* * *

It was announced on September 15 that Dr. A. C. Martin, formerly of Harvey, Illinois, would begin practicing medicine in Luverne as soon as office space became available. A graduate of the University of Illinois Medical School, Dr. Martin served in the Navy for ten months before starting his practice in Harvey, Illinois.

* * *

Dr. Paul L. Wermer has joined the staff of the AMA Council on Pharmacy and Chemistry as an assistant to Secretary Austin Smith. Dr. Wermer received a degree in pharmacy from Fordham University School of Pharmacy, took his premedical training at New York University and received his medical degree from the University of Michigan. He has had considerable experience, including a two-year rotating internship, with nine months of specialization in obstetrics and gynecology, postgraduate work in gynecologic pathology and endocrinology, five years of medical practice with special attention to obstetrics and gynecology, five years of service during the war and three years with two pharmaceutical houses.

* * *

Among Minnesota physicians attending a two-week course in psychosomatic medicine for general practitioners at the University of Minnesota Center for Continuation Study during the middle of September was Dr. Paul J. Person of the Medical Arts Clinic, Albert Lea.

* * *

At the annual meeting of the Minnesota Society of Internal Medicine in Saint Paul on October 17, Dr. F. H. K. Schaaf of Minneapolis was elected president of the organization. Dr. Alex E. Brown, Rochester, was elected vice president, and Dr. Robert L. Parker, Rochester, was named secretary-treasurer. The spring meeting will be held in Duluth.

* * *

Dr. Donald M. Houston and Dr. George V. Kleifgen, both of Park Rapids, have dissolved their association in the practice of medicine, it was announced on September 15.

* * *

A free tuberculosis clinic was conducted in South Saint Paul on September 26 by Dr. Karl H. Pfuetze, superintendent of the Mineral Springs Sanatorium, Cannon Falls.

* * *

Cancer co-ordinators from all of the nation's medical schools assembled at the University of Minnesota on October 21 and 22 for their second annual conference.

Dr. Arnold J. Kremen, co-ordinator for the University of Minnesota Medical School, explained that the National Cancer Institute of the United States Public Health Service allocates $25,000 annually to each of the country's seventy-five medical schools, to be used in improving cancer teaching and clinical cancer research. In each of these medical schools, a cancer co-ordinator has been appointed to expedite the improvement of teaching and clinical research in the field of cancer.

* * *

During the middle of September, Dr. J. C. Murphy, formerly of Seattle, Washington, became associated in practice with Dr. Glenn E. Nelson in Fairfax. A graduate of the New York Medical College, Dr. Murphy has been affiliated with the Firland Sanitarium in Seattle for the past several years.

* * *

It was announced on September 15 that Dr. Leonard J. Prochaska of Baudette had purchased the practice of Dr. Richard W. Maertz in Goodhue and would begin practicing medicine there on October 15.

* * *

Principal speaker at a meeting of the Saint Paul Surgical Society in Saint Paul on September 28 was Sir James Learmonth, special surgeon to King George VI of Great Britain. Sir James received much of his medical training at Rochester.

* * *

Mrs. Ida Tunstead, the wife of Dr. Hugh J. Tunstead of Minneapolis, died on September 29 at the age of seventy-three. She was a past president of the Woman's Auxiliary to the Hennepin County Medical Society.

* * *

A continuation course in diseases of the chest was held at the University of Minnesota Center for Continuation Study October 20 through 22. The course, which was sponsored by the Minnesota Chapter of the American College of Chest Physicians, was directed at general practitioners.

* * *

Dr. Carleton S. Strathern, St. Peter, has been named president of the Nicollet County Health Association. His

We are using the opportunity afforded by the advertising facilities of Minnesota Medicine to discuss Municipal securities for investment of your savings.

FIRST: Next to United States Government Bonds, Municipal securities have proven themselves over many years to be the safest form of investment. In addition, under present laws, interest on them is exempt from Federal Income Taxes. THIS MEANS THE INVESTOR DOES NOT PAY ANY FEDERAL INCOME TAXES ON INCOME RECEIVED FROM MUNICIPAL BONDS.

SECOND: The investor may buy municipal bonds to come due at any time between one and thirty years to suit his individual needs. Various types and interest rates may be purchased to fit the needs of large or small individual investors, trust funds, insurance companies and banks.

THIRD: They are secured by taxes levied on real and personal property, earnings of municipal utilities such as water, electric light and gas systems, by assessments (special taxes) against property benefited by local improvements or by other municipal revenue. THE TAXES LEVIED FOR THEIR PAYMENT CONSTITUTE A LIEN PRIOR TO A FIRST MORTGAGE ON REAL OR PERSONAL PROPERTY.

We are merchants dealing exclusively in municipal securities and believe that our experience in this field will be helpful to you.

AT HOME OR AWAY — SPOT TESTS — SIMPLIFY URINALYSIS

No Test Tubes • No Measuring • No Boiling

Diabetics welcome "Spot Tests" (ready to use dry reagents), because of the ease and simplicity in using. No test tubes, no boiling, no measuring; just a little powder, a little urine—color reaction occurs at once if sugar or acetone is present.

Galatest . . . Acetone Test **(DENCO)**

FOR DETECTION OF SUGAR IN THE URINE

FOR DETECTION OF ACETONE IN THE URINE

SAME SIMPLE TECHNIQUE FOR BOTH

1. A LITTLE POWDER
2. A LITTLE URINE

COLOR REACTION IMMEDIATELY

A carrying case containing one vial of Acetone Test (Denco) and one vial of Galatest is now available. This is very convenient for the medical bag or for the diabetic patient. The case also contains a medicine dropper and a Galatest color chart. This handy kit or refills of Acetone Test (Denco) and Galatest are obtainable at all prescription pharmacies and surgical supply houses.

Accepted for advertising in the Journal of the A.M.A.

father, Dr. F. P. Strathern, who headed the county association for twenty-five years, resigned as president last December.

* * *

A $40,000 program to increase medical service in Minneapolis was launched by the Hennepin County Medical Society on September 13. The program includes (1) the installation of a twenty-four hour, two-position switchboard at the society's headquarters in the Medical Arts Building to help persons contact a physician immediately; (2) the establishment of a bureau of medical economics to aid in providing medical care to persons who deprive themselves of it for fear of incurring indebtedness; (3) expansion of the society's medical library to almost double its present size; (4) complete remodeling of the executive offices. Since the expanded facilities will absorb the auditorium space in the Medical Arts Building, future society membership meetings will be held in the auditorium of the North American Life and Casualty Company.

* * *

Dr. A. J. Chesley, executive secretary of the Minnesota Department of Health, spoke at a regional meeting of the Minnesota League of Municipalities in Walker on September 20.

* * *

At the fall meeting of the Tuberculosis and Health Association of St. Louis County, held at Chisholm on October 4, the principal speaker was Dr. E. L. Ross, Winnipeg, medical director of the Sanatorium Board of Manitoba. Dr. Ross spoke on "Changing Emphasis in Tuberculosis Control in Manitoba."

* * *

Dr. Philip S. Hench and Dr. Edward C. Kendall, Mayo Clinic staff members who pioneered in the use of cortisone, received a 1949 Lasker award for administrative and scientific achievement—a $1,000 prize and a figure of "Winged Victory." The award was presented at the annual meeting of the American Public Health Association, in New York on October 25.

* * *

After teaching at the University of Minnesota since 1944, Dr. James F. Bosma left Minneapolis on September 19 to become head of the pediatrics department at the University of Utah Medical School, Salt Lake City. A graduate of the University of Michigan Medical School in 1941, Dr. Bosma came to Minnesota from a post at Western Reserve University in Cleveland.

* * *

Dr. E. W. Arnold of Adrian spoke on a radio program entitled "Your Health Hour" which was broadcast over a local radio station on September 18. He discussed the county-wide immunization program.

* * *

Dr. P. M. Mattill, assistant superintendent of the Glen Lake Sanatorium, will be in charge pending the choice of a successor to Dr. E. S. Mariette, it was announced on September 9. On the same day the sanatorium commission voted to start a nation-wide search for a successor to Dr. Mariette, whose resignation as superintendent was to become effective on November 1.

A former resident of Kasson, Dr. Donald L. Augustine has been named professor of tropical medicine at Harvard University Medical School. Dr. Augustine has been a member of the Harvard faculty since 1924.

* * *

A banquet to honor Dr. John B. Clement for fifty years of service was held in Lester Prairie on October 5. Planned by members of the Civic and Commerce Association and served by the American Legion Auxiliary, the banquet gave residents of the community an opportunity to pay tribute to Dr. Clement, who has practiced uninterruptedly in Lester Prairie since October 5, 1899.

* * *

At a symposium on brucellosis, held at Bethesda, Maryland, September 22 and 23, Dr. Wesley W. Spink, professor of medicine at the University of Minnesota Medical School, spoke on "Clinical Aspects of Brucellosis in Man." Dr. A. I. Braude, fellow in medicine at the University of Minnesota, spoke on "The Pathology and Pathogenesis of Brucellosis."

* * *

After practicing for one year at Hay Springs, Nebraska, Dr. L. S. Winter left to begin a residency in surgery at the Minneapolis Veterans Hospital on October 1.

* * *

Dr. R. Norman Sather, formerly of Mora, has become associated in practice with his brothers, Dr. George Sather and Dr. Edgar Sather, in Fosston. A graduate of Rush Medical College in Chicago in 1937, Dr. R. Norman Sather interned at Ancker Hospital, Saint Paul, then practiced in McIntosh for two years. He served in the Army from 1942 until 1946. During the past three years he was associated with Dr. P. C. Peterson in Mora.

* * *

One of the speakers at a meeting of public health nurses of District 5, Minnesota Department of Health, held at Worthington on September 21, was Dr. Roger P. Hallin of Worthington.

* * *

"Our Mental Health Problem," was the subject discussed by Governor Luther Youngdahl at a joint meeting of the American Academy of General Practice and the Ramsey County Medical Society in Saint Paul on September 26. Governor Youngdahl also spoke about problems in human resources at the state level of government.

* * *

A grant of $552,000 to the University of Minnesota for the study of cardiovascular diseases was announced on September 12. The grant is to be administered by the United States Public Health Service's National Health Institute.

Of the total grant, $485,000 will be used to add a fourth story for research to the Variety Club Heart Hospital and to provide increased research facilities in the proposed Mayo Memorial Medical Center. Amounts totaling $53,516 will go to seven University research men: Dr. Jerome T. Syverton, head of bacteriology; Dr. William G. Kubicek, Dr. Frederic J. Kottke, Dr. Richard L. Varco, Dr. Arthur Kirschbaum, Dr. E. T.

* * *

A speech pointing out the numerous sad results that could be expected under a system of socialized medicine was delivered by Dr. Edwin J. Simons of Swanville at a meeting of the Brainerd Rotary Club on September 27.

* * *

Among those in attendance at the second annual Symposium on Orthopedic Appliances at the Mellon Institute in Pittsburgh, held during the week of September 19, was Dr. William H. Bickel, Rochester.

* * *

Members of the Lions Club in Stillwater, on September 13, heard a talk by Dr. Edwin J. Rose, general manager of the Minneapolis Veterans Hospital, who described the facilities and operations of the 1,052-bed institution.

* * *

Mrs. Viola Williams, the wife of Dr. M. R. Williams of Cannon Falls, died on September 11 at the age of forty-three. She had been ill for several weeks before her death.

* * *

A series of rural health clinics was recently completed in Goodhue County, offering rural residents the benefits of smallpox vaccination, immunization against diphtheria, and Mantoux tests. The series was the fourth since 1941 and was under the direction of Leola Ellis, county nurse. Co-operating in the presentation of the clinics were the county medical society, the county public health association, the Farm Bureau, rural schools, the medical society auxiliary, and the county extension service.

* * *

The association in practice of Dr. H. W. Hermann and Dr. J. J. Ahlfs of the Caledonia Clinic was announced late in September. Dr. Hermann has been practicing with Dr. Ahlfs in Caledonia for the past two years.

* * *

Thirty physicians from Bemidji and the surrounding area attended, on September 27, the first session of an eight-week medical seminar being held in Bemidji. At the first meeting Dr. George N. Aagaard, director of postgraduate education, University of Minnesota Medical School, discussed hypertension; and Dr. R. L. Varco, associate professor of surgery at the University, spoke on cancer of the lungs. The seminar is sponsored by the University of Minnesota Medical School and the Minnesota State Medical Association.

* * *

At a meeting of mental health experts in Milwaukee on September 22 and 23, one of the principal speakers was Dr. Maurice N. Walsh of Rochester. The meeting was sponsored by the Wisconsin Society for Mental Health, with the assistance of the state mental health authority and the department of neuropsychiatry of the medical schools of Marquette University and the University of Wisconsin.

* * *

Four physicians from Duluth and vicinity participated in the Mississippi Valley Conference on Tuberculosis combined with a session of the Mississippi Valley Trudeau Society at St. Louis, Missouri, during the week of September 19. The four physicians were Dr. Reno W. Backus, associate medical director and director of mobile

surveys, Nopeming Sanatorium; Dr. G. A. Hedberg, Nopeming Sanatorium superintendent and medical director; Dr. Mario Fischer, Duluth city health director, and Dr. B. J. Terrell, Nopeming Sanatorium staff physician.

* * *

Dr. Rudolph J. Wilkowske, Owatonna, was one of the Minnesota physicians attending a one-day meeting of the Northwestern Pediatric Society at Bayport on September 30.

* * *

Keynote speaker on the mental health day program presented in Albert Lea on September 23 was Dr. Reynold A. Jensen, consulting psychiatrist for the State Department of Health, who told the audience that national progress along mental health lines has not kept abreast the progress in physical health. Dr. Jensen pointed out that the need for mental health programs in the country is clearly indicated by the fact that 600,000 hospital beds are occupied by persons with mental illness—more beds than are occupied by persons suffering from all other medical conditions combined. The mental health day program was sponsored by the Freeborn County Public Health Nursing Auxiliary.

* * *

"Nutrition in General Health" was the title of a talk presented by Dr. Russell M. Wilder, Rochester, at a conference on dental health education on September 29 at the University of Minnesota.

* * *

The establishment of the James Hoffman Bentson Fund to provide a memorial for the late Dr. James H. Bentson at Mount Sinai Hospital, Minneapolis, was announced on September 26. Dr. Bentson, a fellow at the Mayo Clinic, died on June 28 in New York. His parents, Mr. and Mrs. Mort Bentson of Saint Paul, made an initial contribution of $5,000 to the fund.

* * *

Construction work on a new building, to house the Pine River Clinic, began in Pine River in late September. The structure, which is being erected by Dr. Charles M. Zeigler and Dr. A. T. Rozycki, will contain a waiting room, emergency room, offices, and treatment and convalescent rooms. Dr. Zeigler and Dr. Rozycki hoped that the new clinic would be ready for occupancy by late December.

* * *

It was announced on September 22 that Dr. Martin Munson would begin practice in Barnum as soon as he could find suitable housing and a location for his office. A graduate of the University of Minnesota Medical School in 1946, Dr. Munson served his internship at St. Luke's Hospital, Duluth. He then served in the Army for two years.

* * *

As principal speaker at a meeting of the Kiwanis Club in Rochester on September 22, Dr. Frank H. Krusen, head of the section on physical medicine at the Mayo Clinic, discussed socialized medicine.

* * *

A three-day seminar on infantile paralysis, sponsored by the Sister Elizabeth Kenny Foundation, was held in Minneapolis on October 3, 4 and 5. At the opening session Sister Kenny explained her concept of infantile paralysis. Dr. C. W. Jungeblut, professor of bacteriology

at Columbia University College of Physicians and Surgeons, discussed "Newer Knowledge on the Pathogenesis of Poliomyelitis." Among the other speakers at the seminar were Dr. Miland E. Knapp, director of physical medicine in charge of treatment at the Kenny Institute; Dr. Harold S. Diehl, dean of the University of Minnesota Medical School; Dr. Gaylord Anderson, director of the School of Public Health, University of Minnesota; Dr. Frederic J. Kottke, associate professor of physical medicine at the University, and Dr. Lewis Sher, Minneapolis pediatrician. Treatment demonstrations were conducted at the Kenny Institute by Dr. Knapp.

* * *

Dr. L. H. Flancher, Des Moines, Iowa, former director of Sand Beach Sanatorium at Lake Park, from 1925 to 1941, will again become director of the institution, it was announced on September 22. Dr. Flancher succeeds Dr. R. R. Hendrickson, who resigned recently to become superintendent of Sunnyrest Sanatorium at Crookston. Since leaving the Sand Beach Sanatorium post in 1941, Dr. Flancher has been head of the tuberculosis department of the Iowa State Department of Health.

* * *

One of the speakers at a meeting of the executive committee members and committee chairmen of the Nobles County Health Council in Worthington on September 15 was Dr. B. O. Mork, Jr., acting director of Public Health District 5, who reviewed the growth and development of the council.

* * *

Two Minnesota physicians were honored at a meeting of the Minnesota Public Health Workers' Association in Minneapolis on September 30. The group conferred honorary memberships on Dr. Walter J. Marcley, tuberculosis consultant for the state health department, who opened the first state tuberculosis sanatorium in the United States in 1897 at Rutland, Massachusetts; and Dr. Ernest S. Mariette, who recently retired because of ill health after thirty-three years of service as superintendent and medical director of Glen Lake Sanatorium.

HOSPITAL NEWS

It was announced in Crookston on September 16 that Dr. M. O. Oppegaard had been elected chairman of the Bethesda Hospital Campaign for funds to construct a new wing on the hospital. Mrs. C. L. Oppegaard, the wife of Dr. C. L. Oppegaard, and Mrs. C. M. Larson were named co-chairmen of the Crookston women's division of the fund drive.

* * *

At the annual staff meeting of Northwestern Hospital, Minneapolis, on September 19, Dr. Erling W. Hansen was elected president to succeed Dr. R. S. Ylvisaker. Dr. Claude J. Ehrenberg was elected vice president, and Dr. Albert T. Hays was re-elected secretary-treasurer.

* * *

The Cass Lake General Hospital, owned and operated by Dr. C. H. Coombs, closed its doors on September 15. Stating that the hospital has been operated for ten years without a profit, Dr. Coombs said that a point had been reached where the hospital could not be kept open without community assistance. Following his statement, a citizens committee met in Cass Lake and suggested that the village council appoint a group to investigate the problems of the hospital and plan a way for its reopening.

* * *

Dr. Charles Donaldson, Foley, was elected chief-of-staff of the Community Hospital at Princeton at a meeting held on September 19. Dr. Elton Clothier, Elk River, was re-elected vice chairman, and Dr. William McManus, Princeton, was re-elected secretary.

BLUE CROSS-BLUE SHIELD NEWS

Sixty-eight Minnesota doctors joined the Blue Shield Plan during September. There are 2,536 Minnesota doctors now participating in the plan.

In all, 600 nonparticipating doctors were contacted by mail during September about enrolling with Blue Shield.

All doctors are requested to submit their reports of services rendered to Blue Shield subscribers as promptly as possible. This will enable the Blue Shield office to make prompt payment and eliminate the confusion and misunderstanding caused by delay.

The past few months have shown that Blue Shield has a plan that is operating smoothly and is benefitting both the patient and the doctor. Letters and calls have been coming in increasing numbers from subscribers and doctors' offices throughout the state, expressing gratitude and appreciation for the Blue Shield contract and Blue Shield services.

In view of earlier comment in this column, which called attention to the dissatisfaction apparent among a

MAIN 2494

small minority of the medical profession, these letters have been especially gratifying. The Blue Shield office is keenly aware of the doctors' support and wishes to take this opportunity to express its sincere appreciation.

Minnesota Blue Shield now covers 223,670 participant subscribers, and benefits to subscribers for the first eight months of this year total $676,694.

Minnesota Blue Cross now covers 956,918 participant subscribers, and benefits to subscribers for the first eight months of this year total $5,531,984.

In addition to the regular hospitalization experience during August, Minnesota Blue Cross processed 195 cases providing 1,204 days of hospital care to subscribers of other Blue Cross Plans who were hospitalized in Minnesota Blue Cross hospitals under the reciprocity program. On the other hand, 131 Minnesota Blue Cross subscribers received 836 days of hospital care in other Blue Cross hospitals under the reciprocity program.

This reciprocity arrangement, inaugurated May 1, this year, provides subscribers with much greater coverage than was formerly possible under the emergency care benefits provided in the Blue Cross contract. Under the reciprocity program, Minnesota subscribers who go to any co-operating Blue Cross hospital outside this state receive the contract benefits of the Blue Cross Plan in whose area they are hospitalized. Fifty-eight Blue Cross Plans are now participating in the reciprocity program, with over 3,400 member hospitals.

According to the Blue Cross Commission, hospital care for members of the nonprofit Blue Cross Plans amounted to $161,572,811 during the first six months of 1949. This represents 87.64 per cent of the total income of the 90 Blue Cross Plans—the largest percentage of income paid for members' care during any previous six-month period.

The Blue Cross Commission also announced the approval of the Illinois State Department to inaugurate Blue Cross Health Service, Inc., for the purpose of assisting Blue Cross Plans in enrolling national organizations having branch offices in various states. Minnesota Blue Cross has committed itself to this national enrollment agency.

The Blue Shield Commission is proposing a national enrollment agency similar to the Blue Cross Health Service, Inc.; however, the Board of Directors of Minnesota Medical Service, Inc., is not committing itself to this program until further study.

There's been a change in Minnesotans' thinking about compulsory health insurance. So claims the Minnesota Poll. February 20, 1949, the Minnesota Poll results were headlined in *The Minneapolis Tribune:* "National Health Insurance Proposal Appeals to Many Adults in State." The opening paragraph of the summary stated: "President Truman's proposal for government tax-supported national health insurance is favored by a majority of Minnesota residents, *The Minneapolis Tribune's* Minnesota Poll finds in a statewide survey. Almost two in every three adults in addition feel that such a program is needed." By June 19, the poll takers found that 48 per cent of the state's adults preferred private health plans, as against 28 per cent who were still in favor of a government setup. The last poll taken—August 10—revealed 53 per cent of the people in this state were definitely against a government program for health care.

population is against a government-controlled program of medical care.

Miss Mary McGinn, director of the Women's Division of Whitaker & Baxter, spoke of the national education campaign and outlined the issues involved: "Our liberty is gradually being whittled away. Socialized medicine would be only an opening wedge to state ownership of banks, utilities and business."

The afternoon program centered around a panel discussion of public relations techniques. Participating were: Kenneth Wunsch, Northwestern National Life Insurance Company; P. Kenneth Peterson, Representative, state legislature; Arleth Haeberle, Radio Station WTCN; Joseph West, General Mills; Edwin Lewis, University of Minnesota professor; Mrs. H. F. Wahlquist, first vice president, Woman's Auxiliary to the American Medical Association.

CARE OF AGED AND INVALIDS SETS UP MEDICAL PROBLEMS

The care of the aged and the chronic invalid will be an increasing problem. This, the American Medical Association explains, is because the increased span of life, brought about by the decrease in infant mortality and decrease in mortality from infectious disease, has resulted in more people living to the age at which they are subject to the degenerative diseases of middle and old age.

"Since 1900 the population of the country has doubled, but the number of people over 64 has quadrupled," according to the association. "Paradoxical as it may sound, the reason we have an increasing number of chronic invalids is that these people have received good medical care in youth.

"The American people need greater provision for the care of chronic illness, but the buildings required need not be on as expensive a scale as those necessary for the care of acute illness.

"The American Medical Association, the American Public Health Association, the American Hospital Association and the American Public Welfare Association have jointly created a Commission on Chronic Illness. This commission hopes to stimulate the establishment of state programs."—*AMA News Feature.*

The need is continuous

from infancy to adolescence

While careful supervision is commonly maintained over the feeding of infants, in too many cases the nutrition of older children escapes the doctor's supervision. Dietary surveys of older children have shown a high incidence of malnutrition.

Mead's Oleum Percomorphum With Other Fish Liver Oils and Viosterol is a reliable, convenient product for providing vitamin D in addition to vitamin A. The vitamin D exercises a favorable influence on calcium and phosphorus metabolism, plays an important role in tooth formation, and, in some instances, aids in preventing and arresting dental caries.

With the possible exception of the middle of the first year, the need for vitamin D is probably greater during adolescence than at any other time.

OLEUM PERCOMORPHUM

DROPPER BOTTLES—10 cc. and 50 cc. (60,000 units vitamin A and 8,500 units vitamin D per gram).

CAPSULES—Bottles of 50 and 250 capsules (5,000 units vitamin A; 700 units vitamin D per capsule).

Effective

in relaxing bronchial muscles and in markedly increasing vital capacity, ADRENALIN (epinephrine, Parke-Davis) is "most valuable for treating a severe acute attack of asthma."* ***One of the truly basic drugs,*** it is also used extensively in the treatment of such conditions as urticaria, angioneurotic edema, anaphylaxis, serum sickness and nitritoid reactions.

Adrenalin

plays a prominent life-saving role in the Adams-Stokes syndrome, anesthesia accidents and other emergencies.

Combined with anesthetics it minimizes bleeding and prolongs anesthesia by localizing the site of action. Topically applied to mucous membranes it relieves catarrhal and congestive conditions.

Indispensable

in medical and surgical practice, ADRENALIN — the pure, crystalline hormone of the adrenal medulla — was isolated and its formula determined at the Parke-Davis Research Laboratories in 1901.

Available

as ADRENALIN CHLORIDE SOLUTION 1:1000;
ADRENALIN CHLORIDE SOLUTION 1:100;
ADRENALIN IN OIL 1:500.

Folic Acid

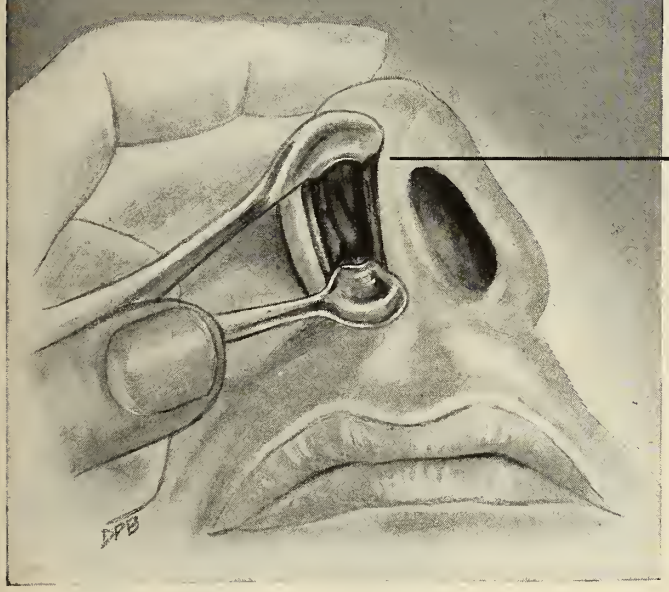
Folic acid, in either free or conjugated form, is a normal constituent of the tissues of the body and is usually present in the gastrointestinal tract. Not only are the glossitis and enteritis of sprue dramatically relieved by folic acid but the blood picture is also simultaneously improved. *Lederle* has been extremely active in conducting research in the field of nutrition, both in animals and man, and it is anticipated that the orientation of folic acid with respect to a number of other nutritional factors — including the anti-pernicious anemia factor and the animal protein factor — will soon be made clear.

LEDERLE LABORATORIES DIVISION AMERICAN Cyanamid COMPANY 30 Rockefeller Plaza, New York 20, N. Y.

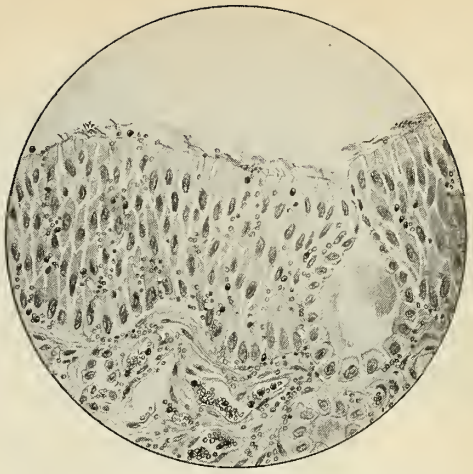
SERVICE

HOW SOON
HOW OFTEN
HOW MUCH

There's no point in assuming an "ostrich attitude" about service. By the very nature of its complexity, X-ray equipment must be serviced. To give you that service . . . to keep your radiographic equipment operating at peak efficiency . . . is the purpose of the KELEKET Service man.



Naturally, with the experience of more than fifty years, KELEKET equipment is designed and built to require the minimum of attention. So, whether it's routine inspection and adjustment, accessory installation or repair, rely on KELEKET Service . . . as soon, as often, as much as you need.



Telephone or write for complete details.

Adapted to a variety of uses

Another product adapted to a variety of uses is short-acting Nembutal. Clinical reports now numbering more than 500 review over 44 conditions in which it is being effectively used. See list at right.

Adjusted doses of short-acting Nembutal can provide any degree of cerebral depression—from mild sedation to deep hypnosis. Dosage required is only about *one-half* that of many other barbiturates. Small dosage has several advantages: less drug to be inactivated, less possibility of "hangover," shorter duration of effect, greater safety and definite economy to the patient.

Short-acting Nembutal is available as Nembutal sodium, Nembutal calcium and Nembutal Elixir, all in easily administered small-dosage sizes. For the tab-indexed booklet, "44 Clinical Uses for Nembutal," write to ABBOTT LABORATORIES, NORTH CHICAGO, ILLINOIS.

In equal oral doses, no other barbiturate combines

Supplementation

A sure step to dietary adequacy

The aim of the dietary at all times and under all conditions is to provide ample amounts—not just minimum amounts—of all nutrient essentials. Only when the daily nutrient intake is fully adequate, based on the most authoritative nutritional criteria, can the possibility of adequate nutrition be assured. It is for this reason that a food supplement assumes great importance in daily practice. It should be rich in those nutrients most likely deficient in prevailing diets or in restricted diets during illness and convalescence.

The *multiple nutrient dietary food supplement*, Ovaltine in milk, is especially suited for transforming even poor diets to full nutritional adequacy. This is clearly shown by the data in the table above.

Note in particular the high percentages of the dietary allowances for nutrients and the relatively low percentage of the total calories furnished by the servings of Ovaltine in milk. Thus, without unduly increasing the caloric intake, Ovaltine in milk greatly increases the contribution of nutrient essentials. Enticing flavor and easy digestibility are other important features of this dietary supplement.

Two kinds, Plain and Sweet Chocolate Flavored. Serving for serving, they are virtually identical in nutritional content.

Ovaltine

THE WANDER COMPANY, 360 N. MICHIGAN AVE., CHICAGO 1, ILL.

a rapidly acting ***oral*** *estrogen*

More potent than any other available oral estrogen, ESTINYL* provides unusually rapid relief from menopausal discomforts. *Symptoms often subside within three days* with one tablet of 0.05 mg. daily. ESTINYL imparts that special sense of well-being characteristic of the parent substance estradiol.

ESTINYL®

(ETHINYL ESTRADIOL)

Flexible tablet dosage ranges from one 0.02 mg. tablet to one 0.05 mg. tablet daily. When a fluid estrogen preparation is preferred, ESTINYL LIQUID is available, containing 0.03 mg. ethinyl estradiol per teaspoonful (4 cc.), in an extremely pleasant tasting vehicle.

Your Cosmetic Budget

During the course of the year you spend a certain sum of money for beauty preparations. This sum of money represents your Cosmetic Budget. As with all budgets, it can be spent intelligently or squandered aimlessly.
Regardless of economic trends, it is always wise to give careful consideration to the act of buying.
We suggest it is both economical and more effective to buy a well-balanced cosmetic service composed of preparations selected with regard to your particular requirements and preferences, and that you will therefore welcome the services of the Cosmetic Consultants who distribute Luzier preparations in your community.

Throat Specialists report on 30-Day Test of Camel smokers—

"Not one single case of throat irritation due to smoking Camels!"

● Yes, these were the findings in a total of 2,470 weekly examinations of hundreds of men and women from coast to coast who smoked only Camels for 30 consecutive days! And the smokers in this test averaged one to two packages of Camels a day!

R.J. Reynolds Tobacco Co., Winston-Salem, N. C.

According to a Nationwide survey:

More Doctors Smoke Camels

than any other cigarette!

Doctors smoke for pleasure, too! When three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel!

CAMP

for POSTOPERATIVE and POSTPARTUM NEEDS

Basic design and the unique system of adjustment make a large variety of Camp Scientific Supports especially useful as postoperative aids. Surgeons and physicians often prescribe them as assurance garments and consider them essential after operation upon obese persons, after repair of large herniae, or when wounds are draining or suppurating. A Camp Scientific Support is especially useful in the postoperative patient with undue relaxation of the abdominal wall. Obstetricians have long prescribed Camp Postoperative Supports for postpartum use. Physicians and surgeons may rely on the Camp-trained fitter for precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

Authorized Service

CHECK LIST

for choice of a laxative

Phospho-Soda (FLEET) TYPE OF ACTION

- ✓ Prompt action
- ✓ Thorough action
- ✓ Gentle action

•

SIDE EFFECTS

- ✓ Free from Mucosal Irritation
- ✓ Absence of Constipation Rebound
- ✓ No Development of Tolerance
- ✓ Safe from Excessive Dehydration
- ✓ No Disturbance of Absorption of Nutritive Elements
- ✓ Causes no Pelvic Congestion
- ✓ No Patient Discomfort
- ✓ Nonhabituating
- ✓ Free from Cumulative Effects

•

ADMINISTRATION

- ✓ Flexible Dosage
- ✓ Uniform Potency
- ✓ Pleasant Taste

Phospha-Soda (Fleet) is a salutian containing in each 100 cc sodium biphasphate 48 Gm. and sodium phasphate 18 Gm.

Judicious Laxation

...through freedom from undesirable side effects

The clinical preference for Phospho-Soda (Fleet)* stems in large part from its freedom from undesirable side effects. This desideratum, together with its controlled action and ease of administration, assure safe, effective anticostive therapy from every prescription of this "tried and true" laxative agent. Clinical samples on request.

CYTOLOGIC DIAGNOSIS OF MALIGNANT LESIONS OF THE ESOPHAGUS AND CARDIA OF THE STOMACH

HOWARD A. ANDERSEN, M.D., JOHN R. McDONALD, M.D., and ARTHUR M. OLSEN, M.D.
Rochester, Minnesota

IN RECENT years there have been numerous reports in the literature concerning the value of cytologic examination of serous fluids, urine, vaginal and cervical secretions, gastric juice, sputum and bronchial secretions in the diagnosis of carcinoma. It is the purpose of this paper to add another region of the human body which is amenable to this diagnostic procedure. Because there are a small percentage (perhaps 10 per cent) of cases of carcinoma of the esophagus and a larger percentage (perhaps 20 or 25 per cent) of cases of carcinoma of the cardia in which the results of roentgenologic and esophagoscopic examination are inconclusive, it was hoped that cytologic examination of smears might increase the percentage of cases in which a correct preoperative diagnosis could be made and also result in an earlier diagnosis than had been possible by roentgenologic and esophagoscopic examination. The work reported in this paper was done in the cytologic laboratory of one of us (J.R.M.) who has been working in close co-operation with the oral endoscopists at the Mayo Clinic.

Collection and Preparation of Material

The material used for cytologic examination was collected by several means.

1. At the time of esophagoscopy, the lesion either was touched directly with a cotton swab or fluid was aspirated from the esophagus and centrifuged. In several cases in which a lesion was not visible in the esophagus, the cotton applicator was pushed through the esophagogastric junction and withdrawn.

2. After dilatation of the esophagus, a cotton applicator was rubbed over the wire spiral of the dilator.

3. A strip of fine mesh gauze was wrapped around the end of an ordinary gastric tube and secured with a silk thread. The tube was then passed to the point of obstruction, or, if no obstruction was noted, it was inserted for approximately 16 inches (40.6 cm.) from the upper incisor teeth and withdrawn immediately.

Cytologic Examination

From three to five smears were prepared from the material obtained in each case. The slides containing the smears were placed immediately in a fixative solution consisting of equal parts of 95 per cent ethyl alcohol and ether. They were permitted to remain in this solution for thirty minutes, as recommended by Papanicolaou.[1] Delay in placing the slides in this solution causes drying of the smears and distortion of the cells, making them unfit for examination. The staining procedure was that which has been used by Woolner and one of us (J.R.M.).[2] The smears were examined methodically with the low-power objective of the microscope. When suspicious cells were observed, they were examined with the high-power objective.

Normal cells of the epithelium of the esophagus and cardia, and inflammatory cells such as leukocytes, lymphocytes and macrophages are not

Dr. Andersen is a Fellow in Medicine, Mayo Foundation; Dr. McDonald is with the Section on Surgical Pathology, Mayo Clinic, and Dr. Olsen is with the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

Read at the meeting of the Minnesota State Medical Association, Saint Paul, Minnesota, May 9 to 11, 1949.

very difficult to distinguish from malignant cells. When neoplastic cells appear in clumps, the diagnosis frequently can be made from the appearance of a single clump of cells. A single cell may

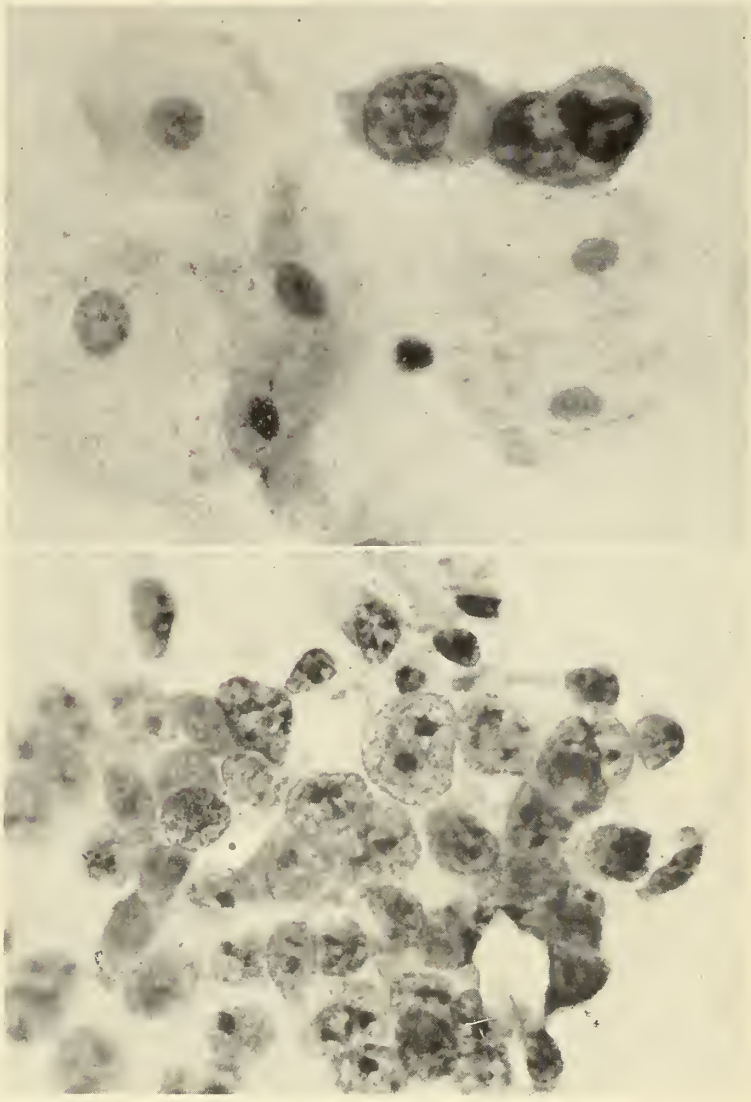

Fig. 1. (*above*) A small clump of malignant cells contrasted with normal squamous cells. The cytoplasmic-nuclear ratio of malignant cells is less and the cells stain more deeply than normal cells (x730).

Fig. 2. (*below*) A large clump of malignant cells. Many are merely naked nuclei; the chromatin is dense; nucleoli are prominent (x730).

arouse one's suspicion, but, as a general rule, it is probably unwise to conclude it is malignant until eight or ten such cells have been observed.

Malignant cells have several features in common. They stain more deeply than do normal cells (Fig. 1), owing to the fact that the nuclei have a greater affinity for hematoxylin. Because of this characteristic, a uniform and consistent staining procedure must be followed. Pale, swollen, degenerating cells frequently may be seen. These changes may be due to faulty technique such as allowing the smear to dry before it is immersed in the fixative solution. Malignant growths, however, contain greater numbers of degenerating cells than normal tissues; therefore, if a proper technique was used, the presence of many of these cells may arouse one's suspicion concerning the presence of a malignant lesion. A careful search may reveal well-preserved cells having characteristic malignant features.

One is attracted by the large size of the malignant cells. The cytoplasm may be increased in

amount, as it frequently is in cases of keratinizing squamous-cell carcinoma, or it may be decreased in amount and form a narrow rim around the nucleus. Occasionally, a naked nucleus may be seen (Fig. 2).

The nuclei vary in size and shape. They sometimes are round; at other times they are irregular, angular and polymorphous. These variations are seen best when the cells appear in clusters. The nuclear characteristics are best seen with the high-power objective of the microscope. The structure is heterogenous; it sometimes is dense (Fig. 2) but at times is loose (Fig. 3). Usually the chromatin is arranged in coarse, irregular fragments which are deeply stained. The nucleoli are larger than those of normal cells and they may be solitary or multiple. They also may be basophilic or acidophilic.

Evidence of mitosis rarely was observed in this study. In cases in which mitotic figures were seen in some of the cells, we observed other cells which did not contain such figures. In these cases, the diagnosis of malignant cells was made without depending on the presence of mitotic figures.

In some cases, the appearance of the cells was so characteristic that it was possible to predict the type of malignant lesion that was present. In cases of adenocarcinoma, the cytoplasm of the tumor cells may contain droplets of mucus which appear as light spots in stained smears. An acinar arrangement of the cells was not observed in any of our cases. In cases of squamous-cell carcinoma, cytologic examination of smears may disclose sufficient keratinization to permit one to predict that this type of tumor is present (Figs. 4 and 5). One malignant cell occasionally may be included in another and suggest the presence of a whorl or nest of cells (Fig. 5).

Material and Results

This report is based on eighty-six consecutive cases in which cytologic examination of smears of material obtained from the esophagus or gastric cardia apparently disclosed malignant cells which were considered indicative of the presence of a primary malignant lesion at one of these sites. In two (approximately 2 per cent) of the eighty-six cases, operation subsequently disclosed only benign hyperplasia of the squamous epithelium. The cytologic diagnosis of a malignant lesion, therefore, was falsely positive in these two cases. In one of the two cases, the operation was performed after the patient had been dismissed from the clinic. In the remaining eighty-four cases, the final diagnosis was as fol-

lows: squamous-cell carcinoma of the esophagus in forty-four cases, adenocarcinoma of the gastric cardia in thirty-nine cases, and leiomyosarcoma of the esophagus in one case.

In thirty-one of the forty-four cases of squamous-cell carcinoma of the esophagus, the diagnosis was confirmed by histologic examination. In twelve of the thirteen cases in which the diagnosis was not confirmed in this manner, the clinical signs and symptoms and the roentgenologic findings were considered characteristic of a malignant lesion. In the remaining case, the presence of a diaphragmatic hernia was suspected until cytologic examination of an esophageal smear disclosed carcinoma cells. A review of the history and the discovery of a small but hard lymph node in the left supraclavicular region led to the final diagnosis of carcinoma of the esophagus. Esophagoscopic biopsy failed to disclose any evidence of carcinoma in six cases.

An exploratory operation was performed in thirteen of the forty-four cases of carcinoma of the esophagus. In one of the thirteen cases, the only positive evidence of a malignant lesion was disclosed by cytologic examination of a smear made from material obtained from the wire spiral of the esophagoscope after diagnostic dilatation of the esophagus. In this case, a lesion of the esophagus was observed by both the roentgenologist and the esophagoscopist, but neither one of them made any comment concerning the nature of the lesion. Esophagoscopic biopsy did not disclose any evidence of a malignant lesion, but an exploratory operation revealed an inoperable squamous-cell carcinoma, grade 4, of the esophagus. In five of the thirteen cases in which operation was performed, the involved portion of the esophagus was resected.

In thirty-three of the thirty-nine cases of adenocarcinoma of the cardia of the stomach, the diagnosis was confirmed by histologic examination of tissue obtained with the esophagoscope or at the time of operation. In five of the six cases in which the diagnosis was not confirmed by histologic examination, the clinical signs and symptoms and the roentgenologic findings were characteristic of a malignant lesion. In the remaining case, the clinical signs and symptoms and the results of the first roentgenologic examination were indefinite. Dilatation of the cardia was performed, and cytologic examination of material obtained from the cardia disclosed malignant cells. Subsequent roentgenologic examination revealed a tumor of the cardia. In nine of the thirty-nine cases, esophagoscopic biopsy did not reveal any evidence of a malignant lesion.

An exploratory operation was performed in twenty-two of the thirty-nine cases. In six of the twenty-two cases, the presence of carcinoma cells was the only microscopic evidence of a malignant lesion before operation was performed. In all of the six cases, the diagnosis was confirmed by surgical biopsy or by microscopic examination of the excised tumor. Resection of the cardia was performed in ten cases.

In the one case of leiomyosarcoma of the esophagus, the diagnosis was confirmed by esophagoscopic biopsy. An exploratory operation revealed that the tumor was inoperable.

During the period in which the eighty-four cases of malignant tumors of the esophagus or gastric cardia were observed, cytologic examination of smears failed to disclose any evidence of malignant cells in 120 additional cases of various diseases of the esophagus or gastric cardia. A primary carcinoma of the esophagus or cardia was present in twenty-eight of the 120 cases. In fourteen of the twenty-eight cases, the smear was prepared from material obtained from the wire spiral of the dilator. Admittedly, this is the least satisfactory method of obtaining suitable smears. In the remaining fourteen cases, the smear was obtained by inserting an applicator through the esophagoscope. In six of the latter group of fourteen cases, biopsy disclosed a malignant lesion; in the remaining eight cases, it failed to disclose any evidence of a malignant tumor. The malignant lesion involved the gastric cardia in three of the twenty-eight cases. Biopsy failed to disclose any evidence of a malignant lesion in these three cases.

Comment

The results of this study indicate that cytologic examination of smears obtained from the esophagus and gastric cardia is of definite value in the diagnosis of primary malignant lesions of these organs. In our hands, this examination has been of more value in the diagnosis of malignant lesions of the gastric cardia than it has been in the diagnosis of malignant lesions of the esophagus. This is probably due to the fact that it usually is difficult for the esophagoscopist to obtain a speci-

men for biopsy in cases of adenocarcinoma of the cardia. In some of the thirty-nine cases of adenocarcinoma of the cardia, esophagoscopy did not reveal any lesion but cytologic examination of smears obtained from the cardia disclosed malignant cells. In two cases in which the diagnosis was made in this manner, biopsy did not disclose any evidence of a malignant lesion but an exploratory operation revealed that an adenocarcinoma was present.

Although statistical proof is lacking, we have gained the impression that cytologic examination of smears prepared from the wire spiral of the esophageal dilator will disclose malignant cells more frequently than will histologic examination of bits of tissue which adhere to the spiral. Cytologic examination of smears prepared from the spiral disclosed malignant cells in twenty-nine of the eighty-four cases, whereas histologic examination of adherent bits of tissue disclosed malignant cells in only seven of the twenty-nine cases.

The simplest method of obtaining smears for cytologic examination in cases in which the presence of a malignant lesion is suspected is to insert a gastric tube equipped with a gauze tip down to the cardia and withdraw the tube immediately. Smears then are prepared from the material on the gauze. Smears were obtained in this manner in ten cases. Cytologic examination of these smears disclosed malignant cells in eight of the ten cases; in two of these eight cases, it furnished the clue which led to the correct diagnosis. This method of obtaining smears is of value in cases of progressive dysphagia in which esophagoscopy either fails to disclose any lesion or is contraindicated or impossible. It also may be used to obtain material for cytologic examination when a trained esophagoscopist is not available. In our hands, it has proved of value in one case in which a carcinoma developed in a lye stricture which had been present for sixty years. Because carcinoma has an increasing tendency to develop in lye strictures as the years pass, cytologic examination of esophageal smears should be performed at regular intervals, particularly in cases in which such a stricture has been present for many years. The smears can be obtained by the method which has just been described or they can be prepared from material which adheres to the dilator in cases in which dilatation is necessary.

Summary

This paper is based on a review of eighty-six consecutive cases in which cytologic examination of smears obtained from the esophagus or gastric cardia apparently disclosed malignant cells which were considered indicative of the presence of a primary malignant lesion of one of these organs. In two (approximately 2 per cent) of the eighty-six cases, operation subsequently disclosed only benign hyperplasia of the squamous epithelium. The cytologic diagnosis of a malignant lesion, therefore, was falsely positive in these two cases. We do not think that it is possible to reduce the percentage of cases in which such an error will occur. In the remaining eighty-four cases, the final diagnosis was as follows: squamous-cell carcinoma of the esophagus in forty-four cases, leiomyosarcoma of the esophagus in one case, and adenocarcinoma of the gastric cardia in thirty-nine cases. In fifteen of the eighty-four cases, esophagoscopic biopsy did not disclose any evidence of a malignant lesion. An exploratory operation was performed in thirty-five of the eighty-four cases. In seven of the thirty-five cases, the disclosure of malignant cells by cytologic examination was the only microscopic evidence of a malignant lesion before operation was performed. In all of the seven cases, the cytologic diagnosis was confirmed by surgical biopsy or by histologic examination of the excised tumor. Cytologic examination of smears is of more value in the diagnosis of adenocarcinoma of the gastric cardia than it is in the diagnosis of carcinoma of the esophagus.

TUBERCULOSIS IN OLDER AGE GROUP

That older persons now constitute the major focus of tuberculous infection is emphasized by recent autopsy studies which show that a relatively large number of persons supposedly succumbing to diseases other than tuberculosis were found to have this disease in active form. It is recognized that the disease in older persons is frequently mild and that the symptoms may be overlooked. —*Stat. Bull.*, Metropolitan Insurance Co., (Nov.) 1948.

MALIGNANT TUMORS OF THE LUNG

Their Diagnosis by Cytologic Examination of Sputum and Bronchial Secretions

JOHN R. McDONALD, M.D., and LEWIS B. WOOLNER, M.D.
Rochester, Minnesota

THORACIC surgery has, in recent years, become a practical procedure because of the marked lowering of mortality. One of the major surgical lesions of the lung for which pneumonectomy is done is bronchogenic carcinoma, which no longer can be regarded as a rare disease. Whether its incidence has increased is not a problem that is easy to settle. Part of the apparent increase, undoubtedly, is due to the increasing accessibility of the thoracic cavity and lungs to methods of diagnosis other than those that were available ten years ago. One of these methods is the examination of smears of sputum and bronchial secretions for malignant cells.

Bronchogenic Carcinoma

At the Mayo Clinic, we have a laboratory in which cytologic examination of the sputum and bronchial secretions is performed routinely in all cases in which the presence of bronchogenic carcinoma is suspected. On several occasions, we have reported the results which we have obtained with this method of examination.[1-7] During the three years that this laboratory has been in operation, this method of examination has been employed in approximately 6,000 cases. In more than 400 of these cases, it has disclosed the presence of carcinoma cells. In approximately four-fifths of the 6,000 cases, the material has consisted of sputum; in the remaining cases, it has consisted of bronchial secretions, bronchial smears or bronchial washings, all of which have been obtained by bronchoscopy. If the patient is not in the hospital, sputum is collected in a sputum bottle containing 8 to 10 c.c. of 95 per cent alcohol. Under such circumstances, the time that elapses between the collection of the material and the cytologic examination is not important. In cases in which the patients are in the hospital, it is possible to receive the sputum in the laboratory within a short time after it has been expectorated. In these cases, we have been using fresh sputum. If any secretions are present in the affected bronchus, they are collected by the bronchoscopist. If secretions are not present, the bronchoscopist may swab the affected mucosa with an applicator or he may obtain washings by instilling 5 c.c. of isotonic salt solution and aspirating it subsequently. A smear is made on a slide and fixed in a mixture of alcohol and ether according to the method of Papanicolaou. If bronchial washings are used, they should be centrifuged before the smear is made. We routinely stain the smears with hematoxylin and eosin. The chief advantage of this method of staining is its simplicity.

In our laboratory, trained technicians scan the smears after they have been stained. In order that they may scan the smears properly, technicians must be trained in the identification of cancer cells. The necessary period of training varies from nine months to one year. The final diagnosis is made by a cytologist or pathologist. It frequently is necessary to examine more than one specimen. In cases in which examination of one specimen of sputum fails to disclose carcinoma cells, we endeavor to examine three specimens. We believe that the sputum and bronchial secretions should be examined without any knowledge of the physical or roentgenographic findings in a given patient. If this is done, the pathologist will not be influenced by the opinion of the clinician or roentgenologist.

The advantages of using sputum instead of bronchial secretions are obvious. Since sputum is a waste product which can be collected easily without discomfort to the patient, several specimens may be examined in each case. We have examined as many as fifteen specimens in one case. The disadvantage of using sputum is that it is more dilute than are bronchial secretions. As a result of this dilution, a longer time is required for the examination of sputum. In the average case in which the sputum does not contain any carcinoma cells, approximately forty-five minutes are required for the examination.

The characteristics which enable one to recognize exfoliated carcinoma cells are those which are generally known to pathologists. Usually,

From the Division of Surgical Pathology, Mayo Clinic, Rochester, Minnesota.

Paper read at the combined meetings of the Minnesota Chapter of the American College of Chest Physicians and the Minnesota State Medical Association, Saint Paul, Minnesota, June 6, 1949.

carcinoma cells are larger than the normal cells, there is variation in the size and shape of the cells, the nuclei are hyperchromatic and the nucleoli are prominent. On the other hand, in at least one cell type in bronchogenic carcinoma (small or "oat-cell"), the cells are smaller than the normal mucosal cells of the bronchus. Cytologic examination of the sputum and bronchial secretions is chiefly of value in the diagnosis of bronchogenic carcinoma. It is of particular value in cases in which bronchoscopic biopsy is impossible owing to inaccessibility of the lesion.

An exploratory operation has been performed in 144 of the 400 cases in which cytologic examination of the sputum or bronchial secretions has disclosed carcinoma cells at the clinic. In seventy-nine (54.8 per cent) of the 144 cases, biopsy also disclosed the presence of carcinoma before operation was performed. In the remaining cases, the only miscroscopic evidence of a malignant lesion was the presence of carcinoma cells in the sputum or bronchial secretions. Pneumonectomy or lobectomy was performed in seventy-seven of the 144 cases. In thirty-two of these seventy-seven cases, the only microscopic evidence of carcinoma was disclosed by cytologic examination of the sputum or bronchial secretions. The value of this diagnostic method has been questioned because the presence of carcinoma cells in the sputum or bronchial secretions has been said to be a late manifestation of bronchogenic carcinoma. In this connection, it is interesting to note that the presence of carcinoma cells in the sputum or bronchial secretions was the only microscopic evidence of carcinoma in thirty-two of the seventy-seven cases in which the lesion proved to be operable.

This method of diagnosis is particularly valuable in cases in which a bronchogenic carcinoma is situated in an upper lobe or involves a small bronchus at the periphery of the lung. Because of physical reasons, the upper lobe is particularly inaccessible to the bronchoscopist. Of the malignant tumors which involve the upper lobe, Pancoast's tumor and those which cause obstruction of the superior vena cava are of particular interest.

In order to determine the value of cytologic examination of the sputum and bronchial secretions, we recently made a study of the clinical records and follow-up data in 588 consecutive cases in which this type of examination was performed at the clinic.[7] The presence of bronchogenic carcinoma was proved or was strongly suspected in 147 of these cases. The examination disclosed carcinoma cells in 100 (68 per cent) of the 147 cases; in the remaining forty-seven cases, it failed to disclose such cells. In none of these cases was a falsely positive diagnosis of bronchogenic carcinoma made on the basis of the cytologic examination. In some of the forty-seven cases in which the examination failed to disclose carcinoma cells, it seems probable that examination of a larger number of specimens would have disclosed such cells. We wish to emphasize that bronchogenic carcinoma cannot be assumed to be absent in cases in which this method of examination does not disclose carcinoma cells.

In a previous paragraph, we said that cytologic examination of the sputum or bronchial secretions had disclosed carcinoma cells in more than 400 cases which have been observed at the clinic. In seven of these cases, a falsely positive diagnosis of bronchogenic carcinoma was made on the basis of the cytologic findings. It is possible, however, that a falsely positive diagnosis was made in a few more cases. In many cases of inoperable carcinoma, it is impossible to obtain a specimen of the lesion for microscopic examination. This is particularly true in cases in which the lesion is inaccessible to the bronchoscopist. It is evident, therefore, that the cytologic examination resulted in a falsely positive diagnosis of bronchogenic carcinoma in approximately 2 per cent of the cases. This should be remembered by physicians who are performing this examination or who are relying on the results of such examination.

The following case illustrates the value of cytologic examination of the sputum.

A man, aged fifty-one, had had a severe "cold" for a month and a half before he came to the clinic. His temperature had been high and he had coughed considerably. On one occasion he had expectorated a small amount of blood. Administration of penicillin had caused his temperature to return to normal. Roentgenographic examination of the thorax disclosed a mass in the hilus of the left lung (Fig. 1). The presence of a bronchogenic carcinoma was suspected. Cytologic examination of the sputum on two occasions disclosed carcinoma cells of the squamous type (Fig. 2). Bronchoscopy was performed twice. On each occasion, it failed to disclose any gross abnormality. On one of these occasions, a specimen was removed for biopsy, but microscopic examination of the specimen did not reveal any evidence of a neoplasm, although cytologic examination of the bronchial secretions disclosed carcinoma cells. Exploratory thoracotomy revealed a squamous-

Fig. 1. Roentgenogram showing a mass (bronchogenic carcinoma) in hilus of left lung.

cell carcinoma which involved the secondary branches of the bronchus of the upper lobe of the left lung (Fig. 3). The carcinoma measured 4 by 3 by 2 cm. and involved 3 of the hilar lymph nodes. The convalescence was uneventful, and the patient was alive six months after the operation.

Alveolar-cell Tumors

We have observed seven cases of alveolar-cell tumor in which resection was performed. Cytologic examination of the sputum was performed in five of the seven cases. In three of the five cases, malignant cells were found in the sputum; in one case, the presence of malignant cells was questionable; in the remaining case, the examination did not disclose any malignant cells. In an occasional case, it is possible to suggest the presence of an alveolar-cell tumor on the basis of the cytologic findings; in most cases, however, the examination merely will disclose malignant cells. Whether alveolar-cell tumors should be treated surgically or nonsurgically is questionable. It seems certain, however, that surgeons will see more and more of these tumors.

Metastatic Tumors

Cytologic examination of the sputum and bronchial secretions is of minimal value in the diagnosis of metastatic tumors of the lung. This is partially due to the fact that metastasis usually occurs by way of the blood stream and metastatic implantation occurs outside of a bronchus. Ulceration, therefore, usually is a late manifestation of metastatic tumors of the lung. Malignant cells cannot be exfoliated until ulceration occurs. Even after ulceration has occurred, cytologic examination of the sputum and bronchial secretions will not disclose malignant cells consistently. In our hands, this method has been more valuable

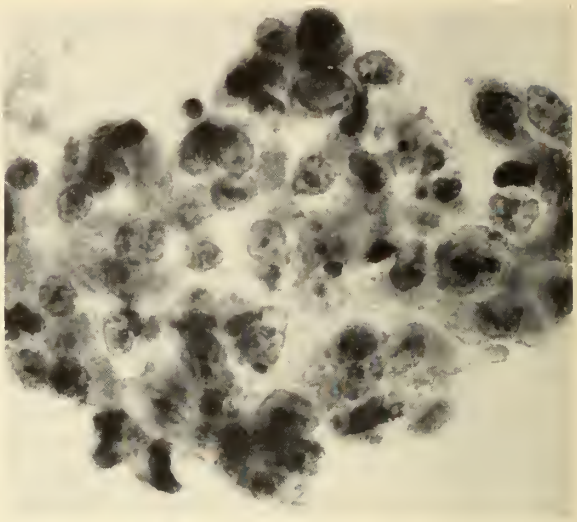

Fig. 2. Carcinoma cells in sputum in case of bronchogenic carcinoma (hematoxylin and eosin stain x525).

Fig. 3. Squamous-cell carcinoma of secondary branches of bronchus of upper lobe of left lung.

in the diagnosis of metastatic carcinoma than it has been in the diagnosis of metastatic sarcoma. It has disclosed malignant cells in several cases in which an esophageal carcinoma has eroded into a bronchus and produced a broncho-esophageal fistula.

Adenomas and Cylindromas

In our laboratory, cytologic examination of the sputum and bronchial secretions has consistently failed to disclose atypical cells in cases of adenoma or cylindroma of the lung. In cases of either type of tumor, the overlying mucosa almost always is intact; therefore, neoplastic cells cannot be exfoliated. This method of examination occasionally has been of great help in the differential diagnosis of bronchial adenoma of the carcinoid type and small-cell bronchogenic carcinoma. On the basis of a small biopsy these tumors may be difficult to distinguish histologically. In cases of small-cell bronchogenic carcinoma, the examination usually will disclose characteristic cells; in cases of adenoma, it will not disclose such cells.

Summary

Cytologic examination of the sputum and bronchial secretions is very useful in the preoperative diagnosis of bronchogenic carcinoma. It should be remembered, however, that this method of examination results in a falsely negative diagnosis of bronchogenic carcinoma in approximately 30 per cent of cases and that it results in a falsely positive diagnosis of this type of tumor in approximately 2 per cent of cases.

Discussion

Dr. Kano Ikeda, Saint Paul: I feel highly honored to be invited to discuss Dr. McDonald's paper. It is an important contribution to medicine which should receive the recognition it deserves. I have practically no experience with cytologic diagnosis of cancer in sputum and bronchial secretions, and will not be able to add further to his excellent presentation.

I have followed with much interest the work of Dr. McDonald and his associates. He and his co-workers are to be complimented on the remarkable results they have been getting in the diagnosis of pulmonary cancer through the examination of the sputa and bronchial secretions. Their work has been thorough and painstaking. Recent reports indicate the diagnostic accuracy of this method to be anywhere from 75 to 92.5 per cent, and more sensitive than the roentgenogram or bronchoscopic biopsy. To obtain the results, however, adequate facilities must be provided for the work, namely, the properly equipped laboratory, the trained technician, the trained cytologist, and the full co-operation of the clinician, the nurse, and the patient.

In sanatoria and institutions where only cases of pulmonary disease are taken care of, a department devoted to this work seems indicated. In general hospitals and clinics, the one in charge of cytological diagnostic work must personally see that the specimens are properly treated. Without the proper facilities and personnel trained to do this work, no physician or laboratory should attempt to utilize this method. No pathologist, furthermore, should feel that he is fully qualified to make cyto-diagnosis, simply because he is a pathologist.

It was an anatomist who developed a cytologic method of cancer diagnosis, and not the pathologist. It was a gynecologist who first saw the merit in the method and made the practical application of the technique in the diagnosis of cancer, and not the pathologist. Indeed, for many years, the pathologist had been taught to belittle a diagnosis of cancer by the appearance of single cells. Today, however, the pathologist has come to accept the cytologic method as an important additional laboratory aid in the diagnosis of cancer, equally as effective in the experienced hands as biopsy. Indeed, if we are to believe recent published reports, the cytologic diagnosis is often more sensitive and more readily obtainable, with equal dependability, in certain types of cancer than the biopsy. This is particularly true in the detection of early carcinoma of the uterine cervix, as in cases of obscure pulmonary lesions, in which neither the bronchoscopic biopsy nor the roentgenograms can afford any assistance, as Dr. McDonald so clearly demonstrated.

The limitations of bronchoscopy and roentgen examination for pulmonary cancers are well appreciated. Bronchoscopy is done only by experts, and roentgen diagnosis is often difficult and controversial. Repeated smear examination of the sputum can be carried out in any locality, which is a great advantage. Experimentally, it was possible to demonstrate tumor cells by this method in 58 per cent of cases, before the tumor

THE CANCER DETECTION CENTER AT THE UNIVERSITY OF MINNESOTA

T. BRANNON HUBBARD, JR., M.D.
Minneapolis, Minnesota

WHEN a cancer is localized without lymph node metastases the chance of cure is good with our present-day tools. However, when the cancer has progressed and lymph node metastases are present, the cure rate drops markedly. Thus, in the breast, a five-year cure rate may be expected of 75 to 80 per cent when nodes are not involved, but of only 30 per cent or less, when there are metastases. In the stomach, results fall from approximately 50 to 9 per cent.[4] Similar contrasts are present in other organs. The fact remains, however, that a distressingly small proportion of cancers that come to treatment are in an early localized stage. This aspect, that of early detection of cancer, is still to be improved upon in peripheral cancers such as the breast. However, the internal cancers of the gastrointestinal tract present the really acute problem in this regard. One's attention is called to such tumors only by symptoms or by late signs such as bleeding, anemia or weight loss, and by then lesions without nodal involvement are few.

The idea of a Cancer Detection Center is based upon these facts, that cancer in its early stages is a silent disease, and that with our present-day methods of treatment, our primary hope for increasing the number of cures is to treat cancer when it is early. This means, then, picking the cancer up in asymptomatic people.

The Center at the University of Minnesota was begun March 1, 1948, with the approval of the Minnesota State Medical Association. It is a clinical experimental project which will have a limitation of five years, after which the results will be evaluated to determine its worth. It was originally planned to examine 1,000 new patients each year, with each patient returning every six months for re-examination.[10] From March 1, 1948, to March 1, 1949, 1,164 new patients were examined, and the patients are returning for re-examination in one year. It is planned that at the end of five years we will have 5,000 patients in all, upon which to formulate our conclusions. Our primary purpose is, of course, to pick up early malignancies in apparently well individuals. In addition, however, we want to determine the practicability of such a project, and also to develop methods of screening by which those patients may be singled out who are most apt to harbor a neoplasm and who, therefore, are more in need either of the routine or of various specific examinations. In this way, a thorough examination may be done of a few, rather than a more superficial examination of many.

Only symptom-free, apparently well individuals forty-five years of age and over are examined. They all are given a routine complete examination which occupies the greater part of one day.

In the Morning:

1. Complete blood count.
2. Urinalysis.
3. Blood Wassermann test.
4. Occult blood in the stool (both by guaiac and benzidine tests) after a meat-free diet for three days.
5. Gastric expression, using histamine (1 dose, 0.5 mg.) as a gastric acid stimulant.
6. A proctoscopic examination by a proctologist.
7. Female patients have a complete pelvic examination by a gynecologist, with papanicolaou smears.
8. Photofluorogram of chest.

In the Afternoon:

1. Ear, nose and throat examination by an otolaryngologist.
2. Prostate examined by urologist.
3. General physical examination by one of our doctors with correlation of all findings.

The latter doctor then discusses the results with the patient and the patient is told to return to his family doctor for more detailed information. In particular, if any cancer or similar lesion is found, the patient is told to return to his doctor for immediate treatment. No therapy is given at the Center. Each patient is required to give the name of his personal physician, and to the latter is sent a complete résumé of our findings.

This ends the routine examination. Any further x-rays are taken at a later date by appointment. Gastric x-ray examinations are not taken routinely. We feel that there is a particular need for limiting the field to those most likely to harbor a gastric lesion. For instance, St. John, Swenson, and Harvey in 1944 subjected 2,413 pa-

Presented at the annual meeting of the Southern Minnesota Medical Association at Red Wing, Minnesota, September 12, 1949.

tients over the age of fifty without gastric complaints to a brief fluoroscopic examination after barium swallow. They found two silent gastric carcinomas and one lymphosarcoma, an incidence of silent gastric malignancy of 1.2 per thousand patients.[7] Dailey and Miller in 1945 examined 500 asymptomatic men over forty-five years of age after a barium meal and found three gastric lesions: a benign gastric ulcer, a polyp, and an antral gastritis.[2] The need for screening such patients so that x-rays may be taken only of those most likely to develop a gastric malignancy is apparent.

The tendency of patients with carcinoma of the stomach to have a low free acid on gastric analysis is known. At the University Hospitals, patients with carcinoma of the stomach have shown achlorhydria in 65 per cent of cases after histamine gastric analysis. Another 21 per cent show hypochlorhydria, i.e., a free acid of 30 degrees or less.[3] In comparison, a group of patients of the same age group, but with carcinoma in other organs than the stomach, showed achlorhydria or hypochlorhydria in only 56 per cent of the cases.[5]. Based upon these facts, the following study has been carried out. Since August 1, 1945, all patients over the age of fifty, who passed through the University Hospital outpatient clinic, and who had no symptoms of gastric malignancy, were subjected to a gastric analysis, using histamine (0.5 mg.) in triple doses at half-hour intervals as a stimulant. All those who had less than 30 degrees of free acid were given a routine gastrointestinal x-ray examination.[11] Up to August 1, 1949, gastric analyses were done on 4,172 such patients; 1,419 proved eligible for gastrointestinal series. X-rays of this group of 1,419 revealed six gastric cancers, twenty-five gastric polyps, and one questionable cancer. The significance of gastric polyps as a precancerous lesion has been the subject of some discussion.[1,6,8,9] To go into this problem is not within the realm of this paper. However, we might point out that of eighty-five patients with polyps at the University Hospital who have been followed, thirty-one have been operated on and seven of these proved malignant. Whether these represent carcinomas derived from benign polyps or polypoid carcinomas, malignant from start, remains, of course, a moot point.

With this background we have relegated gastrointestinal x-ray examinations at the Cancer Detection Center to the following patients:

1. Individuals with histamine achlorhydria and hypochlorhydria (less than 30 degrees free acid).
2. Patients with occult blood in the stool.
3. Patients with a strong family history of gastric carcinoma.
4. Patients with unexplained hemoglobin level below 11.0 grams.
5. Patients with vague symptoms of gastric pathology which in any sense could be interpreted as being due to gastric carcinoma by the examining physician.

Similarly, x-ray examination of the colon after barium enema has been limited to the following:

1. Patients with abnormal findings on proctoscopic examination.
2. Patients with occult blood in the stool.
3. Patients with unexplained hemoglobin level below 11.0 grams.
4. Patients with a family history of large bowel malignancy.
5. Patients who have vague symptoms that could possibly be conceived as being due to malignancy of the large bowel by the examining physician.

TABLE I

Total number of patients (male, 1049—female, 1057)	2106
Carcinomas:	
Basal cell carcinoma of the skin	6
Squamous cell carcinoma of the skin	2
Carcinoma of the stomach	1
Carcinoma of the cecum	2
Carcinoma of the sigmoid	4
Carcinoma of the rectum	3
Carcinoma of the esophagus	1
Carcinoma of the prostate	1
Chronic lymphatic leukemia	1
Lymphosarcoma involving the bone marrow	1
Lymphosarcoma of submaxillary gland	1
Total	23

From March 1, 1948, to July 31, 1949, 2,106 patients have been through the Center (Table I). In this group, twenty-three patients with carcinoma were found. Details of these lesions appear in Table I. Eleven of these tumors were in the gastrointestinal tract. Of these eleven, six were early lesions, in that they were confined to the organ involved and the regional lymph nodes showed no metastases. The carcinoma of the stomach, also with no lymph node metastases, was less than a centimeter in diameter and barely invaded the submucosa. These figures, though obviously small, are interesting when contrasted with the patient who comes to treatment for alimentary tract carcinoma through routine channels. At the University Hospitals, approximately 80 per cent of the latter cases show regional lymph node metastases.

TABLE II

Precancerous lesions:	
Senile keratosis of the skin	50
Gastric polyps	2
Kraurosis vulvae	7
Leukoplakia	36
Pigmented naevi in areas of irritation	152
Polyp of the vocal cord	1
Multiple adenomas and polyps of the rectum and colon	228
Solitary thyroid adenomas	21
Total	497

TABLE III

Benign Tumors:	
Fibroma	42
Lipoma	18
Retention cysts	52
Papilloma	41
Osteoma	4
Hemangioma	14
Adenocystic disease of the breast	1
Adenoma of the prostate	1
Uterine Myomata	4
Nabothian cyst	26
Ovarian cyst	3
Verruca	3
Seborrheic keratosis	30
Polyps of the gum and nose	4
Polyps of the cervix uteri	24
Pyrogenic granuloma	3
Thyroglossal duct cyst	1
Polyp—axilla	1
Papule—tongue	1

Four hundred ninety-seven precancerous lesions were found (Table II). The most worthwhile finding here was that 228 patients (10.8 per cent) showed adenomas or polyps of the rectum and colon. Two hundred seventy-three individuals with benign tumors were likewise found (Table III). Six hundred sixty-six non-neoplastic lesions requiring medical attention were also discovered.

While it would seem impractical to take gastrointestinal x-rays and barium enema x-rays on every patient, the use of such screening methods as described above has enabled us to add these examinations for certain patients. It is hoped that further development of such filters will let us limit this group to a smaller number, yielding an even higher percentage of positive findings.

AUREOMYCIN HYDROCHLORIDE

Aureomycin is an antibiotic produced by fermentation using the organism Streptomyces aureofaciens. It is used in the form of the hydrochloride.

For tests and standards, see regulation under Sec. 507. Food, Drug and Cosmetic Act, copies of which are obtainable from the Division of Antibiotics, Food and Drug Administration, Washington, D. C.

Actions and Uses.—In vitro aureomycin hydrochloride is effective against certain strains of beta hemolytic streptococci, nonhemolytic streptococci, group D; alpha hemolytic streptococci, pneumococci, staphylococci, Escherichia coli, Aerobacter aerogenes, Klebsiella pneumoniae, Bacillus subtilis and Corynebacterium hoffmanii. In embryonated eggs it has an effect against rickettsiae and certain large viruses.

Clinically, aureomycin hydrochloride has been reported to be effective in the treatment of Rocky Mountain spotted fever, typhus, scrub typhus, murine typhus, and Brills' disease in the rickettsial group; Q fever, primary atypical pneumonia, beta hemolytic streptococcic infections, urinary tract infections produced by E. coli, A. aerogenes, staphylococci or streptococci. It should not be used in systemic infections produced by Proteus vulgaris or Pseudomonas aeruginosa. It may also be used in staphylococcic and pneumococcic infections, in acute brucellosis and in subacute bacterial endocarditis which does not respond to penicillin.

Aureomycin hydrochloride, suitably buffered, may be used locally in the eye against a variety of ocular viral infections, such as inclusion conjunctivitis, follicular conjunctivitis and ocular bacterial infections caused by susceptible organisms.

The drug produces nausea, vomiting and diarrhea in a fair number of patients.

Dosage.—Severe infections require 5 to 10 mg. per kilogram of body weight every four hours orally.

Mild infections can be treated with oral doses of 5 mg. per kilogram of body weight every four hours.

Solutions for ophthalmic use may be prepared by adding 5 c.c. of sterile distilled water to 25 mg. of hydrochloride. One or two drops every two hours in the affected eye will usually suffice to control the condition.

Lederle Laboratories Division, American Cyanamid Co., Pearl River, N. Y.

Capsules Aureomycin Hydrochloride: 50 mg. and 250 mg.

Aureomycin Hydrochloride: 50 mg. vial of crystalline material, each packaged with a 10 c.c. vial of 0.75 per cent of sodium carbonate solution as a diluent for injection.

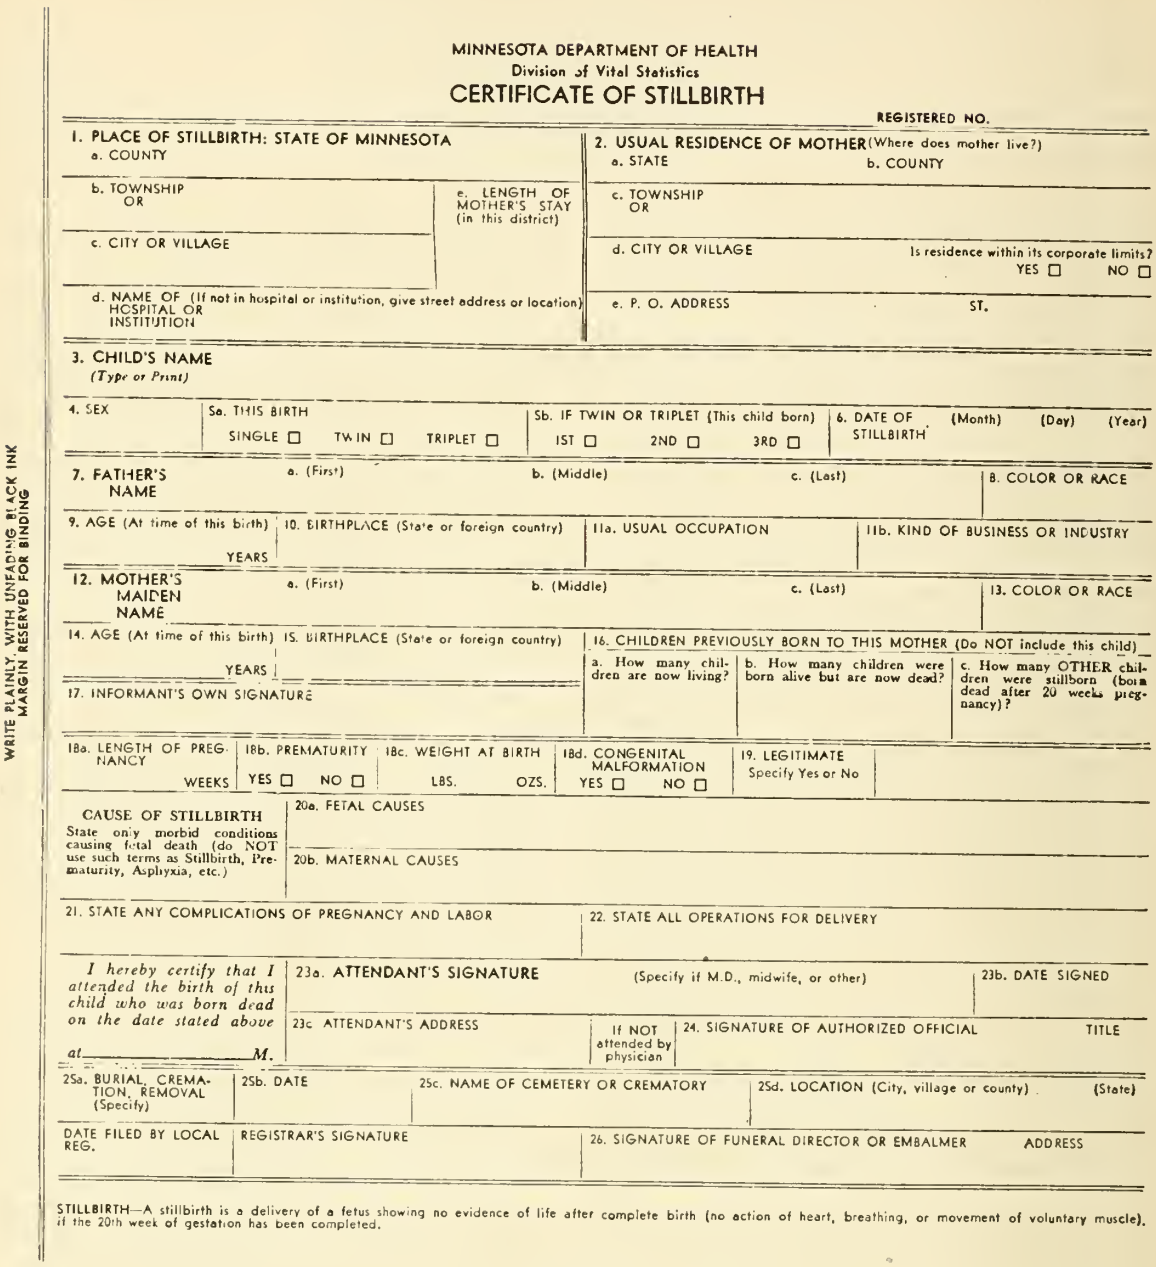
Aureomycin Hydrochloride: 25 mg. with sodium chloride 62.5 mg. and sodium borate 25 mg. in vials with dropper to be diluted with distilled water for ophthalmic use.—*Journal American Medical Association,* October 22, 1949.

NEW FORMS OF VITAL RECORDS FOR 1950

GLADYS G. CASADY AND JEROME W. BROWER
Division of Vital Statistics
Minnesota State Board of Health
Saint Paul, Minnesota

THE PROCEDURE prescribed for the registration of vital statistics constitutes what is commonly spoken of as the system of bookkeeping for public health. Just as the accounting methods of the business world are found not infrequently to be outmoded, the forms and processes employed in the state system of vital registration likewise can become less adaptable to the changing concepts of public health practices and require modernization. Periodically, the Minnesota birth and death record forms are redesigned to elicit such new factual or statistical data as are deemed essential to further the advancements in the field of preventive medicine and public health.

Since the turn of the century these adjustments in the style and content of the vital statistics forms have been made regularly at ten-year intervals. The progress which has been charted for the coming decade in terms of public health statistical accomplishments will be readily traceable to the efforts of the World Health Organization. Since its formation in 1946 it has been instrumental in the formulation of an International Statistical Classification which combines both morbidity and mortality data in its scope. American medical authorities, participating in the work as members of expert committees, have made valuable contributions to its development. The classification was unanimously recommended for world-wide adoption by the International Conference for the Sixth Decennial Revision of Diseases, Injuries and Causes of Death which was convened by the French Government in April, 1948. It was prescribed for international use in WHO Regulation No. 1 on July 24, 1948, by the World Health Assembly.



The Sixth Revision of the International Lists of Diseases and Causes of Death has only recently been published. The coding of causes of death under these new requirements has necessitated an alteration in the form of the medical certification. The Minnesota revised standard Certificate of Death for 1950 contains this new certification. The Certificate of Live Birth has also been improved, and the State Board of Health, departing sharply from precedent, has adopted a separate form for the reporting of stillbirths.

These new forms of certificates will greatly enhance the Minnesota registration system for two principal reasons. Uniformity on a national plane is achieved for the first time not only in the format but in the vital data which will now be called for in these records. For each individual state this represents a distinct gain which will become more pronounced as other countries of the world adopt this standardized pattern. Less difficulties will be encountered in the future in the preparation and interpretation of state, regional, national and even international tabulations of vital statistics. A reliable and uniform basis will be afforded for the comparison of data from all areas. The production of much needed statistical compilations, the fundamental tools of public health, will be expedited. Furthermore, the effective tapping of these broader, more complete and readier sources of essential material can only result in the strengthening of program planning, co-ordination and control in health agencies.

Secondly, a classification of world-wide acceptance and application, furnishing a practical coding treatment of the diagnoses of illness and of the causes of death, should, in a relatively short time, be advantageous in other respects. A marked improvement reflected through these means in any phase of public health in any part of the world will thus be brought into sharp focus. The efficacies of the techniques employed and the methods pursued in such accomplishments can be studied and evaluated. The advisability of utilizing similar approaches in the solution of local problems may then be weighed, after a consideration of all relevant factors, by medical experts and public health authorities.

Filing of Certificates

The new forms of certificates, facsimiles of which are reproduced as part of this article, are to be used for the recording and certification of vital events occurring on and after 12:01 A. M., January 1, 1950. Needless to say, the filing pro-

Burial or removal permit issued .....

Figure 1.

cedures and fundamental registration requirements which are prescribed by the Uniform Vital Statistics Law in Minnesota are not otherwise changed by the adoption of these new certificate forms. The certificates will continue to be filed in the usual manner with the local registrar of vital statistics, who is the Town Clerk, the Village Clerk or the City Health Officer having jurisdiction of the locality where the birth, death or stillbirth occurred. The records of illegitimate live births must be transmitted by the physician directly to A. J. Chesley, M.D., State Registrar of Vital Statistics, State Office Building, St. Paul. However, this direct filing is not required in the case of the stillbirth of an illegitimate child. The stillbirth certificate in all cases will be filed with the local registrar of the district of occurrence.

Certificate of Stillbirth

Minnesota has been one of the few states which have never used a stillbirth record. A stillbirth is defined in the Uniform Vital Statistics Law as "a

birth after 20 weeks of gestation which is not a live birth." A more complete definition is given as a footnote on the certificate of stillbirth. It reads "A stillbirth is a delivery of a fetus showing no evidence of life after complete birth (no action of heart, breathing, or movement of voluntary muscle), after 20th week of gestation has been completed." For the reporting of stillbirths in Minnesota the practice has been to place on file both a birth and death certificate. This procedure will be discontinued on January 1, 1950. A single stillbirth form will thereafter serve the purpose. It will be treated for practical purposes as a death certificate. It will not bear a birth number. The information to be entered on this form is largely that which is called for in the usual birth and death record of such cases. The cause of stillbirth is to be specified in a manner which does not differ greatly from the present method of medical certification of death.

While the item calling for an indication of the length of the infant has been dropped from the record because it has not been considered a satisfactory measurement, there has been restored to the birth certificate forms a provision for a "Yes" or "No" response as to the presence of congenital malformation.

It is emphasized that premature birth is the principal problem in the causes of infant deaths. In 1948, with 716 deaths attributed to premature

N.B. Since this cut was prepared, items 13 and 14 have been renumbered 13a and 13b, respectively, and a new item has been added, to read—14. Spouse's name.

birth out of a total of 27,240 from all causes, it was the eighth leading cause of death in Minnesota. The only means available for the determination of the nature and extent of this problem is through the securing of data on the birth records of the weight and weeks of gestation.

Certificate of Live Birth

A confidential portion of the Certificate of Live Birth, which is designated for "Medical and Health Use Only," will contain these items, numbered as they appear on the form: (22a) length of pregnancy (in weeks); (22b) prematurity; (23) weight at birth; (24) legitimacy status; (25) use of 1 per cent silver nitrate; and (26) congenital malformation. All but item (25) are also a part of the Certificate of Stillbirth. These six items will not be photostated or copied in the preparation of the official certificate of a record of live birth.

The items of "length of pregnancy (in weeks)," "prematurity," and "weight at birth" should per-

haps be explained. Full-term pregnancy varies from 220 to 330 days, with 270 days the average length. This is the equivalent of nine calendar months of thirty days each or approximately ten lunar months of twenty-eight days, computed on the basis of Naegele's rule, from the date of onset of last menstrual period to delivery. Hence, a full-term pregnancy is not thirty-six weeks, but actually forty weeks, and the latter figure is to be used to describe the length of the pregnancy in the normal case.

Prematurity ends at the beginning of the twenty-eighth week of gestation (period of viability) to the close of the thirty-seventh week. In any case, the infant must be born more than two weeks before term computed on the basis of forty weeks for term. The Committee on Fetus and Newborn of the American Academy of Pediatrics defines a premature infant as one whose weight at birth is 2500 grams (5 pounds 8 ounces) or less.

Provision has been made for the insertion by the Clerk of the District Court of the birth number which will appear in the upper left-hand corner of the form.

Certificate of Death

The new certificate of death generally contains little that was not required for identification and statistical purposes in the former certificate. It will no longer be necessary to compute, in terms of months or days, the age of a decedent who was more than one year old at his death. It will suffice if his age in years at his last birthday is stated.

Medical Certification

The medical certification portion of the certificate of death is vastly changed. The International Committee, which prepared the Sixth Decennial Revision of the International Classification of the Causes of Death, and the expert committee, which planned the uniform death certificate, have arranged the uniform medical certification in such a way as to facilitate the entry of the causes of death in reverse sequential order leading back to the underlying cause. The emphasis is on the primary underlying cause of death. Some difficulty has been experienced in the past in securing a clear designation of what constitutes the underlying cause of the death.

With each revision of the death certificate, attempts, not too successful, have been made to guide the physician in setting down the cause of death in such a way that Nosologists and Death Editors would be able to recognize readily the primary underlying cause and thus choose it for statistical tabulation in preference to any of its sequelae which might be shown. On the other hand, when two or more independent causes appeared together, selection of the one to be tabulated for statistical purposes was made by means of rigid tables constructed by International Experts on the basis of a vast body of clinical experience. General rules followed in setting up these tables were that rare, very severe, and infectious diseases; accidents, suicides, homicides, and conditions for which surgery was done were given precedence over other causes certified, and considered the main cause of death for statistical tabulation.

Beginning with 1950, these rigid tables, which have given valuable service in spite of their shortcomings, will be discarded and the responsibility will then be placed upon the attending physician to show by the manner in which he certifies the cause of death, the underlying condition which in his considered judgment caused death. The standard definitions of Cause of Death and Underlying Cause of Death are as follows:

"Cause of Death: A morbid condition or disease process, abnormality, injury, or poisoning leading directly, or indirectly, to death. Symptoms or modes of dying, such as Heart Failure, Asthenia, etc., are not considered to be causes of death for statistical purposes.†

"Underlying Cause of Death: The disease or injury which initiated the train of morbid events leading *directly* to death or (b) the circumstances of the accident or violence which produced the fatal injury."†

By International agreement, the Underlying Cause in the sequence of events resulting in death is to be the one chosen for statistical tabulation, and beginning with 1950 the physician is to report that underlying cause in Part I of the Revised Medical Certification, which consists of two separate parts. As an aid in showing a clear picture of the events which preceded the main or underlying cause, he should enter in Part 1(a) of the certificate, the Direct Cause, which, for discussion, we will call a Massive Broncho-pneumonia. Lacking any intermediate cause, which the physician might feel would make the picture clearer, he could place the Underlying Cause itself, which

†*Vital Statistics Instruction Manual*, Public Health Service, National Office of Vital Statistics, 1949.

we will say is Carcinoma of the Breast, in 1(b). Or, should Metastasis have developed, he would report in Part I the entire sequence of events in their reverse order, giving the Direct Cause first and leading back to the Underlying Cause, which he would state last in 1(c).

In Part 2 of the certificate, he would state any other cause which in his opinion contributed to the death but was not related to the Underlying Cause, the overwhelming and precipitating factor in the termination of life. Suppose this patient had also a Mitral Insufficiency. Then the Medical Certification would read as follows:

1 (a).	Massive Broncho-pneumonia
Due to (b)	Generalized Carcinomatosis
Due to (c)	Carcinoma of the Breast
2.	Mitral Insufficiency (Rheumatic)

It would be perfectly clear to the person editing this certificate prior to classifying it that the cause of death in the doctor's opinion, the Underlying Cause, was Carcinoma of the Breast.

Another example: A Diabetic patient sustains a fracture in an automobile accident. Subsequently and in a relatively short time, he dies. The post mortem reveals a Coronary Occlusion with Coronary Sclerosis, based on Diabetes. In considering this case, the physician concludes that the fracture was not the Underlying Cause of Death, because the Direct Cause was the Coronary Occlusion and its Underlying Cause Diabetes. Consequently, he would certify the cause of death as:

1 (a).	Coronary Occlusion
Due to (b)	Coronary Sclerosis
Due to (c)	Diabetes
2.	Fracture of the hip

In Item 21 of the Death Certificate, he would further give the required additional information relative to the means of the fracture.

This cause of death would be classified Diabetes, because the physician clearly demonstrated in the way he certified the Cause of Death that the Underlying Cause was Diabetes.

It is important for physicians to know that they and not Death Editors with the State Board of Health are to decide which one of the causes, among multiple causes, brought about death; which was the Underlying Cause, the main or major cause, giving rise to the Direct Cause, which finally took the individual out of his misery. Only in so far as the physician realizes his responsibility and meets it will the mortality statistics in Minnesota adequately serve the purpose for which they are needed. They are essential to and being used daily by those engaged in research in Cancer, Heart Disease, Rheumatic Fever, and all other diseases and accidents which deprive mankind of a full life span.

When the physician fails to certify the Cause of Death as is contemplated by the Revised Death Certificate, Editors will be forced to apply a complex body of rules to select the cause for assignment. When this happens, the principles upon which the Revised Certificate and the Sixth Revision of the International List of Causes of Death are based will be defeated. It is agreed that in many cases an exact and true Cause of Death cannot be arrived at because it will not be known. Nevertheless, the objective of the State Board of Health is to deal as intelligently as possible with such information as is available. There is little doubt that the mortality statistics of Minnesota are of excellent calibre because of the high standards of the medical profession in this State and the splendid co-operation which the Board always receives from them.

HUMPHREY HAS CHANGE OF MIND

On the same day that the editorial mailing was made, newspapers carried stories about Senator Humphrey's announcement that he did not expect any congressional action on the administration's health bill next year. The Minnesota Democrat thus lined up with two other sponsors of the measure—Thomas of Utah and Murray of Montana—who look for it to stay on the shelf through 1950. Humphrey said that until the "practical difficulties" of administering the hotly disputed plan have been met, "legislative action might well be a disservice to the principle in which we believe."

All this comes at a time when the British Socialists, who once boasted that there would be no cuts in the "free medical treatment" experiment, are beginning to back water.

Now, if a Briton wants a box of aspirin, a package of laxative or a wisp of cotton he has to pay for it. Under the modification patients will have to pay up to a shilling (14 cents) each for medicines they used to get free. The government thus expects to save $28,000,000 a year. As one *Chicago Dainly News* writer said: "It used to be only critics of the Socialists who said that one reason for the high cost of socialized medicine was that the public was abusing it. Now the Socialists themselves admit it."—AMA Secretary's Letter, Novem-7, 1949.

FLEXOR TENDON INJURIES OF THE HAND

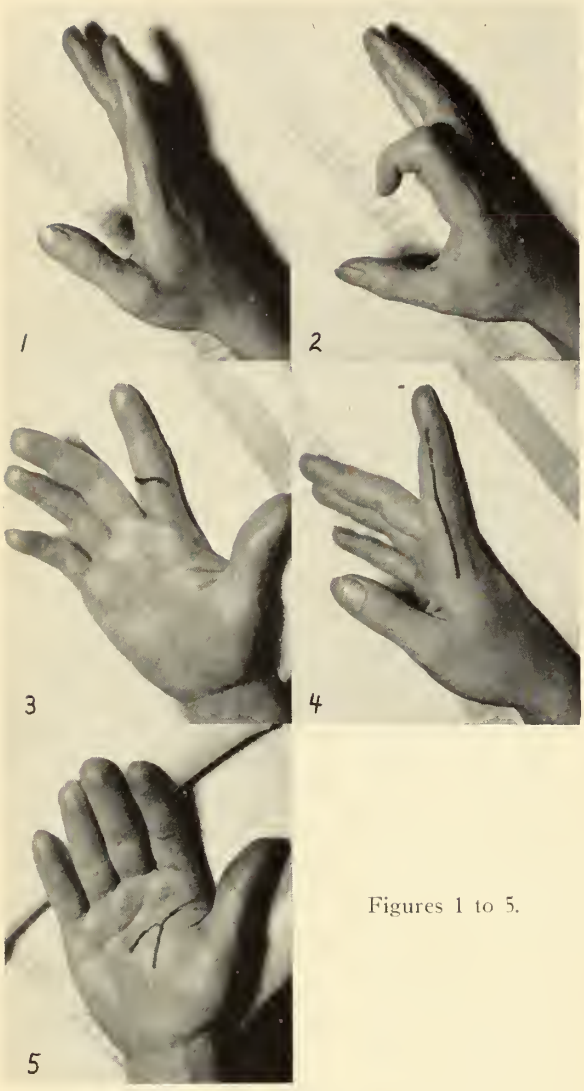
ALBERT T. HAYS, M.D.
Minneapolis, Minnesota

STERLING Bunnell[8] has stated that "next to the brain, the hand is the greatest asset to man and to it is due the development of man's handiwork." Although it is now unusual to have a man attempt an operation on the brain without a special knowledge of its anatomy, physiology, pathology and of the accepted technique, there are still too many men who will attempt to operate on the hand without a similar knowledge and who still relegate this task to the office or the emergency room as a minor surgical procedure.

Lacerations of the hands are the most common injuries encountered by doctors. They are the most frequent household injuries and the most common industrial injuries. The greater number of lacerations of the hand are not serious and can be repaired as a minor surgical procedure. Despite this fact, one should not minimize his respect for hand lacerations. The more serious ones, involving the functioning mechanism of the fingers, must be recognized at the time of the injury in order that the proper treatment may be started with the first-aid care and the first surgical procedure.

The most common lacerations of the hand are those on the palmar surface. It is here that the complicated and delicate mechanism of the hand and fingers is vulnerable to injury. It is here where the poor results of tendon repairs are seen. Better results could be obtained by the proper recognition and handling of these injuries. The disabled hand, from flexor tendon injuries, is still far too common, and it is the purpose of this paper, by discussing the handling of these injuries, to attempt to reduce these disabilities and create a respect for such injuries and their surgical repair.

Sumner L. Koch[12] has said "Surgery of divided tendons differs from other types of reparative surgery in one important respect. Not only must the sutured tissue heal so firmly that the line of union can withstand the tension that is put on it as muscles contract, but the line of union must be so smooth that there is no interference with free gliding movement essential for normal function." This is a very important point, that healing of this tissue must be strong, yet without excess or adhering scar. It is the prevention of this scar which provides the difference between a good or a poor functional result. Many factors influence the degree and extent of scar formation from the time of injury to the resumption of use of the hand. Most of these factors may be controlled by those caring for the injuries, beginning with the first-aid treatment, through the definitive surgical repair, and ending with the after-care.



Nature of the Wound

The first factor influencing scar formation is the nature of the wound. The more traumatizing the wound, the greater the tissue reaction in healing and the greater the extent of scar.

Although this factor cannot be controlled, a certain amount of benefit can be provided through the judgment of the surgeon. He must decide which procedure will result in a more successfully functioning tendon: a primary tendon repair, or a debridement with simple closure of the wound and a secondary tendon repair at a later date. The surgeon, in contemplating a primary tendon repair, must consider whether the additional surgical trauma, the time element involved in a complete repair, and the exudative reaction at the site of the approximated tendon ends may not cause an unfavorable degree of tissue reaction which may offset the value of such a procedure. The surgeon must consider in the secondary repair a shorter time element, less surgical trauma and a minimum of healing reaction at the approximated tendon ends, so that the healing might result in less scar formation and adhesions.

This is especially true when the laceration involves the tendon sheaths where normally there is little space for the gliding tendon. Here very little added swelling will make the enclosed tendon fit too snugly against the tunnel wall and underlying bone. Such snug fitting might result in an interfered blood supply and congestion and add to the likelihood of a final adherence of the tendon to its sheath. Because of this snug-

Inaugural paper presented before the Minneapolis Surgical Society, May 5, 1949.

Figures 1 to 5.

ness within the tunnel sheaths, it is now recommended by most surgeons that a repair of the tendons within these tunnels be confined to the profundus tendon, and that the sublimis tendon be removed at the wrist.

At the Roosevelt hospital in New York, flexor tendons severed beyond the distal flexor crease of the hand are repaired by secondary operation. Their results have been very gratifying.

Figures 1 and 2 represent the result of a severed profundus tendon repaired seven weeks after the initial injury. Healing had taken place by primary intention with only a minimum of scar resulting. Figure 3 shows the laceration. At operation the proximal end of the profundus tendon was found in the palm of the hand. It was coiled under itself and was drawn down easily. A mid-lateral incision was used on the finger (Fig. 4). Incisions in the flexor creases of the palm raised a flap, baring the underlying structures (Fig. 5). The annular ligaments were opened along their lateral margins close to the bone. Bunnell's[2] technique of end to end suture at a distance, with No. 34 stainless steel wire for the proximal tension suture with a pull-out wire, and blood-vessel silk for approximating the tendon ends, was used. The tunnels or annular ligaments were closed with mattress wire sutures brought out through the skin on the dorsolateral aspect of the finger and tied over small buttons.

Tendons in the palm of the hand have more leeway in the amount of scarring which will bind and adhere them, limiting their movement or excursion. Here primary repair of the tendon may be attempted in lacerations or injuries with a greater degree of trauma than those involving the tunnels or sheaths.

Figures 6 and 7 represent such a repair of the long flexor tendon of the thumb lacerated in the thenar eminence by a porcelain water faucet handle. Figure 8 shows the laceration. Repair was done by fine silk suture with relief of tension by flexion of the wrist and thumb at the metacarpophalangeal joint. Figure 9 shows the extension of the operative incision from the laceration.

Influence of Infection

The second factor influencing the amount of scar formation is the presence or absence of infection during the healing. This may vary from the minimal scar in healing by primary intention to the extensive and dense scar which results from actual suppurative infections or gangrenous hemolytic infections. Between these extremes are the various milder forms of infection or inflammatory reaction with or without drainage. These are the result of bacterial contamination. Each produces a degree of scarring in proportion to the infection and the length of time required for that infection to subside. Infection in either the primary tendon repair or simple closure greatly reduces the chance of a successfully functioning tendon.

First Aid

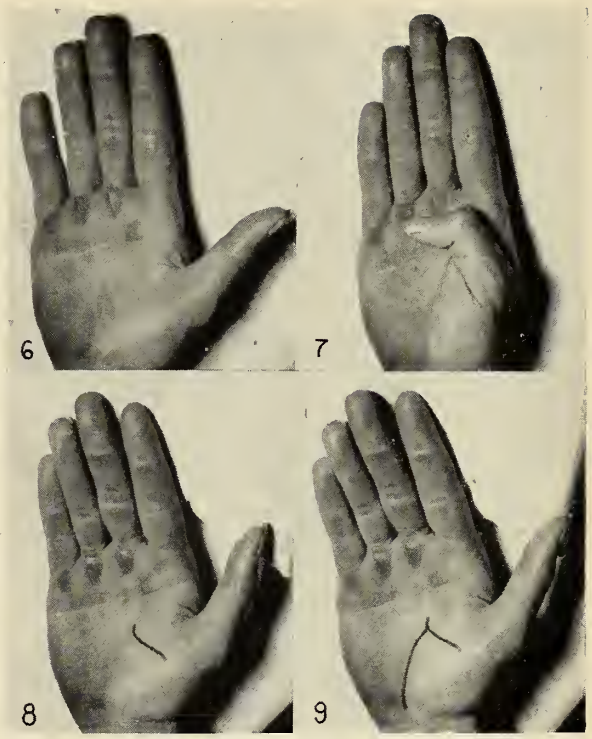
Infection can be minimized considerably, but in order to do so the co-operation of many people is needed. Proper first-aid care of the injured

hand and fingers should be taught and publicized in factories, schools, Red Cross organizations, boy scout activities and first-aid agencies.

Whenever possible, thick sterile dressings should be applied to the wound and hand. The injured hand should be wrapped or bandaged snugly but not tightly. The dressings should be abundant to prevent soaking through of the blood. If sterile dressings are not available, then as clean dressings as possible should be used—never a used handkerchief. If an antiseptic is available, it should be applied to the hand about the laceration but not into it. Iodine should never be used. A tourniquet is never necessary for lacerations of the hand or fingers, and frequently its use is harmful.

Duties of the Hospital Staff

The next persons involved in the prevention of infection are the interns and nurses in the emergency rooms at hospitals, the nurse in the office, or the doctor first receiving the patient.



A careful history of the extent and the direction of the wound, the type of cutting instrument, the areas of fingers involved and the patient's ability to move his fingers can usually determine whether or not tendons have been involved.

If it is determined that tendons are involved or if there is any suspicion of involvement, the original dressing should not be disturbed until the hand is ready for definitive surgical treatment. If x-ray films are thought advisable, they should be taken through the original dressing.

If inspection of the wound is absolutely necessary, it should be done under proper aseptic technique. A mask should be worn by those who make the inspection. Sterile gloves and sterile instruments should be used. Unnecessary sponging or rubbing of the wound should be avoided. Sponges should not be held in unsterile fingers. Probing of the wound for tendon ends is no more justifiable in a hand injury than it is in the peritoneal cavity without proper asepsis.

Duties of the Surgeon

The surgeon must also play his role in the prevention of infection. These injuries are emergencies of the first order. No delay of hours to a convenient time or the next morning is permissible. The greater the length of time between the injury and the operative repair, the greater the likelihood of infection from the growth of

Figures 6 to 9.

the contaminating bacteria in the wound. The importance of this time element is emphasized in the recommendation of M. L. Mason[16] as well as other surgeons. He indicates that severed flexor tendons, in the fingers more than two hours old and in the palm more than four hours old, should not be repaired primarily. The more prolonged the contamination, the greater the degree of inflammatory reaction.

The next important duty of the surgeon in preventing infection is the preparation of the hand for repair or closure. This means the conversion of a dirty, contaminated and traumatized laceration into a surgically clean wound, in which the chance of healing by primary intention is greatest.

The cleansing and preparation of the hand should be done by the surgeon or a capable assistant. It should be done under general anesthesia. A pneumatic tourniquet should be used to control the bleeding. The cleansing should be done with a mild soap and an abundance of water. Brushes should not be used. The removal of the dirt should be dependent upon the emulsifying action of soap and the washing effect of water, rather than upon the effect of scrubbing or rubbing. This may consume a considerable period

of time. Twenty, twenty-five or thirty minutes may be required. Ether may be used to remove grease or oil. A detergent antiseptic may be used.

Following such cleansing, the hand and wound should be irrigated copiously with normal saline. The hand, all fingers and the forearm are then prepared with an antiseptic, meticulously avoiding the introduction of antiseptic into the wound.

A thorough but careful debridement of the wound is then done. All contaminated and devitalized tissue should be carefully removed by sharp dissection. All viable tissue should be saved. Extreme care should be taken to preserve other vital structures such as nerves, blood vessels, tendon sheaths and other tendons. Frequently these are difficult to recognize in a bloodless hand, especially the nerves and vascular branches. Severed nerves should be identified for repair.

This work cannot be done fast, and there are no short cuts. Even the surgeon with a thorough knowledge of the anatomy of the hand must proceed carefully. Many tedious hours may be spent by the surgeon who is striving for good results in his flexor tendon surgery.

Operative Technique

A third factor which may influence the formation of scar tissue in the treatment of tendon injuries is the operative technique. As stated before, the greater the trauma, the more extensive and the more severe the scarring in healing. Therefore a minimum of operative trauma should be added to the original accidental trauma.

"Atraumatic technique," a term used by Bunnell, implies the most delicate handling of the tissues. In order to attain this end, it is suggested that three fundamental principles be applied. First, the operative procedure should be carried out in a bloodless field by use of a pneumatic tourniquet. In order to accomplish this, a general anesthetic may be required, and if such is the case, gastric lavage may be indicated in order to proceed with the operation without delay. A bloodless field eliminates the frequent sponging and wiping of the tissues which, although slight, adds a traumatic factor to the wound. It shortens the operative time by permitting clearer observation and identification of the structures.

It is my practice never to leave the tourniquet on longer than ninety minutes without a release. It is then released for three minutes, following which the hand is elevated and the tourniquet reapplied. The bloody wound is irrigated with normal saline to remove the clots and blood rather than being wiped or sponged out.

Following the completion of the tendon repair, the tourniquet is again released and the gross bleeding points clamped and ligated with fine silk. The wound is again irrigated and the tourniquet reapplied.

The tourniquet is not released finally until the closure has been made and a copious pressure dressing applied to the hand. The pressure dressing is applied so as to minimize the amount of oozing which otherwise would result in a collection of blood with its subsequent organization and undesirable fibrous tissue formation. Residual blood in the field of operation also provides a nutrient field for any remaining contaminant bacteria.

The use of general anesthesia demands that the surgeon have an accurate knowledge of the anatomy of the hand as he cannot be dependent upon the active movement of the tendons to identify them. If the surgeon does not possess this knowledge, he should not be attempting the repair of such injuries. More damage is done by the inexpert or inaccurate repairs of tendon injuries than by the simple closure of the wound with no attempt at repair of the tendons. An improperly repaired tendon with its scarring and adhesions usually presents a far greater problem for secondary repair than the tendon on which no attempt at repair has been made. Also, it may be mentioned here that the anchoring of a proximal tendon end for later repair is a procedure to be condemned. It is far better to prevent retraction by limiting the active use of the tendon by splinting and to keep the joints flexible by passive movements.

Operative Incision

The second principle to be applied in atraumatic technique concerns the operative incision. The operative repair should be done under adequate exposure in order to eliminate unnecessary probing for tendon ends. Much less trauma is produced by wide exposure along proper lines of incision and with sharp dissection than by attempting a repair through the original wound or through a small improperly placed incision.

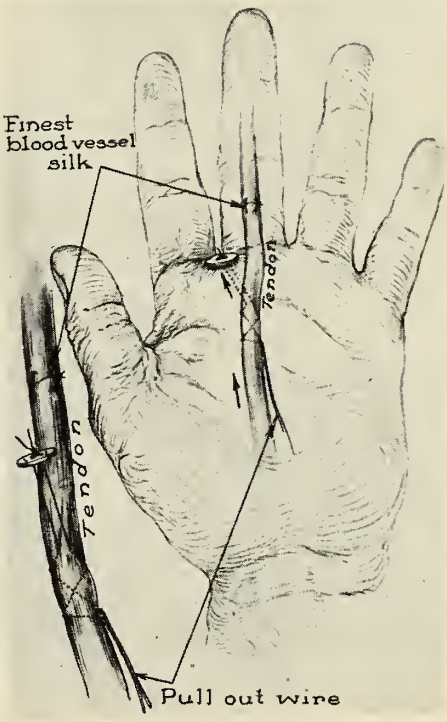
In locating the distal end of a severed tendon it is better to extend the incision and open the

tendon sheath rather than probe for it through the sheath.

In the palm of the hand, large flaps of skin and subcutaneous tissue may be laid back in order to expose the underlying tendons adequately. There will be less formation of adhesions in doing this than when the incision is made directly over the injured tendon, as the scar of the incision lies well away from the repaired tendon. Care should be taken that the adequate blood supply comes through the base of the flaps when the lacerations of the trauma intersect them or complicate them.

Incisions should not cross the flexor creases of the fingers or hand. Mid-line incisions should not be made. Incisions of the fingers should be along the mid-lateral aspect. This position may be found by flexing the finger and placing a dot at the dorsal end of the flexion creases. On straightening the finger an incision passing through the dots will properly locate the incision (Figs. 10 and 11). This incision runs parallel with the digital nerves and vessels and lies midway between the dorsal and palmar branches. Tendon sheaths or annular ligaments should be opened along their lateral aspects close to the bone. A palmar incision should parallel the flexion crease of the hand or the opponens crease of the thumb. My preference is to make the incision directly in these creases (Figs. 5 and 9). The lacerations of the trauma may be extended along the above-mentioned lines or may be left alone and the exposure obtained through new incisions entirely. Finger flaps may be made with incisions across the flexor creases connected with the mid-lateral incisions.

Figures 10 and 11.



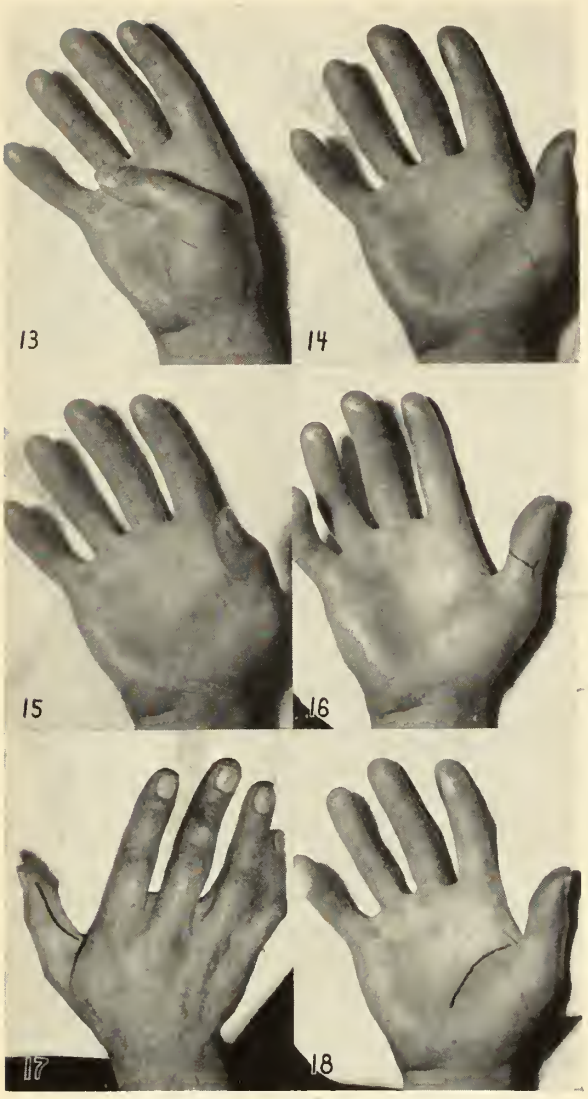


Figure 12.

Proper Choice of Instruments

The third principle involves the instrument and material used in the repair. The instruments used in these procedures should fit the operation at hand. They should be small, delicate and atraumatic. Mosquito forceps should be used for clamping. Delicate small tissue forceps, small fine pointed curved scissors with sharp, good cutting blades, small blunt or rake retractors and small sharp scalpel blades which are changed frequently should be used.

Fine silk, 4° to 6° is used for vessel ligatures. For the tendon repairs themselves I prefer the technique of Bunnell[5] in the use of fine stainless steel wire with pull-out wires. Fine silk, size 6°, is used, especially in primary repairs in the palm or thenar eminence, although here, also, the wire technique may be used.

Each case with its individual problems dictates the suture or technique used. In tendon repairs within a tunnel, either primary or secondary, I prefer the "suture at a distance" technique of Bunnell[2] with wire tension sutures and pull-out wire and the approximation of the tendon ends with one or two blood-vessel silk, right angle sutures (Fig. 12). Threading of the distal tendon over the wire suture and bringing the wire out through the end of the finger over a button works out well in repair of deep flexor tendons

Figures 13 to 18.

cut quite distally. Figures 13, 14 and 15 show a secondary repair of the long flexor tendon of the thumb, using this technique in a case in which a primary repair had been attempted seven and a half weeks previously and which had separated due to improper immobilization. Figure 16 shows the original laceration, and Figures 17 and 18, the secondary operative incisions. Short tendon grafts may be threaded over the wires. Long tendon grafts may be threaded through intact tunnels to the finger end and approximated to the proximal end by only blood-vessel silk, while the proximal end of the tendon is held distally under tension with a wire suture brought out in the palm. The use of wire which can be removed reduces foreign body reaction to a minimum. Stainless steel wire itself produces a minimum of foreign body reaction, and after its removal only one or two very fine blood-vessel silk sutures remain as a foreign body. Usually a size 34 wire will suffice for finger tendons with a slightly larger wire used for the pull-out wire. Also, through-and-through mattress wire sutures tied over buttons are used for the closure of the tendon tunnels along the finger. The skin is closed with interrupted fine silk.

Postoperative Care

The final factor influencing the amount of scar formation is the postoperative care given. The excellent work of M. L. Mason and H. S. Allen[18] on the rate of healing of tendons has taught us much and guided our course in the after-care of repaired tendons. They have shown that, in the healing of the tendons, three tissues are involved, namely, the tendon itself, the connective tissue in and on the surface of the tendon, and the connective tissue surrounding the tendon. They have further shown that the healing processes pass through stages of tissue reaction and regeneration and three phases of varying tensile strength of the tendon. Tendon healing begins in the connective tissue in and about the tendon with proliferation of fibroblasts to form a cuff between and around the tendon ends. During this exudative phase there is an actual enlargement at the approximated tendon ends due to swelling and exudative reaction. Such enlargement must be taken into consideration during the early postoperative period in view of the fact that such swelling produces a tight fit of the tendon within its sheath. The stage of exudation and fibrous tissue proliferation lasts until the fourteenth to sixteenth day. It is during this stage that the tensile strength at the point of union is the weakest and therefore separation can occur most readily.

Mason and Allen found that there is a rapid diminution of the tensile strength at the point of union, reaching its maximum on the fifth postoperative day. Thereafter there is a gradual increase in the tensile strength up to the sixteenth day as fibrinous union takes place. The holding power of the tendon does not rise above the strength of the sutures until the fourteenth day. The suture strength itself, although carrying most of the tension during this period, is weaker than the immediate suture until after the fourteenth day.

The next stage of healing is one of regeneration and conversion into tendon-like tissue. This is a stage of maturation and differentiation, where the cells appear very similar to tendon cells although distinguishable. This stage begins about the fourteenth day. The swelling begins to subside and the connective tissue elements loosen and allow movement. It is during this period that increase of the tensile strength of the tendon levels off into a plateau until about the nineteenth day, when it again passes into a third phase of increasing tensile strength.

In the third phase, between the nineteenth and twenty-fist day, the maturation of the healing occurs.

The work of Mason and Allen also showed that function of the tendon after the fourteenth day will increase rapidly the tensile strength but will also increase the tissue reaction about the tendon. Function or motion during the first fourteen days has no effect on increasing the tensile strength although it does increase the tissue reaction and may lead to separation at the suture line. After the nineteenth and twenty-first days, function further increases tensile strength with less reaction, although some reaction still takes place and stretching of the suture line may occur.

Thus, the work of these men has pointed out that to gain the strongest healed tendon with the least amount of adherent scar, complete immobilization of the healing tendon is required for a minimum of three weeks. This is accomplished by applying a posterior plaster splint to the forearm, wrist and hand onto the proximal phalanges of the fingers, with the wrist slightly palmar flexed to relax the flexor tendons and the fingers slightly flexed in the position of function. The hand is dressed with an abundant pressure dressing with the fingers flexed in function over the dressing. The splint is applied on the dorsum of the arm and is held in place with elastic bandages. The hand and forearm then are well elevated on three pillows postoperatively to reduce the congestion as much as possible, which in itself is another factor in the amount of scarring and fibrosis which will develop. Skin sutures are removed at the end of a week. The splint is removed at the end of three weeks and hot soaks of the hand begun with guarded active movements. The splint is reapplied at night. At the end of four weeks, active physical therapy is begun with whirlpool, massage, active and passive movements and muscle training. Improvement and progress may take place well over a year. Penicillin and sulfa drugs are used postoperatively for five days to a week but reliance on them to overcome the improper handling of the injury is never justified.

Conclusions

The success of flexor tendon repairs is dependent upon the firm healing of the specialized tissue with the minimum amount of scarring or adherence to surrounding tissue.

Many factors are involved in attaining the above desired healing from time of injury to the final functional use.

The majority of these factors is definitely under the control of the people caring for these injuries. The proper control of these factors has been discussed with the underlying principals.

A plea has been made for the proper handling of such injuries to prevent the permanent crippling and disabling of man's second greatest asset, his hands.

MEDICAL CARE PROBLEMS OF THE AGED

EDWIN J. SIMONS, M.D.
Swanville, Minnesota

MEDICAL and hospital care for the aged is not only a state and local problem, but a national one. Three salient facts should be borne in mind in any consideration of this matter. First, the number of aged persons in our population is steadily and greatly increasing. Second, aged persons are subject to more physical hazards and illnesses than younger ones. And, finally, our present hospital system is adapted principally to care of acute, emergency illness, making beds for the aged or chronically ill unavailable and excessively costly.

In the United States in 1948, there were 10,000,000 persons sixty-five years of age or older. Boas has estimated that by 1980 there will be 22,000,000 such persons in this country. At present there are about 250,000 persons sixty-five years of age or older in Minnesota. Of these, about 60,000 are Old Age Assistance recipients. Also, it is known that the number is steadily increasing, and the case load of Old Age Assistance is likely to increase gradually. This increasing load is sure to raise the total medical cost as well as other costs of the program.

Besides the increasing case load, persons over sixty-five years of age are subject to more illness and different diseases than those of younger age. Problems of medical care of this population group are evident in the very types of disease with which the aged are afflicted. Principally, they are of three types: infectious, degenerative, and neoplastic or cancerous. And immediately you ask, "How does this influence medical care costs?"

Infectious diseases of the aged most often involve the lungs as pneumonia or the genito-urinary tract as kidney or bladder infections. Two drugs, the "sulfas" and penicillin are effective against most infections. Notoriously, however, aged persons have less resistance to infection and their bodies are less resilient, which means their return to normal is more prolonged. Lessened resistance means larger doses of drugs. This increases cost. Low resilience means more prolonged attendance and hospitalization. Beyond these two factors is another, the greater frequency of complications of such diseases in the aged. All of these factors are responsible for an unavoidably high cost of medical care for this group.

Degenerative diseases involve any tissues or organs in the body, but the heart and blood vessels are the tissues most often involved. Thus, high blood pressure, heart failure, hardening of the arteries, apoplexy and coronary heart disease often require medical care in this group of people. Such other diseases as arthritis, hip fractures, kidney disorders, diabetes and psychiatric problems often demand medical care in persons over sixty-five years of age. All of these afflictions are expressions of wear and tear of different organs of the body. Each of them is a chronic, incurable ailment requiring varying amounts of medical care over a prolonged period of time. So again, with this group of diseases, factors are operative which make medical care costs beyond the control of anyone.

And, finally, is that group known as neoplastic which includes various types of tumors and cancer. Treatment falls into two classes, palliative and curative. Palliative measures at times are both frequent and heroic, and at other times infrequent but prolonged—in either event, expensive. Curative treatment is principally radium, x-ray or surgery. All of these forms of treatment involve hospitalization and are costly.

Thus, then, the very nature of the diseases and the constitutional characteristics of the aged tend to increase the cost of their medical care. It is not possible for the attending doctor nor for the social worker to control or influence such expense. Such a statement is based upon the assumption that Old Age Assistance recipients are entitled to the same care as others even though government has assumed responsibility financially.

Medical Care Problems of the Doctor

With these basic factors understood by all, the question arises, "What, then, are the immediate problems as the doctor attends these patients?" With the exception of the customary minor illnesses and regulatory regimes that can be managed in the doctor's office, proper diagnosis and treatment requires hospitalization. This is due to various evolutionary changes in medical practice. Up-to-date diagnostic procedures and treatment

Presented at the Minnesota State Conference of Social Workers, Minneapolis, May 4, 1949.

methods are not possible in the home. Notable also is the fact that in present times relatives and neighbors are not available to assist with care in the home. Neither practical nor registered nurses can be secured for home treatment. And even of greater moment is the general desire of people now to be hospitalized when ill. Thus, then, hospitalization is the first problem for the doctor when called upon to treat the aged for anything but minor illnesses.

Clearly, it appears that the answer is, "Well, hospitalize the patient and be done with it." It is not that simple. Just an example, consider St. Gabriel's Hospital in Little Falls. It serves all of the doctors and most of the patients of Morrison County. On several occasions during the past winter it had an unusually high census of elderly patients with cancer, heart disease, threatened gangrene, fractured hips, diabetes and other chronic disorders. Prolonged hospitalization of these patients meant that case after case of acute illness in younger persons had to be cared for in the home. Actually, the hospital superintendent had to refuse admittance to a three-year-old patient with pneumonia. She was treated in the home with injections of penicillin. Two days later her seven-year-old sister required penicillin treatment of pneumonia at home. This meant traveling twelve miles over nearly impassable roads. A blizzard then could possibly have cost one or two lives. Such situations occurred not once but a number of times. Aged persons with prolonged illnesses can better be refused hospital beds than those with emergency illnesses. Appendicitis cases requiring immediate operation have to be cared for in the halls and corridors after operation. Such experiences are common to every hospital and location in the state. Hospital administrators are compelled to refuse hospital beds for the aged, for chronic illnesses, or for anything but emergencies of either a medical or surgical nature.

It is because our hospital system is adapted only to handling of acute conditions that the whole country is so lacking in domiciliary or convalescent homes, and in hospitals for the aged and chronically ill. On a national level only 28,000 acceptable beds are available for the chronically ill, and 248,000 more such beds are needed. In Minnesota in 1948, there were 564 acceptable chronic disease hospital beds whereas the total needed was 5,634 or ten times the number actually available. Solution of this problem only too obviously is construction of more hospitals for the aged and chronically ill.

Financial Problems of the Physician

The second general problem regarding medical care of the old age assistance recipient is financial. To give you as broad coverage of this as well as of the other matters discussed, many doctors in various other sections of the state have been interviewed. So, the following impressions are not mine alone. Furthermore, the suggestion has been made by conference members that I discuss some of the financial aspects as physicians see them.

Most frequently, the point of dissatisfaction of the doctor about the bill for medical services is, "Who is responsible for the bill, the patient or the welfare agency?" Old age assistance patients often do not identify themselves as such when seeking medical care. The doctor consequently makes his usual charge instead of the reduced fee charged such patients. When medical service is ended, a bill is sent to the patient. This procedure elicits the information for the first time that the patient is receiving Old Age Assistance. Consequently the bill must then be reduced and, as the patient usually asks, sent to the welfare agency. Then, word is received from the executive secretary that the patient has been receiving a grant for medical care and should pay the bill himself. At other times, a check is received covering part or all of the bill for medical services.

Often the physician is both confused and a little disgruntled. He is confused because he does not know from one case to the next whether the welfare board or the patient is to pay the bill. And he is disgruntled since regular charges have had to be reduced because the patient is unidentified as an Old Age Assistance recipient. His discontent is not lessened when he recalls that fees for such patients were reduced because payment for their medical services was practically guaranteed. Yet, as frequently as not, when the grant is given the patient, the money does not reach the doctor.

It is quite obvious that the basic cause of this type of complaint is the unrestricted grant required by federal regulations. But almost equally responsible is the lack of uniformity of handling these financial policies by the 87 counties of the state. Many doctors treat patients from more

than one county. Difference of policies in the different counties further confuses him.

Generally speaking, physicians of the state do not understand that federal regulations require that the money be given recipients for medical care without policing the use of the grant. Several years ago, a survey revealed that in some instances as much as 50 per cent of money paid recipients for medical care did not reach the attending physicians. Possibly this is one reason that doctors are criticized for the high cost of medical care. Surely, closer liaison between welfare and medical groups would acquaint doctors with such regulations. Moreover, it might provide the doctor an opportunity to secure payment from recipients when it has been covered in the grant. Beyond that, when federal regulations are responsible for misapplication of funds, efforts should be made by all concerned to see that these regulations are changed.

As mentioned, lack of uniformity in payment of physicians bills in different counties contributes to confusion and resentment. When the medical bill can be paid by increasing the recipient's total grant to $50 a month over a six-month period, advantage lies in the country's handling the matter in this way to secure federal participation. This is not fully understood by all doctors, and again suggests better liaison between the two groups. Nevertheless, were it understood, the attending doctor would still not know which medical bill would be handled this way and which one would be paid in full at once by the welfare agency. Before the doctor secures such information, several months have passed, and possibly some of the money paid the recipient for medical care has already been spent otherwise.

Still another point of dissatisfaction is the discrimination of welfare boards in payment of hospital and doctor bills. More often than not, according to some doctors, the hospital bill is paid at once and the doctor is compelled either to wait till the six months has expired or to accept small monthly payments. Again, these monthly payments may or may not be made by the recipients. Besides the reduced fees for such patients, which reduction is not made by hospitals, doctors often not only wait prolonged periods for their pay, but actually lose a part or all of their bill. Uniformity of handling hospital and doctor bills would avoid these points of dissatisfaction and the inequities involved.

Terminal medical care bills still remain a bone of contention. By these terms, doctors mean medical bills remaining unpaid on the books after the death of the old age assistance recipient. They may be for medical service dating back some months prior to the recipient's death. Or, they may be items related entirely to the recipient's terminal illness. While there are fewer actual terminal illness bills unpaid, there are some. Quite frequently the unpaid items extending back over many months represent appreciable losses. Some state-wide policy which is fair and reasonable to all concerned would eliminate this type of complaint.

Other Areas of Physician-Welfare Discord

At this juncture, it may be best to explain that whatever has been said or is to be said is intended solely as constructive criticism. You as administrators of the welfare program are entitled to know the technical difficulties and the dissatisfactions of the doctors who provide the service. Similarly, the medical profession should learn and know the administrative problems which you face. It is with this viewpoint, one which envisions ultimate solution of joint problems, that I am presenting these matters. Looking at the matter in this way there still remain several features which require consideration.

Frequently, welfare boards have complained about the seemingly excessive medical care given these patients. Almost every doctor, at least in rural areas, knows patients who seldom, if ever, sought medical care until they were on Old Age Assistance rolls, and then regularly and frequently insisted upon care of inconsequential illnesses. This same demand for medical care became apparent in the Farm Security Administration medical care program in Morrison County. When medical care costs were assumed by the governments of New Zealand and England, demand of the people for more medical care raised costs of these programs enormously. It is just another facet of such thinking that makes such patients demand hospitalization when someone else bears the cost, whereas hospitalization was not to be considered when its cost came from the patient's own pocketbook.

This aspect of the matter immediately poses the question, "When is medical care needed and when is it unnecessary?" When the type and frequency of medical care does not change before and after

the patient's sixty-fifth birthday, it is to be assumed that the patient is as much entitled to care when the government pays the bill as when the patient himself pays it. When the patient's physical condition before age 65 is neglected because of insufficient funds, one of the objectives of the social security program has been to provide adequate medical care at government expense. So, these two groups of old age assistance recipients are fully entitled to proper and adequate medical care at government expense.

It is the group which immediately demands more care at government cost than the type of illness or change in financial status warrants that causes difficulty for both attending physician and welfare workers. Practically all doctors are so busy that they do not want nor need such cases. Yet, it is this type of patient which has been responsible for the belief of welfare workers that doctors are using such patients to build practice or increase income. Two very real problems face the doctor in these cases. Morally and otherwise, it is not proper for the doctor to neglect anyone needing medical care. So, when such a patient presents himself to the doctor, it is imperative that he determine the physical condition of the patient. Doctors, almost without exception, have this attitude. Who is to be responsible for the bill is of secondary consideration. In solving the dilemma of neglect or adequate care, the error is usually on the side of proper medical care.

Suggestions for Improvement

Physical hazards and constitutional traits of persons sixty-five years of age or older inherently raise medical care costs for this group of people. Understanding and acceptance of such factors will assist materially in avoiding friction over their seemingly excessive medical care bills.

The next problem, hospitalization, can best be solved by construction of more domiciliary institutions, convalescent homes, and hospitals for the aged and chronically ill. Such institutions can be operated at a much lower per diem cost, since it is the special services required in any hospital for treatment of acute and emergency cases which raise per diem costs. Education of the public, and molding public opinion regarding the need for these facilities is perhaps a joint welfare-medical responsibility.

Confusion and discord concerning medical care bills for the aged can best be solved by a uniform equitable system of payment of hospital and medical bills by welfare boards throughout the state. Where federal regulations encroach upon state philosophy, principles or policy, a sustained and united effort to change federal regulations should be followed to its successful conclusion. This, too, is probably a joint welfare-medical responsibility.

And finally, the whole area of misunderstanding and confusion regarding joint medical-welfare matters could be greatly improved by a reactivation of county Medical Advisory Committees. Physicians have offered their services and cooperation in this regard. Exploitation of these committees by welfare boards throughout the state should be enlightening to both groups. It is only by harmonious liaison between the two that these questions can be answered for the greatest good to the people served, the old age assistance recipients.

THE PHYSICIAN AS HEALTH EDUCATOR

Little can be accomplished in preventive medical service without the intelligent co-operation of the family. The physician rendering such service is, therefore, primarily a health educator. Although health education in the mass has been adopted by schools, health departments and industries, individual and family instruction is the most effective approach. Every health examination from the prenatal period to old age should be a session in health education, with simple explanation of the reasons for various tests, favorable comment on normal findings and instruction on how deviations from the normal can be overcome or held in check. Such procedures are paramount in winning the confidence of the individual and family in the skill and personal interest of the physician.—Henry E. Meleney, M.D., The Milbank Memorial Fund Quarterly, July, 1949.

SOURCES OF ERROR IN THE DIAGNOSIS OF FEEBLEMINDEDNESS

GRACE ARTHUR, Ph.D.
Saint Paul, Minnesota

OF LATE, a good deal of confusion has been created in the thinking of both lay and professional groups in regard to feeblemindedness. Reports with titles such as "They are Feebleminded No Longer" do more than imply that feeblemindedness can be cured. By definition, the mental defect existing from birth or from an early age, that prevents an adult from managing himself or his affairs with ordinary prudence, is a permanent condition. This amentia, or general mental defect which is accompanied by defective development of the nerve cells of the brain, is not likely to be corrected by improved habit training or increased self-confidence.

Unfortunately, there are still individuals who are convinced that they can identify the feebleminded without recourse to laboratory procedures. It is such snap judgments that furnish the background for overnight recoveries. Physicians, teachers and social workers are likely to overestimate the ability of the outgoing, talkative child, and to underestimate the potential intellectual power of the child with a specific handicap. The special defect is confused with general defect, because it tends to lower the reaction level. The dull child with poorly fitted glasses hasn't a chance on tests requiring vision. More than one child with impaired hearing has been committed as feebleminded because he could not learn in the regular classroom, and was found to be unable to respond adequately in verbal test situations or in those where verbal instructions were given.

Thomas was a tall, handsome, adolescent boy with an I.Q. of 85. He walked with a severe limp. It was hard to believe that in his pre-school years he had been diagnosed "Spastic paralysis. Idiot."

The child with delayed speech is at a terrible disadvantage. If he is suffering from oral inactivity, few people understand him when he tries to talk, and his original handicap is augmented by emotional upset. One boy with normal appearance, little speech, but good adjustment to ordinary life situations, had collected a series of I.Q.'s between 50 and 60 on the Binet and other verbal scales. When examined with the Point Scale of Performance Tests, which can be administered without any speech on the part of either the psychologist or the patient, he earned an intelligence rating of Somewhat Superior, with an I.Q. of 112. When he earned this rating he had not been "cured" of anything. He simply was given an opportunity to demonstrate his general intelligence level under circumstances where he was not handicapped by his very defective speech.

It is recognized that defective speech is common among individuals with retarded intellectual development. But it is faulty logic to assume that every individual with defective speech is suffering also from general mental retardation. One child who could not talk plainly at the age of five years accomplished very little when tested with the Binet scale. But the combined rating from the Arthur Adaptation of the Leiter International Performance Scale and the Revised Form II of the Point Scale of Performance Tests yielded an I.Q. of 140. Both scales can be administered without the use of any speech on the part of either the patient or the psychologist. From the quality of his work, his capacity for auto-criticism, and the general intelligence level of his family, there was every reason for accepting his nonverbal rating as a valid measurement of his rate of intellectual development. As a result, his training was adapted to his general developmental level, and not limited to that of other children with the same amount of speech, or of the same chronological age. A wealth of new experiences created a greater need for speech, and speech began to improve. (Speech therapy was needed but was not available in this situation.)

The special disability that causes most confusion in the diagnosis of feeblemindedness is a specific reading disability described by Hinschelwood under the name of Congenital Word Blindness. Like some types of feeblemindedness, it has been regarded as hereditary. It is more common among males than among females. Like musical ability, it is independent of brightness or general intelligence, occurring among the very bright as often as among the dull. If neglected, it tends to lower the Binet I.Q. and lowers ratings obtained with all other verbal tests, and tests where instructions must be given verbally.

Donald was a homely, friendly little boy with general ability at the low average level. Nobody thought of him as anything but normal until he spent year after year in school without being able to learn to read. His Binet I.Q. slipped from a comfortable 92 to a less comfortable 80, and down to an alarming 69. During this period, his I.Q. on the Point Scale of Performance Tests was 92, as it was unaffected by school learning or the lack of it. The year he was twelve years old, he had the good luck to be in a school where tutoring under psychological supervision could be provided. When taught by methods suited to his special intellectual organization, he began to learn. When satisfactory reading skills had been acquired, and he was no longer handicapped by inability to deal with a printed page, a re-examination on the Binet scale again yielded an I.Q. of 92. Early diagnosis of specific reading disabilities saves anxiety on the part of the parents and emotional disturbance for the child by providing the kind of teaching method which his particular reading difficulty requires.

To avoid mistakes in the diagnosis of feeblemindedness, full weight must be given to all physical handicaps. A complete psychological examination must be given, and not just a Binet test or any other test depending on verbal instructions. Both verbal and non-verbal ratings are necessary to give a complete picture. For the school-age child, care must be taken to avoid confusing school failure due to a specific disability with general retardation. The time element, too, is important. A short scale seldom yields as reliable results as a full scale. A child under observation in standardized situations for two hours has a fairer opportunity to demonstrate his average level of response than he would in a time-saving test. It is a commonly accepted rule that a final diagnosis is never made on the basis of a single examination, no matter how thorough that may be. A tentative diagnosis, a constructive plan of treatment, an opportunity to observe the capacity of the child to respond over a period of time, and a re-examination at the end of six months for a pre-school child, a year for a grade school child, and at the end of a year on alternate forms of the scales originally used for pre-adolescent and adolescent patients would serve as a sound basis for diagnosis. With more careful diagnosis, there will be less need and less opportunity for miraculous recoveries. Moreover, remediable conditions will be discovered in time to be helped before emotional disturbances enter in and complicate relatively simple problems.

The day is past when the family physician told the anxious parents to go home and "quit worrying"—and gave no further advice. In all situations where a child is failing to develop normally, or to make a satisfactory school adjustment, parents need specific, detailed advice as to what to do *now,* if the condition is to be helped to improve, or prevented from growing worse.

35 North Grotto

NATIONALIZED MEDICINE

A review of the background of this movement to nationalize medicine shows that two powerful lobbies have developed over the past 20 years—one outside the Government, headed by Michael M. Davis, the other inside the Government, headed by Isidore S. Falk. Aiding the nongovernment lobby are many Communist-front organizations, notably the International Workers Order. Davis' lobby, the Committee for the Nation's Health, draws a considerable part of its membership from Communist-front organizations. Out of 166 CNH members listed on that organization's letterhead, 91 are members or supporters of subversive organizations working to overthrow the United States Government by force and violence if need be. Whatever their methods, they are opposed to the capitalist system and to our way of life. One of their main weapons is national compulsory social insurance.

The Committee for the Nation's Health has invaded Congress. It has the ear of the President.

The program for nationalization is being sold by misrepresentation regarding the way in which it would be administered and the costs. It is a fraud on the American people.

This program is one for the socialization or nationalization of medicine. The essence of socialized or State medicine is *control by the State and payment for services out of tax funds.* The Federal Security Agency has tried to write a new definition stating that the program would not be socialized if the physicians were not salaried servants. That is not the issue. The issue is *control* and *method of payment.* When a National Social Insurance Board, under the direction and supervision of a Federal official, writes the rules and regulations for *all* the health personnel of the country, for all hospitals, pharmacists, *and patients,* the resulting medical care program is *socialized* or *State medicine.* Indeed, it is *nationalized medicine,* notwithstanding assertions to the contrary.

The present bill is a first step, and a long one, toward complete nationalization of medicine. The ILO stated:

"The fact is that once the whole employed population, wives and children included, is brought within the scope of compulsory sickness insurance, the great majority of doctors, dentists, nurses, and hospitals find themselves engaged in the insurance medical service, which squeezes out most of the private practice on the one hand, and most of the medical care hitherto given by the public assistance authorities on the other. *The next step to a single national medical service is a short one . . .*" (Italics mine.)—American Medicine and The Political Scene, MARJORIE SHERON, June 10, 1949.

Case Report

HEMOLYTIC JAUNDICE ASSOCIATED WITH HEMOGLOBINURIA

RICHARD B. TUDOR, M.D.

Minneapolis, Minnesota

THIS IS the case of a three-year-old white boy, who was first seen on June 15, 1946, with the chief complaints of fever (103.8°), earache, reddish urine, anorexia and listlessness of one week's duration. The present illness began approximately one week before admission when the child complained of a sore ear and was found to have a mild fever. This cleared and he felt fine until the day before admission when he was listless, without appetite, and his mother noted that he was passing dark urine. On the day of admission he vomited twice, passed a small amount of "bloody" urine and was noted to have a temperature of 103.8° (rectal). His past and family history were noncontributory to the present illness.

Physical examination revealed a well-developed and well-nourished white male child, three years of age, in moderate distress. His temperature was 101.5° (rectal), pulse was 80, and his respirations were 20 per minute. Blood pressure was normal. He was slightly pale, and an occasional cough was noticed. His face was pale and the upper eyelids were sightly edematous. Lymph nodes in the neck were shotty, bilateral, and tender to palpation in the left posterior cervical chain. His tonsils were 2-plus enlarged and slightly reddened. The oral pharynx was also moderately infected. The ears were normal. His chest was clear to auscultation and percussion, and his breathing was without distress. Examination of the heart revealed it to be of normal size and shape and to have a soft basal systolic murmur, heard best in the first and second left intercostal spaces. It was thought that it was most probably a functional murmur. The rest of the physical examination was normal.

Laboratory examination was as follows: The hemoglobin was 9.5 grams; the leukocytes were 22,000 with 66 per cent neutrophiles, 25 per cent lymphocytes, 3 per cent monocytes and 3 per cent eosinophiles. Urine revealed a specific gravity of 1.018, pH of 5, 3-plus albumin, no sugar and only an occasional erythrocyte and leukocyte.

Our impression at this time was that the child had a hemorrhagic nephritis, so the urine was cultured and he was given penicillin, 30,000 units intramuscularly every three hours.

The next day his condition, if anything, was worse. He had a pale sallow complexion, his eyelids were increasingly edematous and he was very listless. Urine at this time revealed the same dark brown color as on admission; he was oliguric, there was still only an occasional erythrocyte present, but the benzidine test was 2-plus. Blood urea nitrogen at this time was 15 milligrams per cent, and the sedimentation rate was 116 millimeters in one hour. Still not knowing what we had, we continued the same treatment. The next day it was noted that he was definitely icteric and that the liver was now enlarged 2 centimeters below the rib margin on the right. Blood at this time revealed a hemoglobin of 4.6 grams with an erythrocyte count of 1.48 million, the urine was dark colored and as above; also it was found to show 1-plus urobilinogen but to contain no bile. It was also negative for porphyrins. At this time a serum bilirubin was 2.34 milligrams per cent, alkaline phosphatase was 18 (10 to 20, normal) and the cephalin cholestrol was negative to 1-plus, indicating a possible retention jaundice (hepatitis). The patient's cells hemolyzed in the dilutions .30 through .60 in salt solution (normal). Several diagnoses were entertained. One would expect a hemolytic icterus to have produced much more urobilinogen in the urine than seemed to be present for this degree of anemia. A hepatitis would be an exceedingly rare cause of the degree of anemia present in this patient. Bile was not found at any time, furthermore, in the urine.

The patient was immediately transfused with 100 c.c. of citrated blood intravenously, and I began to smell the "proverbial rat." Spectroscopic examination of the urine was ordered for the next day, and it came back very positive for hemoglobin. In spite of the transfusion on the third day, his hemoglobin dropped another gram to 3.9 grams and although the urine was highly colored, no erythrocytes were found. An Esbach test revealed that our patient was losing albumen at the rate of 1.6 grams per liter. Reticulocyte count on this same day, the fourth hospital day, was 8 per cent, indicating a marked destruction and regeneration of erythrocytes going on. He was given in all 300 c.c. of fresh, type A Rh-positive blood that day, with immediate improvement. The urine seemed to get clearer immediately. Blood examination on the fifth day for autoagglutinin for hemolysins revealed moderate agglutination at 37° and at 27° C. and marked agglutination at 40° C. There was no hemolysis present at any temperature.

From this time on he received four more transfusions of Rh-positive type A, fresh blood, bringing the entire amount to 1,080 c.c. of blood. He weighed 15.4 kilograms on admission, so that he would have blood volume of some place between 1,150 and 1,500 c.c. We considered that we just about replaced his total blood volume.

The rest of his course was uneventful; the jaundice cleared gradually, the urine cleared almost immediately, and on discharge on the twelfth hospital day his urine

From the Pediatric Teaching Service of the University of Minnesota and Northwestern Hospital, Minneapolis, Minnesota.

was entirely normal, his hemoglobin was 15.2 grams per 100 c.c. and his reticulocyte count was 5.5 per cent. A stool urobilinogen on the tenth day revealed 1,277 Ehrlich units. Spectroscopic examination of the urine on the last hospital day was negative for hemoglobin.

Discussion

Any toxin or process that destroys erythrocytes rapidly enough produces hemoglobinemia and hemoglobinuria. This hemoglobinuria is occasionally seen in almost any type of acute hemolytic anemia. The number of toxic agents that are hemolytic is very large, however.

Among them may be cited:

BACTERIA
- Streptococcus
- Yellow fever
- E. typhi

PROTOZOA
- Malaria
- Oroya fever
- Lues

CHEMICAL AGENTS
- Arsenic
- Quinine
- Pyrogallic acid
- Sulfonamides
- Lead
- Phenylhydrazine

VEGETABLE POISONS
- Risin
- Croton oil (Castor)
- Toadstools
- Fava bean

ANIMAL and ENDOGENOUS POISONS
- Snake venoms
- Severe burns
- Administration of serum for tetanus, diphtheria and meningococcus infections.

MISCELLANEOUS
- Blood transfusions
- Paroxysmal cold hemolysis
- Paroxysmal nocturnal hemoglobinuria
- Acute hemolytic anemia (Lederer's)
- Acute crises in congenital hemolytic anemia (rare)
- March hemoglobinuria
- Crush hemoglobinuria

Hemoglobinemia and hemoglobinuria occur when excessive numbers of erythrocytes are destroyed rapidly, especially when the hemolytic process occurs intravascularly. They are usually accompanied by severe anemia, reticulocytosis, increased serum bilirubin, urobilinoginuria and fecal urobilinogen and at times methemaglobinemia and methemoglobinuria. If the concentration of hemoglobin in the plasma is between 60 and 150 milligrams per cent, hemoglobinuria may occur, and may persist until the plasma hemoglobin has fallen below 50 milligrams per cent.

For a careful review of the whole subject of hemoglobinemia and hemoglobinuria, I suggest reading the fine article by Ross.[2]

The only drug that our patient took before the urine was noted to be dark was aspirin, which he had had before. He, of course, did have an infection before the onset of the hemoglobinuria. There are no cases of familial hemoyltic icterus in the background of his family; moreover, as I have said before, it is rare to have hemoglobinuria in familial hemolytic icterus. The presence of 4-plus cold agglutinins in his blood which produced hemolysis *in vitro* was perhaps related to his mild pharyngitis.

Since the initial attack, the patient has had one recurrence of the dark urine. It came about six months after the initial episode and was also preceded by a cold for which aspirin was given. Unfortunately, cold agglutinins were not taken at this time. The mother had thrown the initial urine away by the time I arrived at the home, and subsequent urines were clear. Incidentally, I have suggested that he receive no more aspirin. It has now been six months since the second episode.

Summary

1. A case of acute hemoglobinuria with severe anemia in a three-year-old boy was presented.

2. Differential diagnosis was suggested.

3. The only salient finding in the patient's blood was the presence of marked cold agglutinins with no hemolysis, perhaps related to a mild upper respiratory infection.

4. He received 1,000 c.c. of blood over a period of one week, an amount roughly about equal to his calculated blood volume.

5. Recovery was uneventful, and except for one questionable recurrence he has been in good health ever since.

DISCHARGED TUBERCULOSIS PATIENTS

Tuberculosis patients discharged from sanatoria face the future with various life expectancies. Their subsequent mortality is in part influenced, as in the general population, by sex, race and age. The fact that they have had tuberculosis and have been treated for it may also affect their length of life. For one thing, tuberculosis is a disease which places great stress upon the family involved. It sometimes reduces the level of living to such a point that the mortality risk of the patient returning to the family group may be increased, since higher mortality rates are associated with lower family incomes. Premature efforts on the part of the patient to return to gainful employment in order to restore the standard of living may result in relapse and death.—Agnes W. Brewster, A.B., and Ralph Carr Fletcher, M.A., Pub. Health Rep., June 3, 1949.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY

Rochester, Minnesota

(Continued from the November issue.)

The Olmsted County Medical Society.—In Olmsted County the *Rochester Post* of April 4, 1868, carried the following notice: "To the Medical Profession of Olmsted County: All those who feel an interest in the advancement of the profession will meet at the office of Dr. Allen on the 15th day of April, at 2 o'clock in the afternoon to take into consideration the formation of a Medical Society for Olmsted County." The notice was signed *"Many Citizens."*

The same newspaper, on April 25, 1868, carried the following account of the birth of the *Olmsted County Medical Society:*

Medical Organization: A meeting was held by a number of the medical profession at the office of Dr. Allen in this city on the 15th inst., for the purpose of forming a medical association for Olmsted County. The meeting was called to order by Dr. Allen, president pro tem, who submitted a constitution for the Society, which was adopted after discussion and emendation.

The following gentlemen were elected officers of the Association until the first annual meeting in 1869: President, Dr. J. S. Allen; Vice President, Dr. E. W. Cross; Secretary, Dr. R. M. Reynolds.

Committees were appointed by the President to report on the different branches of medical science at the regular annual meetings of the Association, as follows:

Physiology	Dr. W. W. Mayo
Theory and Practice	Dr. H. Galloway
Obstetrics	Dr. J. S. Allen
Surgery	Dr. E. W. Cross
Chemistry	Dr. R. M. Reynolds

The following bill of prices was adopted: visits in the city, one dollar; visits in the country, seventy-five cents per mile; night visits double the above; ordinary office consultation fee, one dollar; physical examination, five dollars; ordinary cases of obstetrics, ten dollars; fractures, simple, first dressing, from five dollars up to twenty-five dollars; fractures, compound and comminuted, from twenty-five dollars up to seventy-five dollars; dislocations, from five dollars to fifty dollars; capital operations from twenty-five dollars up to one hundred dollars; consultation fee, five dollars.

J. S. Allen, M.D.
W. W. Mayo, M.D.
E. W. Cross, M.D.
H. Galloway, MD.
E. C. Cross, M.D.
R. M. Reynolds, M.D.

R. M. Reynolds, Sec'y.

Thereafter the society for a year or two met often, at first in the offices of members, and later at special club rooms, at one time in the Bank Block and later in the rear of Hargesheimer's Drug Store. In addition to the annual business

meeting there were weekly sessions and special quarterly meetings, until by-monthly meetings were adopted, and finally, monthly meetings.

The society welcomed the medical legislation of 1869 as a solution of the local problem of irregular practitioners, and the local newspapers relayed pertinent information to the public. One editor, in discussing the laws and the fines and imprisonment to be imposed on unqualified persons who undertook to practice medicine for pay, said, "This is rough on quacks but no more so than they are on the community." On September 25, 1869, it was announced that a meeting of the Board of Censors of the Minnesota State Medical Society would be held in Rochester on September 30, at Dr. Mayo's office, with the object of examining persons not already licensed who might wish to receive authority to practice medicine, and that on the same day a meeting of the Olmsted County Medical Society would be held at the office of Dr. Cross.

The range of subjects discussed by the Olmsted County Medical Society during its early years was catholic. On January 16, 1869, Dr. Mayo began a series of papers, "The Character of the Earth's Elements, Its function, Development, and Ultimate Destiny, and Its Inhabitants." On February 13, 1869, Dr. Galloway gave an essay, "The Philosophy of Disease," in the course of which he prophesied the time when science would find remedies for all diseases but cancer. Lively discussion followed, after which the faculty discussed charcoal as an antiseptic, the properties of mephitic vapors, and ethnology. It was announced that Dr. J. S. Allen, the president, would read a paper, "Electricity and Lightning Rods" at the next meeting. At a subsequent meeting Dr. Galloway and Dr. Mayo restored clinical character by discussing, respectively, the minute anatomy and the comparative anatomy of the liver, and at the next meeting Dr. Mayo gave a lecture on digestion, illustrated by colored crayon drawings done by himself. Ethnology and evolution held the attention of the group, however, and for several years attention was centered on the theories of Huxley and Darwin. Mr. John H. Whitney, an honorary member, and Mr. H. H. Young, a guest, the latter at one time associated with Dr. Mayo in publication of a newspaper at Le Sueur, were prominent in the discussions. From 1870 for several years the Rochester Conversazione, of the same membership as the medical society but augmented by lay persons, seems to have supplanted the Olmsted County Medical Society, although in 1873, when Dr. Mayo was moving to Saint Paul, a special meeting of the medical group was held to pay him honor.

For ten years after 1874, although mention of the Olmsted County Medical Society did not appear in the public print, the facts that delegations of physicians from the county attended meetings of the state medical society and that these men took an active part in the work of the state society, as will be shown, argue the existence of a functioning county medical group.

On December 4, 1885, the Olmsted County Medical Society was reorganized formally in accordance with the tenets of the Minnesota State Medical Society* and with the provisions of the Minnesota Medical Act of 1883. The account published in the *Rochester Post* of December 11, 1885, is accepted as accurate:

County Medical Society: The Olmsted County Medical Society was organized in this city last Friday. There were present at the meeting Drs. W. W. and W. J. Mayo, E. C. and E. W. Cross, Ida Clarke, and P. N. Kelly, of Rochester; J. E. Bowers, Homer Collins and R. M. Phelps, Insane Hospital; A. W. Stinchfield and N. S. Lane, Eyota; Drs. Trow [A. H. and M. A., father and son], Chatfield; E. A. Holmes, Oronoco; W. T. Adams, Elgin; E. D. Stoddard, High Forest; C. R. Keyes, Byron; and A. W. Hill, Pleasant Grove. The following

*In 1903 the Minnesota State Medical Society took the title "Minnesota State Medical Association." In this article the early title is used except in such parts of biographical sketches as the later title is chronologically correct.

officers were elected: President, W. W. Mayo; Vice Presidents: A. W. Stinchfield and E. A. Holmes; Secretary and Treasurer, Ida Clarke. The rules of procedure and organization were those of the state medical society and the Code of Ethics that of the American Medical Association. Meetings of the society will be held once in two months.

The following fee bill was adopted at the organizational meeting:

FEE TABLE OF THE OLMSTED COUNTY MEDICAL SOCIETY

December 1, 1885

Ordinary office advice or treatment	$ .50 to $ 5.00
Ordinary visit in city or country, one mile from physician's office	1.50
Ordinary consultation	5.00 upwards
Subsequent visit as associate physician	Usual fees
Visit at night (from 10 p.m. to 6 a.m.)	3.00
Visit in cases of smallpox	3.00
Visit in country, per mile	.50 to 1.00
Visit, additional	1.50
Visit in country at night, additional per mile	.25 to .50
Visit	3.00
Visit and passing catheter or boujie [*sic*] if often required	2.00
Introduction of catheter in difficult cases	5.00
Attendance in obstetrics ordinary	10.00 to 20.00
In cases requiring version or use of forceps, additional	10.00 to 15.00
Craniotomy	25.00 to 50.00
Delivery of placenta only	5.00 to 10.00
Detention in cases of obstetrics, over 6 hours, per hour	1.00
Ordinary local treatment of uterus	2.00 to 5.00
Reduction of prolapsus uteri or ani	2.00 to 5.00
Examination per vaginam except in obstetric cases	2.00 to 5.00
Examinations per anum	2.00 to 5.00
Introduction of tampon	3.00 to 5.00
Testing urine	2.00 to 10.00
Administering anaesthetics, including the anaesthetic	2.00 to 5.00
Application of the galvanic battery	1.00 to 5.00
Physical examination of chest or abdomen and prescription	2.00 to 5.00
Examination for life insurance	2.00 to 5.00
Certificate of disability or death	1.00 to 3.00
A letter of advice	1.00 to 10.00
Vaccination, each time	.50

SURGERY

Dressing simple wounds in office or opening abscesses	1.00 to 5.00
Amputation of fingers and toes, each	5.00 to 10.00
Amputation of forearm or leg below the knee	25.00 to 75.00
Amputation of arm below elbow	50.00 to 75.00
Amputation of thigh	50.00 to 100.00
Amputation at shoulder or hip joint	100.00 to 200.00
Reducing simple fractures and dislocations of fingers and toes	5.00 to 10.00
Reducing simple fractures and dislocations of larger bones and joints	15.00 to 50.00
Reducing dislocations of long standing and compound fractures	25.00 to 100.00
Extirpation of uvula	2.00 to 3.00
Extirpation of tonsils, each	5.00 to 10.00
Extirpation of mammary gland	50.00 to 100.00
Extirpation of tumors	5.00 to 500.00
Removal of polypus uteri	25.00 to 50.00
Removal of polypus nasi	5.00 to 20.00
Removal of hemorrhoids	10.00 to 50.00
Removal of testicles, each	25.00
Operation for fistula, in ano	25.00 to 50.00
Operation for fistula lachrymalis, 1st operation	10.00 to 15.00
Operation hare lip, single	15.00 to 25.00
Operation hare lip, double	30.00 to 50.00
Operation cataract	25.00 to 50.00
Operation club foot	25.00 to 50.00
Operation wry neck	25.00 to 50.00
Operation phimosis or paraphymosis	5.00 to 15.00
Operation lithotomy	50.00 to 100.00
Trephining cranium	50.00 to 100.00
Tapping chest	25.00 to 50.00
Tapping abdomen	15.00 to 25.00
Tapping hydrocele	5.00 to 10.00
Radical cure of hydrocele	10.00 to 50.00
Reducing hernia by taxis in difficult cases	5.00 to 20.00
Reducing strangulated hernia by operation	50.00 to 100.00
Ordinary application of truss	1.00 to 5.00
Cauterization of urethra, male	5.00 to 10.00

Cauterization of urethra, female	2.00 to	5.00
Treating stricture of urethra otherwise than by simple introduction of boujie [*sic*]	10.00 to	50.00
Introduction of seton		2.00
Plugging posterior nares	3.00 to	10.00
Treating of gonorrhoea, retaining fee	5.00 to	10.00
(And for subsequent treatment as in other cases.)		
Treatment of syphilis, retaining fee	10.00 to	25.00
(And for subsequent treatment as in other cases.)		
Post-mortem examinations in cases of coroner's inquest or proposed legal investigation	25.00 to	50.00
Post-mortem examination in ordinary investigation—*may charge*		10.00

The fees for all operations not mentioned in the above will be governed by the importance of the case and the responsibility of the operator.

EXTRACTS FROM THE REGULATIONS OF THE SOCIETY

I.

All bills for professional services are due and payable as soon as the service is rendered, and may be charged with legal interest if unpaid at the expiration of six months from the time above specified.

II.

Resolved, That the members of the Olmsted County Medical Society, in publishing this Fee Table and Regulations, hereby express their willingness and desire to make suitable deductions from the regular prices, when the circumstances of patients are such as to render them worthy objects of such charity.

From the beginning the membership of the Olmsted County Medical Society included most of the reputable physicians of Olmsted County and confreres from counties other than Olmsted. Dr. W. T. Adams, of Elgin, Wabasha County, was a charter member in 1868. After 1885, physicians from outside counties were admitted each year. Between 1885 and 1888, S. W. Ranson, Dodge Center; S. S. Walbank, Duluth; S. H. Van Cleve, Mantorville; J. F. Percy, Mazeppa; J. W. Scott, St. Charles, and C. N. Frye, Zumbrota, were enrolled. In the next year or two the society welcomed C. O. Wright, Kasson; F. W. Calkins, Mazeppa; J. P. Waste and N. S. Tefft, Plainview, and W. A. Chamberlain, St. Charles. Within the next few years many other physicians well known in southern Minnesota became members, it appears, among them H. F. Peirson, Austin; Seth E. Howard, Goodhue; A. J. Button, Hammond; C. L. Chambers, Kasson; M. H. Cremer, Mazeppa; J. McPeek and —— Holtz (Holst?), St. Charles; J. B. McGaughey, Winona; G. E. Campbell, Wykoff; C. M. Beebe, J. E. Crewe and K. E. Gryttenholm, Zumbrota, and Dr. Pickard, Burlingame, Kansas.

Since 1885, and probably since 1879, the staff of the second Minnesota Hospital for Insane (Rochester State Hospital) have been active members of the Olmsted County Medical Society. In 1886 Dr. J. E. Bowers, superintendent (1879-1889) of the state hospital, began the pleasant custom, continued ever since, of inviting the society to hold at least one meeting yearly at the state hospital and of supplying a clinical program and social enertainment.

There are given here, in addition to the officers of 1868 and of 1885, already mentioned, other officers, all of them physicians, of the county medical society prior to 1900, insofar as record has been available. At the annual meeting in December, 1886, there were elected W. W. Mayo, president; E. A. Holmes, first vice president; W. T. Adams, second vice president; Ida Clarke, secretary and treasurer, and W. J. Mayo, H. H. Witherstine and P. N. Kelly, censors. The officers in 1888 were A. W. Stinchfield, president; J. E. Bowers, vice president; Ida Clarke, treasurer, and H. H. Witherstine, secretary. In 1889 Dr. Bowers was president. At a meeting held in March, 1891, R. McE. Phelps was elected

president; E. D. Stoddard, vice president, and H. H. Witherstine, secretary and treasurer. In 1892 A. S. Adams became president; S. H. Van Cleve, first vice president, and H. H. Witherstine, secretary and treasurer, a capacity in which he was to serve at many different times. In 1894 A. L. Baker was elected president, and C. E. Fawcett, vice president. In January, 1895, Dr. Van Cleve became president; C. O. Wright, vice president, and Dr. Stinchfield, secretary and treasurer. In 1896 R. C. Dugan was president; C. L. Chambers, vice president; C. E. Fawcett, second vice president, and J. G. Cross, secretary and treasurer. In 1897 Dr. Wright became president; F. W. Burns, first vice president; M. C. Millet, second vice president, and Dr. Cross again secretary and treasurer. In 1898 C. H. Mayo was elected president; F. W. Burns, vice president, and J. G. Cross was re-elected secretary and treasurer. As 1900 opened, the officers were E. M. Clay, president; O. C. Heyerdale, vice president; Gertrude Booker, second vice president, and J. G. Gross, secretary and treasurer.

Although, in the period considered here, meetings of the society usually were held in Rochester, the group occasionally met in Eyota, Oronoco, Mantorville or elsewhere. At regular intervals after 1892 the society was host at annual meetings of the Southern Minnesota Medical Association, which was founded at Winona on July 28, 1892. It is interesting, in relation to the latter association, that at a meeting of the early Olmsted County Medical Society, on January 16, 1869, "a communication was read from Dr. Youmans of Winona, suggesting that the organization [O.C.M.S.] be extended to include all Southern Minnesota. It was moved and passed that the entire membership form a committee to correspond with practitioners in the district generally to the end of organization of such an organization."

Since its reorganization in 1885 the Olmsted County Medical Society has functioned actively, increasing its membership and the scope of its work. As community of interests among physicians of Olmsted County and physicians of neighboring counties increased, amalgamation of local medical groups came about. On November 14, 1832, at Rochester, the Houston-Fillmore County Medical Society merged with the Olmsted County Medical Society, to form a three county society. On July 5, 1934, the Dodge County Medical Society joined with the group, to form the Olmsted-Houston-Fillmore-Dodge County Medical Society, the charter of which was issued on July 15, 1934.

Physicians of Olmsted County in the Minnesota State Medical Society.—When the Minnesota State Medical Society was reorganized in Saint Paul on February 1, 1869, after nearly sixteen years of inaction, the medical profession of Olmsted County was represented at the meeting by Dr. W. W. Mayo. On this occasion Dr. Mayo was elected a member of the board of censors and of the committee on finance and also was appointed to determine the number and the names of regular physicians in Olmsted County and the names and classification of practitioners in the county who were not recognized as physicians by the state medical society. At the semi-annual meeting of the state society at Owatonna on June 16, 1869, Dr. Mayo reported that there were in Olmsted County eight regular physicians and six irregular practitioners.

At the meeting of June 16, 1869, Dr. E. C. Cross, of Rochester, became a member of the state society. In 1870 four other physicians from Olmsted County, E. W. Cross, H. Galloway, J. S. Allen and W. P. Belden (the last-named long resident in Fillmore County), all then of Rochester, were admitted, and in the following year Dr. C. E. Teel, of Eyota, became a member. It was in 1870 that Dr. Harriet E. Preston, of Rochester, the first woman to seek recognition by the

state society, presented her application and thereby started a controversy that was to continue ten years before it ended in admittance of women physicians to the society, and in the election to membership, in 1880, of three women, among them Dr. Preston, who was then in Saint Paul. In 1871 Dr. D. S. Fairchild, of High Forest, was enrolled; in 1872, Dr. A. Grant, of High Forest, Dr. G. W. Nichols, of Rochester, and Dr. A. W. Stinchfield, then of Dundas, but soon to remove to Eyota, Olmsted County, became members. Until 1878 there was little change in the representation from Olmsted County, with the exception of the removal of Dr. Fairchild to Ames, Iowa, in 1872, and the return of Dr. Belden to Hamilton, Fillmore County. In 1878 Dr. S. S. Bishop, of Rochester, was enrolled. In 1879 Dr. J. E. Bowers, already a member from St. Peter, settled in Rochester. In 1880, because of removals, the membership from Olmsted County was four: Drs. Bowers, E. C. Cross, E. W. Cross and W. W. Mayo. It was increased in 1881 by the coming to Oronoco of Dr. E. A. Holmes and to Rochester of Drs. W. A. Vincent and Ida Clarke. In 1884 Drs. P. N. Kelly and W. J. Mayo, both of Rochester, were enrolled, and in 1886 Dr. N. S. Lane, of Eyota. In 1888 Dr. C. R. Keyes, of Byron, and Dr. C. H. Mayo, of Rochester, were admitted; in 1889 Dr. A. L. Baker, of Eyota, and Drs. R. McE. Phelps and H. R. Randall, of Rochester; in 1890 Dr. A. F. Kilbourne, of Rochester, was enrolled; in 1891 Dr. R. C. Dugan, Dover; and in 1892 Dr. N. M. Baker, Rochester. By 1895, again because of changes of residence, the membership in the county had been reduced to seven. In 1897 there were added Dr. C. Graham and Dr. J. G. Gross, both of Rochester; in 1898 Dr. H. H. Witherstine, Rochester, and in 1899 Dr. E. M. Clay, Oronoco, and Dr. M. C. Millet, Rochester.

Throughout the period 1868-1899 the members from Olmsted County were active in the work of the state society, acting as delegates to the American Medical Association, sending in reports to the state group on disease in their localities, contributing to programs and discussions, serving on committees and on the board of censors, and, some of them, in offices. Dr. W. W. Mayo, in 1871, was third vice president of the Minnesota State Medical Society and in 1872 was elected president. In 1875 Dr. A. W. Stinchfield was elected corresponding secretary, in 1876 Dr. E. C. Cross became second vice president, in 1886 Dr. E. A. Holmes was third vice president and in 1889, second vice president. In 1891 Dr. W. J. Mayo became first vice president, in 1892 second vice president, and in 1893 president, the youngest man, until then, to hold the presidency. It was at the meeting of 1891, when a paper on acute intestinal obstruction, by Dr. S. W. Ranson, of Dodge Center, failed to arouse the discussion it obviously merited, that Dr. W. J. Mayo electrified the assembly by rising to say, "In the language of the adjutant general of this state, I would like to know what we are here for. We from the country come up here to the city. We accept the hospitality of the gentlemen who live here. We find out that they are royal good fellows, but we come here to learn something from them. We don't invite them down to our town because we cannot give them the amount of learning and experience and all that sort of thing that we can get here; so when we leave our business and come up here, we feel as though they ought to talk to us. We think the papers should elicit something more than the experience of one man. We want the experience of leaders who live up here in the cities. . . ." Thorough discussion followed. The chairman, Dr. E. C. Spencer, said: "I think most of the instruction which the society has received, outside of the papers, has been from the members from the country, and especially the two from Rochester." At the close Dr. Mayo said, "I would like to thank the gentlemen from Saint Paul and Minneapolis in the

name of the profession outside of the Twin Cities for the noble way they have responded to my request."

Hospitals in Olmsted County Prior to 1900

Within the last twenty years of the nineteenth century there were established at Rochester, Olmsted County, three hospitals, on of which was a state institution for the care of the insane.

The Second Minnesota Hospital for Insane (since early 1893, the Rochester State Hospital).—Not until 1866 did Minnesota provide institutional care within its own borders for the insane among its residents. On April 28, 1862, one insane patient was sent from this state to the Iowa State Hospital, which subsequently received fifty-five other patients from Minnesota, on agreeement that all of the Minnesota patients should be removed by the autumn of 1866. In the spring of 1866 six patients were sent from Minnesota to St. Vincent's Institute for Insane at St. Louis, Missouri.

In January, 1866, the Hon. J. V. Daniels, of Rochester, introduced into the state senate a bill for the establishment of a state insane hospital in that city. On March 2, 1886, the Minnesota legislature passed an act providing for such a hospital in southern Minnesota. A board of trustees was appointed and authorized to erect or lease or purchase buildings and as soon as practicable bring back the insane patients from Iowa. The Minnesota Hospital for Insane was established at St. Peter, was opened officially on December 6, 1866, and two days later received its first patient. By 1870 the hospital was crowded; in 1875 appeal was made to the legislature to provide a site for a second hospital. In 1877, when conditions at the St. Peter hospital had become censurable, solution of the problem was approaching.

Since the late sixties or earlier a movement had been growing for the establishment of a state institution in Minnesota for the care of inebriates. Physicians were active in the work, notably Dr. T. H. Everts and Dr. H. C. Grover, of Fillmore County. On March 10, 1873, the state legislature passed an act "to establish a fund for the foundation and maintenance of an asylum for inebriates." This act, amended on March 9, 1874, imposed an annual tax of $10 on every liquor dealer in the state, and on liquor dealers only, the purpose being to raise money for creation of the proposed asylum, the institution to be maintained by continuation of the tax. Accumulation of money proceeded slowly; there was much protest against the law by those affected as being class legislation, and much litigation in test cases. The Supreme Court of Minnesota upheld enforcement of the law. In 1875 the Minnesota State Medical Society appealed to the legislature for immediate action in providing an inebriate asylum. At that session a bill was enacted that located the asylum at Rochester, and soon afterward a board of seven directors was appointed by Governor C. K. Davis, of which Dr. J. A. Leonard, of Rochester, was the local member. A farm of 160 acres east of Rochester was bought and in 1877 erection of buildings was begun.

Opposition to the liquor tax had been increasing steadily, as had the need for additional hospital space for insane patients. On March 7, 1878, the legislature repealed the act providing for an inebriate asylum, passed an act to locate and establish the Second Minnesota Hospital for Insane at Rochester, and transferred to the hospital the funds, lands and properties of the Inebriate Asylum, *provided* that the board of trustees of the hospital "make provision for special departments in the said hospital for the treatment of inebriates."

Inadequate and unsuitable as the unfinished buildings at Rochester were, they were accepted and were brought sufficiently near completion by January 1, 1879, so that on that date the Second Minnesota Hospital for Insane was opened, with Dr. J. E. Bowers, formerly assistant physician at the Minnesota Hospital for Insane, at St. Peter, as superintendent and physician, and with eight men patients, who had been brought from St. Peter the previous day, in residence. By December 1, 1879, there were ninety-four male patients in the hospital. Provision for women patients was yet to be made.

The detailed history of the hospital for insane at Rochester belongs elsewhere in the history of medicine in Minnesota. The great growth of the institution from year to year could be shown dramatically by a time-lapse motion picture. In 1889 a training school for attendants was opened at the hospital, and in 1890 an excellent training school for nurses. The inebriate department, never a suitable division of a hospital for insane, was abolished by legislation on April 27, 1897. An official report of July 31, 1900, shows that there were then 1,251 patients connected with the hospital, 715 men and 536 women. The buildings, several times enlarged since 1879, again were inadequate. The medical staff had increased from one, in 1879-1881, to six in 1900. There were, in 1900, eight official assistants in the hospital and six heads of departments having to do with engineering, farming, cooking, laundry and maintenance. The hospital grounds, in the beginning a stubble field, had become a beautiful park, of recreational value to the staff and especially of therapeutic value to the patients.

It has been said by able psychiatrists that the rulings instituted by Dr. Bowers, around 1886, for the care, treatment and control of insane patients were excellent and that they may be considered modern. From about 1883, Dr. W. J. Mayo, and from 1888, Dr. C. H. Mayo, it has appeared in many official reports from the state hospital, gave "kindly assistance in important surgical cases," as they did for many years at the state hospital at St. Peter also. In 1926 it was stated, "Most amicable relations have always existed between the officials of the Rochester State Hospital and the members of the staff of the Mayo Clinic. The mutual exchange of consultation services between the two institutions has been of great advantage to both."

In its seventy years (1949) the state hospital at Rochester has had four superintendents: Dr. J. E. Bowers, 1879-1889; Dr. A. F. Kilbourne, 1889-1934; Dr. B. F. Smith, 1935-1942; and Dr. M. C. Petersen, 1942——. In 1949 there were in prospect, in the near future, complete reconstruction and enlargement of the buildings and extension of facilities and departments.

(To be continued in the January issue.)

President's Letter

Last Page on the Calendar

Last January, when I began this series of President's Letters, I tried to express my appreciation of the high honor that had been paid me by the Minnesota State Medical Association and to indicate my awareness of the responsibilities contingent on leadership during a time when the medical profession faced the most critical issues in its history.

Now, as the year is almost over, I'd like to reiterate my appreciation: Serving as your president during 1949 has been an unequaled and invaluable experience for me. I have enjoyed meeting with so many of my colleagues throughout the state during my travels for the Association. I have been impressed with the serious intent and enthusiasm of the committees whose sessions I have attended as an ex officio member. In brief, my year as president has given me a 50-yard-line view of the highly divergent, yet interwoven activities of the Association and a renewed understanding of the part that sincerity, co-operation and individual initiative play in the furtherance of these activities.

As I look back over the year, I can say unhesitatingly that we have reached high points of achievement, not only in medical research and practice, as we strive to make healthy living a reality for ever greater numbers of people, but also in the closely related field of medical economics, where threats to the public's health have sprung from political origins.

Credit for the progress the Association has made goes to every Minnesota doctor who, not content with diagnosing and treating the ills of his own patients, helped toward diagnosing and treating the nation's ills.

Special thanks are due the officers and councilors and committee chairmen, all of whom, I know, worked devotedly and long during the year to fulfill the obligations delegated to them.

With 1949 almost history, our attention turns to the year that lies ahead. Not an easy year, we know, but the challenges and their inherent opportunities for service will be greater than ever; and with the unfailing co-operation of every member and the wise and able leadership of Dr. F. J. Elias, our new president, the Minnesota State Medical Association will make new progress in safeguarding the nation's health and freedom.

Merry Christmas - - Happy New Year

President, Minnesota State Medical Association

Editorial

Carl B. Drake, M.D., *Editor;* George Earl, M.D., Henry L. Ulrich, M.D., *Associate Editors*

GRIEVANCE COMMITTEES

OCCASIONALLY a patient has, or feels he has, a grievance against a physician or hospital. When he has a real grievance, it results in injury to the physician or hospital and to the entire medical profession. One justified grievance does more harm to the public relations of the profession than can be counteracted by much favorable publicity. It is, therefore, highly important that there be a mechanism for handling such cases.

Several states, including Nebraska, Utah, Virginia, Indiana and Colorado, have statewide grievance committees and give considerable publicity to their existence. In Colorado, the grievance committee is known as the "Medical Grand Jury." A patient with a grievance is required to make his complaint in a signed statement. A copy of the complaint is sent to the physician concerned, and the complainant is notified that this has been done. The two are asked to get together and settle the difficulty. If this is not successful, the two are asked to appear before the committee in an effort to settle the dispute.

For a number of years, the Minnesota State Medical Association has had a Committee on Medical Ethics which now is composed of Dr. R. D. Mussey of Rochester, Dr. B. S. Adams of Hibbing and Dr. Harold Diehl, Dean of the Medical School, who in conjunction with the Council of the Minnesota State Medical Association handle any complaints submitted. The Hennepin County Medical Society has its Board of Ethics, and the Ramsey County Society uses its Executive Committee to handle such cases. The county societies have all been urged to have similar committees appointed to investigate any grievances. Some have done so. It has been thought, with good reason, that it is sometimes better for a state-wide committee to handle complaints instead of a local committee of confreres; the mechanism exists in Minnesota in the form of the Committee on Medical Ethics of the State Medical Association for use, if so desired, by a county society.

Some of the comparatively few complaints received are from crack-pots with imaginary grievances. Some consist of misunderstanding of charges, such as laboratory fees that are not itemized, and are generally easily settled. Cases of out-and-out overcharging are perhaps the most important ones. The knowledge of the existence of a grievance committee doubtless is effective in reducing the number of instances in which a physician so ignores the dignity of his profession as to attempt to gouge his patient. Although there is some elasticity in the matter of proper fees, an overcharge should be readily detectable by a grievance committee.

THE BRITISH HEALTH "SCHEME"

IN ESTIMATING the desirability or undesirability of our adoption of National Compulsory Health Insurance, an appraisal of how the National Health Service in England is working out should be of inestimable value. The proposed socialization of medicine in our country closely resembles that in operation in England since July 5, 1948. To obtain first-hand information on the subject, John W. McPherrin, editor of the *American Druggist,* made a visit to England this year and personally interviewed physicians, druggists, hospital personnel and individuals including those contacted in the "pubs" in an effort to obtain a comprehensive view of the opinions of those in different walks of life on the health "scheme." The results of his investigation appeared in the July, 1949, issue of the *American Druggist.*

Under the new "scheme" each wage earner contributes the equivalent of $1.02 (before devaluation of the pound) per week. About 17 cents of this tax goes to the cost of the health service, 85 cents being applied to cash benefits, retirement, pay widows' pensions, unemployment, sickness and disablement benefits. Five-sixths of the cost of medical care is supplied by other taxes and amounts to about $80 per family in addition to the $1.02 a week. While this fact has been made pub-

lic, it is apparently not generally realized. The government pays for all medical, dental and hospital care, for drugs, spectacles, et cetera, on doctors' prescriptions. Refills for drugs require new prescriptions.

Each general practitioner receives $4.00 per panel patient which provides his services for the family. Specialists receive special remuneration. Hospital care is provided when beds are available, but some 60,000 are now empty due to lack of hospital personnel.

Mr. McPherrin, as a result of his questioning, found that most physicians and druggists who are better off financially as a result of the "scheme" are favorably disposed. This includes the poorer and mediocre physicians and the druggists who had little prescription business previously. It seems that 70 per cent of drugs were formerly dispensed by physicians. The general practitioner is commonly swamped by the increase in patients, and the volume of business done by the druggist is greatly increased, but his financial gain is only slight because of the prices allowed by the government for drugs.

The public, the author divides into three groups. The first group are the gyppers. They have paid their money and are bent on getting their money's worth in medical service and insist on medicine whether they need it or not. The second group are those who are doing their best to make the "scheme" work and are conscientious in their demands. The third group are the objectors. They employed private physicians formerly and dislike the medical attention now available.

England is experimenting in socialism, otherwise known as the welfare state. This term is coming to be used in our country as though it were different from socialism. The responsibility of the individual to provide for himself is to be shifted to a beneficent government in the belief that the state alone can provide security and happiness. The British were conditioned to the present "scheme" by the panel system adopted in 1911, which included half the population. The Beveridge Plan, proposed in 1942, which formed the structure of the present "scheme" received the support of all the political parties in England —the druggist, and to some extent the medical specialists. While the general practitioners strongly opposed the "scheme," they had insufficient backing. This made its adoption comparatively easy.

Upon his return to America, Mr. McPherrin took part in an informal debate with Oscar Ewing on the subject of Compulsory Health Insurance at the annual convention of the Proprietary Association at White Sulphur Springs, West Virginia. The issue narrowed itself down to the question of whether it is possible to manage any compulsory medical care system without the imposition of staggering government controls. Ewing believed it was possible and painted a glowing picture of increased drug volume for producer and distributors under government health insurance. McPherrin contended that a complicated set of government controls would be necessary to support any such action. Be it said to the credit of the Proprietary Association that the lure of more business did not prevent the members from going on record as opposed to government health insurance.

The British experiment has been costly, both financially and in medical standards. It has been recently reported that it has been necessary to charge a shilling for each prescription in order to reduce the number unnecessarily prescribed. It is incumbent on the medical profession and the people of America to develop other methods of providing medical care which will preserve individual initiative and responsibility rather than shifting the responsibilty to the government. This can and is being done.

JOURNALS FOR JAPAN

THE MEDICAL SCHOOL of Tokyo University is greatly in need of medical journals. Its files for the past eight years are scant and the few copies on hand are much worn through use. Contributions of spare journals of every description, including those of the specialties and state medical journals, would be greatly appreciated.

Contributions should be sent to Dr. Tomio Ogata, Editor, Journal of the Japan Medical Association, Department of Serology, Medical School, Tokyo University, Hongo, Tokyo, Japan.

THE 1949 TUBERCULOSIS CAMPAIGN

"Minnesota's record of tuberculosis control is an inspiration to the entire civilized world as the finest job done anywhere on the globe. The death rate has been brought down through hard work, intelligently planned and diligently carried out."

Speaking at the state Christmas Seal dinner, October 25, at the Coffman Memorial Union, University of Minnesota, Dr. Edwin R. Levine, director of Chest Services,

Michael Reese Hospital and medical director of Winfield Hospital, Chicago, lauded the program against tuberculosis carried on in this state.

The Christmas Seal dinner launched the 43rd annual tuberculosis fund-raising and educational campaign. Christmas Seal funds finance the national, state and local program of case-finding, education and medical research. Ninety-five per cent of the funds raised remain in Minnesota to support the local and statewide programs, and five per cent make possible the medical research and other activities of the National Tuberculosis Association.

Facts which speakers, newspaper articles, radio programs and leaflets are bringing to the attention of the public in the intensive educational campaign accompanying the sale of Christmas Seals include the following:

Minnesota's tuberculosis death rate struck an all-time low in 1948—17.1 per 100,000 population. The death rate has been reduced 87 per cent over the past 40 years. But this preventable and curable disease took the lives of 502 men, women and children in the state in 1948, and there are an estimated 5,000 active cases in the state.

Christmas Seal funds are helping finance county mass X-ray Surveys, tuberculin testing surveys of school children, tuberculosis follow-up work and a continuous program of education, using all media for reaching the public.

Early discovery of tuberculosis aids early recovery. In the Mass X-ray Surveys of apparently healthy people, approximately 80 per cent of the cases discovered are minimal cases. In former years, approximately 80 per cent of the cases entering Minnesota sanatoriums were moderately or far-advanced cases.

No county, state or nation are safe until all are safe. In this connection, the following facts are presented:

Tuberculosis kills from three to five million people in the world annually.

Tuberculosis is one of the most important health problems facing the American people today.

It is important because in the productive young age group from 15 to 34 it costs more lives than any other disease.

It is important because it is a communicable disease which is killing nearly 1,000 Americans a week, 125 a day—at the rate of one person every 11 minutes.

It is important because 500,000 people in this country are estimated to have tuberculosis, one-half of them unknown to health authorities.

Tuberculosis is an important public health problem because *it can be prevented.*

GOVERNMENT INVESTIGATION OF MEDICAL SOCIETIES

Dr. R. B. Robins of Camden, Arkansas, Democratic National Committeeman from Arkansas and member of the House of Delegates of the American Medical Association, recently issued the following statement in reply to Attorney General J. Howard McGrath:

"Attorney General McGrath's attempted explanation of the current wave of investigations which the Department of Justice is directing against medical societies throughout the Nation is an insult to the intelligence of the American people.

"As a United States Senator, Mr. McGrath was one of the leading advocates of Compulsory Health Insurance and one of the most intemperate, vitriolic critics of the American medical profession. As chairman of the Democratic National Committee, he misused the facilities of that committee to make scurrilous, slanderous accusations against State Medical Societies and the American Medical Association. His statements and his tactics were an affront to all doctors, whether Democrats or Republicans. Now, he has gone even farther, by using the facilities of the Department of Justice for political purposes.

"For many months Mr. McGrath and some of the other Washington proponents of political medicine have cleverly and indirectly threatened the medical profession because of its open opposition to Compulsory Health Insurance. Coming events cast their shadows before. Now, with Mr. McGrath in the saddle as Attorney General, the reprisals and crack-downs are in full swing.

"This Nationwide use of Police-State methods was revealed and protested yesterday by the Board of Trustees of the American Medical Association. Mr. McGrath, in admitting the investigations, then gave the lame explanation that they resulted from complaints by doctors and the general public.

"The straight-thinking American people, believing in fair play according to democratic rules, will recognize his public excuse as camouflage. They will recognize, I am sure, that the present attack against the medical profession is a politically-inspired maneuver to frighten American doctors, discredit them in the eyes of the public and stifle opposition to the Truman health program.

"I hope and believe that the American people will rise up in protest against such Gestapo methods in a Nation which cherishes the right of free speech."

Dr. Robins called attention to the fact that Senator James W. Fulbright of Arkansas in the U. S. Senate spoke in support of the Nation's doctors and had the official AMA statement printed in the *Congressional Record.*

PNEUMONIA STILL A KILLER

Pnuemonia remains the only communicable disease among the first ten causes of death in Minnesota, according to a recent report from the Division of Vital Statistics, Minnesota Department of Health. Pneumonia now ranks fifth as a cause of death in Minnesota. In all its forms, it took a total of 1,013 lives in the state in 1948, and another 564 during the first half of the present year. However, this total represents only about 4 per cent of all deaths occurring in the state.

Except for accidents, conditions causing death today tend more and more toward a preponderance of chronic conditions and those affecting mainly older people. The five leading causes of death in Minnesota have remained the same for some time. They are heart disease, cancer, intercranial lesions of vascular origin (such as cerebral hemorrhage), and pneumonia. Next in rank after these five are diabetes, nephritis, arteriosclerosis, premature birth, and congenital malformations.

The report from the Division of Vital Statistics states that, although accidents appear in fourth place among the leading causes of death for the entire population of Minnesota, they actually are the leading cause of death among younger age groups. "During the years 1946-1948," the report states, "accidents were the leading cause of death for each age group from one to nineteen years of age, accounting for 33.5 per cent of the deaths in these ages."—*Minnesota Health,* November, 1949.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

ENGLISH SUSPECT SM END NEARING

"People are demanding prescriptions and otherwise trying to get as much as possible out of the British health scheme," reported John W. McPherrin, editor of *The American Druggist,* when he spoke before the annual conference of State Medical Association Secretaries and Editors, November 4, at AMA headquarters. "They have an intuition that the thing can't last."

McPherrin spent five weeks in England, traveling 1,600 miles with a portable wire-recording machine which he used in interviewing Bevan and other top-ranking British officials, housewives, men in the neighborhood pubs—in short, anyone and everyone who could, when considered as part of the composite whole, give him a picture of British reactions to socialized medicine.

"My attitude was that of a journalist," he explained. "My publication is not affiliated with any association."

"Not An Entity"

To find out what he wanted to know about the health program in Britain—Britishers call it the "health scheme"—McPherrin found that he could not consider it as an entity; he had to "dig into the welfare state."

He concluded that the American and British people are "pretty much alike, but the British have acquired some different habits of thinking." "These are not common to Americans and, I'm not sure that they are common to the British people."

McPherrin credited working conditions, class distinctions and the "stupid private enterprise" of Britain with bringing on the welfare state: "If those things had happened here, we might have had a welfare state."

"It (the welfare state) is not the ideology of the people," he opined, "but the competition of two political parties to see which could offer the most—at tax expense."

As to those who like it and those who don't—McPherrin found it a simple question of economics. "If the individual is making more money since the health scheme, then he's in favor of it," McPherrin declared. "With the majority of people, the first response is 'it's a good idea'; most people like to get things for free."

One Dollar a Week?

The truth about the cost of the program is not known by many people in Britain, however, McPherrin believes. The government takes a dollar a week from the British worker and leads him to believe that the money is his entire contribution for the medical and related services that he receives. Actually, five-sixths of that dollar goes for so-called "cash benefits"—including unemployment insurance, funeral expenses and the like. Seventy-eight per cent of the cost of the health scheme comes out of general taxes.

In terms of the health scheme, England can be divided into three classes now, McPherrin pointed out: the abusers, the users and the objectors.

Summarizing his analysis of the change that has come over Great Britain, Editor McPherrin said, "I came home with a new reverence for America and the faith in mankind that created this nation. Socialism, a polite word for communism, is a system founded on lack of faith in people."

HUMPHREY AMPLIFIES STAND ON HEALTH PLAN

During a November 1 radio debate on the "Town Meeting of the Air" program, Senator Hubert Humphrey amplified his new view of compulsory health insurance — a withdrawal, at least temporarily, of his support from the Truman plan.

". . . a very serious point has been brought up here tonight in reference to my stand on the so-called so-

cialized medicine. I would like to reply to my doctor friend. I am opposed to socialized medicine. Socialized medicine is charity medicine.

"I am for the general principle of national health insurance, which is a prepayment type of medicine, a prepayment insurance plan. I do not believe we should prematurely enter into it. I agree with my friend from Maine (Senator Owen Brewster); we need time to study and to think. That is exactly what we're doing. We're going to build up the medical schools of this country, which the medical profession is for—they're for federal aid on that. We're building up the hospitals, which they're for—they're for federal aid on that. We're building up the community clinics.

"When the time arrives—unless the medical profession has spread out the means of coverage for health services in this country—the American people are going to ask of their government help from their government in an insurance plan—not a pension plan, not a gift plan but an insurance plan—to provide for the medical services which the great medical profession can provide."

Senator Humphrey and Senator Brewster were debating the question: "Are we depending too much on government for general welfare?" Mr. Humphrey answered the question with what he called a "categorical 'no.'"

EWING OFFERS CASH APPEAL TO DRUGGISTS

In the current issue of *The Bulletin* of the Academy of Medicine of Toledo and Lucas County (Ohio) appears an interesting study of Oscar Ewing's recent address before the annual convention of the National Association of Retail Druggists.

The writer of the article has taken parts of Ewing's talk and italicized them for greater emphasis. Typical are these:

"In a very real sense, health is your stock in trade."

"Certainly any major progress we make in this age-old struggle against sickness and disease is sooner or later reflected in larger receipts for your own cash registers."

"And the result of this activity (mass x-ray, cancer and heart clinics), I am certain, has already been felt across your own drug counters."

"Again let me point out that the drug trade flourishes in the shadow of the hospital."

"National health insurance would automatically give to every man, woman and child the status of a 'good paying' patient. In all this I do not see how the retail druggist can fail to profit enormously."

Mr. Ewing is evidently under the impression that he can gain support for his compulsory health insurance plan by a dollars-and-cents appeal; but he has been contending, up to this point, that the American people must go into the program through motivation of a great humanitarian nature.

MEDICAL OFFICIALS TOLD TO SELL LIBERTY

"Selling Liberty, a Public Relations Project for Every American," was the subject selected by Leonard E. Read, president of the Foundation for Economic Education, when he addressed the second annual AMA Public Relations Conference November 5 at the Hotel Bismarck, Chicago.

Mr. Reed began his discussion with the assertion that socialism is "coercive collectivism."

"Regardless of its beginning," he contended, "it means state ownership and/or control of production.

"Socialism, a parasitical philosophy, presupposes the existence of healthy and going economy, just as mistletoe presupposes a healthy, live tree."

Taxes Take 29 Per Cent

Giving an indication of the parasitical approach of socialism, Read pointed out that between two and five per cent of all earned income was once the government's take; now it's 29 per cent of all earned income.

The speaker recalled the Lenin theory: that debauching its curency is the quickest way to destroy a society. Mr. Read then took examples from countries abroad where the currency has been devalued—in France, for instance, if one had deposited $1.52 cents in a bank there thirty-two years ago, he would be able to withdraw only one penny today.

"In America, the debauchery of the currency and the progress of socialism is such that we are no longer able to quit our evil ways and be all right—we're now over the brink."

Plunderbund Did It

Individuals and groups responsible for this socialistic trend, Mr. Read termed the "plunderbund," adding, "Until we have a re-learning of the proper relationship between society and the state, the plunderbund will continue to grow."

The struggle between democracy and socialism, Read referred to as "an ideological contest"—a contest in the field of explanation.

The discouraging aspects of this contest, according to the economist, are: (1) The almost all-pervasive notion that it is always "someone else" who is in need of further understanding,

(2) indifference, (3) complacency, (4) unconsciousness of the problem, (5) people who "have no time to read," (6) those persons who are so busy reaping the rewards of an economy facing destruction that they have no time to assist in its preservation.

Mr. Read's answer to the question of what to do was: "Gain a few thousand articulate, active-minded individuals who thoroughly understand the fallacies of socialism and the philosophy of a voluntary society and the trend would be reversed."

FEW HEALTH BILLS PASSED BY CONGRESS

Despite the fact that medical and hospital bills occupied a sizable space in the 80th congress' hopper, few measures of national importance received congressional approval during the session.

S.614 is regarded as the prime example of health measures, national in scope, which became law. This bill was the first comprehensive amendment of the Hill-Burton Hospital Survey and Construction Act. Extending the program until June 30, 1955, the new law authorizes $150 million in federal grants annually and makes a few changes in the method of allocating funds to the state. Under its terms, also, the U. S. Public Health Service has been delegated the task of conducting hospital utilization demonstrations and studies.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Building
Saint Paul, Minnesota

Julian F. DuBois, M.D., Secretary

Man Posing as Doctor Sentenced for Grand Larceny

Re. State of Minnesota vs. Lavern E. Bartholomew

On October 11, 1949, Lavern E. Bartholomew, age unknown, was sentenced at Rochester, Minnesota, to a term of not to exceed five years at hard labor in the State Prison at Stillwater. The sentence was imposed by Judge Vernon Gates in the District Court of Olmsted County, following the defendant's plea of guilty on September 2, 1949, to an information charging him with the crime of grand larceny in the second degree.

Bartholomew has a long criminal record, according to the Federal Bureau of Investigation. That record dates back to 1928, notwithstanding the fact that Bartholomew claims he was born in December, 1923. According to Bartholomew's signed statement, he came to Rochester, Minnesota, from Garden City, Kansas, on August 22, 1949. The following day he applied for work as an orderly at a Rochester hospital. While at the hospital Bartholomew removed two billfolds from the surgeons' lockers. He also stole $400 in cash and a wrist watch from a patient. That particular theft was the basis of the criminal charge against Bartholomew. Bartholomew left Rochester but was arrested at Kansas City, Missouri, and returned to Minnesota for prosecution.

According to the Federal Bureau of Investigation, Bartholomew, under the name of Calvin Lasky, was placed in the Boys' Industrial Home at St. Johns, New Brunswick, in August, 1928. Since that time Bartholomew, under various aliases, has been in penal institutions in New Brunswick; Montreal, Quebec; Florence, Arizona; Los Angeles, California; Boston, Massachusetts, and Calgary, Alberta. The charges against Bartholomew ranged from vagrancy to grand larceny. Bartholomew has used the following aliases: Lasky, Laskey, Carmelle and McAllister. Bartholomew's true name is unknown; his birth place, likewise, is unknown. He has been the subject of long investigation by the Federal Bureau of Immigration and also the Canadian authorities. Bartholomew is probably in his early thirties.

TRAINING OF BLIND FOR JOBS IN X-RAY DARKROOMS

A St. Louis physician, writing in the November, 1949, issue of *The American Journal of Roentgenology and Radium Therapy*, urged industrial and hospital x-ray departments today to explore more fully the possibility of training blind persons, both men and women, for permanent jobs in the darkrooms where x-ray films are processed.

The very best technique employed by x-ray specialists is "only as good as the darkroom processing of the films," Dr. Sherwood Moore, director of the Mallinckrodt Institute of Radiology of St. Louis, said in his plea for the employment of blind x-ray technicians for darkroom work.

Dr. Moore said that with the help of the St. Louis Bureau for the Blind he employed three blind men in his laboratory and after a month's training they acquired manual proficiency which justified attempting to use them under actual working conditions. "The blind men are happy," Dr. Moore wrote, adding that one of them commented "this is far better than making brooms."

"There is hope," the article said, "that the film industry and commercial photographic laboratories will take up this form of employment for those handicapped by loss of sight."

One advantage in hiring the blind, the doctor explained, is that experienced x-ray technicians "are freed from the monotony and fatigue of darkroom work, where their superior abilities are more or less wasted.

"Success in employing blind darkroom technicians depends upon the selection of suitable individuals who should be thoroughly trained in advance of embarking on the actual work. The selection should be left to the state or federal agencies for the blind. These agencies have the facilities for giving aptitude tests and finding persons with the proper background."

Dr. Moore said he found that blind employes can unload and load and place a film in solution as speedily as can a technician with sight.

"The Federal Security Agency, Office of Vocational Rehabilitation and the Illinois Division of Vocational Rehabilitation and a representative from the Bureau for the Blind have investigated this training program and expressed the view that it has possibilities for a good livelihood for the blind. It is not and should not be a method of getting cheap help.

"Such a training program may open a door for large opportunities."

In Memoriam

C. ANDERSON ALDRICH

Dr. C. Anderson Aldrich, since 1944 Director of the Rochester Child Health Institute, died October 6, 1949, at the age of sixty-one.

Dr. Aldrich was born at Plymouth, Massachusetts, March 4, 1888. He obtained his M.D. degree from Northwestern Medical School in 1915 and interned at the New York Nursery and Children's Hospital in 1915 and the Evanston Hospital in 1916. He took postgraduate work in pediatrics at the Harvard Medical School in 1921.

After practicing in Winnetka, Illinois, from 1916 to 1940, and in Chicago, from 1940 to 1944, he moved to Rochester, Minnesota, where he was Professor of Pediatrics in the Mayo Foundation and Director of the Child Health Institute conducted by the Section of Pediatrics of the Mayo Clinic. The purpose of the Institute is to watch over the health and emotional development of Rochester children from birth on, in an attempt to prevent disease. For his activities in this project, Dr. Aldrich received national recognition and the 1948 award from the Lasker Foundation of New York.

Dr. Aldrich was the author of several books, including "Cultivating a Child's Appetite" and "Babies are Human Beings." Mrs. Aldrich was a co-author of the second book.

While in Illinois, Dr. Aldrich became successively chief of staff at Children's Memorial Hospital in Chicago, consultant in pediatrics at the Chicago Municipal Tuberculosis Sanatorium, chairman of pediatrics in the department of medicine at the Evanston Hospital and a member of the faculty of Northwestern University.

Dr. Aldrich was a member of the Olmsted-Houston-Fillmore-Dodge County Medical Society, the Minnesota State and American Medical Associations.

Surviving him are his wife, a daughter, Mrs. David Rower of Northbrook, Illinois, and two sons, Dr. Robert A. Aldrich of Rochester and Dr. Stephen L. Aldrich of Chicago.

LYLE LELAND BROWN

Dr. L. L. Brown, a well-known pediatrician of Crookston, died October 11, 1949, at the age of fifty-eight.

Dr. Brown was born at Crookston, September 7, 1891. After attending the University of Minnesota, he received his medical degree from the University of Illinois Medical School in 1918. His internship was served at the Michael Reese Hospital in Chicago. After serving in the medical corps of the Army during World War I, he entered private practice in Crookston. Since 1926 he had been associated with the Northwestern Clinic of Crookston as a pediatrician.

Dr. Brown was active in civic affairs. He had been health officer of Crookston since 1928, member of Crookston park board for eleven years, and was active in local Chamber of Commerce affairs and county Red Cross activities.

He was a member of the Red River Valley Medical Society, the Minnesota State and American Medical Associations.

Dr. Brown is survived by his wife whom he married in St. Louis in 1921.

GRANT R. CHRISTENSON

Dr. Grant R. Christenson of Minneapolis died October 19, 1949, at the age of forty-eight.

Dr. Christenson was born at Starbuck, Minnesota, May 20, 1901. With his parents he moved to St. Paul in 1906. He graduated from Central High School and attended Hamline University. He graduated from the medical school of the University of Minnesota in 1931. He was a member of Phi Gamma Delta and Nu Sigma Nu fraternities, Scottish Rite Temple and Zuhrah Temple in Minneapolis. His medical society memberships included Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association. He was an active member of the Hennepin Avenue Methodist Church.

He is survived by his wife, Virginia; two sons, Carl R. and Robert W.; two daughters, Virginia Louise and Judith Lynn; and his mother, Mrs. Nellie Grant Christenson of St. Paul.

PAUL N. JEPSON

Dr. Paul N. Jepson, former fellow of the Mayo Foundation and member of the staff of the Mayo Clinic, died October 24, 1949, in Pottstown, Pennsylvania.

Dr. Jepson was born October 12, 1893, in Faribault, Minnesota. He received the degree of M.D. in 1920 from the University of Pennsylvania and was an intern at Presbyterian Hospital, Philadelphia, from 1920 to 1921. He entered the Mayo Foundation as a fellow in orthopedic surgery on September 1, 1921. He became first assistant in orthopedic surgery on July 1, 1924, associate in orthopedic surgery, the Mayo Clinic, on October 1, 1925, and instructor in orthopedic surgery, the Mayo Foundation. He received the degree of M.S. in Orthopedic Surgery from the University of Minnesota in 1926. Dr. Jepson left the Clinic on February 1, 1927.

Dr. Jepson was a fellow of the American College of Surgeons and a member of the American Medical Association, the American Academy of Orthopaedic Surgeons and the Philadelphia Orthopedic Club.

ELIAS HOMER LOOFBOURROW

Dr. E. H. Loofbourrow, well-known physician on the Range for over forty years, died September 16, 1949. He was seventy-one years of age.

Dr. Loofbourrow was born at New Madison, Ohio,

June 2, 1878. He graduated from the Ohio Northern University at Ada, Ohio, in 1902, and obtained his medical degree from the College of Physicians and Surgeons in Chicago in 1906.

He practiced at Chisholm for about six years and at Wakefield and St. Charles for short periods before locating at Keewatin. Since his retirement in June, 1948, Dr. and Mrs. Loofbourrow had resided at Northfield.

Dr. Loofbourrow was a member of the St. Louis County Medical Society, the Minnesota State and American Medical Association, and carried on a general practice.

He is survived by his wife, a daughter, Mrs. Bernard Street of Northfield, and a son, Dr. Ralph Loofbourrow of Minneapolis.

GEORGE E. MALMGREN

Word has been received of the death of Dr. George E. Malmgren, former fellow of the Mayo Foundation, which occurred on August 24, 1949, in Los Angeles.

Dr. Malmgren was born June 6, 1902, in St. Paul, Minnesota. He received the degree of M.D. in 1927 from the University of Minnesota and was an intern at St. Mary's Hospital, Duluth, Minnesota, from April 1, 1926, to April 1, 1927. He entered the Mayo Foundation as a fellow in surgery in April, 1927, but transferred his major subject to proctology in January, 1928. He received the degree of M.S. in Proctology in 1930 from the University of Minnesota.

Dr. Malmgren left the Mayo Foundation October 1, 1931, at which time he went to Los Angeles to practice proctology. He was a member of the American Medical Association and Alpha Omega Alpha.

WILLIAM HENRY VON DER WEYER

William Henry Von der Weyer was born in Saint Paul, Minnesota, November 12, 1891, and died in his sleep July 26, 1949.

He was the son of Henry and Josephine Stathel Von der Weyer. He attended St. Francis parochial school and St. Thomas Academy, the Marquette University School of Medicine, graduating in 1915, following which he interned at St. John's Hospital, Saint Paul, being the first intern at that hospital.

In 1917 he became associated with the late Dr. Arthur J. Gillette, specializing in orthopedic surgery, and after his death, with Dr. Carl C. Chatterton until 1938. In 1948 he formed an association with Dr. Frank S. Babb which continued until his death.

Dr. Von der Weyer was a member of the Ramsey County Medical Society, the Minnesota State and American Medical Associations, the American Academy of Orthopedic Surgery, and the American College of Surgeons.

Dr. Von der Weyer married Mildred M. Esswein, October 5, 1921. He is survived by his mother, his widow, a son, William, and a daughter, Elizabeth.

"Bill," as he liked to be called, endeared himself to everyone by his modesty, his unfailing equanimity, his friendliness and his jovial disposition. He will live long in the memory of his many friends.

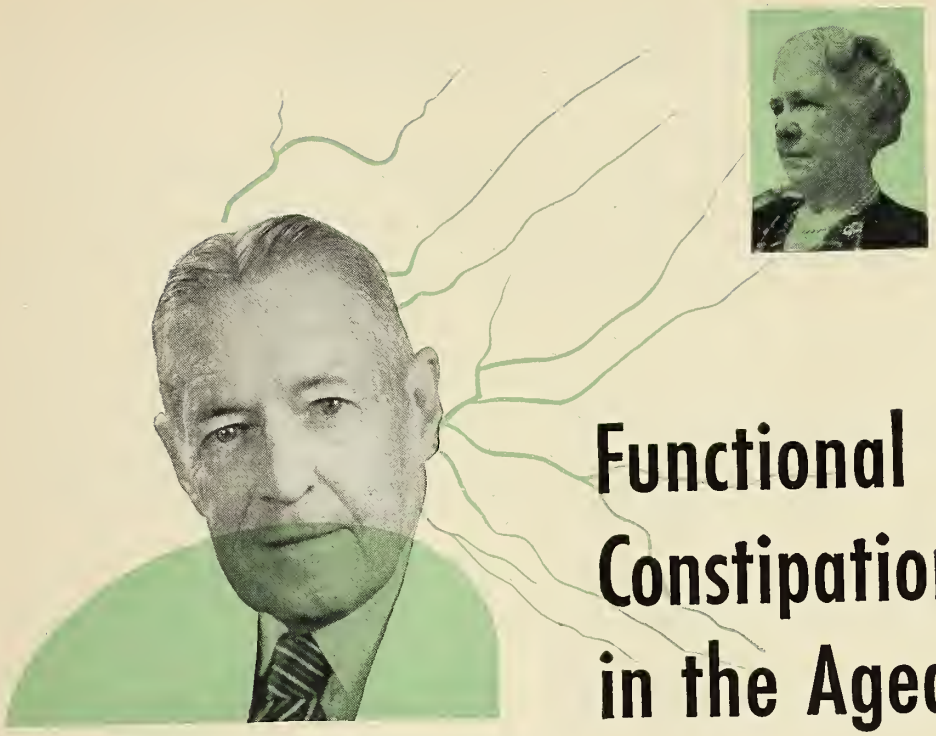
CARL L. LARSEN, M.D.

MALIGNANT TUMORS OF THE LUNG

(Continued from Page 1189)

was grossly recognizable in experimentally produced pulmonary cancer in rabbits, and at a stage where neither x-ray examination nor bronchoscopy could have identified the growth.

The real difficulty lies not so much with the method itself, as it does with the training and experience of the cytologist—be he a pathologist, a clinician or a biologist. Cytology has come to be an important department of clinical pathological laboratories. Dr. McDonald and his associates should be congratulated for their pioneer work in the diagnosis of pulmonary cancer by the cytologic method.



DR. DEFOREST R. HASTINGS, Minneapolis: Dr. John B. McDonald has very ably presented this paper on the cytologic examination of sputum in the diagnosis of bronchiogenic carcinoma.

Being an internist, and not a pathologist, I shall limit my discussion to the clinical phases of carcinoma of the lung. I have been especially interested in the diagnosis of this disease for the past few years, primarily because of the frequency with which it has been occurring. Perhaps we should say because it is being diagnosed more often rather than that the disease itself is occurring more often.

The diagnosis of carcinoma of the lung is difficult and often impossible without a biopsy, even though all other methods of diagnosis are used. As an illustration, a neighbor of mine came to me a few years ago, stating that he had a slight pain in the chest. After history, physical, and x-ray examinations were done, an atypical lesion was found in the lung. The roentgenologist thought it was an atypical tuberculosis. The man was very impatient, as is often the case in private practice, and wanted a diagnosis at once. He was sent to the sanatorium, and after several months was discharged as nontuberculous. The lesion remained the same. The patient did not want a lobotomy, and consequently a definite diagnosis has not been made. One year later the lesion is still the same.

Through the courtesy of the Minneapolis Health Department, and in my own work at the Public Health Center, I have had the privilege of seeing and studying many of the films taken during the x-ray survey conducted in Minneapolis in 1947. The Minneapolis Health Department has received a diagnosis on about 4,000. From this survey, 117 people were found who had carcinoma in some form, and twenty-eight with carcinoma of the lung.

In summary, carcinoma of the lung is common. The diagnosis of it is difficult, and often by the time it is made, the patient is inoperable. Even the smallest x-ray lesion resembling a tumor should have immediate attention, and all means of diagnosis used. History, physical examination, x-ray, and bronchoscopic methods have been used for some time. Now, we can definitely add cytologic examination to the armamentarium for the diagnosis of lung diseases.

Functional Constipation in the Aged

"Constipation is very frequently found in people of climacteric age,.... In the vast majority of patients, constipation is probably due to improper habits, diet, or gastrointestinal disorders."*

The soft, demulcent, water-retaining, mucilloid bulk provided by Metamucil gently initiates reestablishment of reflex peristalsis and movement of the intestinal contents.

G. D. Searle & Co., Chicago 80, Illinois.

AMERICAN ACADEMY OF GENERAL PRACTICE

At the annual meeting of Minneapolis Chapter of the American Academy of General Practice, held at Interlachen Club, November 16, Dr. Willis L. Herbert was elected president to succeed Dr. Willis M. Duryea, and Dr. C. W. Del Plaine was elected vice president to succeed Dr. J. H. Higgins.

Dr. Alexander J. Ross was elected secretary-treasurer to succeed Dr. James A. Blake.

AMERICAN COLLEGE OF ALLERGISTS

The American College of Allergists, numbering over 1,000 physicians in North, South and Central America, as well as in England, France, Africa, Cuba and the Scandinavian countries, mostly specialists in the fields of allergy and immunology, will meet at the Hotel Jefferson, St. Louis, Missouri, January 15 to 18, 1950.

There will be forty-two addresses by well-known physicians and allergists on such subjects as "Dangers from Cosmetics," "Snake Venom in the Treatment of Chronic Urticaria," "The Relation of Allergy to Character Problems in Children," and "Marital Adjustments in Parents of Allergic Children."

The von Pirquet medal, awarded for outstanding achievement in allergy, will be presented to Dr. Paul Kallós of Hälsingborg, Sweden, by President Jonathan Forman. Vera B. Walker, chairman of the British Allergy Society, London, will be a guest speaker.

Dr. Fred W. Wittich, Minneapolis, is secretary-treasurer of the College.

ANNUAL CLINICAL CONFERENCE OF THE CHICAGO MEDICAL SOCIETY

An announcement of this year's Annual Clinical Conference of the Chicago Medical Society, marking the centennial year of the Society, appears on page 1241 of this issue. The conference is scheduled for February 28 through March 3, 1950.

The conference, in the nature of a postgraduate course, will consist of clinical sessions and lectures by the nation's foremost medical authorities and educators, and scientific and technical exhibits. Color television and black-and-white telecasts will be utilized. The dinner will highlight speakers and entertainers. Reservations should be made at the Palmer House, which will be headquarters for the meeting.

CONTINUATION COURSES

Cardiovascular Diseases.—The University of Minnesota will present a continuation course in cardiovascular diseases at the Center for Continuation Study on January 5 through 7. The course is intended for general practitioners. Dr. Tinsley Harrison, professor of medicine at Southwestern Medical College, Dallas, Texas, will act as visiting faculty member for the course. He also will present the annual Clarance M. Jackson Lecture on the evening of January 6, when his subject will be "The Evaluation of Cardiac Murmurs."

Clinical Neurology.—A course in clinical neurology will be presented at the Center for Continuation Study, University of Minnesota, January 30 to February 11. The course is particularly recommended for neurologists, psychiatrists, pediatricians, internists and neurosurgeons. Visiting faculty members will consist of Dr. Fred Mettler, Neurological Institute, Columbia University, New York; Dr. Walter Klingman, Department of Neurology, University of Virginia Hospital, Charlottesville, Virginia; Dr. Harold Voris, Neurologic Surgery, Mercy Hospital, Chicago; and Dr. Earl Walker, Neurological Surgery, Johns Hopkins University, New York.

* * *

Pediatrics.—A continuation course in Pediatrics for general physicians will be presented at the Center for Continuation Study January 26 to 28, 1950. The course will be divided into three major divisions. A short period will be devoted to the importance of hereditary and genetic factors in understanding pediatric problems. A second portion of the course will emphasize common dermatological problems seen in infants and children. Common infectious diseases will be considered in the third portion of the course. Dr. Franklin Top of the Herman Kiefer Hospital, Detroit, Michigan, will be the visiting faculty member for the course.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

At the annual meeting of the Minnesota Society of Neurology and Psychiatry held at the Town and Country Club, Saint Paul, November 8, 1949, the following officers were elected to serve for the coming year:

President—William L. Patterson, M.D., Fergus Falls

Vice President—Burtrum C. Schiele, M.D., Minneapolis

Secretary-Treasurer—Royal C. Gray, M.D., Minneapolis

The program for the evening included two scientific papers: "A Concept Found Useful in Teaching Psychotherapeutic Interviewing to Medical Students" (inaugural thesis) by Frank Kiesler, M.D., Minneapolis, and "Diagrammatic Presentation of the Etiology and Treatment of Mental Disorders" by N. J. Berkwitz, M.D., Minneapolis.

MISSISSIPPI VALLEY MEDICAL SOCIETY 1950 ESSAY CONTEST

The tenth annual essay contest of the Mississippi Valley Medical Society will be held in 1950. The society will offer a cash prize of $100, a gold medal, and a certificate of award for the best unpublished essay on any subject of general medical interest (including medical economics and education) and practical value to the general practitioner of medicine. Certificates of merit may also be granted to the physicians whose essays are

THE SECOND OF A SERIES

Discussing Municipal Securities for Safety and Assured Income from Investment of Your Savings

Municipal securities are issued by States, Counties, Towns, Villages, School Districts, etc., throughout the United States to provide funds for roads, school houses and other public buildings, water, light, gas and sewer systems and other improvements needed to furnish service to the Public. We buy such of these issues as we feel are safe investments and afford proper income and in turn sell them to investors.

During the war years, municipal borrowing was practically at a standstill and the volume of municipal securities was abnormally low. Because of demand on the part of certain investors in high tax brackets and lack of supply, the income from municipal securities was so low as not to be of interest to the average investor. Municipalities are now going ahead with municipal improvements and yields are considerably higher. Yields on municipal bonds (income received by investor) suitable for short term bank investment are now available from 1.20% to 2.50% and on municipals for the average investor are available from 2.50% to 3.50%.

At present rates of Federal Income Tax, THE TAX EXEMPTION AFFORDED BY MUNICIPAL SECURITIES IS VERY IMPORTANT. A 2½% U.S. Government Bond or Corporate Bond for the person paying 20% Federal Income Tax leaves a net return of 2%, 30% tax a net yield of 1.75% and 40% tax a net yield of 1.50%. We have a pamphlet showing a comparison of yields between taxable and tax exempt (municipal) securities. We will be glad to mail you a copy if you will write or call us.

WASHINGTON COUNTY SOCIETY

The regular monthly meeting of the Washington County Medical Society was held on November 8. The scientific part of the meeting's program consisted of a color-sound motion picture on hypothyroidism.

Woman's Auxiliary

PRESIDENT-ELECT CITES WA "POWER"

Mrs. Charles W. Waas

The power of 49 thousand well-informed women is immeasurable, judging by the marvelous enthusiasm, dynamic energy and sincerity of delegates to the State Presidents' Conference, held November 3 and 4 in Chicago.

Although the program afforded an opportunity to hear addresses by a number of prominent doctors and laymen and one particularly fine talk by a member of the Associated Women of the American Farm Bureau, the most impressive aspect of the meeting was the familiarity with current problems demonstrated by Auxiliary officers, chairmen and members.

If all Minnesota Auxiliary members could have been present, they would have agreed with the goals discussed and the methods for achieving those goals, notably: arranging for the *Bulletin,* official Auxiliary publication, to be available to every member; making sure that doctor-husbands subscribe to *Hygeia* and that each Auxiliary member presents a gift subscription to at least one nonprofessional friend or acquaintance; recognizing the importance of county Auxiliary meetings, taking into account the fact that the day of the purely social meeting is past.

Those attending were advised that there is much to be done and the time is late. It is up to every Auxiliary member to do her part, study the literature given her, keep informed, attend meetings regularly and accept special responsibilities when the need arises.

FIVE HUNDRED ATTEND HEALTH MEETING

Mrs. Walter K. Haven*

Hennepin county health problems were analyzed from the standpoints of nursing, medical service, engineering and public health education November 4 at the Community Health program, held at the Woman's Club, 410 Oak Grove street, Minneapolis, and sponsored by the Hennepin County Woman's Auxiliary.

An estimated 500 women were present to hear the discussion of county health problems, conducted by a panel which included: Miss Ann Hauser, director, Hennepin County Public Health Nursing Service; Myron Peterson, public health engineer, Minnesota Department of Health; Miss Jeannette Simmons, community health educator, Minnesota Department of Health; Dr. Clare Gates, director, Bureau of Health Information, Minnesota Health Department; Dr. A. B. Rosenfield, director,

*Public Relations chairman, Hennepin County Auxiliary.

DEALERS IN DEPENDABLE MERCHANDISE

Health District No. six, Minnesota Department of Health; Dr. Reuben F. Erickson, chairman, Committee on Public Policy, Minnesota State Medical Association.

Dr. Mitrofan Smorszczok, displaced Polish physician who is now interning at St. Mary's hospital, Minneapolis, told the women of his experience in caring for the sick under Soviet government supervision. He was introduced by Dr. Horatio B. Sweetser, Jr.

Luncheon was followed by the showing of several health movies. Dr. R. F. McGandy, president, Hennepin County Medical society, spoke briefly and introduced the afternoon speaker, Dr. Donald W. Hastings, head of the Department of Psychiatry and Neurology, University of Minnesota. Dr. Hastings discussed "Emotions and Illness."

The meeting was concluded with "The Trials of a Doctor's Wife," a comedy presented by members of the Auxiliary.

COUNTY GROUP STUDIES SCHOOLS

The five-point basic program for improvement of school health services was studied and discussed by the Red River Valley Auxiliary when it met October 26 at the home of Mrs. J. E. Norman, Crookston.

The school health program was developed by the Minnesota Department of Health, the State Department of Education and the Minnesota State Medical Association. It includes: (1) Stripped-to-the-waist examinations, (2) examination of all children on admission as a minimum, (3) each school to have a physician serving as school medical adviser, (4) recognition of the many emotional problems that exist among the school children of today, (5) all adult school personnel to have a medical examination each year, including a chest x-ray.

Mrs. C. L. Oppegaard and Mrs. A. R. Reff led the discussion. Mrs. O. K. Behr, president, conducted the business meeting. Out-of-town members present were: Mrs. E. L. Zorn, Erskine; Mrs. George Cather, Fosston; and Mrs. M. D. Starekow, Thief River Falls.

If tuberculosis control is to reach its proper goal—the disappearance of tuberculosis from the United States—every reservoir of infection must be found and eliminated. One of the great sources of infection still remaining in this country may be found among inmates of mental institutions. Over and over again we have been told of the high rates of disease which prevail there. In 1946 there were 635,769 mental patients in the United States, and 4,247 of them died of tuberculosis. This is a rate of 668.0 per 100,000 in contrast to 36.4 for the general population. Deaths from tuberculosis in mental institutions comprised 8.3 per cent of the total deaths from tuberculosis in the United States during that year.—Robert J. Anderson, M.D., Pub. Health Rep., Jan. 7, 1949.

Of General Interest

The Council on Pharmacy and Chemistry of the American Medical Association has withdrawn its acceptance of sulfathiazole and sulfathiazole sodium. The decision was made in view of the fact that less toxic sulfonamide drugs and penicillin and streptomycin are now available. In conformity with its policy of withdrawing acceptance of a toxic drug when a less toxic but equally effective agent becomes available, the Council voted to omit sulfathiazole and sulfathiazole sodium from the 1949 edition of New and Nonofficial Remedies.

* * *

Principal speaker at a Farm Bureau meeting in Wright on October 18 was **Dr. Henry Hutchinson,** superintendent of the Moose Lake State Hospital, who discussed the hospital's mental health program.

* * *

It was announced on November 2 that **Dr. William D. Misbach** would soon begin practice in Fairmont in association with Dr. E. E. Zemke of that city. A graduate of the University of Minnesota Medical School, Dr. Misbach served his internship at Wesley Memorial Hospital, Northwestern University, Chicago. He then was called to active duty with the Navy and served at the United States Naval Hospital, St. Albans, Long Island, New York, and on the aircraft carrier, the U.S.S. Coral Sea. Following his discharge, he took postgraduate training at Midway Hospital, Saint Paul, and the University of Minnesota Hospitals.

* * *

One of the humanitarian service programs of the **American Cancer Society** is that of volunteer workers making thousands of dressings to be used by cancer patients. The cellulose filling is provided without charge by the Society, and volunteers make the dressings out of old sheets, diapers or other soft materials. They range in size from 2 by 2 inches to 8 by 12 inches. Hospitals, physicians and individuals may obtain them free by writing to a county cancer chapter or the Minnesota Division, American Cancer Society, 622 Commerce Building, Saint Paul 1.

* * *

Dr. Carlton Nelson, formerly of Minneapolis, became a member of the staff of the Worthington Clinic on November 1. A graduate of the University of Minnesota Medical School, Dr. Nelson interned at Minneapolis General Hospital. After serving with the Army during World War II, Dr. Nelson returned to Minneapolis General Hospital for three and one-half years of postgraduate training in surgery.

* * *

The marriage of Miss Martha Nordenstrom and **Dr. F. Norman Sather,** of Fosston, took place in the Hamline Methodist Church, Saint Paul, on October 1. Dr. Sather is associated in practice in Fosston with his two brothers, Dr. George A. Sather and Dr. Edgar Leland Sather.

* * *

A joint loan fund of $100,000, maintained by the **Illinois State Medical Society** and the Illinois Agricultural Association, is available to medical students and is being loaned to finance their medical education on condition that they agree to return to a rural community to practice medicine on completion of their training. Under the program, young men from rural areas who have completed premedical courses and have been approved by local farm bureaus and medical societies may borrow up to $5,000 to complete their four-year medical course and one-year internship. Many other states have followed Illinois' example since their program was announced last year.

* * *

Dr. Reta Adams, formerly of San Antonio, Texas, became a staff member of the Fergus Falls State Hospital on November 1. A graduate of the New York Medical College, Dr. Adams has been affiliated with several mental hospitals in the United States. She has also been an instructor in the National Medical College at Nanking, China, and has held a teaching position in Calcutta, India.

* * *

During the last week of October, **Dr. Jules O. Meyer** of Grand Rapids reported for duty with the Regular Army. He was temporarily assigned to the medical staff at the U. S. Disciplinary Barracks at Milwaukee, Wisconsin, pending transfer to European duty later in the winter.

Dr. Meyer began practice in Grand Rapids in 1938 and was associated with the Itasca Clinic. As a member of the Army Reserve, he was called to active duty in 1941 and served in many of the Pacific campaigns. Following the war, he returned to his medical practice in Grand Rapids. He has entered the regular Army with the rank of major.

* * *

"How National Compulsory Health Insurance Would Affect You" was the title of a talk presented by **Dr. W. D. Coventry,** Duluth, at a meeting of the Woodland Community Club in Duluth on November 3.

* * *

Frank W. Moudry, an outstanding pharmacist of Saint Paul and the state of Minnesota, was elected president of the National Association of Retail Druggists at the annual convention in New York in September. Mr. Moudry is a Minnesota product, having been born in Le Center in 1895, graduated from the College of Pharmacy of the University of Minnesota in 1915, and practiced his profession in various localities in Minnesota before establishing

the Apothecary Shop in Saint Paul which he now owns and operates.

Mr. Moudry held several offices of responsibility before being elected president of the National Association of Retail Druggists. In 1928 he was elected president of the Minnesota State Pharmaceutical Association. He was appointed to the Minnesota State Board of Pharmacy in 1935 and has served as secretary since 1940. Last year he served as president of the National Association of Boards of Pharmacy. In 1939 he was elected executive secretary of the National Association of Retail Druggists and has served as chairman since 1942.

A banquet was given for Mr. Moudry on November 17 at the Saint Paul Hotel by pharmacists of the state and was attended by leaders of pharmacy throughout the country, as well as by members of the Minnesota Pharmaceutical Association.

* * *

The President's Letter entitled "The Defense of Ethics," which was written by **Dr. E. M. Hammes** and which appeared in the September issue of MINNESOTA MEDICINE, was reprinted in the *Mankato Free Press* on October 18. The newspaper editors commented that the letter, which explained why the state medical association had decided to allow medical advertising in newspapers, was "so clear, so explicit and so effective" that they considered it a public service to reprint it in full.

Dr. Deane W. Benton, a staff member of the Worthington Clinic, announced on November 4 that he planned to move to Minneapolis to take further training in a specialized field of medicine. Dr. Benton began practice in Worthington last spring.

* * *

At a meeting of the American Academy of Ophthalmology and Otolaryngology in Chicago on October 14, **Dr. W. L. Benedict,** Rochester, was elected executive secretary-treasurer of the group.

* * *

It was announced on October 12 that prospects of obtaining a physician for Jeffers were improving. **Dr. J. A. Watkins,** who was completing a postgraduate short course at the University of Minnesota, had indicated that he would open his practice there if office space and living quarters were available. Residents of the city began trying to work out a plan whereby a clinic could be constructed.

* * *

Dr. Robert R. Rosenthal, Saint Paul, was the principal speaker at a meeting of the Chelsea Heights Child Psychology Study Circle in Saint Paul on October 25. Dr. Rosenthal, a practicing pediatrician and a clinical assistant professor of pediatrics at the University of Minnesota, spoke on the topic, "Prevention of Disease in Children and Prevention of Complications in Sick Children."

A physician who has completed his internship, or a graduate dentist, may be commissioned as a first lieutenant, either in the Regular Army or in the Medical or Dental Corps Reserve, and now receive **total pay and emoluments** amounting to $473.88 per month (if married or with dependents) or $458.88 per month (if single and without dependents). These figures compare with the former pay totals of $417 and $361, respectively.

A physician or dentist who has acquired sufficient professional experience, and who can meet the other requirements, may be commissioned directly as a captain or higher. A captain's pay, with emoluments, in the Medical and Dental Corps, is now $546 (with dependents) or $531 (without dependents), as against the former $462 and $426, respectively. On completion of four years of service, a captain receives regular increases at two-year intervals.

Comparable increases have been made in the higher grades, thus making the financial rewards of military service more commensurate with those of private practice.

* * *

A highlight of the meeting of the Arrowhead Society of Medical Technologists in Duluth on October 28 was a showing of colored pictures taken by **Dr. John M. Wolff** of Duluth while he was abroad.

* * *

Dr. Benjamin I. Derauf, Saint Paul, has been elected president of the Men's Garden Club of Saint Paul. Dr. Derauf, whose flower-growing specialty is delphiniums, is an official of the Men's Garden Clubs of America.

* * *

At a special meeting of the Bemidji city council on October 6, **Dr. Charles W. Vandersluis** was appointed city health officer. Dr. Vandersluis will fill the unexpired term of Dr. Sidney F. Becker, who resigned to accept a teaching fellowship at the University of Minnesota Medical School.

* * *

Dr. Curtis Johnson has become associated in practice with Dr. Walter H. Halloran and Dr. W. B. Wells in Jackson. A graduate of the University of Minnesota Medical School, Dr. Johnson served his internship at Miller Hospital, Saint Paul. He has practiced for one year at Emmanuel Hospital in Portland, Oregon.

* * *

Dr. Gosta Dohlman, professor of otolaryngology at the University of Lund, Sweden, visited Duluth in November to give a memorial lecture in tribute to the late Dr. David L. Tilderquist of Duluth. As he began his address, Dr. Dohlman presented to the St. Louis County Medical Society an heirloom in the nature of a sword which had been carried by a high officer in the Swedish medical corps in the seventeenth century, and which Dr. Dohlman had brought with him on his lecture tour of this country.

The sword was given in gratitude for the hospitality he had received in Duluth and as an act of appreciation of the fine qualities of Dr. Tilderquist. The sword was accepted by Dr. M. H. Tibbetts, president of the St. Louis County Medical Society, and will adorn the walls of the society's library in the Medical Arts Building.

It was announced on October 25 that **Dr. Jan H. Tillisch,** consultant in medicine at the Mayo Clinic, had been named a member of the board of directors of Mid-Continent Airlines, Inc.

* * *

Dr. and Mrs. Paul Kenyon, former residents of Wadena, celebrated their golden wedding anniversary at their home in Vestal, New York, on September 27. Dr. Kenyon practiced medicine in Wadena for thirty-eight years before retiring and moving away twelve years ago.

* * *

On October 21 the Madison Clinic announced that **Dr. M. M. Barr** would be associated with the clinic for the next few months. A graduate of the University of Minnesota Medical School, Dr. Barr has completed a three-year fellowship in obstetrics and gynecology at the Mayo Clinic. During his temporary stay at the Madison Clinic, Dr. Barr planned to conduct a general practice.

It was announced on October 26 that **Dr. B. J. Branton** of Willmar had been elected president of the Minnesota Public Health Association, to take office on April 1, 1950. Dr. Branton, in addition to conducting his medical practice, is also mayor of Willmar.

* * *

Ten Minnesota surgeons were received into fellowship in the **American College of Surgeons** at a meeting in Chicago on October 21. They are Dr. Frank S. Babb, Saint Paul; Dr. Edward A. Banner, Rochester; Dr. William A. Black, New Ulm; Dr. Clarence Dennis, Saint Paul; Dr. Rudolph E. Hultkrans, Minneapolis; Dr. Sim B. Lovelady, Rochester; Dr. Collin S. MacCarty, Rochester; Dr. Melvin B. Sinykin, Minneapolis; Dr. Hendrik J. Svien, Rochester, and Dr. Robert W. Utendorfer, Minneapolis.

* * *

The Cook County Graduate School of Medicine, Chicago, has announced that John W. Neal has joined the staff as comptroller and assistant registrar. Mr. Neal, a graduate of the Northwestern University School of Law, has been engaged in practice in Chicago for eleven years. He is associated with the Illinois State Medical Society as general counsel and as executive secretary of its Committee on Medical Service and Public Relations. He is the son of the late Dr. John R. Neal, who was dean of the Cook County Graduate School of Medicine at the time of his death.

* * *

"Neurosurgery" was the title of a talk presented by **Dr. Gordon J. Strewler,** Duluth, at a meeting of the St. Mary's Hospital Alumnae Association and the private duty section of the Second District, held at St. Mary's Hospital on November 2.

* * *

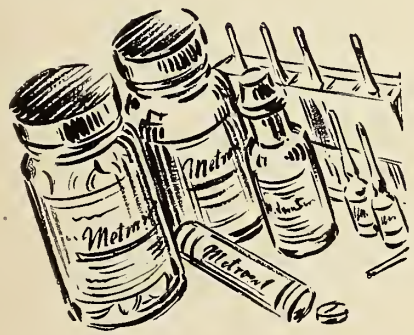
Among members of a Minnesota delegation attending scientific sessions at the **Menninger Foundation** in Topeka, Kansas, early in October, were Dr. M. C. Petersen, superintendent of the Rochester State Hospital; Dr. Royal C. Gray, chief of the mental health unit of the state division of public institutions; Dr. Edmund Miller of the Anoka State Hospital, and Dr. John Reitman of the Hastings State Hospital.

* * *

Dr. and Mrs. S. G. Knight were honored at a reception in Randall on November 4. A program and refreshments were provided by the many friends of the retired physician and his wife.

* * *

Formerly of Madison, **Dr. Arthur R. Andrejek** has become associated with the Henry Clinic in Milaca. Dr. Andrejek, a graduate of the University of Minnesota Medical School, served his internship at the Henry Ford Hospital in Detroit. He then took some postgraduate training in obstetrics at Florence Crittenton Hospital, Detroit, before moving to Madison where he was affiliated with the Madison Clinic for two years.



* * *

The Minnesota Heart Association held an all-day meeting on November 12 in the Founders Room of the Duluth Clinic. The program consisted of a pre-

Among the 1,457 Regular Army officers in the **Army Medical Corps** as of September 30, there were 160, or just a shade under 11 per cent, who were certified by American specialty boards, according to figures released by the Office of the Surgeon General. Represented in the ranks of the uniformed physicians and surgeons were eighteen specialties. The Army is seeking additional certified men in all eighteen specialties, as well as in allergy, cardiology, gastroenterology, and pulmonary diseases.

* * *

A clinic building will be the next new structure to be erected in the business district of Blackduck. **Dr. H. A. Palmer** of Blackduck ordered construction work to start on his building in October, and he expects the clinic to be completed next spring. The one-story modern structure will house a waiting room, a business office, physician's office, two examining rooms, laboratory, x-ray and darkroom, a utility room, and a dental suite.

* * *

Dr. Joseph Twidwell, recently associated with Dr. Frank E. Mork and Dr. A. Harold Mork in Anoka, has become affiliated with Dr. A. A. Zierold and Dr. D. J. Moos, with offices in the Medical Arts Building in Minneapolis.

* * *

Principal speaker at the annual dinner meeting of the Rice County Public Health Nursing Service, held in Faribault on November 9, was **Dr. Viktor O. Wilson,** city health officer of Rochester and director of District 3, Minnesota Department of Health. Dr. Wilson discussed the subject, "Community Health."

* * *

Thirty suburban Hennepin County Christmas Seal chairmen, meeting in Minneapolis on November 4, preparatory to launching the annual seal campaign, heard **Dr. Mario Fischer,** Duluth public health director, speak on "Milestones in Tuberculosis Control."

* * *

Dr. C. G. Uhley, Crookston, attended a special conference in Lansing, Michigan, on October 11, as a delegate of the Minnesota Division, American Cancer Society. The conference was held to discuss the Hillsdale Plan, a cancer detection plan being tested in Hillsdale, Michigan. Dr. Uhley is chairman of the Service Committee of the Minnesota Division, American Cancer Society, and is a member of the board of directors.

* * *

An exhibit on tumors of the lung won a certificate of merit for four **Mayo Clinic** staff members at a meeting of the American Roentgen Ray Society in Cincinnati in October. The four men honored were Dr. C. A. Good, Dr. J. R. McDonald, Dr. L. B. Woolner and Dr. A. H. Bulbulian.

* * *

Problems that would be presented by an **atomic bomb attack** were discussed at a convention in Minneapolis on October 7, attended by medical officers and enlisted men from Army, Navy and Air Force organized reserves. The convention was sponsored by the 804th Hospital Center, Colonel Edward P. Burch, Saint Paul, commanding officer.

Lt. Colonel Hanns C. Schwyzer, commanding officer of the 900th Mobile Army Surgical Hospital, assisted in the planning of the program. Included in the program were motion pictures on the nature of the atomic bomb, based on the Bikini test; a talk on the use of radioactive drugs in medicine, presented by Dr. Harry Z. Mellins, University of Minnesota; and a discussion of antibiotics by Dr. Wesley W. Spink, professor of medicine at the University of Minnesota.

* * *

Dr. A. S. Midthune, formerly of Borup, has opened offices for the practice of medicine in Lake Park. A graduate of the University of Minnesota Medical School, Dr. Midthune recently completed two years of service in the Army.

* * *

At the sixth session of a **medical postgraduate seminar** in Bemidji on November 1, Dr. John F. Briggs, clinical assistant professor of medicine at the University of Minnesota, discussed the treatment of

heart disease. Dr. William C. Bernstein, clinical instructor in surgery at the University of Minnesota, spoke on "Cancer of the Rectum and Anus." The session was part of a seminar consisting of eight consecutive weekly meetings, sponsored by the University of Minnesota Medical School, the Minnesota State Medical Association, and the Minnesota Department of Health.

* * *

Dr. Louis A. Buie, Rochester, has been elected secretary-general of the American Board of Proctology, a new organization approved by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association. The principal duty of the board is to certify physicians and surgeons who are qualified to practice in the specialty of proctology.

* * *

A former staff member of the Norwich, Connecticut, State Hospital, **Dr. Leo Whitehill** has joined the staff of the Anoka State Hospital, it was announced on November 3.

* * *

At a meeting of the Minneapolis branch of the American Association of University Women on October 10, members heard the first of three scheduled talks on national health insurance, with **Dr. Max Seham** of Minneapolis speaking in favor of compulsory health insurance.

Dr. Phebe Pearsall Block, a former Virginia physician and a sister of Dr. Robert P. Pearsall, Virginia city health officer, has been named the outstanding general practitioner for 1949-50 in Rock County, Illinois, by the Rock Island County Medical Society.

A graduate of the University of Minnesota Medical School in 1913, Dr. Block served her internship at the University Hospitals. When her brother, Dr. Robert Pearsall, entered military service in World War I, Dr. Block moved to Aurora to take charge of his practice. Later she opened a practice in Virginia. In 1928 she moved to Illinois, where she has since practiced.

* * *

Fifty members of the **International Society of Surgery** arrived in Rochester on October 24 for a three-day tour of inspection of the local medical facilities. The tour included visits to the Mayo Clinic and the Rochester hospitals, an honor dinner, and a scientific program presented by Mayo Clinic staff members.

* * *

Dr. Edward C. Maeder, Minneapolis, spoke on "Office Gynecology" at a meeting of the Barron-Washburn-Burnett Counties Medical Society at Rice Lake, Wisconsin, on November 8.

* * *

Carlton obtained a full-time physician on November 1, when **Dr. E. A. Pasek** opened offices there for

the practice of medicine. Dr. Pasek previously had been practicing with his brother, Dr. A. W. Pasek, in Cloquet.

* * *

The American Filipino Medical Aid Association has been organized to help provide medical and surgical supplies for the Filipinos. The aftermath of war has left a crying need there for medical aid. The association has been incorporated in Minnesota, with headquarters at Room 200, City Hall, Rochester, Minnesota. Contributions in the form of money, drugs or surgical instruments may be sent to the Rochester address. Checks for annual dues or contributions should be made out to the American Filipino Medical Aid Association. Such sums are deductible for income tax purposes.

* * *

Principal speaker at a meeting of the Blue Earth Valley Medical Society in Blue Earth on September 29 was **Dr. Robert Green** of the University of Minnesota. Dr. Green spoke on "Coronary Thrombosis."

* * *

Dr. Robert W. Keyes, formerly of Hastings, became a staff member of the Shipman Hospital in Ely on October 3, it was recently announced by Dr. J. P. Grahek and Dr. H. N. Sutherland of the hospital. A graduate of the University of Minnesota, Dr. Keyes served his internship at Mercy Hospital, Loyola University Clinic. He later took postgraduate training at Mercy Hospital, Janesville, Wisconsin. During the past year Dr. Keyes practiced in Hastings.

* * *

At a meeting of the Exchange Club in Duluth on October 26, **Dr. Reno W. Backus,** associate medical director of Nopeming Sanatorium and director of mobile x-ray surveys, stated that St. Louis County's record in tuberculosis control had favorably improved but still had a long way to go to compare with many Minnesota counties.

Dr. Backus said that the death rate from tuberculosis had dropped from about 120 per 100,000 in 1920 in St. Louis County to 20.5 per 100,000 in 1948. He pointed out that mass x-ray surveys had been very instrumental in reducing the rate, since in 1943, the year the first x-ray survey was begun in the county, the rate was about 40 deaths per 100,000.

"But," added Dr. Backus, "we're still just in the middle of the 'respectable' group of Minnesota counties." He urged full co-operation of Duluth residents in the x-ray resurvey of Duluth which was slated to begin about January 15, 1950.

* * *

Dr. Arthur A. Zierold, Minneapolis, was named a member of the International Society of Surgery at a meeting of the organization in New Orleans early in October.

* * *

As guest speaker at the annual dinner meeting of the McLeod County Public Health Association on October 27, **Dr. Paul F. Dwan,** Minneapolis, discussed "The Public Health Aspect of Rheumatic Fever" and presented a motion picture entitled "We Saw Them Through." Dr. Dwan is an associate professor of pediatrics at the University of Minnesota Medical School and chief cardiac clinician of the rheumatic fever program.

* * *

It was announced on October 20 that **Dr. Edward Zupanc,** who was completing a fellowship in pediatrics at the University of Wisconsin General Hospital, had been offered an opportunity to study for one year at the Royal Hospital for Sick Children at the University of Edinburgh, Scotland. A graduate of the University of Minnesota Medical School in 1946, Dr. Zupanc served his internship in a Duluth hospital. It was not known whether he would accept the offer, but it had been stated that he might begin practice in Duluth early in 1950.

* * *

Dr. Cleon R. Holland, a former Rochester resident, has opened offices for the general practice of medicine in Rochester, it was announced on October 28. A graduate of Hahnemann Medical College in 1940, Dr. Holland interned at Swedish Hospital, Minneapolis. He served in the Army from 1941 through 1945, being stationed in Alaska and the Aleutian Islands for two and one-half years. After completing a residency in medicine at Ancker Hospital, Saint Paul, Dr. Holland did research work and was a teaching assistant in the physiology department at

At the annual dinner meeting of the board and auxiliary committees of the Jackson County Public Health Nursing Service, held in Jackson on October 18, **Dr. Paul C. Benton,** instructor at the University of Minnesota, presented a talk on "Mental Health."

* * *

Through the association in practice of three local physicians, it was announced on November 3, the communities of **Glenwood and Lowry** acquired a combination clinic, with offices in both communities. The three physicians constituting the clinic staff are Dr. B. A. McIver, Lowry, and Dr. Edward M. Elsey and Dr. M. K. Plasha, both of Glenwood. According to plans at the time of the announcement, Dr. Elsey would remain in Glenwood all of the time, Dr. McIver would spend three afternoons each week in Glenwood, and Dr. Plasha would alternate between the two communities, mornings in one and afternoons in the other.

* * *

The second annual **Medical Public Relations Conference,** sponsored by the Public Relations Department of the American Medical Association, was held in Chicago on November 5 and 6. Attending were physicians from all parts of the country who are charged with the responsibility of interpreting the profession and its problems to the general public. The afternoon session on November 5, which covered state society public relations projects, was presided over by Dr. A. E. Cardle, Saint Paul, chairman of the Health Education Committee, Minnesota State Medical Association.

* * *

The Rochester Child Health Institute, established in newly completed quarters, held an open house for the public on November 3 and 4. Of primary interest to visitors was the large playroom furnished like a child's dream house and equipped at one end with a one-way-vision glassed partition for use in observing children at play.

Incorporated in January, 1948, with its purpose to study and contribute to the health and welfare of Rochester children, the nonprofit institute receives grants-in-aid from the Mayo Foundation, the Public Health Service, the Marshall-Field Foundation and the Mead-Johnson Company. Among the staff members of the institute are Dr. Lloyd E. Harris, assistant director, and Dr. Benjamin Spock, in charge of preventive psychiatry.

* * *

Dr. Harold S. Diehl, dean of medical sciences at the University of Minnesota, left on November 21 for Great Britain where he and two other medical school deans were to make a one-month to six-week study of England's nationalized medical service. The study, which was being made at the request of the trustees and Council on Education and Hospitals of the AMA, was to determine the effects of nationalized

The 23,000 members of the **New York State Medical Society** have assessed themselves $12 each to provide a scholarship fund for the college or professional school education of the children of the thirty-four members who died in World War II. It is estimated that the fund will remain in operation until 1972 and will entail a total expenditure of $328,000.

* * *

Public Health Service grants of $2,174,900 for the construction of cancer research facilities in fourteen hospitals, universities and other institutions were announced on November 17 by Oscar R. Ewing, Federal Security Administrator. These awards were made by the National Cancer Institute, following recommendations of the National Advisory Cancer Council and approval by Surgeon General Leonard A. Scheele of the Public Health Service.

Dr. Scheele pointed out that the grants have been made primarily to institutions closely affiliated with medical schools.

The sum of the National Cancer Institute construction grants since 1947, when Congress made the first appropriation for this purpose, has been sizable —$15,728,000.

* * *

In addition to the speakers reported in the November issue as participating in the seminar on infantile paralysis sponsored by the **Elizabeth Kenny Foundation** in Minneapolis on October 3 to 5, the following physicians took part in the program: Dr. E. J. Huenekens, Minneapolis; Dr. Wallace H. Cole, Saint Paul; Dr. John F. Pohl, Minneapolis; Dr. Gilbert Dalldorf, Albany, New York; Dr. Marvin A. Stevens, New Jersey Medical Center, Jersey City, New Jersey; and Dr. Sidney Sideman, Chicago.

* * *

Dr. Russell J. Moe of Duluth was chosen president-elect of the Central Association of Obstetricians and Gynecologists at the annual meeting of the association in Oklahoma City, November 3 to 5.

* * *

Among those in attendance at the regional meeting of the American College of Physicians, held in Indianapolis, Indiana, on November 19, was **Dr. Clyde A. Undine** of Minneapolis.

* * *

A plaque for distinguished service in the field of tuberculosis control was presented to **J. Arthur Myers, M.D.**, professor of medicine, preventive medicine and public health at the University of Minnesota, at the annual Christmas Seal dinner, October 25, at Coffman Memorial Union, University of Minnesota.

The award was made on the occasion of the publication of Dr. Myers' latest book, "Invited and Conquered," a history of tuberculosis in Minnesota.

Dr. Myers is a past president of the National Tuberculosis Association, Mississippi Valley Conference on Tuberculosis, American College of Chest Physicians, and the Minnesota Public Health Association. He is editor-in-chief of the official publication of the American College of Chest Physicians, "Diseases of the Chest," and a member of the editorial board of the "American Review of Tuberculosis."

* * *

The AMA Board of Trustees, meeting in Chicago, November 5, authorized the Bureau of Medical Economic Research to undertake a **study of physicians' incomes** during 1949. The study will be undertaken in co-operation with the Office of Business Economics of the U. S. Department of Commerce and will begin sometime next spring.

The sample study will be of the mail-questionnaire type and will be prepared jointly by the Bureau of Medical Economic Research and the Department of Commerce. The sample will be drawn from the Bureau's complete punch-card file of physicians. The questionnaires will be confined principally to questions of income and those necessary to cross-classify the respondents. The physician will not sign his questionnaire.

* * *

It was announced on November 10 that **Dr. John E. Verby, Jr.**, formerly of Saint Paul, had purchased the practice of the late Dr. V. J. Telford in Litchfield and would begin practice there on November 14. A graduate of the University of Minnesota Medical School in 1949, Dr. Verby had been practicing in Cannon Falls.

HOSPITAL NEWS

Construction of a new neurologic unit at **Glenwood Hills Hospitals**, Minneapolis, has been announced by the board of trustees.

The $175,000 unit, which is expected to be ready for service by January 1, will be the only non-governmental center devoted exclusively to the diagnosis, treatment and retraining of patients with neurologic disabilities in the Upper Midwest. It will have facilities for the evaluation and treatment of hemiplegic patients, multiple sclerosis, convulsive disorders, speech disorders, paraplegia and other paralysis, and ataxias.

Staffed by a large number of neurologists, neurosurgeons and therapy technicians, the neurologic center of Glenwood Hills Hospitals plans to make available a program of total neurologic and rehabilitative treatment which can result in the discharge of about 75 per cent of chronic neurologic patients.

The neurologic unit will occupy a modern-designed addition to the main Glenwood Hills building at 3501 Golden Valley Road, Minneapolis.

* * *

Lutheran Deaconess Home and Hospital, Minneapolis, celebrated its sixtieth anniversary on October 23 by dedicating two new floors that have been added to the hospital since the war. Two special Sunday services marked the event. The two additional floors, which were constructed at a cost of more than $300,000, increase the facilities at Deaconess Hospital so that 160 adults and 40 child patients can now be accommodated.

* * *

Amendments to Hill-Burton Act.—The prospects for new hospitals and for important research leading to improved services in existing hospitals have been materially enhanced by amendments to the Hospital Survey and Construction Act. The amendments, doubling the amount of federal funds which will be made available to the states under the Hill-Burton Act of 1946, and liberalizing the amount of the federal contributions, became effective October 25 when they were signed by President Truman.

Under the terms of the new legislation, the amount of federal grants to the states is increased from 75 to 150 million dollars annually, and the period during which allotments can be made is extended from June 30, 1950, to June 30, 1955. In addition, a new formula has been developed which permits a federal contribution ranging up to 66.6 per cent of the total construction costs for new hospitals, as against a contribution of 33.3 per cent under the original law.

The new legislation provided also for federal grants totaling $1,200,000 a year for five years for a research program looking toward co-ordination and improvement of hospital services.

The national hospital construction program is administered by the Public Health Service of the Federal Security Agency.

Surgeon General Leonard A. Scheele has pointed out that as of October 1, 1949, 954 hospital projects have been approved, approximately 400 are under construction, while fifty have been completed and are open. The majority are small general hospitals of fifty-bed or less capacity, located in small towns or rural areas. Approximately 37,000 beds will be provided for by this construction, or 4 per cent of the total need, which has been estimated at 900,000 additional beds, the Surgeon General stated.

Under the provisions of the amendments, the Public Health Service is authorized to make grants for additional studies to the states, medical schools, regional hospital councils, and similar private nonprofit institutions in an expanded research program. These studies may include such projects as the establishment of rotating internships, refresher courses for physicians, clinical conferences, and provisions for common use of diagnostic facilities and equipment, all of which will be of aid to smaller hospitals.

* * *

It was announced on November 4 that work on the **Carlton Community Hospital** would be resumed immediately, since approval of the floor plans had at last been granted by the Minnesota Board of Health. Approval had been withheld pending revision of some of the floor plans to conform with state sanitary and safety standards.

* * *

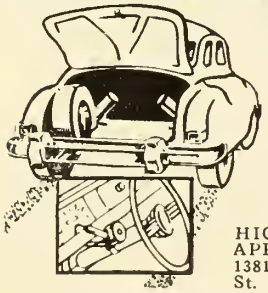
More than $50,000 has been pledged by Crookston physicians to the **Bethesda Hospital Building Fund,** it was announced on October 26. The contributions of the physicians will amount to more than one-sixth of the $300,000 which is being sought to construct an addition to Bethesda Hospital in Crookston, Solicitation of physicians was conducted voluntarily by agreement among themselves. Results in the general campaign were not available at the time the announcement was made.

* * *

Cornerstone-laying ceremonies for the **Blue Earth Community Memorial Hospital** were held on October 17, with Dr. Charles W. Mayo of Rochester as the principal speaker. The $450,000 structure, then in an advanced stage of construction, was expected to be completely enclosed before the onset of winter. When completed, the hospital will be a three-story building of reinforced concrete and brick, with facilities for thirty-two beds.

* * *

Even strict bed-rest doesn't keep patients at **Glen Lake Sanatorium** from exercising a "nose for news." Many of the patients, though confined to bed, still serve as reporters for *Terrace Topics,* a monthly news magazine published by the sanatorium patients.



Eight hundred copies of the magazine are issued each month—varying in size from sixteen to sixty pages and covering general news stories about the hospital, poetry, book reviews and gossip. The reportorial staff, made up entirely of patients, fluctuates with each edition to give everyone an opportunity to contribute. Advertising for the publication is sold by telephone, and printing is handled by a Minneapolis firm.

BLUE CROSS-BLUE SHIELD NEWS

One person out of every two families protected by Blue Cross and Blue Shield used hospital and doctor care during the first nine months of this year. Doctors received $797,517 for care to Blue Shield subscribers, and hospitals received $6,228,952 for care to Blue Cross subscribers.

In September alone, Blue Shield claims totaled 3,219 —nearly twice the number of claims paid during the entire first nine months of 1948 when Blue Shield claims totaled 1,881. Doctors received $120,823.23 in Blue Shield payments during September.

During the first nine months of this year participating doctors provided services for 94 per cent of the claims, and non-participating doctors for 6 per cent. Unlimited or low-income subscribers represented 20.4 per cent of the total cases, and limited or higher-income subscribers represented 79.6 per cent. Of the total cases, 35.6 per cent were medical, 49.4 per cent surgical, 4.8 per cent obstetrical, 5.4 per cent x-ray and the balance were for

assisting, after care, endoscopy and anesthesia totaling 4.8 per cent.

Of the total $6,228,952 Blue Cross benefits to subscribers during the first nine months of this year, over $5,300,000 was paid to hospitals for care of family subscribers.

From January through June, this year, families enrolled under the Blue Cross "Family A," $5.00 room allowance contracts used hospital benefits amounting to 99 cents out of every dollar they paid into the Blue Cross plan.

These are facts which made an increase in rate for this family Blue Cross contract unavoidable. The increase, which amounts to 25 cents a month, will go into effect January 1, 1950.

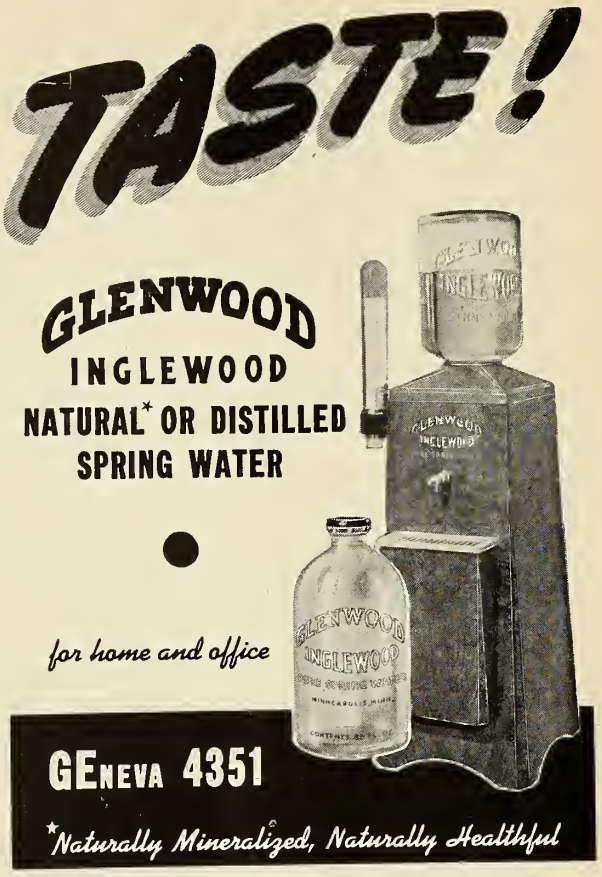
This increase is in direct proportion to the increase in utilization for this "Family A" group over the 1948 utilization figure, and amounts to 9 per cent. It affects only those subscribers who carry the "Family A," $5.00 a day room allowance contracts.

The only alternative to the price increase was a decrease in benefits. Greater, not lesser hospital and doctor care benefits are needed today with the increased cost of medical care. The slight 9 per cent increase will enable the Blue Cross plan to continue to give subscribers liberal benefits, and continue to be financially sound.

It is only because Blue Cross and Blue Shield are non-profit, community plans that they can offer such broad service benefits. Hospitals and doctors working together with employers and employes in a non-profit plan, designed to benefit the entire community, make such benefits possible.

As of September 30, 1949, close to a million persons (954,507) in Minnesota subscribed to Blue Cross, and 228,956 persons in Minnesota subscribed to Blue Shield.

Nationally, there are now 75 Blue Shield Plans with an enrollment of 11,000,000.



Over 35,000,000 persons in the nation now subscribe to Blue Cross. This is more than half of the 61,000,000 reported by the Health Insurance Council as having voluntary insurance against hospital expense.

During the month of October, 18 additional doctors enrolled as participating doctors in the Minnesota Blue Shield plan, bringing the total of participating doctors to 2554 as of October 31, 1949.

Doctors in private practice who are not participating doctors in the Blue Shield plan are requested to enroll. Write Minnesota Medical Service, Inc., 2388 University Avenue, St. Paul, for information.

During the month of October the Board of Directors authorized an additional $22,500 to be paid to doctors holding notes for funds lent to the Blue Shield plan. Doctors whose names were drawn by lot were notified of redemption of their notes.

Doctors are again requested to send in their claims as early as possible after a patient's case is completed. Claims on all outstanding Blue Shield cases should be submitted to the Blue Shield office prior to January 1, 1950, if possible.

Correspondence

To the Editor:

There have been many inquiries recently regarding the arrangements for covering the cost of care for poliomyelitis patients. There are a number of factors which will be of interest to your readers.

During 1949 a poliomyelitis incidence of unprecedented size (more than 37,000 stricken since January 1) has put serious financial strain upon the National Foundation for Infantile Paralysis. For the first time in its eleven-year history it was necessary to conduct a Polio Epidemic Emergency Drive which although very helpful did not entirely meet current needs.

In its avowed purpose to lead, direct, and unify the national fight against infantile paralysis the National Foundation undertook support of research and education, for in these areas lie the ultimate hope for eradication of poliomyelitis. These programs are not to be compromised in any way.

The greatest cost to the National Foundation, however, is payment for medical care to patients. It is urgent for all physicians to assist in the institution of measures which will reduce costs without prejudice to patients. The chief costs are for hospitalization. Many poliomyelitis patients are hospitalized when they can be cared for at home at a reduced cost.

Our experience in this year's epidemic which has spared virtually no part of the country suggests the following:

1. Abortive, nonparalytic and mildly paralytic poliomyelitis patients are being hospitalized in the mistaken idea that the stated period of isolation must be spent in the hospital.

2. Overly prolonged hospitalization is frequent. This is particularly true of the paralytic patient who has achieved maximum improvement from daily physical therapy. Home care with periodic office or clinic visits is then in order.

3. There still exists in some places a general attitude that poliomyelitis is a bizzare disease which only a few physicians can manage. This is not so. It is disturbing, for example, to find physicians leaning so heavily upon the guidance of physical therapists and nurses. The physician's assessment of the total patient is the best index in determining when a patient shall leave the hospital to receive home, office or clinical care.

4. Patients hospitalized on general ward services are not charged medical fees ordinarily. When patients are hospitalized on isolation wards for poliomyelitis, however, bills for medical fees are at times submitted. Payment is frequently made by the local chapters of the National Foundation whose treasuries are now generally depleted.

It is hoped that your readers will understand clearly how urgent is our need for co-operation from all practicing physicians in the matters mentioned above.

Sincerely yours,

HART E. VAN RIPER, M.D.
Medical Director,
National Foundation for Infantile Paralysis

In 1948 the Federal Government collected 74 per cent of the total taxes collected. State and local governments collected 26 per cent of the total.

Of the 40 billion dollars collected by the Federal Government in 1948, 5.5 billions were returned to the states. The percentage returned varied from 3 per cent in Delaware to 96 per cent in Mississippi. In Minnesota, $124,051,188 of the $706,239,359 collected by the Federal Government was returned to the state.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

ALLERGY IN RELATION TO OTOLARYNGOLOGY. French K. Hansel, M.D., M.S., F.A.C.A. Editor-in-Chief, Annals of Allergy; Director of the Hansel Foundation; Associate Professor of Otolaryngology, Washington University School of Medicine. 77 pages. Price, $2.50, cloth. Saint Paul: Bruce Publishing Company, 1949.

X-RAY TREATMENT—Its Origin, Birth and Early History. Emil H. Grubbé, B.S., M.D., F.A.C.P. Charter member and emeritus member of the Radiological Society of North America; charter member of the American Roentgen Ray Society; Diplomate of the American Board of Radiology; Associate Fellow of the American Medical Association; emeritus member of the Illinois State Medical Society, and a member of the Chicago Medical Society, 154 Pages. Illus. Price $3.00, cloth. Saint Paul: Bruce Publishing Company, 1949.

FOR THE NEW MOTHER. Mildred V. Hardcastle, R.N. 163 pages. Illus. Price $2.00, cloth. Philadelphia; John C. Winston Co., 1948.

PRESENT CONCEPTS OF REHABILITATION IN TUBERCULOSIS. A review of the literature, 1938-1947. Norvin C. Kiefer, M.D., M.P.H., Senior Surgeon, United States Public Health Service; Assistant to the Chief, Tuberculosis Control Division, U.S.P.H. Service. 398 Pages. Price $3.50. National Tuberculosis Association, 1948.

This book consists of three parts, the first 260 pages consist of a review of the literature on rehabilitation, 1938 to 1947. This momentous task carries with it the usual shortcomings of such reviews in that probably some of this literature wasn't worth reviewing and, when presented in short abstracts, has little meaning for the reader.

The second part, a chapter called the Future of the Rehabilitation Program, which consists of the author's own ideas of the problem of rehabilitation. This is an excellent summary and reading of it is recommended to all physicians, particularly those interested in tuberculosis. Dr. Kiefer has stressed the importance of the physician assuming the leadership of rehabilitation program. At present large sums of money and numerous agencies are at work on the problem and a lack of proper leadership is quite evident. There is a definite tendency of the physician to isolate himself from the problem, but such should not be, for his position is such that for any degree of success the leadership must come from him. The author has very well summarized the present knowledge of this complex problem and points the direction to lead us from our present confused ignorance to much firmer ground.

The third part of the book consists of a bibliography of some one thousand references, which with part one is useful as reference material.

ROBERT E. LANE, M.D.

PHYSICIAN'S HANDBOOK, John Warkentin, Ph.D., M.D., and Jack D. Lange, M.S., M.D. 5th ed. Price $2.00. 294 p. Lithographed. Spiral Binding. Palo Alto, Calif.: University Medical Publishers, 1948.

As the title suggests, this book is a handbook, easily fitting the intern's pocket or sliding into a desk drawer.

In this small volume are recorded laboratory diagnostic procedures and normal values. Part II of the Handbook covers almost too much territory, including such items as normal obstetrical measurements, antidotes for poisons, and autopsy procedures. However, Part I alone, entitled "Laboratory Diagnosis," merits the purchase of this book.

BURTIS J. MEARS, M.D.

MEDICINE OF THE YEAR. John B. Youmans, M.D. (Editor), Dean, College of Medicine, University of Illinois. 143 pages. Price $5.00, cloth. Philadelphia: J. B. Lippincott Co., 1949.

This book is a readable and brief review of the newer developments in the various fields of medicine during the past year.

It is divided into four large sections consisting of Internal Medicine, Surgery, Obstetrics and Pediatrics. Internal Medicine and Surgery are further subdivided into various chapters such as allergy, cardiovascular dis-

ANNOUNCES CONTINUOUS COURSES

SURGERY—Intensive Course in Surgical Technique, two weeks, starting January 23, February 20.
Surgical Technique, Surgical Anatomy and Clinical Surgery, four weeks, starting February 6, March 6.
Surgery of Colon and Rectum, one week, starting March 6.
Esophageal Surgery, one week, starting June 5.
Breast and Thyroid Surgery, one week, starting June 26.
Thoracic Surgery, one week, starting June 12.
Gallbladder Surgery, ten hours, starting June 19.
Fractures and Traumatic Surgery, two weeks, starting April 17.
GYNECOLOGY—Intensive Course, two weeks, starting February 20. Vaginal Approach to Pelvic Surgery, one week, starting March 6.
OBSTETRICS—Intensive Course, two weeks, starting March 6.
PEDIATRICS—Intensive Course, two weeks, starting April 3.
MEDICINE—Intensive General Course, two weeks, starting April 24. Gastroscopy, two weeks, starting March 6.
DERMATOLOGY—Formal Course, two weeks, starting May 8. Informal Clinical Course every two weeks.
ROENTGENOLOGY—Diagnostic and Lecture Course first Monday of every month. Clinical Course third Monday of every month. X-Ray Therapy every two weeks.
UROLOGY—Intensive Course, two weeks, starting April 17. Cystoscopy, Ten Day Practical Course, every two weeks.
General, Intensive and Special Courses in all Branches of Medicine, Surgery and the Specialties.

eases, urology, fractures, et cetera. Each chapter is reviewed by leading contributors from various parts of the country.

The material presented is a narrative description of what has transpired and its significance written in a most concise manner.

The sections on internal medicine and endocrinology are especially well done. The chapter on cardiovascular diseases made no mention of recent developments in cardiac catheterizations or anticoagulant therapy.

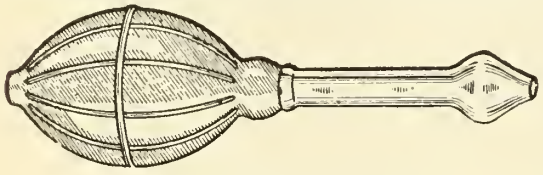
The reviewer recommends this book to the physician as an aid to help keep him informed of medical progress.

J.T.M.

SYMPOSIA ON NUTRITION OF THE ROBERT GOULD RESEARCH FOUNDATION. Vol. 1—NUTRITIONAL ANEMIA. Edited by Arthur Lejwa. 194 pages. Distributed without cost to individuals and organizations interested in nutritional problems. Cincinnati: Robert Gould Research Foundation, Inc., 1947.

This little book of 194 pages is worth while reading for anyone interested in recent research in the anemias. It is composed of ten papers by well-known specialists presenting various aspects of their particular fields of research. The chemical, physiological and clinical phases of nutritional anemias are stressed.

The symposium was held in Cincinnati in October, 1947, under the auspices of the College of Medicine of the University of Cincinnati. The papers dealt with work published in 1946, or at an earlier date. Therefore, the later work on Vitamin B-12 is not included. A paper by Maxwell M. Winthrop on the "Physiological Implications of the Anemic State" is followed by two papers on "Folic Acid, Physiology and Use in Nutritional Anemias." An interesting paper on "Megaloblastic Anemia in Infancy" by Wolf M. Zuelzer, is particularly well written. The topic of "Iron Deficiency Anemias" and the "Biochemical and Physiological Aspects of Iron Metabolism" occupy four short papers. Finally, there are two papers on the "Vitamin B Complex and Anemia" and "Vitamin C and Anemia."



BEN SOMMERS, M.D.

THE BATTLE OF THE CONSCIENCE. A Psychiatric Study of the Inner Working of the Conscience. Edmund Bergler, M.D. 296 pages. Price $3.75, cloth. Washington, D. C.; Washington Institute of Medicine, 1948.

In this complex work, Bergler has attempted to give a Freudian conception of a difficult subject, the formation of the consicence. As might be expected from the pen of such a distinguished and learned man, the book is very well documented and intricately contrived. However, numerous criticisms may be made of the work. First, it is rather badly arranged, so that it is difficult for the reader to gain a clear-cut idea of what the author is attempting to elucidate. Secondly, the psychological explanations which are given are often rather narrow in their basis, in the opinion of this reviewer. For example, the author's usual explanation of abnormal psychological development is on the basis of individual intrapsychic disturbances. He seldom uses cultural or interpersonal pathology as explanatory factors in his cases. In this he follows rather closely the lead of the traditional Freudian theoretician and deviates from the more modern attitudes, which are beginning to assume greater and greater importance in psychoanalysis and in therapy in general.

The book is not recommended for the beginner in the study of theoretic psychology. It is too complicated and too badly organized for such a person to receive much help from it. On the other hand, it is little more than a more detailed explanation of previous Freudian theories and is not likely to be of great value to the mature student. The usefulness of the book is therefore limited to the advanced student in psychology or psychiatry who is eager to gain more knowledge of the general Freudian structure.

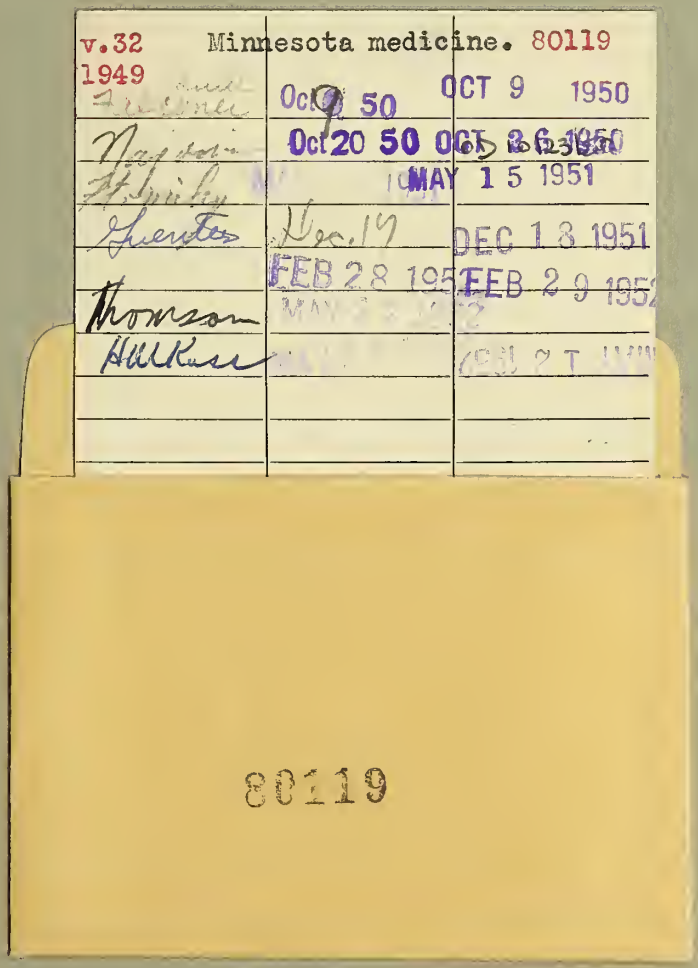
Flexible Formula

FOR AN INDIVIDUALIST

PHYSICIANS concerned with infant feeding have found that the exceptional *flexibility-of-use* offered by Dextri-Maltose* is an important advantage in adapting formulas to the individual requirements of the baby.

By the inclusion of Dextri-Maltose in appropriate amount, the caloric value and carbohydrate content of a formula can easily be adjusted to the infant's special needs.



Since the physician has 5 forms of Dextri-Maltose available, an individual infant's formula may be changed according to various clinical or physiologic indications without disturbance of his routine.

Being a mixture of carbohydrates, Dextri-Maltose offers special qualities of digestibility and slowness of absorption. Hence it is an ideal carbohydrate for use in diarrhea and other gastrointestinal disturbances.

Dextri-Maltose dissolves rapidly in water or milk. It can be used in *your* preferred method of formula preparation. *T.M. Reg. U.S. Pat. Off.
